ENCYCLOPÆDIA LONDINENSIS;

OR,

UNIVERSAL DICTIONARY

OF

ARTS, SCIENCES, AND LITERATURE.

COMPREHENDING,

UNDER ONE GENERAL ALPHABETICAL ARRANGEMENT,

ALL THE WORDS AND SUBSTANCE OF

EVERY KIND OF DICTIONARY EXTANT IN THE ENGLISH LANGUAGE.

IN WHICH THE IMPROVED DEPARTMENTS OF

THE MECHANICAL ARTS, THE LIBERAL SCIENCES, THE HIGHER MATHEMATICS, AND THE SEVERAL BRANCHES OF POLITE LITERATURE,

ARE SELECTED FROM THE

ACTS, MEMOIRS, AND TRANSACTIONS, OF THE MOST EMINENT LITERARY SOCIETIES,

IN EUROPE, ASIA, AND AMERICA.

FORMING A COMPREHENSIVE VIEW OF THE RISE, PROGRESS, AND PRESENT STATE, OF HUMAN LEARNING IN EVERY PART OF THE WORLD.

EMBELLISHED BY A MOST

MAGNIFICENT SET OF COPPER-PLATE ENGRAVINGS,

ILLUSTRATING, AMONGST OTHER INTERESTING SUBJECTS,

THE MOST CURIOUS, RARE, AND ELEGANT, PRODUCTIONS OF NATURE, IN EVERY PART OF THE UNIVERSE;

AND ENRICHED

WITH PORTRAITS OF EMINENT AND LEARNED PERSONAGES, IN ALL AGES OF THE WORLD.

TOGETHER WITH

A COMPREHENSIVE SYSTEM OF HERALDRY,

FINELY ILLUMINATED, AND ENRICHED WITH THE ARMORIAL BEARINGS OF THE ROYAL FAMILY; OF THE ENGLISH, SCOTCH, AND IRISH, NOBILITY; OF THE BARONETS OF THE UNITED KINGDOM; AND OF NUMEROUS DISTINGUISHED FAMILIES, PATRONS OF THIS WORK.

COMPILED, DIGESTED, AND ARRANGED,

BY JOHN WILKES, OF MILLAND HOUSE, IN THE COUNTY OF SUSSEX, ESQUIRE;

ASSISTED BY EMINENT SCHOLARS OF THE ENGLISH, SCOTCH, AND IRISH, UNIVERSITIES.

1810.

Non audiendi sunt homines imperiti, qui humano ingenio majorem, vel inutilem, et rebus gerendis adverſam πολυμαθειαν criminantur. Eſt ſcilicet quædam Scientiarum cognatio et conciliatio; unde et Εγκυκλοπαιδειαν *vocant Græci; ut in unâ perfectus dici nequeat, qui cæteras non attigerit.*—Morhofi Polyhistor, l. i. c. i. s. i.

Those inexperienced perſons, who make it a charge of accuſation againſt variety and extenſive learning, that it exceeds the compaſs of human ability, or is uſeleſs, or that it is an impediment to tranſacting buſineſs, deſerve no attention. For there is between the Sciences a degree of natural and cloſe connexion; from which the Greeks uſe the term "Encyclopædia;" so that no one can be perfect in any one Science, who has not attained to ſome knowledge of the reſt.

DESCRIPTION OF THE FRONTISPIECE ILLUSTRATING GEOGRAPHY.

WE HAVE DESCRIBED GEOGRAPHY UNDER THE SEMBLANCE OF THE GODDESS TERRA, WHO, WITH THE FEMALE FIGURE AT HER RIGHT HAND, WITH HER HAIR ORNAMENTED WITH SHELLS, CORAL, AND SEA-WEED, AS TETHYS GODDESS OF THE SEA, ARE SUPPOSED TO BE EMPLOYED IN MARKING OUT UPON A GLOBE THE DIFFERENT COUNTRIES OF THE WORLD, AND DIVIDING THEM INTO THE FOUR QUARTERS, OF EUROPE, ASIA, AFRICA, AND AMERICA.

ENCYCLOPÆDIA LONDINENSIS;

OR, AN

UNIVERSAL DICTIONARY

OF

ARTS, SCIENCES, and LITERATURE.

FRANCESCHI'NI (Marc Antonio), a painter of eminence, born at Bologna in 1648. He was firſt a pupil of Gio-Maria Galli Bibiena, and afterwards ſtudied under Cignani. He worked at firſt in partnerſhip with Quani, whoſe ſiſter he married, and they were together at Parma, Placentia, Modena, and other places, painting in churches and palaces. One of Franceſchini's capital works was the ceiling of the great council-chamber at Genoa, in which he repreſented ſeveral of the principal actions of the republic, in a very grand ſtyle of compoſition. He painted, at the requeſt of the ſenate of Bologna, ſeveral pieces to be ſent to pope Clement XI. with which his holineſs was ſo well ſatisfied, that he invited him to Rome, and employed him in a grand deſign for a moſaic in one of the cupolas of St. Peter's. He was rewarded by being created a chevalier of the order of Chriſt; but he would not permit his friends to call him by his title, leſt it ſhould inſpire jealouſy in his old maſter Cignani. He carried this delicacy of ſentiment ſo far as to refuſe to undertake a work in rivalry to Cignani's ſon. He declined ſeveral invitations from foreign princes to ſettle in their ſtates, as well through love of freedom and independence, as through unwillingneſs to give uneaſineſs to the painters already eſtabliſhed there. The towns of Italy were the theatres of his labours; and during the courſe of a long and induſtrious life he filled many of them with monuments of his genius. At the age of ſeventy-eight he ſtill painted with the ſpirit and facility of his younger days; and the peculiar elegance of his pencil did not quit him to the laſt. He died in 1729, at the age of eighty-one.

FRAN'CESTOWN, an interior townſhip of the American States, in Hillſborough county, New Hampſhire, on the eaſt ſide of Contecook river, about twenty-one miles to the ſouth-weſt of Concord. It was incorporated in 1772, and in 1790 contained 982 inhabitants.

FRANC'FORT. See FRANKFORT.

FRANCHE-COMTE', before the revolution, a province of France, and anciently a part of the kingdom of Burgundy. Almoſt one half of the country is level, abounding in grain, wine, paſture, hemp, &c. The reſt is mountainous, but breeds excellent cattle, and produces corn and wine. There are mines of copper, iron, lead, and ſilver, and ſome mineral ſprings, with quarries of alabaſter and marble. The principal rivers are the Saône, the Ougnon, and the Doubs. It is now divided into the three departments of Mount Jura, the Doubs, and Upper Saône. This country was formerly the ſcene of the moſt dreadful calamities, reſulting from the ambition and cruelty of contending princes, till the year 1678, when it was ceded to France. The inhabitants then ſtipulated for the preſervation of their ancient privileges, with reſpect to taxation; part of this agreement was afterwards violated by Louis XIV. but ſtill they were leſs oppreſſed than the other provinces of France. The natives are ſaid to be a ſtouter race of men than the French, and ſeem to reſemble the Swiſs in character. Like other mountainous countries, Franche-Comté abounds with mineral productions, and has ſeveral grottoes and caverns that deſerve the attention of the traveller. Among theſe, is a natural ice-cellar, near the abbey of *Grace Dieu*, about twenty miles from Beſançon. Its ſituation is very romantic. On the higheſt part of a mountain, covered with a thick grove of lofty pines, is the opening of the cavern, which cannot be perceived till one is cloſe to it, when, from its depth, which to the bottom is above two hundred and twenty feet, and the ſolemn gloom of the ſurrounding wood, it reſembles what poets have feigned of the deſcent to the infernal regions. The cavern itſelf is ſixty feet in length and height, and forty in breadth: the bottom is covered with ice, of which vaſt pyramids riſe from it, while others appear as it were ſuſpended from the arched roof, with their points oppoſite to thoſe of the former. Within the cave is a hole, or well, which is always full of water, and is never frozen; and, at the entrance, ſome mould, which ſeems to have been thrown there accidentally, is adorned with primroſes and other wild flowers. The ice, which, in the cavern, appears of a beautiful azure, is, when ſeen by day-light, remarkably white. From this natural repoſitory, the ice-houſes in Beſançon are ſupplied, when the winters are too mild to freeze water in the open air.

The grotto of Oſſelles, near Quingey, is ſimilar to Poole's Hole in Derbyſhire: it penetrates for nearly a mile into the mountain: but its height and breadth are different in different parts. In ſome apartments of it, the roof is above a hundred feet high: but the paſſages between theſe are ſo low, that they who go through them muſt creep on hands and feet. The inſide of the cavern is adorned with ſtalactites, and preſents ſcenes like thoſe which are ſo juſtly admired in Poole's Hole, and in Caſtleton, a cavern much ſuperior to Poole's Hole. The ſalt-works at Salins are alſo worthy of attention: one of theſe is at the bottom of a ſquare pit, or ſhaft, about thirty feet in width, in which is a narrow ſtair-caſe: the deſcent to this lower region is rendered awful by the noiſe of the pumps below, which, being reflected by the ſides of the rock, ſounds like the groans of perſons in torment: at the bottom are two fine ſprings of ſalt water.

FRANCHIMO'NT, a town of Germany, in the circle of Weſtphalia, and biſhopric of Liege, with a ſmall country, to which the title of marquis is annexed: thirteen miles ſouth-eaſt of Liege.

FRAN'CHISE, *ſ.* [French.] Exemption from any onerous duty. Privilege; immunity; right granted:

His gracious edict the ſame *franchiſe* yields
To all the wild increaſe of woods and fields. *Dryden.*

Diſtrict; extent of juriſdiction.—There are other privileges granted unto moſt of the corporations, that they ſhall not be travelled forth of their own *franchiſes*. *Spenſer's State of Ireland.*

To FRAN'CHISE, *v. a.* To enfranchiſe; to make free; to keep free:

I loſe no honour
In ſeeking to augment it; but ſtill keep
My boſom *franchis'd*, and allegiance clear. *Shakeſpeare.*

FRAN'CHISEMENT, *ſ.* [*franchiſe*, Fr.] Freedom:

To work Irena's *franchiſement*,
And eke Grantorto's worthy puniſhment. *Spenſer.*

FRAN'CHISES, *ſ.* in law, are a ſpecies of incorporeal hereditaments. *Franchiſe* and *Liberty* are uſed as ſynonymous terms; and their definition is "A royal privilege or branch of the king's prerogative, ſubſiſting in the hands of a ſubject." *Finch, L.* 164. Being therefore derived from the crown, they muſt ariſe from the king's grant; or in ſome caſes may be held by preſcription, which preſuppoſes a grant. The kinds of them are various and almoſt infinite: they may be veſted either in natural perſons or in bodies politic; in one man or many: but the ſame identical franchiſe that has before been granted to one, cannot be beſtowed on another, for that would prejudice the former grant. 2 *Rol. Ab.* 191: *Keilw.* 196.

The principality of Wales is a franchiſe. To be a county-palatine is alſo a franchiſe, veſted in a number of perſons. It is likewiſe a franchiſe for a number of perſons to be incorporated, and ſubſiſt as a body-politic; with a power to maintain perpetual ſucceſſion, and do corporate acts: and each individual member of ſuch corporation is alſo ſaid to have a franchiſe or freedom. Other franchiſes are, to hold a court-leet: to have a manor or lordſhip; or at leaſt to have a lordſhip paramount: to have waifs, wrecks, eſtrays, treaſure trove, royal-fiſh, forfeitures, and deodands: to have a court of one's own, or liberty of holding pleas, and trying cauſes: to have the conuſance of pleas, which is a ſtill greater liberty, being an excluſive right, ſo that no other court ſhall try cauſes ariſing within that juriſdiction: to have a bailiwick, or liberty exempt from the ſheriff of the county, wherein the grantee only and his officers are to execute all proceſs: to have a fair or market, with the right of taking toll, either there or at any other public places, as at bridges, wharfs, or the like; which tolls muſt have a reaſonable cauſe of commencement, (as in conſideration of repairs, &c.) elſe the franchiſe is illegal and void: 2 *Inſt.* 220: or laſtly to have a foreſt, chaſe, park, warren or fiſhery, endowed with privileges of royalty. *F. N. B.* 230.

Uſage may uphold franchiſes, which may be claimed by preſcription, without record either of creation, allowance, or confirmation; and wreck of the ſea, waifs, ſtrays, fairs and markets, and the like, are gained by uſage, and may become due without any matter of record. But goods of felons and outlaws, and ſuch like, grow due by charter, and cannot be claimed by uſage. 2 *Inſt.* 281. 9 *Rep.* 27.

It hath been adjudged, that grants of franchiſes, made before the time of memory, ought to have allowance, within the time of memory, in the king's bench, or before the barons of the exchequer, or by ſome confirmation on record; and it is ſaid they are not records pleadable, if they have not the aid of ſome matter of record within time of memory; and ſuch ancient grants, after ſuch allowance, ſhall be conſtrued as the law was when they were made, and not as it hath been ſince altered: but franchiſes granted within time of memory are pleadable without any allowance or confirmation; and if they have been allowed or confirmed as aforeſaid, the franchiſes may be claimed by force thereof, without ſhewing the charter. 9 *Rep.* 27, 28. 2 *Inſt.* 281. 494.

By *magna charta*, c. 1, and ſeveral ancient ſtatutes, the church ſhall have all her liberties and franchiſes inviolable: and the lords ſpiritual and temporal ſhall enjoy their liberties, &c. and the king may not deprive them of any of them. 14 *Edw.* III. ſt. 2. c. 1. 2 *Hen.* IV. c. 1.

By *magna charta*, c. 37, the franchiſes and liberties of the city of London, and all other cities, &c. are confirmed. By ſtat. 27 Hen. VIII. c. 24, all writs, proceſſes, &c. in franchiſes, are to be made in the king's name; and ſtewards, bailiffs, and other miniſters of liberties, ſhall attend the juſtices of aſſize, and make due execution of proceſs, &c.

Some franchiſes, as York, Briſtol, &c. have return of writs, to whom mandates are directed from the courts above, to execute writs and proceſs: and a mayor or bailiff of a town, may have liberty to keep courts and hold pleas in a certain place, according to the courſe of the common-law; and power to draw cauſes out of the king's courts, by an excluſive juriſdiction: but the cauſes here may be removed to the ſuperior courts. *Co. Lit.* 114. Sheriffs of counties, within which is any franchiſe, the lord whereof is intitled to a return of writs, ſhall, on his requeſt, appoint one or more deputies, to reſide at ſome place near, there to receive all writs in the ſheriff's name, and under his ſeal to iſſue warrants for their due execution; and the lord chancellor is to ſettle the charges to be paid any ſuch deputy, &c. 13 *Geo.* II. c. 18.

A franchiſe hath no relation to the county wherein it lies, as has been generally held; for it is not neceſſary to ſet forth the county when any thing is ſhewn to be done within a liberty or franchiſe. *Trin.* 23 *Car. B. R.* If a franchiſe fails to adminiſter juſtice within the ſame, the franchiſe ſhall not be allowed; but on any ſuch failure, the court of king's bench may compel the owners of the franchiſe, &c. to do juſtice; for that court ought to ſee juſtice equally diſtributed to all perſons. 1 *Lill. Abr.* 635.

Wherever the king is party to a ſuit, as in all informations and indictments, the proceſs ought to be executed by the ſheriff, and not by the bailiff of any franchiſe, whether it have the clauſe *non omittas*, &c. or not; for the king's prerogative ſhall be preferred to any franchiſe. 2 *Hawk. P. C.* A ſheriff upon a *non omittas*, or on a *capias utlagatum*, or *quo minus*, may enter and make arreſts in a franchiſe. 1 *Lill.* 635. An arreſt by the ſheriff within a franchiſe on a common writ, is ſaid to be good, though the officer be ſubject to an action at the ſuit of the lord of the franchiſe.

Franchiſes may be forfeited and ſeized where they are abuſed, for miſ-uſer, or non-uſer; and when there are many points, a miſ-uſer of any one will make a forfeiture of the whole on a *quo warranto* brought. *Kitch.* 65. For contempt of the king's writ, in a county palatine, the liberties may be ſeized, and the offenders fined; and the temporalities of a biſhop have been adjudged to be ſeized until he ſatisfied the king for ſuch a contempt, on information exhibited, &c. *Cro. Car.* 253. The biſhop of Durham pretending he had ſuch a franchiſe, that the king's writ was not to come there, and becauſe one brought it thither he impriſoned him; this being proved upon an information brought againſt him, it was adjudged he ſhould pay a fine to the king, and loſe his liberties. 2 *Shep. Abr.* 250.

Diſturbance of franchiſes happens, when a man has the franchiſe of holding a court-leet, of keeping a fair or market, of free warren, of taking toll, of ſeizing waifs or eſtrays, or, in ſhort, any other ſpecies of franchiſe whatſoever, and he is diſturbed or incommoded in the lawful exerciſe thereof. As if another by diſtreſs, menaces, or perſuaſions, prevail upon the ſuitors not to appear at my court; or obſtruct the paſſage to my fair or market; or hunts in my free warren; or refuſes to pay me the accuſ-

tomed

tomed toll; or hinders me from ſeizing the waif or eſtray, whereby it eſcapes, or is carried out of my liberty: in all caſes of this kind, and which are of a variety too extenſive to be here enumerated, an injury is done to the legal owner of the franchiſe; his property is damnified; and the profits ariſing from ſuch his franchiſe are diminiſhed. To remedy which, as the law has given no other writ, he is therefore entitled to ſue for damages by a ſpecial action on the caſe: or in caſe of toll, may take a diſtreſs, if he pleaſes. 3 *Comm.* 236.

FRAN'CI, the Franks, the Germans who conquered France.

FRAN'CIA, a town of Italy, in the kingdom of Naples, and province of Calabria Ultra: eight miles north-eaſt of Nicotera.

FRAN'CIA (Franceſco), a celebrated Bologneſe painter, born in 1450. He was firſt a jeweller, and afterwards a graver of coins and medals; but applying at laſt to painting, obtained great reputation by his works. He pined to death by deſpairing to equal Raphael; and paid the debt of nature in 1518.

FRANCIGE'NA, *ſ.* In old records, a Frenchman, a foreigner.

FRAN'CIS [ꝼꝛancıꝛe, Sax. *frank*, Teut. free.] A proper name of men.

FRAN'CIS I. the patron of arts and literature; and Francis II. called "the king without vice," were two illuſtrious monarchs of France. See the article FRANCE, p. 697, and 706, of vol. vii.

FRAN'CIS I. emperor of Germany. See the article GERMANY.

FRANCIS OF ASSI'SI, in Italy, a ſaint in the Romiſh calendar, and founder of the celebrated order of FRANCISCANS, or mendicant friars, was born at Aſſiſi, about the year 1181. The name given him at his baptiſm was John; for which that of Francis was afterwards ſubſtituted, either becauſe of his father's commercial connections with France, or from his own facility in ſpeaking the language of that country. As his father was a merchant, Francis was brought up to the ſame profeſſion, which he followed till the year 1206, leading for ſome time a moſt diſſolute life. Upon his recovery from a ſevere fit of ſickneſs, the conſequence of his licentious conduct, he changed his mode of living, reſolved to retire from the world, and to practiſe the moſt auſtere and rigid devotion. He ſecluded himſelf ſo much from ſociety, and mortified himſelf to ſuch a degree, that he contracted a ghaſtly countenance, which led the inhabitants of Aſſiſi to ſuſpect him of being diſtracted. His father now entertained thoughts of obliging him to reſume the buſineſs to which he had been educated; and when perſuaſion and parental commands produced no effect, he adopted the ſevere alternative of throwing him into priſon. When, however, he found that no means could produce any impreſſion on his ſon's mind, he carried him before the biſhop of the place, to make him reſign all claim to his paternal eſtate. Francis readily complied with his father's wiſhes on this point, and ſtripped himſelf of all his clothing, even to his ſhirt, that he might be better able to repeat, he ſaid, "Our Father who art in heaven!" Some time after this, in the year 1208, he happened to be in a church, where he heard this paſſage read from the goſpel of St. Matthew: "Provide neither gold, nor ſilver, nor braſs in your purſes, nor ſcrip for your journey; neither two coats, neither ſhoes, nor yet ſtaves; for the workman is worthy of his meat." "That," he exclaimed, "is the life I wiſh for;" and he threw aſide his ſhoes, his wallet, his ſtaff, and the little money he had, keeping only one poor coat, with a cowl, ſuch as the ſhepherds in Italy then wore, girded about with a knotted cord. He now conſidered a voluntary poverty to be the eſſence of the goſpel, and the ſoul of religion, and reſolved henceforwards ſtrictly to follow it, and to employ himſelf in recommending it to others. From this time he commenced preacher, and, having ſoon attracted a number of followers, he formed the deſign of founding a new order of mendicant friars.

He firſt drew up an inſtitute, or collection of rules for the diſcipline of the propoſed fraternity, according to which the members were not only to take the cuſtomary monaſtic vows of obedience, chaſtity, and poverty, but were to remain entirely deſtitute of all fixed revenues and poſſeſſions; to ſupport themſelves by the free contributions of the faithful; and on no occaſion to receive any money. When he had obtained eleven diſciples who were willing to ſubmit to theſe regulations, he went to Rome, and preſenting himſelf before pope Innocent III. entreated his confirmation of his new inſtitution. That pontiff, after debating on the impracticability of the ſcheme, gave it his ſanction in the year 1210, which was confirmed in the Lateran council held in 1215. Afterwards it was ſolemnly confirmed by pope Honorius III. in 1223, when its progreſs had more than anſwered the moſt flattering expectations of its founder. Francis, out of his great humility, would not ſuffer the monks of his order to be called *fratres*, i. e. brethren or friars, but *fratriculi*, i. e. little brethren, or friars minors, by which denomination they continued afterwards to be diſtinguiſhed. The fame of his ſanctity, and the enthuſiaſm for entering into his order, ſoon produced a multitude of diſciples, from whom colonies were ſent into the different provinces of Italy, Spain, France, and other countries. So rapidly did his inſtitutions increaſe, that in a general chapter of the order held near Aſſiſi in 1219, more than five thouſand monks were preſent. In the year 1214, Francis had projected a voyage into Syria, to convert the Mahometans to the Chriſtian faith, and, after obtaining the pope's permiſſion, had actually embarked for that country; but was driven by a tempeſt into ſome port on the eaſtern coaſts of the Adriatic ſea, whence he returned into Italy. Afterwards he ſet out on a journey through France and Spain, with the intention of paſſing over into Africa, to convert the Moors; but was prevented by illneſs from undertaking the latter expedition. Having returned into Italy, after the meeting of the general chapter of his order already mentioned, he embarked on a voyage to the eaſt, for the purpoſe of viſiting the holy ſepulchre, and propagating the Chriſtian faith among the Saracens. In this ſcheme, as may be imagined, he met with no ſucceſs, and was fortunate to eſcape with his life, after attempting to perſuade the ſultan to embrace Chriſtianity. He offered, it is ſaid, to commit himſelf to the flames, in teſtimony of the truth of that religion for which he pleaded; but the ſultan would not permit him to give ſuch a proof of the ardour of his zeal, though he reſpected him for it, by ſuffering him to be civilly diſmiſſed.

After his return to his native country, he employed himſelf in extending his inſtitutions, and in forming regulations for new branches of his order, comprehending laymen, as well as female devotees. When he had completed his plans, he reſigned the generalſhip of his order to one of his diſciples, and withdrew to indulge in contemplation and religious auſterities, in a ſolitude among the Appennine mountains. By the ſevere diſcipline which he adopted, of which repeated flagellation and faſtings formed no inconſiderable part, he brought on himſelf a complication of diſorders, which put an end to his life at Aſſiſi, in 1226, when only forty-five years of age. He was canoniſed by pope Gregory IX. in 1230. His order roſe to great ſplendor after the founder's death, and materially contributed to ſupport the power and influence of the Roman ſee, by the zeal and activity with which the members employed themſelves in extirpating heretics; the various negociations and embaſſies undertaken by them for the intereſts of the hierarchy; and their inceſſant labours to enforce an implicit obedience to the Roman pontiffs. But the particulars relating to it belong to the province of the eccleſiaſtical hiſtorian. St. Francis was the author of 1. *Epiſtolæ.* 2. *Orationes.* 3. *Regulæ Monachis Præſcriptæ.* 4. *Collectiones.* 5. *Sermones, &c.* which were collected together

gether and publiſhed at Paris in 1641, by John de la Haye, in one volume folio.

FRANCIS DE BOR'GIA, a Romiſh ſaint, born in Spain, about the year 1511. He was the grandſon of pope Alexander VI. and hereditary duke of Candia. He obtained the viceroyſhip of Catalonia, and from his birth and connections might have expected the higheſt honours which the king of Spain had to beſtow; but he grew diſguſted with the world, and determined to embrace the eccleſiaſtical life. One circumſtance that contributed to produce this reſolution was the loſs of his wife, by whom he had a numerous offspring. Relinquiſhing to others the care of their education, he became a member of the ſociety of Jeſus in 1548, and in 1565 was raiſed to the poſt of general of that order. He refuſed ſeveral eccleſiaſtical dignities, as well as the high honour of the cardinalate; and dedicated his whole time to the advancement of the intereſts of the Jeſuits. Pope Pius V. knowing his talents for buſineſs, and entire devotedneſs to the Roman ſee, obliged him to accompany his nephew cardinal Alexandrinus, whom he ſent legate into Spain, and Portugal, and afterwards into France. He died at Rome, in 1572, in the ſixty-ſecond year of his age, and was canonized by pope Clement X. in 1671. He was the author of ſeveral theological and devotional pieces, written in the Spaniſh language. They were tranſlated into Latin by father Alphonſus Deza, a jeſuit, and publiſhed at Bruſſels in 1675, in folio.

FRANCIS DE JESUS-MARI'A, a learned Spaniſh carmelite monk, of the reformed order of St. Thereſa, who flouriſhed in the 17th century, was a native of Burgos, in Old Caſtille. He taught theology with much applauſe in the univerſity of Salamanca, and diſcharged the office of definitor-general of his order with great reputation. He died in 1677. He was the author of *Curſus Theologiæ moralis Salmanticenſis*, publiſhed at Salamanca in 1665, in folio, and afterwards reprinted at Lyons, and Madrid; Commentaries on the Apocalypſe, publiſhed at Lyons in 1648 and 1649, in two volumes folio.

FRANCIS DE PAU'LO, a Romiſh ſaint, founder of the order of *Minims*, born at Paulo, a town of Calabria, in 1416. In conſequence of a vow made by his parents to devote him to a religious life, he entered into the Franciſcan convent at St. Mark's, the epiſcopal town of the province, where he continued for one year. Afterwards he engaged in various pilgrimages, and finally adopted the hermit's life, in a ſolitary ſpot not far from his native town. Finding that in this ſituation he was expoſed to too many viſitors, he retired to a deſert on the ſea-coaſt, where he conſtructed a cell among the rocks. The fame of his ſanctity drew after him diſciples, who built a chapel and a ſmall hermitage adjoining to his cell; but their numbers rapidly increaſing, a monaſtery was built upon the ſame ſpot, of which the original denomination was that of *Hermits of St. Francis*. After his inſtitute had received the approbation of pope Sixtus IV. in 1473, Francis de Paulo was nominated the ſuperior-general. At a ſubſequent period he reviſed and altered his regulations, and obtained pope Alexander VIth's confirmation of them in their new form; on which occaſion the name of the order was changed to that of *Minims*, becauſe that out of his profound humility Francis wiſhed himſelf and followers to be diſtinguiſhed by the diminutive appellation of *Fratres Minimi*. The rules of his order were extremely rigorous, enjoining on the members a perpetual Lent, and great ſeverity of perſonal diſcipline. Francis practiſed to an extreme the abſtinence and mortifications which he preſcribed to his followers; on no occaſion taking any wine, meat, fiſh, or milk; contenting himſelf with bread and water; never taſting food till after ſunſet; going barefoot; ſleeping on the floor of his cell, without any other pillow than a ſtone or a block of wood; and wearing a rough hair-cloth next his ſkin, under a coarſe and mean upper dreſs. So great was the ſuperſtition of the times, that he acquired the higheſt character for piety and virtue by theſe auſterities. His fame ſoon ſpread over Europe, in different parts of which many monaſteries were erected for friars of his order. So high was the opinion entertained of his ſanctity, that when Louis XI. of France was attacked by a dangerous diſtemper, he ſent for Francis out of Calabria, hoping to obtain a cure by virtue of his prayers. This journey he refuſed to undertake, until commanded to do ſo by the pope. He was received by Louis with the greateſt honour, and had apartments aſſigned to him in the palace of Pleſſis-les-Tours, where the king then reſided. After the death of that monarch, his ſucceſſor Charles VIII. built a convent for Francis and his monks in the park belonging to the palace. In this convent Francis died, in 1507, at the advanced age of ninety-one years. He was canonized by pope Leo X. in 1519. In Paris the friars of his order were called *Bons-Hommes*, probably after the name of *Bon-Homme*, given by the kings Louis and Charles to their founder; and in Spain *Fathers of the Victory*, on account of a memorable defeat of the Moors by Ferdinand V. which it is pretended was foretold by St. Francis.

FRANCIS DE SA'LES, another ſaint of the Romiſh calendar, and founder of the religious order of *the Viſitation*. He was deſcended from one of the moſt ancient and noble families in Savoy, and born at the caſtle of Sales, near Geneva, in 1567. In his early years his mind was ſtrongly impreſſed with virtuous and pious principles, and he recommended himſelf to univerſal eſteem by the ſweetneſs of his diſpoſition, and amiableneſs of his manners. His early claſſical education he received at the college of Annecy; whence he was removed to the univerſity of Paris, where he was perfected in the learned languages, and went through his courſe of philoſophy, and alſo part of a theological courſe under the Jeſuits. Among the other profeſſors whoſe lectures he attended was the famous John Maldonat. Afterwards his father ſent him to the univerſity of Padua, to ſtudy juriſprudence under the celebrated Guy Panciroli. Having taken his degree of doctor in law, he returned into Savoy, and was admitted an advocate of the ſenate of Chamberry; but he ſoon renounced his legal profeſſion, and embraced the eccleſiaſtical. After having taken orders, and being made provoſt of Annecy, he ſpeedily acquired great reputation as a preacher; and as he was poſſeſſed of an ardent zeal for the converſion of proſelytes, he was ſent into the valleys of his dioceſe, to endeavour to bring back the diſciples of Zuingle and Calvin into the papal fold. His labours are ſaid to have been attended with wonderful ſucceſs; in conſequence of which he was judged to be the moſt proper perſon to ſucceed to the epiſcopal dignity in that dioceſe. With this view the biſhop of Geneva choſe him for his coadjutor: an appointment which he was deſirous of declining, but was obliged to accept of it by the injunction of pope Clement VIII. and was conſecrated to it under the title of biſhop of Nicopolis. Soon afterwards he had occaſion to take a journey to Paris, where Henry IV. made him conſiderable offers, in order to retain him in his kingdom; but he preferred his humble appointment in Savoy to the ſplendid biſhoprics of which he might have had his choice in France, together with a cardinal's hat, and returned to his native country in 1602. It was in the ſame year that the death of the biſhop of Geneva called him to the full exerciſe of the epiſcopal functions in that dioceſe, when he applied himſelf with great diligence to the reformation of abuſes among the clergy, and the monaſtic inſtitutions, and united to the character of a vigilant eccleſiaſtical ſuperintendant, that of the good paſtor, and beneficent friend of his flock. He viſited the ſick, relieved the poor, and was always ready to afford his aſſiſtance, in temporal as well as ſpiritual matters, to all who applied to him. And he exhibited in his own life, a commendable pattern of piety, purity, candour, and unaffected ſimplicity and urbanity. In 1610 he eſtabliſhed, in conjunction with madame le Chantal, the order of *the Viſitation*, for female devotees, of which the firſt inſtitution

tion was fixed at Annecy. In this order fewer auſterities are enjoined on the profeſſed than in moſt other monaſtic inſtitutions; and it proved ſo popular, that during the life of madame de Chantal, eighty-ſeven houſes, governed by its regulations, were eſtabliſhed in France and Savoy, whence they ſoon ſpread into Italy, Germany, and Poland. In 1622 the biſhop received an order from the duke of Savoy to proceed to Avignon, to be preſent at an interview between that prince and Louis XIII. of France; after which he went to Lyons, where he was cut off by a ſtroke of apoplexy in the fifty-fifth year of his age. He was canonized by pope Alexander VII. in 1665. He was the author of ſeveral works, of which the moſt valuable is entitled An Introduction to a Devout Life, intended to ſhew that devotion ought not to be confined to perſons immured in cloiſters, or the religious by profeſſion, but that its duties are perfectly compatible with the obligations of civil and ſecular life. He was alſo the author of a treatiſe On the Love of God; and of Spiritual Letters, and other practical and devotional pieces. The whole of his works compoſe two volumes in folio.

FRANCIS DE VICTO'RIA, ſo named from a town of Navarre, in which he was born, was a celebrated Spaniſh divine in the 16th century. He purſued his ſtudies in the univerſity of Paris, where he took his degrees, and afterwards returned to his native country. Having entered into the order of dominican preaching friars, he was appointed to the office of profeſſor of theology, and delivered lectures at Salamanca and other Spaniſh univerſities. His merits were held in high eſtimation, and his works have met with a favourable reception in the catholic world. The moſt important of them is a collection of theological and moral lectures, which was publiſhed after the author's death at Lyons, in 1557, under the title of *Theologicæ Prælectiones XIII.* &c. in two volumes, which are analyſed by Dupin. The author died at Salamanca, in 1549.

FRANCIS DE XAVIER', a Romiſh ſaint, called *the Apoſtle of the Indians*, born at the Chateau de Xavier, at the foot of the Pyrennées, in 1506. His inclination early prompted him to embrace a ſtudious life. After having been inſtructed in claſſical learning in his native country, he was ſent to the univerſity of Paris, where he went through a courſe of theology and philoſophy. For ſome time he taught philoſophy in the college of Beauvais, until he became acquainted with the famous Ignatius Loyola, who was purſuing a courſe of theology at Paris. With Loyola he contracted a ſtrict intimacy, and was one of the ſeven companions who entered into a vow in the church of Mont-Martre, in 1534, to conform themſelves to a ſtrict religious diſcipline, and to embark in a new undertaking for promoting the intereſts of the catholic faith, particularly by the converſion of infidels. From this time he renounced all proſpect of any eſtabliſhment in the world, and applied himſelf diligently to the ſtudy of theology. In 1537 he quitted Paris, and went to Venice, where Loyola, who had taken a journey into Spain, met him and the reſt of his companions, who were ten in number. From Venice Francis Xavier and ſome others of the companions went to Rome, where they obtained leave from pope Paul III. to embark on a miſſion to the Holy Land; but they were prevented from undertaking it by the reſtrictions which the grand-ſeignior had laid on the admiſſion of pilgrims and miſſionaries into Paleſtine. Their attention was therefore engaged in increaſing their numbers from among the members of the different Italian univerſities; in preaching, and inſtructing young perſons; and in laying the foundation of the famous Society of the Jeſuits. Soon after the pope had given his ſanction to the eſtabliſhment of that new order, John III. king of Portugal applied to the holy ſee for miſſionaries, to be ſent to propagate the catholic faith in the Eaſt Indies. Francis Xavier was one of the perſons ſelected for this arduous enterpriſe; and he poſſeſſed an undaunted reſolution, together with a degree of genius and ſagacity, of perſeverance, patience, and zeal, that eminently fitted him for the purpoſe. He embarked at Liſbon for the Indies in 1541, and in the following year arrived at the Portugueſe ſettlement of Goa. For ten years he laboured inceſſantly in ſpreading the knowledge of the catholic faith in that city, the ſouthern continent of India, Malacca, the Molucca iſlands, and Japan; and certainly prevailed on vaſt numbers to receive Chriſtianity. In the latter iſland, eſpecially, he with wonderful rapidity laid the foundations of the catholic church, which flouriſhed for many years in that vaſt empire. From Japan, Francis Xavier departed for China, but he fell ſick on his voyage, and died juſt as he came in ſight of that empire, in 1552, in the forty-ſixth year of his age. He was canonized by pope Paul V. in 1619; and by his ſucceſſor pope Gregory XV. in 1622. He was the author of five books of Epiſtles, publiſhed at Paris in 1631, octavo; a Catechiſm; and ſome other ſmall pieces.

FRAN'CIS (Laurence), a French abbé, and various writer, was born at Arinthod in Franche-Comté, in 1698, and died at Paris in 1782. He was the author of ſeveral works, which, though not entitled to much praiſe for their elegance, met, nevertheleſs, with a favourable reception from the public, on account of their utility. One was a treatiſe on Geography, 12mo. known by the name of *Crozat*, becauſe dedicated to a lady ſo called, for whoſe uſe it was compiled. It is commended as a perſpicuous, methodical, and accurate, performance, and has undergone a great number of impreſſions. The moſt important of his other publications are, 2. The Evidences of the Religion of Jeſus Chriſt, 4 vols. 12mo. 3. A Defence of Religion, 4 vols. 12mo. 4. An Examination of the Catechiſm of an Honeſt Man. 5. An Enquiry into the Facts on which the Chriſtian Religion is founded, 3 vols. 12mo. 1767. 6. Obſervations on the Philoſophy of Hiſtory, 8vo.

FRAN'CIUS (Peter), a Greek and Latin poet, born at Amſterdam in 1645. He was taught the rudiments of claſſical learning by Hadrian Junius, rector of the Latin ſchool, who adviſed him to take Ovid as his model. He afterwards purſued his ſtudies at Leyden, under John Frederic Gronovius, with whom he entered into a moſt intimate friendſhip, as well as with his ſon James. In 1669 he made a tour to England, from which he proceeded to France, and while in the latter country, he obtained the degree of doctor of laws at Anjou. After reſiding ſome time at Paris, he continued his travels to Italy. At Florence he was treated with great reſpect by the grand-duke, and at Rome he was much noticed by the principal men of the city. In 1674, the magiſtrates of Amſterdam appointed him profeſſor of hiſtory and rhetoric. In 1692 he was invited to Leyden to be profeſſor of Greek; but the magiſtrates of Amſterdam having raiſed his ſalary, he declined this offer, and continued to diſcharge the duties of his office till the period of his death, which took place in 1704. His works are: 1. *Specimen Eloquentiæ Exterioris, primum & alterum*; the firſt publiſhed in 1697, and the ſecond in 1699. 2. *Poëmata*, 1672, in 12mo. and 1697, 8vo. 3. *Orationes*, 1692, and 1704, 8vo. 4. *Gregorii Nazianzeni Homilia De Amore Paupertatis, ex Græca vernacule verſa & notis illuſtrata*, 1697, 8vo. 5. *Poſtuma*, conſiſting of three orations, viz. *Pro Eloquentia, Pro Poetica, De Uſu Eloquentiæ in Sacris*; and his Latin poems, viz. *Elegiarum, liber quintus*; *Odarum, liber tertius*; *Epigrammatum, liber tertius*; together with *Illuſtrium viorum ad P. Francium Epiſtolæ*.

FRANCIS'CANS, in eccleſiaſtical hiſtory, the order of Minorites or mendicant friars, founded by St. Francis, as deſcribed above, under FRANCIS of ASSISI.

FRAN'CISBOROUGH, a ſettlement of the American States, in York county, diſtrict of Maine.

FRANCKE (Auguſtus Herman), a German Lutheran divine, born at Lubeck, in 1663. In 1679 he was ſent to the univerſity of Erfurt, and afterwards to that of Kiel, in both which places he diſtinguiſhed himſelf by his diligence and improvement. In 1684 he proceeded to Leipſic, where he eſtabliſhed a ſociety for conferences on theological and biblical ſubjects, which is ſaid to exiſt to the preſent time, under the name of *Collegium Philo-Biblicum*.

He was ſo popular a lecturer in Leipſic, that his audience frequently conſiſted of near 300 ſtudents of the univerſity. In 1691 he was elected to the profeſſorſhip of the Oriental and Greek languages in the univerſity of Halle, to which was added the appointment of paſtor to a church in the ſuburbs of that town. Here he projected an eſtabliſhment, to be ſupported by charitable contributions, in which orphans and poor children in general ſhould not only be inſtructed, but entirely ſupported, until qualified to be ſent out into the world. His humane deſign was no ſooner known than it was patroniſed; and in 1698, without any capital adequate to ſo great a work, but truſting that Heaven would diſpoſe the humane and benevolent to enable him to complete it, he began, and in a few years finiſhed, the celebrated houſe for orphans at Halle. This inſtitution has been of eſſential ſervice to the intereſts of humanity and good morals in Germany, and has rendered the projector's memory worthy of being cheriſhed as a true benefactor to his ſpecies. Mr. Francke lived to ſee his pious and benevolent labours ſo well ſeconded, that proviſion was made during his time for the ſupport and education of two thouſand one hundred and ninety-ſix children. He was alſo enabled to eſtabliſh, for the benefit of his inſtitution, a printing-office, furniſhed with types of every ſort, and even of ſuch languages as are leaſt generally known; a muſeum of natural curioſities, and a numerous library. It may not be improper to mention, that the ſchools for orphans at Peterſburgh, and at Potzdam, were founded on the model of this inſtitution. He died in 1727, in the 65th year of his age, regretted by all ranks in Germany, for the noble ſervices which he had rendered to the intereſts of humanity and virtue. Beſides ſermons and devotional treatiſes, he was the author of 1. *Programmata*, 1712. 2. *Prælectiones Hermeneuticæ*, 1712. 3. *Methodus Studii Theologici*, 1723. 4. *Introductio ad Lectionem Prophetarum*, 1724. 5. *Commentatio de Scopo Librorum Veteris & Novi Teſtamenti.* 6. *Manuductio ad Lectionem Scripturæ Sacræ*, 1693. 7. *Obſervationes Biblicæ*, 1695. *Idea Studioſi Theologiæ*, 1712. 8. *Monita Paſtoralia Theologica*, 1717.

FRANCK'EN (Chriſtian), a German unitarian divine of the 16th century, born at Gardleben, in the marche of Brandenburg. His parents were of the Lutheran perſuaſion, in the principles of which he was at firſt educated; but he became early a convert to popery, and entered into the Jeſuits' ſociety in 1568. He was ſent to Rome, to go through his noviciate; where, by his cloſe application to his ſtudies, he greatly injured his health, and was obliged to be ſent to the purer air of Naples, in order to re-eſtabliſh it. After ſpending ſome years in Italy, he was recalled to Germany, where, if we are to credit his biographer, he adopted the Lutheran and Calviniſt creeds. Yet, after a temporary reſidence in different towns in Germany and Bohemia, he joined himſelf to the unitarian communion in Poland, and became a ſtrenuous advocate for the opinions which had drawn the ſeverity of proteſtant perſecution on the head of Francis David. In 1584 he held a diſpute at Chmelnitz, with the celebrated Fauſtus Socinus, in which he maintained the ſame ſentiments with David reſpecting the incarnation of Jeſus Chriſt. At this time Francken was at the head of a ſeminary at Chmelnitz. Afterwards he removed to Tranſylvania, where he taught philoſophy in the unitarian ſeminary at Clauſenburg. In 1591, he accepted ſome overtures made him by Ladiſlaus Popelius, one of the emperor's officers, who was attached, like himſelf, to the ſtudy of philoſophy. With this patron and friend he lived till he had produced his *Analyſis Rixæ Chriſtianæ, quæ Imperium turbat & diminuit Romanum.* From this time we learn no farther particulars concerning him. He was the author of a ſevere ſatire on the Jeſuits, entitled, 2. *Breve Colloquium Jeſuiticum, toti Orbi Chriſtiano, ad recte cognoſcendam hactenus non ſatis perſpectam Jeſuitarum Religionem, utiliſſimum; habitum a Sacræ Theologiæ Doctore & Profeſſore Paulo Florenio cum Chriſtiano Franckeu, &c.* 1578. 3. *Præcipuarum Enumeratio Cauſarum, cur Chriſtiani, cum in multis Religionis Doctrinis ſint mobiles & varii, in Trinitatis tamen Dogmate retinendo ſint conſtantiſſimi.* 4. *De Honore Chriſti, id eſt, utrum Chriſtus, cum ipſa perfectiſſima ratione Deus non ſit, religioſa tamen adoratione colendus ſit.* 5. *Reſponſio ad tres Orationes Warcawicii Jeſuitæ, quibus regem Stephanum (Bathori) & Senatores ad Proteſtantes perſequendos incitat.* 6. *Typus Veritatis Conſcientiarum, &c.*

FRANCK'ENBERG, a town of Germany, in the circle of the Upper Rhine, and principality of Upper Heſſe: ſixteen miles north of Marpurg, and twenty-nine ſouth-weſt of Caſſel.

FRANCK'ENMARK, or FRANKEMARK, a town of Germany, in the archduchy of Auſtria: eight miles ſouth-weſt of Voglabruck.

FRANCK'LIN (Thomas, D. D.), a writer in polite literature, born in London about 1720. His father, a printer, was publiſher of the antiminiſterial paper called the Craftſman, ſupported by Bolingbroke, Pulteney, and other diſtinguiſhed perſons. The ſon, through the intereſt of Pulteney, was brought up to letters, and ſent to Weſtminſter ſchool. He was thence transferred to Trinity-college, Cambridge, where he diſtinguiſhed himſelf, and of which, after paſſing through the uſual degrees, he became a fellow. He was firſt known as an author in 1749, by a tranſlation of The Epiſtles of Phalaris, and of Cicero on the Nature of the Gods. His reputation for learning received a ſanction in 1750 by his election to the Greek profeſſorſhip in the univerſity of Cambridge. In 1753 he publiſhed a poem called Tranſlation, written in eaſy verſe. He was, in 1758, preſented to the livings of Ware and Thundridge in Hertfordſhire. One of his greateſt works, A Tranſlation of all the Plays of Sophocles, 2 vols. quarto, appeared in 1759. He preſented to the public two tragedies, The Earl of Warwick, and Matilda, both taken from the French. He lent his name to a tranſlation of all the works of Voltaire; but it is ſuppoſed that he executed little more than the verſion of his Electra, and Oreſtes, both which were acted. He was the author of ſeveral ſingle ſermons, and of a volume of Diſcourſes on the Relative Duties, publiſhed in 1765, and well received. He was nominated one of the king's chaplains in 1767, and took the degree of D.D. in 1770. He did not, however, diſcontinue his literary employments, and even wrote a farce for the ſtage after this period. He concluded his literary labours by a tranſlation of The Works of Lucian, 2 vols. 4to. 1780; and died in London in 1784.

FRAN'CO (NICHOLAS), a man of letters, born at Benevento in 1510. His father was a ſchoolmaſter, and it was probably under him that he acquired an acquaintance with the learned languages. He had the misfortune in his youth to contract an intimacy with the noted Peter Aretino, from whom he caught the ſpirit of perſonal ſatire, with a total diſregard of moderation or decency. After he had made himſelf many enemies in his own country, he removed to Venice, where Aretino then was. Their union, which from the ſuperior learning of Franco was advantageous to the other, did not long continue. The ſucceſs of Aretino's Letters, publiſhed in 1573, excited the envy of Franco, who publiſhed his *Piſtole Vulgari* in 1539, by way of rivalry; and immediately a fierce war broke out between them, ſuſtained on each ſide with the greateſt rancour and malignity. Franco left Venice with an intention of going to France; but on paſſing through Caſal, he was received with ſo much courteſy by Fanzino, governor of Montferrat, that he took up his abode there for ſome time. There he publiſhed a dialogue, entitled *Delle Belleze*; and alſo a collection of ſonnets againſt Aretino, in conjunction with a *Priapeia Italiana*, likewiſe in ſonnets. He was a principal member of the academy of Argonauti at Montferrat, and in that capacity wrote his *Rime Maritime*, printed at Mantua in 1549. In this latter city he followed the profeſſion of a ſchoolmaſter. Thence he returned to Rome, where he publiſhed his Latin commentaries on the *Priapeia*, attributed

to Virgil, the copies of which were ſuppreſſed and burned by order of pope Paul IV. He continued under Pius IV. to indulge his virulence, but was preſerved from perſonal chaſtiſement by the protection of cardinal Morone. At length, his impudence in writing a Latin epigram againſt Pius V. with other defamatory libels, brought upon him that puniſhment, which it is extraordinary that he ſhould ſo long have eſcaped. He was taken from his ſtudy in his furred robe, and hanged on the common gallows. This cataſtrophe took place in 1569. It is affirmed, that ſome years before his death he had been ordained prieſt. A French writer in the *Année Littéraire*, 1778, has deſcribed Franco as a man of a free ſpirit, moved with virtuous indignation againſt the corruptions he witneſſed, and diſdaining to flatter the great. But the indecency of ſome of his writings will not juſtify ſo favourable an opinion of his moral principles. He poſſeſſed qualities, however, which have procured him praiſe from ſome of his contemporaries; and it is allowed that his talents and learning were conſiderable. Beſides the works already mentioned, he publiſhed *Il Petrarchiſta*, a romance called *Filena*, and ſome poems printed in different collections. He left in manuſcript a tranſlation of Homer's Iliad in *ottava rima*.

FRANCOC'CI, a town of Italy, in the ſtate of the church, and duchy of Spoleto: ſeven miles weſt-north-weſt of Spoleto.

FRANÇOI'SE (La), a town of France, in the department of the Lot, and chief place of a canton, in the diſtrict of Montauban: two leagues and a half north-weſt of Montauban, and ſix and three quarters ſouth-ſouth-weſt of Cahors. Lat. 44. 7. N. lon. 18. 54. E. Ferro.

FRAN'COLI, a river of Spain, which runs into the ſea, near Tarragon, in Catalonia.

FRANCO'NIA, a circle of Germany; bounded on the north by Meiſſen and Thuringia, on the eaſt by Bohemia and the Upper Palatinate, on the ſouth by Bavaria and Suabia, and on the weſt by the Lower Palatinate and the electorate of Mentz. It is ſituated near the centre of Germany, the form inclined to a circle, whoſe diameter is about fifty leagues. In the centre the land is fertile in corn, wine, fruit, &c. but the frontiers are full of foreſts and mountains, and little cultivated. The principal river is the Maine. The inhabitants of many towns are Roman catholics, though the principal part are Lutherans. The Calviniſts have ſome churches, and the Jews ſome ſynagogues. The ſtates which compoſe the circle of Franconia are either eccleſiaſtical or civil. The eccleſiaſtical princes are the biſhops of Bamberg, Wurtzburgh, and Aichſtett, and the grand maſter of the Teutonic order. The ſecular princes are, the prince of Culmbach; the counts of Henneberg, Schwarzenberg; the princes of Lowenſtein-Wertheim, Hohenlohe-Waldenburgh, Hohenlohe-Neuenſtein, Caſtell, Wertheim, Rieneck, Erbach, Limburgh-Geildorf, Limburgh-Speckfeld, Seinſheim, Reigelſburgh, Wiegentheid, Welzheim, and Hauſen; with the imperial towns of Nuremberg, Rothenburg, Windſheim, Schweinfurt, and Weiſſenburg. In the military arrangement of the empire, being in time of peace fixed at 40,000 men, Franconia furniſhes 980 horſe, and 1902 foot; and, at the diviſion of 300,000 florins to the cheſt of the empire, this circle was rated at 22,696 florins 47 kruitzers.

FRANCO'NIA, a townſhip of the American States, in Grafton county, New Hampſhire, fourteen miles north-eaſt of Haverhill (N. H.) on Connecticut river. Incorporated in 1764, firſt called Morriſtown.

FRANCO'NIAN, *adj.* Belonging to Franconia.

FRANCO'NIAN, *ſ.* A native of Franconia.

FRAN'CONVILLE, a town of France: ten miles north of Paris.

FRANCO'SO, a town of Portugal, in the province of Beira: twenty-two miles eaſt of Viſeu.

FRANCOVIL'LA, a town of Italy, an imperial fief, in the ſtate of Genoa: ſix miles ſouth of Novi.

FRAN'CREMONT, a town of Germany, in the circle of Weſtphalia, and biſhopric of Liege: four miles north of Spa.

FRANE, a town of France, in the department of the Doubs, and chief place of a canton, in the diſtrict of Pontarlier: two leagues and a half ſouth-weſt of Pontarlier.

FRAN'EKER, a town of the United Dutch States, in Frieſland, ſituated in the diſtrict of Weſtergoo, in the canton of Franekeradeel, to which it gives name; it is watered by two canals, navigable for barges, and has a caſtle, built in the fifteenth century, where the governors of the country ſometimes reſided. It is ſaid that the city was built in 1191, in the reign of the emperor Henry VI. the ſon of Frederic Barbaroſſa. It has a celebrated univerſity, eſtabliſhed by the States, and William Louis count of Naſſau, in 1585. Adrian Metius, profeſſor of mathematics; Pierius Winſemus, lawyer and hiſtoriographer of Frieſland; George Paſor, profeſſor of the Greek language; Sixtus Amama, &c. have done honour to this univerſity by their learning and writings. It is one of the neateſt towns in Frieſland, and the ordinary reſidence of the nobleſſe of the country: nine miles weſt of Lewarden, and five eaſt of Harlingen. Lat. 53. 11. N. lon. 22. 54. E. Ferro.

FRAN'GIBLE, *adj.* [*frango*, Lat.] Fragile; brittle; eaſily broken.—Though it ſeems the ſolideſt wood, if wrought before it be well ſeaſoned, it will ſhew itſelf very *frangible*. *Boyle*.

FRAN'GULA, *ſ.* See CASSINE and RHAMNUS.

FRA'NION, *ſ.* [derivation uncertain.] A paramour; a boon companion.

Firſt, by her ſide did ſit the bold Sanſloy,
Fit mate for ſuch a mincing minion,
Who in her looſeneſs took exceeding joy.
Might not be found a franker *franion*. *Spenſer*.

FRANK, *adj.* [*franc*, Fr.] Liberal; generous; not niggardly.—'Tis the ordinary practice of the world to be *frank* of civilities that coſt them nothing. *L'Eſtrange*.—Open; ingenuous; ſincere; not reſerved; without conditions; without payment.

Thou haſt it won; for it is of *frank* gift,
And he will care for all the reſt to ſhift. *Hubberd*.

Not reſtrained; licentious. *Not in uſe*.—Might not be found a *franker* franion. *Spenſer*.

FRANK, *ſ.* [*franc*, Fr. an old word for a hog-ſty.] A place to feed hogs in; a ſty.—Where ſups he? Doth the old boar feed in the old *frank*? *Shakeſpeare*.—[From *franc*, Fr. free.] A letter which pays no poſtage.—You'll have immediately, by ſeveral *franks*, my epiſtle to lord Cobham. *Pope*.

To FRANK, *v. a.* To ſhut up in a frank or ſty. *Hanmer*.

In the ſty of this moſt bloody boar,
My ſon George Stanly is *frank'd* up in hold. *Shakſ*.

To feed high; to fat; to cram. *Junius* and *Ainſworth*.—To exempt letters from poſtage.—My lord Orrery writes to you to-morrow; and you ſee I ſend this under his cover, or at leaſt *franked* by him. *Swift*.

Gazettes ſent gratis down, and *frank'd*,
For which thy patron's weekly thank'd. *Pope*.

FRANK, one of the inhabitants of a diſtrict in Germany who invaded the ancient Gaul, conquered a great part of it, and gave it the name of France. See FRANKS.

FRANK, or FRANC, *ſ.* an ancient French coin, either of gold or ſilver, ſtruck and current in France. The value of the gold franc was ſomething more than that of the gold crown; the ſilver franc was a third of the gold one: this coin has been long out of uſe, though the term is ſtill retained as the name of a money of account: in which ſenſe it is equivalent to the livre, or twenty ſols.

FRANK-ALMOI'GN, *ſ.* in law, a tenure by ſpiritual ſervice, where an eccleſiaſtical corporation, ſole or aggregate, holdeth land to them and their ſucceſſors, of ſome

lord and his heirs in free and perpetual alms; and *perpetual* ſuppoſes it to be a fee-ſimple, though it may paſs without the word *ſucceſſors*. *Co. Lit.* 94. A lay perſon cannot hold in free alms: and when a grant is in frank-almoign, no mention is to be made of any manner of ſervice. *Lit.* 137. None can hold in frank-almoign but by preſcription, or by force of ſome grant made before the ſtatute of mortmain. 7 *Edw.* I. ſt. 2. 18 *Edw.* I. c. 3. So that the tenure cannot at this day be created, to hold of a founder and his heirs in free alms; but the king is not reſtrained by the ſtatutes; nor a ſubject licenſed or diſpenſed with by the king, to make ſuch a grant. *Co. Lit.* 98. And if an eccleſiaſtical perſon holds lands by fealty and certain rent, the lord may at this time confirm his eſtate, to hold to him and his ſucceſſors in frank-almoign; for the former ſervices are extinct, and nothing is reſerved but that he ſhould hold of him, which he did before; whereby this change and alteration is not within the ſtat. 18 *Edw.* I. of *quia emptores terrarum*. *Co. Lit.* 99.

Tenure in frank-almoign is incident to the inheritable blood of the donor or founder; except in caſe of the king, who may grant this tenure to hold of him and his ſucceſſors. *Lit.* 135. And the reaſon why a grant in frank-almoign, ſince the ſtat. 18 *Edw.* I. (*quia emptores*) is void, except in the caſe of the king, &c. is becauſe none can hold land by this tenure, but of the donor; whereas the ſtatute injoins, that it be held of the chief lord, by the ſame ſervice by which the feoffor held it; though the king may grant away any eſtate, and reſerve the tenure to himſelf. *Co. Lit.* 223. The ſervice which eccleſiaſtical corporations were bound to render for lands held in frank-almoign was not certainly defined, but only in general, to pray for the ſouls of the donor and his heirs, dead or alive; and therefore they did no fealty (which is incident to all other ſervices but this), becauſe this divine ſervice was of a higher and more exalted nature. *Lit.* 134, 5.

This is the tenure by which almoſt all the ancient monaſteries and religious houſes held their lands; and by which the parochial clergy and very many eccleſiaſtical and eleemoſynary foundations hold them to this day. The nature of the ſervice being, upon the reformation, altered and made conformable to the doctrines of the church of England. It was an old Saxon tenure, and continued under the Norman revolution; from the reſpect then ſhewn to religion and religious men; which is alſo the reaſon that tenants in frank-almoign were diſcharged of all other ſervices, except the *trinoda neceſſitas* of repairing the highways, building caſtles and repelling invaſions. See *Bract.* l. 4. tr. 1. c. 28. *Seld. Jan.* 1. 42.

FRANK-CHA'SE, in law, a liberty of free chaſe; by which all perſons that have lands within the compaſs thereof, are prohibited to cut down any wood, &c. without the view of the foreſter, though it be in their own demeſnes. *Cromp. Jurif.* 187.

FRANK-FEE, in law, freehold lands which are held exempted from all ſervices, but not from homage. That is frank-fee which a man holds at the common law to him and his heirs; and not by ſuch ſervice as is required in ancient demeſne, according to the cuſtom of the manor; and the lands in the hand of king Edward the Confeſſor, at the making of the book of Domeſday, were ancient demeſne, and all the reſt of frank-fee. *Reg. Orig.* 12. *F. N. B.* 161. Theſe lands were exempted from all ſervices, but not from homage. *Bro.* tit. *Demeſne* 32, ſays, that land which is in the hands of the king or lord of any manor, or being ancient demeſne of the crown (viz. the demeſnes), is called *frank-fee*; and that which is in the hands of the tenant, is ancient demeſne only. The author of the Terms of the Law defines a free-fee to be a tenure pleadable at the common law; and not in ancient demeſne. See *Cowel*, *Blount*, and the article ANCIENT DEMESNE, vol. i. p. 675.

FRANK-FE'RM, in law, lands or tenements changed in the nature of the fee by feoffment, &c. out of knight ſervice, for certain yearly ſervices. *Britton*, c. 66. See the article FEE-FARM, vol. vii. p. 287.

FRANK-FOLD, the ſame with FOLDAGE, vol. vii. p. 535.

FRANK-LAW, in the ancient Engliſh juriſprudence, is the benefit of the free and common law of the land. Crompton ſays, "he that for any offence loſeth his frank-law, falls into three miſchiefs, viz. he may never be impannelled upon any jury or aſſize; or be permitted to give any teſtimony: if he hath any thing to do in the king's courts, he muſt not attend them in perſon, but appoint his attorney therein for him; and his lands ſhall be eſtreated, and his body committed to priſon." *Cromp. Jurif.* 156.

FRANK-MAR'RIAGE, in law, a tenure in tail ſpecial, where a man ſeiſed of land in fee-ſimple gives it to another with his daughter, ſiſter, &c. in marriage; to hold to them and their heirs. This tenure groweth from theſe words in the gift, i. e. *Sciant, &c. me* A. B. *dediſſe & conceſſiſſe, &c.* F. B. *filio meo & Annæ uxori ejus, filiæ, &c. in* liberum maritagium, *unum meſſuagium, &c. Litt.* 17. *Weſt. Symb. par.* 1. *lib.* 2. The effect of which words is, That they ſhall have the land to them and the heirs of their bodies; and ſhall do no ſervices to the donor, except fealty, until the fourth degree. *Glanvil* 7. c. 18. And Fleta gives this reaſon why the heirs do no ſervice until the fourth degree: *Ne donatores vel eorum hæredes per homagii receptionem à reverſione repellantur.* And why in the fourth deſcent and downward, they ſhall do ſervices to the donor; *quia in quarto grada vehementer præſumitur, quod terra eſt pro defectu hæredum donatorum reverſura. Fleta*, 3. c. 11. *Bracton*, 2. c. 7.

Bracton alſo divides marriage into *liberum maritagium* and *maritagium ſervitio obligatum*; which laſt was where lands were given in marriage, with a reſervation of the ſervices to the donor, which the donee and his heirs were bound to perform for ever; but neither he, or the next two heirs, were obliged to do homage, which was to be done when it came to the fourth degree, and then, and not before, they were required to be performed both ſervices and homage. *Bract. lib.* 2. A gift of lands by one man to another with a wife in frank-marriage, amounts by implication of law to a gift in tail; which in this caſe may be created without the words *heirs* or *body*. *Lit.* 17. *Wood's Inſt.* 120. A gift in frank-marriage might be made as well after as before marriage: and ſuch a gift was a fee-ſimple before the ſtatute of *Weſtm.* 2. but ſince, it is uſually a fee tail: though this tenure is now grown out of uſe, it is ſtill capable of ſubſiſting in law. It is liable to no ſervice but fealty. See 2 *Comm.* 115. c. 7.

FRA'NK-PLEDGE, in law, a pledge or ſurety for the behaviour of freemen; it being the ancient cuſtom of this kingdom, borrowed from the Lombards, that for the preſervation of the public peace, every free-born man at the age of fourteen (religious perſons, clerks, &c. excepted) ſhould give ſecurity for his truth towards the king and his ſubjects, or be committed to priſon; whereupon a certain number of neighbours, uſually became bound one for another, to ſee each man of their pledge forth-coming at all times, or to anſwer the tranſgreſſion done by any gone away: and whenever any one offended, it was forthwith inquired into what pledge he was, and then thoſe of that pledge either produced the offender within one and thirty days, or made ſatisfaction for his offence. This was called frank-pledge; and this cuſtom was ſo kept, that the ſheriffs at every county-court, from time to time, received the oaths of young perſons as they grew to fourteen years of age, and took care that they were ſettled in one decennary or other; whereby this branch of the ſheriff's authority was called *viſus franci plegii*, or view of frank-pledge. Living under frank-pledge was termed living under law, &c. See the article COURT-LEET, vol. v. p. 301.

FRANK-TEN'EMENT, in law, a poſſeſſion of freehold lands and tenements. See FREEHOLD, in this vol.

FRANKED-

FRANK'ED-LET'TERS. See the articles POST, and POST-OFFICE.

FRANK'ENAU, a town of Germany, in the circle of the Upper Rhine, and principality of Heſſe: twenty-four miles ſouth-weſt of Caſſel, and eighty ſouth-ſouth-weſt of Waldeck.

FRANK'ENBERG, a town of Germany, in the archduchy of Auſtria: ſix miles weſt-north-weſt of Voglabruck.

FRANK'ENBERG, a town of Germany, in the circle of Upper Saxony, and territory of Erzegeburg: nine miles weſt of Freyberg, and ſeven north-north-eaſt of Chemnitz.

FRANK'ENDAL, a town of Germany, in the circle of the Lower Rhine, and Lower Palatinate, ſituated in a fertile plain, on a navigable canal, which communicates with the Rhine. It owes its riſe to two convents, one of men, and the other of women. Some Flemings, who fled from perſecution, ſettled here, and it became a flouriſhing town, when, with the reſt of the palatinate, it felt the miſeries of war, and was deſtroyed by the French; but, by the care of the prince, ſoon after rebuilt in a regular and handſome manner. The inhabitants are engaged in manufactures of porcelain, cloth, ſerges, ſilk-ſtuffs, ſtockings, ſoap, &c. It was taken by the French republican army in 1793, and laid under contribution. The inhabitants of Frankendal, among other privileges, are exempted from the military preſs, which is to ſupply the contingency to the army of the empire. It contains three churches, and a handſome hoſpital: eight miles north-north-weſt of Manheim, and eight ſouth of Worms.

FRANK'ENFELS, a town of Germany, in the archduchy of Auſtria, ſituated on the river Noderſpach: twenty miles weſt-ſouth-weſt of Hainfelden, and thirty-ſix weſt of Vienna.

FRANK'ENHAUSEN, a town of Germany, in the circle of Upper Saxony, and principality of Schwartzburg-Rudolſtadt; divided into Old and New Town, ſituated on a branch of the Wipper. It contains a chateau, three churches, and a ſchool, formerly a Ciſtertian convent; with rich ſalt-works, which are very profitable, and belong to the citizens: ten miles eaſt of Sonderſhauſen, and twenty-ſix north of Erfurt. Lat. 51. 16. N. lon. 28. 43. E. Ferro.

FRANK'ENHAUSEN, a town of Germany, in the circle of Upper Saxony, and territory of Erzgeburg: eight miles north-north-weſt of Zwickau.

FRANKE'NIA, *ſ.* [ſo named in honour of *John Frankenius*, profeſſor of botany at Upſal, who firſt enumerated the plants of Sweden in the Speculum Botanicum.] In botany, a genus of the claſs hexandria, order monogynia, natural order of calycanthemæ, (caryophylleæ, *Juſſ.*) The generic characters are—Calyx: perianthium one-leafed, ſubcylindric, ten-cornered, permanent; mouth five-toothed, ſharp, patulous. Corolla: petals five; claws the length of the calyx; border flat, with roundiſh, ſpreading, laminas; nectary with a channelled acuminate claw, inſerted into each claw of the petals. Stamina: filaments ſix, length of the calyx; antheræ roundiſh, twin. Piſtillum: germ oblong, ſuperior; ſtyle ſimple, length of the ſtamens; ſtigmas three, oblong, erect, obtuſe. Pericarpium: capſule oval, one-celled, three-valved. Seeds: very many, ovate, very ſmall.—*Eſſential Character.* Calyx five-cleft, funnel-form; petals five; ſtigma ſix-parted; capſule one-celled, three-valved.

Species. 1. Frankenia lævis, or ſmooth Frankenia or ſea-heath: leaves linear, crowded, ciliate at the baſe. Root perennial. Stems numerous, round, branched, trailing. Leaves in little cluſters, ſmall, fleſhy, rolled back ſo as to appear almoſt cylindrical, with a groove underneath, flatted at the baſe, where they are dilated into a pair of minute membranaceous ciliate ſtipules. Flowers at the ramifications of the ſtem, and in the middle of a bundle of leaves, ſolitary, ſeſſile; calyx with five, ſix, or ſeven, ribs, and as many teeth, but rarely more than five; corolla purple, petals wedge-ſhaped, a little ſcolloped at the end. The flowers are elegant in form and colour, like thoſe of a little red pink or campion. The ſtamens and piſtil much reſemble the lychnis, to which this plant is nearly allied, though ſo different in habit. Grows in ſalt marſhes, near Leghorn. In England, Mr. Goodyer found it, September 3, 1621, at Burſeldon-ferry, Hampſhire; on the coaſts of Eſſex, Suſſex, and Kent, abundantly, as in the iſlands of Shepey and Thanet, Lovingland, juſt over the water at Yarmouth; about Thurrington in Eſſex, between Maldon and Goldhanger; in Selſey iſland, Suſſex; near Portſmouth; Tid Goat near Wiſbeach; near Lynn in Norfolk. It flowers in July and Auguſt.

2. Frankenia hirſuta, or hirſute Frankenia, or ſea-heath: ſtems hirſute; flowers in terminating bundles. Stems procumbent, preſſed as it were cloſe to the ground, panicled, and dichotomous. Leaves like thoſe of thyme, ciliate, eſpecially at the baſe. Flowers violet-coloured. Native of the South of France, Apulia, Crete, Siberia, and the Cape of Good Hope.

3. Frankenia pulverulenta, or duſty Frankenia, or ſea-heath: leaves obovate, retuſe, mealy underneath. Stems lying flat, ſlender, branching, with the knots about a finger's breadth from each other. Leaves four at a joint, with very ſhort hairs underneath, the edges not rolled in; petioles ſhort. Flowers in the axils of the leaves, ſeſſile; calyx tough, rigid, with five angles; teeth upright. Annual. Native of the South of France, Italy, and Spain. Found on the coaſt of Suſſex, by Mr. Brewer; between Bognor and Brighthelmſtone, by Mr. Hudſon. It flowers in July. Gerarde and Ray name it *Valentia knot graſs.* Theſe plants were named *Franca* by Micheli, from Giov. Sebaſt. Franchi, of Lucca, phyſician at Florence to the grand duke Coſmo III. Linnæus changed the name to *Frankenia*, in order to perpetuate the name of a perſon not of much greater celebrity.

FRANK'ENSTEIN, a town of Sileſia, in the principality of Munſterberg, on the river Bautze: nine miles weſt of Munſterberg, and twelve ſouth-ſouth-weſt of Glatz.

FRANK'ENSTEIN, a town of Germany, in the circle of the Upper Rhine: five miles ſouth-eaſt of Darmſtadt.

FRANK'ENSTEIN, a town of Germany, in the circle of the Upper Rhine, and duchy of Deux Ponts: twenty miles ſouth-eaſt of Deux Ponts.

FRANK'FORT, a townſhip of the American States, in Hancock county, diſtrict of Maine, on the weſt ſide of Penobſcot-bay: eight miles weſt of Penobſcot, 123 weſt of Paſſamaquoddy, and 238 north-eaſt of Boſton.

FRANK'FORT, or FRANKFORD, a pleaſant town of the American States, in Philadelphia county, Pennſylvania, ſituated on the north-eaſt ſide of a creek of the ſame name, a mile and a half from Delaware river; with an epiſcopal and a German church; on elevated ground, about five miles north-eaſt of Philadelphia.

FRANK'FORT, a new townſhip of the American States, in Herkemer county, New-York, eaſt of Whiteſtown.

FRANK'FORT, a town of the American States, in Hampſhire county, Virginia, on a creek which empties into Potowmack river. It is thirteen miles north-weſt of Rumney, four miles ſouth of the Potowmack, and ten ſouth-ſouth-eaſt of Fort Cumberland.

FRANK'FORT, the capital of Pendleton county, Virginia, in the American States, ſituated on the weſt ſide of a ſouth branch of Potowmack river. It contains a court-houſe and a gaol: 180 miles north-weſt of Richmond.

FRANK'FORT, the metropolis of Kentucky, in the American States, ſituated in Franklin county, on the north-eaſt bank of Kentucky river, about fifty miles from its confluence with the Ohio. It is a flouriſhing town, regularly laid out, and has a number of handſome houſes. The ſtate-houſe is a ſuperb ſtone building. Here is alſo a tobacco warehouſe: thirty miles north of Harrodſburgh, forty north-by-weſt of Danville, 123 from Louiſville, and 790 weſt-by-ſouth of Philadelphia. Lat. 38. 14. N. lon. 95. 28. W.

FRANK'FORT ON THE MAINE, or FRANCFORT, an

an imperial city of Germany, in the circle of the Upper Rhine, ſituated in a pleaſant, fertile, and healthy, country, on the river Maine, by which it is divided into two parts; that on the north, which is the largeſt, is properly called *Frankfort*, the other on the ſouth ſide of the Maine is called *Saxenhauſen*; the whole divided into fourteen wards, two only of which are ſituated in Saxenhauſen. The kings of the Franks reſided here, as likewiſe the immediate ſucceſſors of Charlemagne: the emperors of Germany are ſtill elected and crowned here. Frankfort is about a league and a half in circumference. The inner wall is lined with towers; beyond are ditches filled with water, ramparts, baſtions, &c. The principal ſtreets are handſome, the others are narrow. The Roman Catholics have three churches, and the Lutherans ſix. The Jews are confined to a narrow ſtreet, where they are ſhut up every night; they have a ſynagogue, a ſeminary, and an hoſpital; but they are excluded from the public walks, ſuffer great indignities, yet ſtill find it their intereſt to reſide here. Among the archives of the town-houſe is kept, in a caſket of gold, the golden bull of the emperor Charles IV. which is a parchment book of forty-three quarto leaves, containing the fundamental inſtitutes of the empire, written in Latin, in capital letters. The magiſtrates are divided into three benches; the firſt is compoſed of fourteen echevins, the ſecond of fourteen counſellors, the third is compoſed chiefly of tradeſmen and artificers. All affairs of importance are decided by the two former, out of whom two burgomaſters are annually choſen; the third bench executes offices relating to the police. Frankfort, like Leipſic, is celebrated for its fairs, which are the grand marts for literature, as well as for articles of commerce. In order to provide a ſufficient ſtock for theſe markets, authors of all kinds are kept in pay by the booksellers, and it is ſuppoſed that the annual publications do not amount to leſs than five thouſand volumes. We are told, in a German review, entitled *Atlgemeine Literatuur Zeitung*, publiſhed at Jena, that above three hundred authors are employed, and that the number of books annually reviewed in it is about eighteen hundred. Frankfort is famed for the *adeliche ſtiftungen*, or "convents for female nobility," deſcended from proteſtant families. Theſe are very numerous, and their luxurious mode of living equals that of the firſt nobility in Germany. The ladies are permitted to marry, and to aſſociate with the moſt noble families in the city. Every new emperor at his coronation, which is, by the law of cuſtom, always ſolemnized in this city, lodges in one of theſe noble convents during his reſidence at Frankfort, which is a month. Theſe edifices are the moſt magnificent that can be imagined, and their apartments are furniſhed in the moſt elegant ſtyle. Every lady, who is introduced and admitted into ſuch convent, muſt produce a lineal genealogy of nobility. They enjoy every happineſs, and are not in the leaſt confined to any irkſome regulations. The greater part of them are well educated; and are extremely affable to their inferiors and ſtrangers. They are generally the daughters of noble and ancient warriors; as dukes, counts, marquiſſes, generals, &c. who at their death have not been able to leave them a fortune ſufficient for the proper ſupport of their rank in life. They have the advantage of being provided with every article both of neceſſity and luxury; and enjoy, likewiſe, an annual income, which is frequently very conſiderable. Many of theſe ladies dreſs in a peculiar ſtyle of elegance, and wear armorial ornaments about their necks, ſhewing the diſtinction and antiquity of their anceſtors. Others have croſſes and relics from the holy land to which their families have been entitled. The ſuperiors have their orders given them by the emperor of the Romans. The territory of Frankfort contains a great number of country houſes, and ſeveral villages. In the year 1759, this city was taken by the French. It was again taken by the French republican army in 1792, but ſoon after ſurrendered by them to the Pruſſians. Twenty miles eaſt of Mentz. Lat. 52. N. lon. 26. 17. E. Ferro.

FRANK'FORT ON THE ODER, a town of Germany, in the circle of Upper Saxony, and Middle Mark of Brandenburg, with an univerſity, founded, in the year 1506, by the elector, Joachim, and his brother, Albert; compoſed of Calviniſt profeſſors. It has beſides a noble academy, a ſociety for the promoting of arts and ſciences, two colleges, two fauxbourgs, and ſeveral churches: twelve miles ſouth-ſouth-weſt of Cuſtrin, and forty-eight eaſt of Berlin. Lat. 52. 24. N. lon. 32. 22. E. Ferro.

FRANK'INCENSE, *ſ.* [ſo called perhaps from its liberal diſtribution of odour.] See the article INCENSE.

Cedar and *frankincenſe*, an od'rous pile,
Flam'd on the hearth, and wide perfum'd the iſle. *Pope.*

FRANK'LAND's I'SLAND, a cluſter of iſlands on the north-eaſt coaſt of New Holland, in the South Pacific Ocean; about two leagues from the land. Lat. 17. 19. S. lon. 146. E. Greenwich.

FRANK'LIN, *ſ.* [from *frank.*] A ſteward; a bailiff of land. It ſignifies originally a little gentleman, and is not improperly Engliſhed a gentleman ſervant. *Not in uſe:*

A ſpacious court they ſee,
Both plain and pleaſant to be walked in,
Where them does meet a *franklin* fair and free. *Spenſer.*

FRANK'LIN (Benjamin), a philoſopher and ſtateſman of great celebrity, born at Boſton, in the American States, in 1706. His family was originally from Ecton, in Northamptonſhire, where his anceſtors for ſeveral generations poſſeſſed a ſmall freehold. His father removed from England to America, in order to avoid the perſecution carried on in the reign of Charles II. againſt nonconformiſts; and he followed the occupation of a ſoap-boiler and tallow-chandler, in Boſton. The mother of Benjamin, his ſecond wife, was a deſcendant of one of the firſt coloniſts in that province. Dr. Franklin has left in print an account of his own life to his twenty-fifth year, which, though terminating while he was yet in an humble ſtation, abounds with incidents and obſervations which render it a moſt valuable leſſon to young perſons. We ſhall extract from it ſome of the moſt remarkable circumſtances.

The indications Benjamin gave from his childhood of a diſpoſition for literature, cauſed his father to deſtine him to the church; but the burthen of a large family prevented him from perſiſting in the education commenced for this purpoſe, and at the age of ten he was taken home to be employed in the lower offices of the family trade. With this change he was ſeverely mortified, and he felt a ſtrong deſire of quitting his ſituation for a maritime life, but this was oppoſed. His father, though in an humble condition, poſſeſſed a variety of knowledge, with great ſolidity of underſtanding, and took pains to form the minds of his children to thoſe principles of good ſenſe and moral rectitude which might give a proper direction to their conduct when left to their own controul. In the ſcanty library of his father, young Franklin met with ſome books which gratified his paſſion for reading, though without ſelection. His own taſte chiefly led him to voyages and travels, and hiſtory; but he alſo went through a courſe of polemical divinity, more, probably, to the advantage of his argumentative powers, than of his practical principles. He mentions a work of Defoe's upon Projects, as giving him impreſſions which influenced the principal events of his future life.

A buſineſs was at length choſen for him, which was much better ſuited to his diſpoſition than that of his father's ſhop. An elder brother having ſet up a printing-office at Boſton, Benjamin, at the age of twelve, was articled to him as an apprentice. He ſoon rendered himſelf a proficient in the mechanical part of the trade, and he eagerly ſeized every opportunity it afforded of procuring new books to read, in which amuſement he frequently

ſpent

ſpent the greater part of the night. It was not long before he began to imitate what he ſo much admired, and his firſt attempts were in verſe. He wrote ballads and printed them; but notwithſtanding their temporary ſucceſs, his father was able to convince him that his talent was not poetry. His efforts to acquire a facility in writing proſe were better directed, and purſued with great aſſiduity; and to their ſucceſs may be chiefly attributed his early ſuperiority to his brethren of the preſs, and his ſubſequent elevation to ſtations of public importance. With a paſſion for reading and writing, he imbibed the kindred one of diſputing. This met with fuel from his familiarity with a youth of a ſimilar turn, and he was for a time a very doughty and dogmatical polemic. The peruſal of a tranſlation of Xenophon's Memorabilia, ſoftened him into a Socratic, and he became very dextrous in the ſubtile mode of confuting or confounding an antagoniſt by a ſeries of queſtions. In ſuch a courſe of mental exerciſe he naturally became a ſceptic with reſpect to the religion in which he had been educated; and with the zeal of a convert, took all opportunities of propagating his unbelief. The unhappy moral effects this produced upon ſome of his companions, at length convinced him that it was unſafe to looſen the ties of religion, without the probability of ſubſtituting others equally efficacious. The doubts which ſubſiſted in his own mind, he appears never to have been able to remove; but he took care ſtrongly to fortify himſelf with ſuch moral principles of conduct, as directed him to the moſt valuable ends by honourable means. He early obtained that dominion over his appetites which is ſo important a ſtep in moral diſcipline. Of this, a remarkable inſtance was the effect produced upon him by reading, in his ſixteenth year, a treatiſe by one Tryon, in recommendation of vegetable diet. He immediately diſcarded animal food; and offering to his brother to maintain himſelf for half the ſum paid for his board, he was able out of that allowance to make ſavings for the purchaſe of books. Though he afterwards relaxed in the auſterity of his diet, the habit of being contented with a little, and diſregarding the gratifications of the palate, remained with him through life, and was highly uſeful on various occaſions.

His brother ſet up a newſpaper, and Benjamin ventured anonymouſly to ſend ſome pieces for inſertion, and had the ſatisfaction of finding them applauded by the beſt judges in the place. His conſcious merit probably made him more impatient under the harſh treatment of his brother, who behaved to him more like a maſter than a relation. At length an arbitrary interdiction from the ſtate to James Franklin, upon a political offence, to continue his paper, cauſed Benjamin's name to be employed as publiſher, and, in conſequence, his indentures to be given up to him. He was obliged, however, to ſign a private agreement for ſerving out his term; but not thinking himſelf bound by it, (which he acknowledges to have been a fault,) he ſecretly departed by ſea to New York, whence he ſoon proceeded to Philadelphia. This event of his life took place in his ſeventeenth year. At that city he engaged in the ſervice of one Keimer, a printer, whoſe affairs he ſoon put into better order. He contracted an acquaintance with ſeveral young men fond of reading, in whoſe ſociety he ſpent his evenings, and improved his literary taſte.

After ſome time he became known to ſir William Keith, the governor of the province, who took much notice of him, and urged him to ſet up for himſelf, with many promiſes of ſupport. At his inſtigation, Franklin paid a viſit to his parents at Boſton, in order to obtain an advance of money for his project; but though he was kindly received, he was unable to gain his point. Upon his return to Philadelphia, the governor offered to take the whole burthen upon himſelf, and propoſed to him to make a voyage to England in order to furniſh himſelf with all the neceſſaries of a new printing-office. Franklin gladly embraced the propoſal, and ſet ſail about the beginning of 1725, accompanied by his intimate companion, Ralph, who afterwards became a political writer in England of ſome note, and is commemorated in the Dunciad. Previous to his departure, he exchanged promiſes of fidelity with miſs Read of Philadelphia, with whoſe father he had lodged. Upon his arrival in London, Franklin found that governor Keith, upon whoſe promiſed letters of credit and recommendation he had relied, had entirely deceived him. He was therefore obliged to have recourſe to the buſineſs in his hands for a ſupport, and engaged himſelf as a workman in the office of Palmer, a printer of note in Bartholomew-cloſe. His friend Ralph, whoſe dependence was upon his head, did not ſo readily obtain employment, and he was long a drain upon Franklin's purſe. The morals of the two friends did not improve from their ſociety: Ralph forgot his wife and child in America, and Franklin forgot his miſs Read. He has candidly marked this as another great error of his life; to which he has added the printing, about this period, of a Diſſertation on Liberty and Neceſſity, Pleaſure and Pain, dedicated to Ralph, and intended as an anſwer to ſome of the arguments of Woolaſton's Religion of Nature, which paſſed through his hands at the preſs. This piece, however, gained him ſome fame, and introduced him to the acquaintance, among others, of Dr. Mandeville, author of the celebrated fable of the Bees. In whatever other virtues Franklin might be defective, he retained in a high degree thoſe of induſtry and temperance, which eventually were the means of ſecuring his morals, as well as of raiſing his fortune. He has given a curious and inſtructive account of his endeavours, in the ſecond printing-office in which he worked, (Watts's, near Lincoln's-inn-fields,) to reform the ſottiſh habits of his fellow-workmen. He attempted to perſuade them that there was more real ſuſtenance in a penny roll than in a pint of porter; and though he was at firſt ſtigmatiſed by the name of the *American aquatic*, he was able in the end to induce ſeveral of them to ſubſtitute gruel and toaſted bread as a breakfaſt, to their uſual morning libation from the tankard. They who are acquainted with the London artificers, will conſider this as no ſmall proof of his perſuaſive powers.

After an abode of eighteen months in London, he returned, in 1726, to Philadelphia, where he had engaged to act in the capacity of clerk to Mr. Denham, a worthy perſon, who opened a warehouſe in that city. He ſoon obtained a conſiderable knowledge of trade, and paſſed his time happily, till the death of Mr. Denham, in 1727, diſſolved the connection. He was again obliged to apply for ſupport to the preſs, and accepted an offer from Keimer to become the ſuperintendant of his office. In this ſituation he acquired general eſteem, and improved his connections, ſo that at length he began to entertain thoughts of ſetting up for himſelf. This he brought to effect by means of a partnerſhip with one Meredith, a fellow-workman, whoſe father was capable of advancing ſome money. They took a houſe in Philadelphia; and Franklin has recorded the extraordinary pleaſure he received from a payment of five ſhillings, the firſt fruits of their earnings. "The recollection of what I felt on this occaſion," ſays he, "has rendered me more diſpoſed, than perhaps I ſhould otherwiſe have been, to encourage young beginners in trade:" an amiable effect, indicating the radical benevolence of his heart. His habitual induſtry was now ſharpened by the conſciouſneſs of working for his own benefit. It obtained the notice of ſome of the leading men of the place, and, joined to his punctuality, gave him increaſing reputation. A club which he inſtituted, under the name of *the Junto*, for the diſcuſſion of political and philoſophical queſtions, proved an excellent ſchool of mutual improvement among the members, and united them in ſupporting each other's intereſts. The queries put to the candidates for admiſſion, by way of teſt, deſerve copying, as indicating the liberal and philanthropical ſpirit of the founder. "Do you ſincerely declare that you love mankind in general, of what profeſſion or religion ſoever?

ſoever? Do you think any perſon ought to be harmed in his body, name, or goods, for mere ſpeculative opinions, or his external way of worſhip? Do you love truth for truth's ſake; and will you endeavour impartially to find and receive it yourſelf, and communicate it to others?" Franklin and his partner ventured to ſet up a new public paper, which his efforts both as a writer and a printer cauſed to ſucceed, and they alſo obtained the printing of the votes and laws of the aſſembly. In proceſs of time, Meredith withdrew from the partnerſhip, and Franklin met with friends who enabled him to take the whole concern, and add to it the buſineſs of a ſtationer. A diſcuſſion concerning a new emiſſion of paper-money taking place, he wrote an anonymous pamphlet in favour of the meaſure, which was well received, and contributed to its ſucceſs. This obtained for him farther countenance from perſons in power, and enſured his proſperity. He confeſſes that at this time he was drawn into improper connections with the ſex, owing, probably, to the diſappointment he met with in the object of his firſt attachment, miſs Read, who had been induced by his neglect to marry another perſon. From this man, however, ſhe was ſoon ſeparated, on account of a report that he had a former wife living; and he had removed to the Weſt Indies, where he died. The lovers renewed their intercourſe, and in September, 1730, they ventured to marry, though yet in ſome degree uncertain of her widowhood. She proved a good and faithful companion, and eſſentially contributed to his comfort and proſperity.

Hitherto we have been tracing the hiſtory only of an humble tradeſman, rendered intereſting by the example it affords of gradual advance by means of frugality and induſtry, and of the developement of a ſtrong and ſagacious mind. We are now to view his progreſs in the characters of politician and philoſopher; but it is to be regretted that at the very commencement of this period, we loſe the thread of narration from his own pen, which has hitherto conducted us. His friend, Dr. Stuber, of Philadelphia, has in ſome degree ſupplied this defect; and other ſources of information have not been neglected.

The eſtabliſhment of the public library in Philadelphia, was one of the uſeful projects of Franklin, which he brought to effect in 1731. He had the ſatisfaction of ſeeing and aiding its advance to that flouriſhing ſtate which it has long attained. In 1732 he began to publiſh his Poor Richard's Almanac. This work became remarkable by the number of excellent prudential maxims occaſionally inſerted in it, diſtinguiſhed by a proverbial point and conciſeneſs, and calculated to be indelibly impreſſed upon the memory. They have been collected into a ſingle ſhort piece, entitled, The Way to Health, which has been publiſhed in a variety of forms. His proper political career commenced in 1736, when he was appointed clerk to the general aſſembly of Pennſylvania. To this office he was re-elected for ſeveral years, till he became a repreſentative. In the next year he obtained the valuable office of poſt-maſter to the city of Philadelphia. In 1738 he improved the police of the city with reſpect to the dreadful calamity of fire, by forming a ſociety called the fire-company, to which was afterwards added an inſurance-company againſt loſſes by fire. In the French war of 1744, when it became a queſtion to ſecure the province againſt the inroads of the enemy, a militia-bill was recommended by the governor to the aſſembly, which a diſpute between the proprietary intereſt and that of the citizens at large prevented from being carried. Franklin at this criſis ſtood forth, and propoſed a plan of voluntary aſſociation for defence, which was immediately ſigned by 1200 perſons; and being circulated through the province, at length obtained 10,000 ſubſcriptions. This may be reckoned a very important ſtep towards acquainting America with her ſtrength, and the means of bringing it into action.

It was about this time that he made a commencement of thoſe electrical experiments which have conferred ſo much celebrity on his name. Peter Collinſon had ſent, in 1745, to the library-ſociety of Philadelphia, an account of the curious facts relative to electricity which then engaged the attention of the European philoſophers, together with a tube for experiments, and directions for its uſe. Franklin, together with ſome of his friends, immediately began to apply to the ſubject. His diſcoveries were communicated in three publications, entitled, New Experiments and Obſervations in Electricity, made at Philadelphia in America, in the form of letters to Mr. Collinſon. Their dates are from 1747 to 1754. Theſe were univerſally read and admired; and Dr. Prieſtley (Hiſtory of Electricity) ſays of them, "It is not eaſy to ſay whether we are moſt pleaſed with the ſimplicity and perſpicuity with which theſe letters are written, the modeſty with which the author propoſes every hypotheſis of his own, or the noble frankneſs with which he relates his miſtakes, when they were corrected by ſubſequent experiments." Referring to the work above quoted for a particular account of our philoſopher's new ideas and diſcoveries, we ſhall only give a ſketch of the moſt important of them. Having been led to think that in the excitation of the electric tube, the fluid was conveyed from the perſon who rubbed it, to him who touched it, he deſignated the ſtate of the latter by the expreſſion of being electrified *poſitively*, or *plus*, as having received more than his original quantity of electric fire; while the former was ſaid to be electrified *negatively*, or *minus*, as having loſt a part of his natural portion of the ſame. This led him to the capital diſcovery with reſpect to the manner of charging the Leyden phial; the theory of which is, that when one ſide of the glaſs is electrified *plus*, the other is electrified *minus*; ſo that in charging it, all that is done is to throw the electric fire from one ſide, and convey it to the other; while diſcharging it is the reſtoration of the equilibrium. This theory he confirmed by a ſet of very ingenious experiments, which have generally been thought deciſive; and accordingly it has made its way againſt all oppoſition. He farther proved that the accumulated electric fire in the charged ſide of the phial reſided not in the coating, but in the pores of the glaſs itſelf.—See the article ELECTRICITY, vol. vi. p. 408–427. The moſt brilliant, however, of his diſcoveries, was that of the identity of the electric fire and that of lightning. Their ſimilarity had been ſuſpected, and ſome experiments, according to his directions, had begun to be made in France towards the verification of the fact; but Franklin completed the demonſtration of it entirely by his own experiments. They were guided by the extraordinary power he had obſerved to be poſſeſſed by pointed bodies in attracting and throwing off the electric fire. The firſt poſitive proof he obtained of his problem was in June, 1752, when, by means of a ſilken kite furniſhed with an iron point, and having a key appended at the termination of its hempen ſtring, he drew down from a paſſing thunder-cloud electric fire enough to yield ſenſible ſparks from the key. He afterwards fixed an inſulated iron rod upon his houſe, which drew down the lightning, and gave him an opportunity of examining whether it was poſitive or negative. As utility was in his mind the great end of philoſophical inveſtigation, he immediately applied this grand diſcovery to the ſecuring of buildings from the effects of lightning, which are particularly alarming on the continent of North America. By means of pointed metallic conductors projecting from the top of the building, he conceived that the paſſing thunder-clouds might be made to diſcharge their fire ſilently and innoxiouſly; and ſuch was the confidence in his opinion, that theſe conductors ſoon came to be generally uſed in America, and were adopted in England and other countries. He gave an inſtance of his application of phyſics to the purpoſes of common life by his invention, in 1745, of the Pennſylvanian fire-places, combining the qualities of an open grate with that of a ſtove.

Politics

Politics continued to be a great object of his attention, as it can ſcarcely fail to be of every public-ſpirited man in a popular government. In 1747 he was elected a repreſentative of the city of Philadelphia to the general aſſembly of the province. At that time a conteſt ſubſiſted between the aſſembly and the proprietaries, chiefly with reſpect to the claim of the latter to have their property exempted from the public burthens. The principles of Franklin in favour of equality of rights led him to take the popular ſide of the queſtion; and he obtained ſuch an influence, that he was regarded as the head of the party in oppoſition to the governors, who were always in the proprietary intereſt. This influence did not ariſe from his eloquence, for he ſpoke ſeldom, and never in the way of harangue. But his ſhrewd obſervations, and plain good ſenſe, often diſconcerted the moſt elaborate ſpeeches on the other ſide, and decided the queſtion.

Senſible of the great importance of liberal education in the members of a free ſtate, he drew up a plan for an academy to be founded in Philadelphia, ſuited to the ſtate of an infant country, yet providing for that future extenſion which might be neceſſary when the country itſelf ſhould have attained that advancement, to which his prophetic eye was always directed. His plan was carried into effect in the beginning of 1750 by means of a ſubſcription, to which the proprietors were afterwards liberal contributors. He himſelf took great intereſt in the riſing inſtitution, and vigilantly watched over its progreſs. He was alſo greatly inſtrumental towards the foundation of the Philadelphia hoſpital. The ability and punctuality he had diſplayed in his office of poſtmaſter cauſed him, in 1753, to be raiſed to the important employ of deputy poſtmaſter-general for the Britiſh colonies; and the revenue ſoon felt the benefit of his attentions. In 1754, when the depredations of the Indians upon the frontiers had excited ſuch an alarm through the colonies, that commiſſioners from a number of them held a meeting at Albany for the purpoſe of a defenſive union, Franklin attended with the plan of a general government in the colonies for this purpoſe, to be adminiſtered by a preſident nominated by the crown; and by a grand council choſen from the repreſentatives of each colony, veſted with extenſive powers. This plan was unanimouſly agreed to by the commiſſioners preſent, and copies of it were tranſmitted to each aſſembly, and to the privy council in England. It was, however, finally rejected, and that upon ſingular grounds. The Engliſh miniſtry thought it gave too much power to the repreſentatives of the people; while each aſſembly objected to it as augmenting the authority of the crown. Theſe contradictory objections were, perhaps, good evidences of the wiſdom and moderation of the plan. When the expedition of general Braddock, 1755, to diſpoſſeſs the French of ſome of their encroachments, was in preparation, a difficulty aroſe from the want of waggons. Franklin ſtept forward to obviate it, and in a ſhort time procured one hundred and fifty. The unfortunate iſſue of this expedition having cauſed their deſtruction, he was in danger of a ruinous loſs on this account, but was relieved from his obligations by the interference of the governor. He was afterwards inſtrumental in forming a militia bill; and he was appointed colonel of the Philadelphia regiment of twelve hundred men, and took a ſhare in providing for the defence of the north-weſtern frontier. The militia was however ſoon diſbanded by orders from England; and Franklin, in 1757, ſailed for London, in the capacity of agent for Pennſylvania, the aſſembly of which was involved in warm diſputes with the proprietary. After ſeveral debates before the privy council, it was agreed that the proprietary lands ſhould take their ſhare in a tax for the public ſervice, provided that Franklin would engage that the aſſeſſment ſhould be fairly proportioned. The meaſure was accordingly carried into effect. He remained at the Britiſh court as agent for his province; and his reputation cauſed him alſo to be entruſted with the like commiſſion from Maſſachuſſets, Maryland, and Georgia. The continual moleſtation received by the Britiſh colonies from the French in Canada induced him to write a forcible pamphlet, pointing out the advantages of a conqueſt of that province by the Engliſh. The ſubſequent expedition againſt it, and its retention under the Britiſh government at the peace, were probably much influenced by his reaſonings. His philoſophical merit was now duly recogniſed in Europe. He was received into the royal ſociety of London, and into other ſcientific ſocieties on the continent; and the degree of doctor of laws was conferred upon him at St. Andrew's, Edinburgh, and Oxford. Amidſt his political avocations, he found time to cultivate experimental philoſophy, and to entertain correſpondences with many perſons of eminence.

In 1762 he returned to America, and was welcomed by the thanks of the aſſembly of Pennſylvania for his ſervices, which alſo received a handſome pecuniary recompence. He reſumed his ſeat in that body, to which he had been annually elected during his abſence, and continued to diſtinguiſh himſelf as a friend to the cauſe of the people. The part he took againſt the proprietary intereſt occaſioned the loſs of his election in 1764; but ſo powerful were his friends in the aſſembly, that he was immediately re-appointed agent for the province, and in conſequence again viſited England. This was at the period when the ſtamp-act excited ſuch commotions in America; and Dr. Franklin was called to the bar of the houſe of commons to give evidence reſpecting the diſpoſition of the people to ſubmit to it. The ſtrength and clearneſs of his repreſentations had a material effect in producing the repeal of that obnoxious meaſure. In 1766 and 1767 he paid viſits to Holland, Germany, and France, in which countries he alſo met with a diſtinguiſhed reception. Soon after the year 1775 he returned to America, and was elected by the legiſlature of Pennſylvania a delegate to congreſs.

On the arrival of lord Howe in America, in 1776, he entered upon a correſpondence with him on the ſubject of reconciliation. One of his letters ſtrongly expreſſes his opinion of the temper of the Britiſh nation, to which, and not to any particular deſigns of the court or miniſtry, he imputed the fatal extremity then reſorted to. He was afterwards appointed with two others to wait upon the Engliſh commiſſioners, and learn the extent of their powers; and as theſe only went to the granting pardon upon ſubmiſſion, he joined his colleagues in conſidering them as inſufficient. When the queſtion of a declaration of independence was agitated, he was decidedly in its favour, and contributed much to bring over the public to the ſame ſentiments. He afterwards ſat as preſident of the convention aſſembled for the purpoſe of eſtabliſhing a new government for the ſtate of Pennſylvania. On this occaſion his idea of the beſt form of a conſtitution ſeemed to be that of a ſingle legiſlative and a plural executive. When it was thought adviſable by the congreſs to open a negociation with France, Dr. Franklin was fixed upon as one of the reſidents at that court. The choice was judicious, both on account of his political abilities, and the high character he ſuſtained as a philoſopher, which ſecured him reſpect in a country where ſcientific reputation always bore a peculiar value. He brought to effect the treaty of alliance offenſive and defenſive in 1778, which produced an immediate war between France and England. He was alſo highly ſerviceable to his country in keeping up its credit by his publications and perſonal influence. He was one of the commiſſioners who, on the part of the United States, ſigned the proviſional articles of peace in 1782, and the definitive treaty in 1783. Before he left Europe, he concluded a treaty with Sweden, and with Pruſſia. In the latter are ſeveral moſt liberal and humane ſtipulations in favour of the freedom of commerce, and the ſecurity of private property during war, conformable to the principles he always maintained on thoſe ſubjects.

He obtained his recal from the buſy ſtation he had ſo well filled, in 1785, and returned to Philadelphia, where he was choſen preſident of the ſupreme executive council. In 1787 he ſat as delegate from the ſtate of Pennſylvania in the convention appointed to frame the federal conſtitution of the union. When the deliberations on this important affair were terminated, he delivered a truly wiſe and patriotic ſpeech, recommending perfect unanimity in adopting the reſolutions of the majority, though not entirely conformable to the opinions of individuals, as was the caſe with reſpect to himſelf. The high regard in which he was held by his fellow-citizens appeared in his being choſen preſident of various ſocieties, among which were thoſe for alleviating the miſeries of public priſons, and for the abolition of ſlavery, objects of benevolence in which he heartily concurred. His increaſing infirmities cauſed him in 1788 to withdraw from all public buſineſs; and on April 17, 1790, he cloſed in ſerenity and reſignation an active and uſeful life, aged eighty-four years and three months.

Dr. Franklin perhaps has ſcarcely been ſurpaſſed by any man in that ſolid practical wiſdom, which conſiſts in purſuing valuable ends by the moſt appropriate means. His cool temper and ſound judgment ſecured him from falſe views and erroneous expectations; he ſaw things in their real light, and predicted conſequences with almoſt prophetic accuracy. In all his ſpeculations and purſuits, ſomething beneficial was ever in contemplation. He juſtly ſays of himſelf, "I have always ſet a greater value on the character of a *doer of good* than any other kind of reputation." Though by no means inattentive to his own intereſt, as his riſe in the world to high ſtations and an opulent fortune ſufficiently proves, yet he never ceaſed zealouſly to promote the good of the ſociety of which he was a member, and of mankind in general. It was impoſſible that the ſcenes of violent party conteſts in which he was engaged, ſhould not have expoſed him to cenſure and obloquy from his antagoniſts; but his general character is ſanctioned by the eſteem and veneration of his country, which ranks him among its beſt and moſt valuable citizens. As a natural philoſopher, his fame is principally founded upon his electrical diſcoveries. He has, however, diſplayed great ingenuity and ſagacity upon other topics, particularly relative to meteorology and mechanics. It was his peculiar talent to draw uſeful leſſons from the commoneſt occurrences, which would have paſſed unnoticed by the generality of obſervers. As a political writer he is characteriſed by force, clearneſs, and ſimplicity. Of his miſcellaneous pieces many are marked with a caſt of humour, which renders them equally entertaining and impreſſive. Beſides his publications already adverted to, there was publiſhed a collection of his Political, Miſcellaneous, and Philoſophical, Pieces, 4to. and 8vo. 1779. Several of his philoſophical papers are alſo contained in the American Philoſophical Tranſactions; and his Eſſays, Humorous, Moral, and Literary, with his Life, written by himſelf, have appeared ſince his death in two ſmall volumes. A complete collection of his works, with biographical memoirs, has long been expected from the hand of a relation.

FRANK'LIN, a county of the American States, the north-weſternmoſt in Vermont, bounded north by Lower Canada, and weſt by lake Champlain. It was lately taken from Chittenden county, and contains twenty townſhips.

FRANK'LIN, a county of the American States, in Pennſylvania, bounded north by Mifflin, north-eaſt by Cumberland, eaſt by York, ſouth by Waſhington county in Maryland, weſt by Bedford county, and north-weſt by Hunterdon. It is computed to contain 800 ſquare miles, equal to 512,000 acres. It lies chiefly between the North and South Mountains, and comprehends the middle part of the beautiful and rich valley of Connegocheague; which is watered by the creek of its name, which falls into Potowmack at William's Port in Maryland. This county exhibits a moſt luxurious landſcape in ſummer, from the top of South Mountain. Iron ore is found here ſufficient already to furniſh work for a furnace and forge. The county is divided into eleven townſhips, which contain 15,655 inhabitants.

FRANK'LIN, a county of the American States, in Kentucky, bounded north by Scott county, north-weſt and weſt by Shelby, ſouth-eaſt by Fayette, and ſouth by Woodford. Chief town, Frankfort.

FRANK'LIN, a county of the American States, in Halifax diſtrict, North Carolina, containing by the cenſus of 1796, 7559 inhabitants. It is bounded north by Grenville, ſouth by Johnſton, north-eaſt by Warren, ſouth-weſt by Wake, and weſt by Orange county. Chief town, Louiſburg.

FRANK'LIN, a ſmall iſland in the American States, at the mouth of St. George's river, in Lincoln county, Maine; four leagues ſouthward of Thomaſton.

FRANK'LIN, a county of the American States, in Virginia, bounded north by Bedford, north-weſt by Botetourt, weſt by Montgomery, ſouth-weſt by Henry, ſouth by Patrick, and eaſt by Campbell county. It is about forty miles long, and twenty-five broad, and contains 6842 inhabitants. A range of the Alleghany mountains paſſes through it on the north-weſt. It is conſequently hilly in general.

FRANK'LIN, a county of the American States, in Georgia, ſituated in the Upper Diſtrict, bounded eaſt and north-eaſt by Tugulo river, which ſeparates it from the ſtate of South Carolina; weſt and north weſt by the country of the Cherokees; ſouth by the head branches of Broad river; and ſouth-eaſt by Elbert county. It contains 1041 inhabitants. The court-houſe is ſeventeen miles from Hatton's Ford on Tugulo river, twenty-five from Elberton, and ſeventy-ſeven from Waſhington.

FRANK'LIN, a townſhip in Norfolk county, Maſſachuſetts; taken from Wrentham, and incorporated in 1778, containing 17,000 acres of land; bounded north by Charles river, which ſeparates it from Medway, and lies thirty miles ſouth of Boſton.

FRANK'LIN, a new townſhip of the American States, in Ducheſs county, New York. By the ſtate cenſus of 1796, there were 210 of its inhabitants qualified to be electors.—Alſo, a new townſhip in Delaware county, of whoſe inhabitants 239 are electors. It lies ſouth-weſt from, and borders on, Harpersfield, and its weſt line runs along the ſouth-eaſtern bank of Suſquehannah river. This town was divided by an act of the legiſlature, 1797.

FRANK'LIN, a townſhip of the American States, in Weſtmoreland county, Pennſylvania.—There are alſo three others in the ſame ſtate, viz. in York county, Fayette county, and in Waſhington county.

FRANK'LIN, a townſhip of the American States, the northernmoſt in New-London county, Connecticut, ſix miles north-weſt of Norwich. It contains above one thouſand inhabitants, who are chiefly wealthy farmers.

FRANK'LIN-COL'LEGE. See LANCASTER, in Pennſylvania.

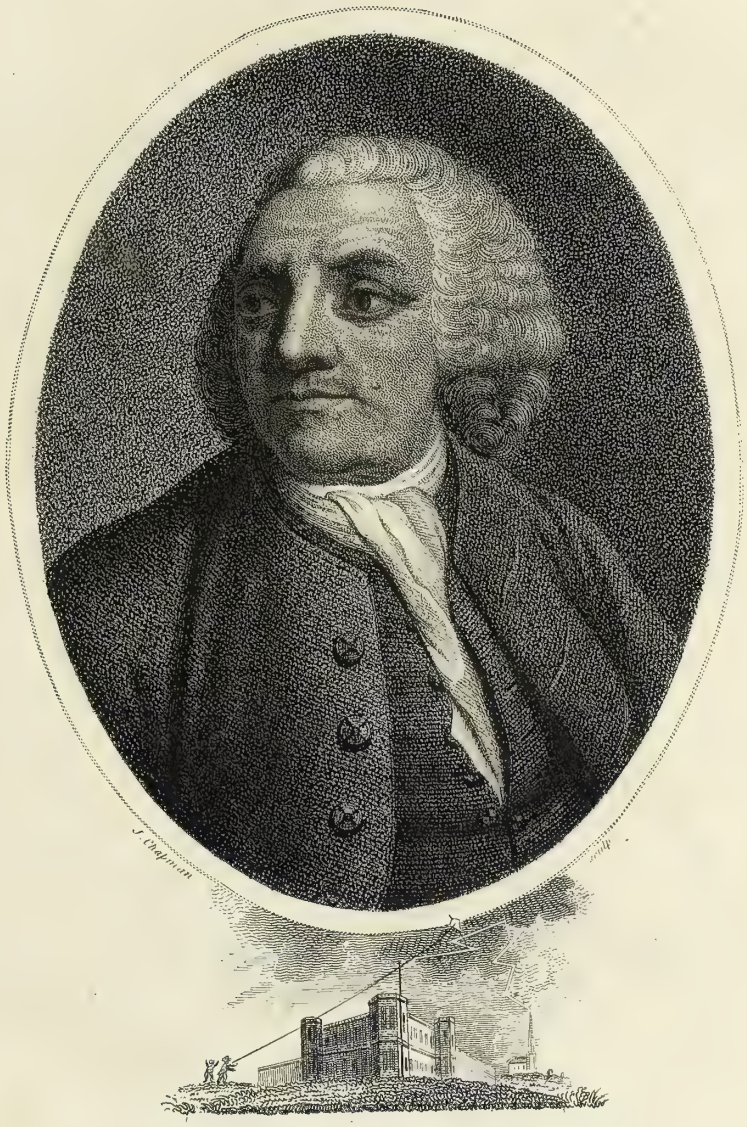
FRANK'LIN-FORT, a fort in Alleghany county, Pennſylvania, near the poſt called Venango, erected in 1787, to defend the frontiers of Pennſylvania from the depredations of the neighbouring Indians. It is ſeated on the ſouth-weſt bank of Alleghany river, oppoſite the mouth of French creek: fifty-three miles ſouth-ſouth-eaſt of Preſque Iſle, and ſixty-three northward of Pittſburg.

FRANKLIN'IA, *ſ.* in botany. See GORDONIA.

FRANK'LY, *adv.* [from *frank.*] Liberally; freely; kindly; readily.—When they had nothing to pay, he *frankly* forgave them both. *Luke* vii. 42.

Oh, were it but my life,
I'd throw it down for your deliverance,
As *frankly* as a pin. *Shakeſpeare.*

Without conſtraint; without reſerve.—He entered very *frankly*



BENJAMIN FRANKLIN, L.L.D.

London Published as the Act directs Jan.y 24th 1800 by J. Wilkes

frankly into thoſe new deſigns, which were contrived at court. *Clarendon.*

FRANK'NESS, *ſ.* [from *frank.*] Plainneſs of ſpeech; openneſs; ingenuouſneſs. Liberality; bounteouſneſs. Freedom from reſerve.—The ableſt men that ever were, have had all an openneſs and *frankneſs* of dealing, and a name of certainty and veracity. *Bacon.*

FRANKS, FRANCS, or FRANQUES, a name which the Turks, Arabs, Greeks, &c. give to all the people of the weſtern parts of Europe. The appellation is commonly ſuppoſed to have had its riſe in Aſia, at the time of the croiſades; when the French made the moſt conſiderable figure among the croiſſees: from which time the Turks, Saracens, Greeks, Abyſſinians, &c. uſed it as a common term for all the Chriſtians of Europe; and called Europe itſelf *Frankiſtan.* The Arabs and Mahometans, ſays M. d'Herbelot, apply the term *Franks* not only to the French (to whom the name originally belonged), but alſo to the Latins and Europeans in general. See the article EGYPT, vol. vi. p. 322.

But F. Goar, in his notes on Condinus, cap. 5. n. 43. furniſhes another origin of the appellation *Franks*, of greater antiquity than the former. He obſerves, that the Greeks at firſt confined the name to the *Franci, i. e.* the German nations, who had ſettled themſelves in France or Gaul; but afterwards they gave the ſame name to the Apulians and Calabrians, after they had been conquered by the Normans; and at length the name was farther extended to all the Latins. In this ſenſe the word is uſed by ſeveral Greek writers; as Comnenus, &c. who, to diſtinguiſh the French, call them the *weſtern Franks.* Du Cange adds, that about the time of Charlemagne, they diſtinguiſhed eaſtern France, weſtern France, Latin or Roman France, and German France, which was the ancient France, now called *Franconia.*

From the middle of the third century, under the reign of Gordian, the Franks began to act an important part in the hiſtory of the calamities of Europe, and in that of the decline of the empire. Their language, their laws, their religion, their manners, and their uſages, prove them to have been of German origin. Great obſcurity prevails in regard to their firſt abodes, becauſe, like all uncivilized nations, they led a wandering life: but they are ſuppoſed formerly to have dwelt between the Elbe and the Weſer, and to have advanced towards the banks of the Lower Rhine previouſly to the time when the barbarians began to inundate Gaul. They conſiſted of various tribes, whoſe names diſappeared to make room for that of Franks, the origin of which is unknown. Under Valentinian, they eſtabliſhed themſelves in Belgium, and on the left bank of the Rhine. Hiſtory mentions the names of ſeveral of their kings, or chiefs, who preceded Clovis. See the article FRANCE, vol. vii. p. 648.

FRANK'STADT, a town of Moravia, in the circle of Prerau: four miles ſouth of Freyberg.

FRANKS'TOWN, a townſhip of the American States, in Huntingdon county, Pennſylvania, ſituated on the Frankſtown branch of Juniatta river: twenty miles weſt of Huntingdon.

FRANK'WALD, or PUSKOWITZ, a town of Sileſia, in the principality of Oels: four miles north-weſt of Feſtenberg.

FRAN'LEU, a town of France, in the department of the Somme, and chief place of a canton, in the diſtrict of Abbeville: two leagues and a half weſt of Abbeville.

FRANQUEMO'NT, a town of Swiſſerland, in the biſhopric of Bâle, on the Doubs, often beſieged and taken in the Swiſs wars: twenty-three miles weſt of Soleure, and ſixteen north of Neufchatel.

FRANQUEVIL'LE, a town of France, in the department of the Lower Seine, and chief place of a canton, in the diſtrict of Rouen: two leagues ſouth-eaſt of Rouen.

FRAN'TIC, *adj.* [corrupted from *phrenetic, phreneticus,* Lat. φρενητικὸς, Gr.] Mad; deprived of underſtanding by violent madneſs; outrageouſly and turbulently mad:

Far off, he wonders what makes them ſo glad;
Of Bacchus' merry fruit they did invent,
Or Cybel's *frantic* rites have made them mad. *Spenſer.*

Tranſported by violence of paſſion; outrageous; turbulent:

To ſuch height their *frantic* paſſion grows,
That what both love, both hazard to deſtroy. *Dryden.*

Simply mad:

The lover, *frantic,*
Sees Helen's beauty in a brow of Egypt. *Shakeſpeare.*

FRAN'TICLY, *adv.* Madly; diſtractedly; outrageouſly.—Fie, fie, how *franticly* I ſquare my talk. *Shakeſ.*

FRAN'TICNESS, *ſ.* Madneſs; fury of paſſion, diſtraction.

FRANTZ'DORF, a town of Sileſia, in the principality of Neiſſe: four miles north of Neiſſe.

FRANT'ZIUS (Wolfgang), a learned German Lutheran divine, born at Plawen in Saxony, in 1564. He received the earlier part of his education at Frankfort on the Oder, whence he went to the univerſity of Wittemberg. In 1598 he was appointed profeſſor of hiſtory in that univerſity, and was admitted to the degree of doctor of divinity. Three years afterwards he was appointed ſuperintendant of the eccleſiaſtical diſtrict of Kemſperg, which ſtation he filled until the year 1605, when he was appointed theological profeſſor at Wittemberg. He died of a ſtroke of apoplexy in 1628, when ſixty-four years of age. Beſides ſeveral ſmaller controverſial pieces, orations, &c. he was the author of 1. *Hiſtoria Animalium Sacra,* 1671, 12mo. which was afterwards continued by John Cyprianus, a Poliſh divine. 2. *Schola Sacrificiorum Patriarchalium Sacra, hoc eſt Aſſertio Satisfactionis a Domine noſtro J. C. pro Peccatis, &c.* 4to. 3. *Tractatus Theologicus de Interpretatione Sacrarum Scripturarum maximè legitima, duabus conſtans Regulis, a Luthero ad Papatus Deſtructionem in Verſione Bibliorum Germanica uſitatis, &c.* 4to. 4. *Diſputationes quindecim per integrum Deuteronomium, quæ vicem Commentarii ſupplere poſſunt,* 4to. 5. *Schola Sacrificialis, ſeu Prælectiones in Leviticum,* 4to. 6. *Commentarius in Leviticum, in quo Leges Moſaicæ ceremoniales & rituales ſolidè explicantur,* 4to. 6. *Auguſtanæ Confeſſionis Articuli priores decem, Diſputationibus XII. breviter explicati, &c.*

FRANZ'BURG, a town of Germany; in the circle of Upper Saxony and Swediſh Pomerania, founded in 1587, on the place where ſtood a rich abbey. Duke Bogiſlas XIII. wiſhed to make it a town only for arts and manufactures; and one hundred noblemen engaged to build it. They choſe the magiſtrates, to the number of ſeven, among themſelves, but it has not flouriſhed: fourteen miles ſouth-ſouth-weſt of Stralſund, and twenty-ſeven eaſt-north-eaſt of Roſtock. Lat. 64. 9. N. lon. 30. 36. E. Ferro.

FRASCA'TI. See FRESCATI.

FRA'SERSBURGH, a ſea-port town of Scotland, ſituated on the north-eaſt of the county of Aberdeen, founded in the beginning of the ſeventeenth century, by ſir Alexander Frazer, with a tolerable harbour: thirty-two miles north of Aberdeen, and ſixteen eaſt of Banff. Lat. 57. 37. N. lon. 1. 16. E. Edinburgh.

FRAS'LA, a town of Germany, in the duchy of Stiria: ten miles weſt of Cilly.

FRAS'SEN (Claude), a learned French monk of the franciſcan order, born at Peronne in Picardy, in 1620. At ſixteen years of age he entered into a convent belonging to the order in his native town, and was afterwards ſent to purſue his ſtudies in the great franciſcan convent at Paris. He took his degrees regularly at the Sorbonne, and was admitted to that of doctor in divinity in 1662. So highly was he reſpected for his wiſdom and integrity, that he was often conſulted by Louis XIV. the parliament of Paris, the higher orders of the clergy and of the nobility, on buſineſs of peculiar importance and delicacy. He died in 1711, in the ninety-firſt year of his age. He was the author of A Syſtem of Philoſophy, in 2 vols. 4to. He alſo wrote, 2. *Scotus Academicus, ſeu Doctoris ſubtilis Theologica*

logica Dogmata, in 4 vols. folio, 1672; 3. *Diſquiſitiones Biblicæ*, in 2 vols. 4to. 1682, afterwards reprinted with conſiderable enlargements at Lucca, in 2 vols. folio, 1764; and ſeveral devotional pieces which have undergone numerous impreſſions.

FRASSINE'TO, a town of Italy, in the kingdom of Naples, and province of Bari: nine miles ſouth-ſouth-weſt of Converſano.

FRAS'TENTZ, a town of Germany, in the county of Feldkirck: two miles eaſt of Feldkirck.

FRATEL'LI, two ſmall iſlands in the Mediterranean, twenty-five miles weſt from the iſland of Scarpanto.

FRA'TER-HOUSE, or RE'FECTORY, *ſ.* The hall, or chamber, in our monaſteries, wherein the brethren took their daily repaſts. This building was uſually ſituated on the ſouth ſide of the cloiſters, provided the cloiſters were on the ſouth ſide of the church, as at Weſtminſter, Durham, Saliſbury, &c.

FRATE'RIA, *ſ.* in the ancient eccleſiaſtical law, a fraternity, brotherhood, or ſociety, of religious perſons, who were bound to pray for the good health and life of their living brethren, and the ſouls of thoſe that were dead: in the ſtatutes of the cathedral church of St. Paul in London, collected by Ralph Baldock, dean, A. D. 1295, there is one chapter *de frateria beneficiorum eccleſiæ S. Pauli, &c.*

FRATER'NAL, *adj.* [*fraternel*, Fr. *fraternus*, Lat.] Brotherly; pertaining to brothers; becoming brothers:

Plead it to her,
With all the ſtrength and heats of eloquence
Fraternal love and friendſhip can inſpire. *Addiſon.*

FRATER'NALLY, *adv.* In a brotherly manner.

FRATER'NITY, *ſ.* [*fraternité*, Fr. *fraternitas*, Lat.] The ſtate or quality of a brother: Body of men united; corporation; ſociety; aſſociation; brotherhood.—'Tis a neceſſary rule in alliances, ſocieties, and *fraternities*, and all manner of civil contracts, to have a ſtrict regard to the humour of thoſe we have to do withal. *L'Eſtrange.*—Men of the ſame claſs or character.—With what terms of reſpect knaves and ſots will ſpeak of their own *fraternity*. *South.*

FRATI'NO, a town of Italy, in the country of Friuli, belonging to the ſtate of Venice: nine miles weſt of Concordia.

FRA'TRIAGE, *ſ.* [*fratriagium*, Lat.] In law, a younger brother's inheritance. Whatever the ſons or brothers poſſeſs of the eſtate of the father, they enjoy it *ratione fratriagii*, and are to do homage to the elder brother for it, who is bound to do homage for the whole to the ſuperior lord. *Bract.* 2. c. 35.

FRATRICEL'LI, in eccleſiaſtical hiſtory, an enthuſiaſtic ſect of Franciſcans, which roſe in Italy about the year 1294. The founders were P. Maurato, and P. de Foſſombroni, who having obtained of pope Celeſtin V. a permiſſion to live in ſolitude, after the manner of hermits, and to obſerve the rule of St. Francis in all its rigour, ſeveral monks joined them, who, living after their own fancies, and making all perfection to conſiſt in poverty, were ſoon condemned by pope Boniface VIII. and his ſucceſſor, and the inquiſitors were ordered to proceed againſt them as heretics: which commiſſion they executed with their uſual barbarity. Upon this, retiring into Sicily, Peter John Oliva de Serignan had no ſooner publiſhed his Comment on the Apocalypſe, than they adopted his errors. They held the Romiſh church to be Babylon, and maintained that the rule of St. Francis was the evangelical rule obſerved by Jeſus Chriſt and his apoſtles. They foretold the reformation of the church, and the reſtoration of the true goſpel of Chriſt, by the genuine followers of St. Francis, and declared their aſſent to almoſt all the doctrines which were publiſhed under the name of the abbot Joachim, in the Introduction to the Everlaſting Goſpel, a book publiſhed in 1250, and explained by one of the ſpiritual friars whoſe name was Gerhard. Among other enormities inculcated in this book, it is pretended that St. Francis was the angel mentioned in Rev. xiv. 6, and had promulgated to the world the true and everlaſting goſpel of God; that the goſpel of Chriſt was to be abrogated in 1260, and to give place to this new and everlaſting goſpel, which was to be ſubſtituted in its room; and that the miniſters of this great reformation were to be humble and bare-footed friars, deſtitute of all worldly employments. They even elected a general, with ſuperiors, and built monaſteries, &c. They were finally condemned by pope John XXII. in conſequence of whoſe cruelty they regarded him as the true antichriſt; but ſeveral of them returning into Germany, were protected by Louis duke of Bavaria.

There are authentic records, from which it appears, that no leſs than two thouſand perſons were burnt by the inquiſition, from the year 1318 to the time of Innocent VI. for their inflexible attachment to this hereſy. The ſeverities denounced againſt them were again revived towards the cloſe of the fifteenth century by pope Nicolas V. and his ſucceſſors. However, all the perſecutions which this ſect endured were not ſufficient to extinguiſh it; for it ſubſiſted until the times of the reformation in Germany, when its remaining votaries embraced the doctrine of Martin Luther. The Fratricelli had divers other denominations: as *Dulcini*, from one of their doctors; *Bizochi*, *Beguins*, and *Beghardi*.

FRA'TRICIDE, *ſ.* [*fratricide*, Fr. *fratricidium*, Lat.] The murder of a brother.

FRAUBRUN'NEN, a town of Swiſſerland, and ſeat of a bailiwick, in the canton of Bern, which takes its name from a celebrated monaſtery, founded in 1246. A battle was fought here between the Bernois, and an army led by ſire de Courcy compoſed of Normans, Engliſh, French, &c. in which the former were victorious: ſeven miles north of Bern.

FRAUD, *ſ.* [*fraus*, Lat. *fraude*, Fr.] Deceit; cheat; trick; artifice; ſubtilty; ſtratagem:

Our better part remains
To work in cloſe deſign, by *fraud* or guile,
What force effected not. *Milton.*

Harm: [a Latiniſm. *Quis deus in* fraudem, *&c. Virg.*]

To all his angels he propos'd
To draw the proud king Ahab into *fraud*,
That he might fall in Ramoth. *Paradiſe Regained.*

FRAUD, *ſ.* in law, comprehends every kind of deceit in grants and conveyances of lands, and bargains and ſales of goods, &c. to the damage of another perſon, which may be either by ſuppreſſion of the truth, or ſuggeſtion of a falſehood. It may be laid down as a general rule, that, without the expreſs proviſion of any act of parliament, all deceitful practices in defrauding, or endeavouring to defraud, another of his known right, by means of ſome artful device, contrary to the plain rules of common honeſty, are condemned by the common law, and puniſhable according to the heinouſneſs of the offence. *Co. Lit.* 3*b*. *Dyer* 295.

As to frauds in contracts and dealings, the common law ſubjects the wrong doer, in ſeveral inſtances, to an action on the caſe; as if a perſon, having the poſſeſſion of goods, ſell them to another, affirming them to be his own, when in truth they are not, an action on the caſe lies. 1 *Rol. Abr.* 90. But if A. poſſeſſed of term for years, offers to ſell it to B. and ſays, that a ſtranger would have given him twenty pounds for this term, by which means B. buys it, though in truth A. was never offered twenty pounds, no action on the caſe lies, though B. is hereby deceived in the value. *Yelv.* 20. If on a treaty for the purchaſe of a houſe, the defendant affirms the rent to be more than it is, whereby the plaintiff is induced to give more than the houſe is worth, this is a fraud. 1 *Salk.* 211. 1 *Lev.* 102. Where a perſon is party to a fraud, all that follows by reaſon of that fraud ſhall be ſaid to be done by

by him. *Cro. Jac.* 469. But when fraud is not expreſsly averred, it ſhall not be preſumed; nor ſhall the court adjudge it to be ſo, till the matter is found by a jury. 10 *Rep.* 56.

All frauds and deceits, for which there is no remedy by the ordinary courſe of law, are properly cogniſable in equity; and it is admitted, that matters of fraud were one of the chief branches to which the juriſdiction of chancery was originally confined. It would be endleſs to enumerate the ſeveral caſes, wherein relief has been given againſt frauds: but the following inſtances are too material to be omitted. Wherever fraud or ſurpriſe can be imputed to, or collected from, the circumſtances of the tranſaction, equity will interpoſe and relieve againſt it. *Finch*, 161. 2 *P. Wms.* 203. 2 *Vern.* 189. It is ſaid, however, that it muſt not be underſtood, from caſes of this kind being generally brought into equity, that the courts of law are incompetent to relieve; for where the fraud can be clearly eſtabliſhed, courts of law exerciſe a concurrent juriſdiction with courts of equity; and will relieve by making void the inſtrument obtained by ſuch corrupt agreement or fraud. 1 *Burr.* 396. Therefore where the obligor was an unlettered man, and the bond was not read over to him, he was allowed to plead this circumſtance in an action on the bond. 9 *Hen.* V. 15. So if the bond be in part read to an unlettered man, and ſome of its material contents be omitted or miſrepreſented. 2 *Rol. Ab.* 28. It is obſervable that lord Coke, in the ſame paſſage where he confines the juriſdiction of courts of equity to ſuch "frauds, covin, and deceit, for which there is no remedy by the ordinary courſe of law," ſeems to admit that all frauds were not relievable at law. 3 *Inſt.* 84. The chancery may decree a conveyance to be fraudulent, merely for being voluntary, and without any trial at law; yet it has been inſiſted, that fraud or not, was triable only by a jury. *Pre. Ch.* 14.

A poor man was drawn in to ſell an eſtate, at a great under-value; but no fraud appearing, though the purchaſe was not a fair bargain, the ſeller could not be relieved in equity, to ſet it aſide. *Preced. Canc.* 206. There does not appear to be a ſingle caſe in the books in which it has been held that mere inadequacy of price alone is a ground for a court of equity to annul an agreement, though executory, if the ſame appear to have been fairly entered into, and underſtood by the parties, and capable of being ſpecifically performed; ſtill leſs does it appear to have been conſidered as a ground for reſcinding an agreement actually executed. *Gilb. Rep.* 155. To ſet aſide a conveyance there muſt be an inequality of price ſo ſtrong, groſs, and manifeſt, that it muſt be impoſſible to ſtate it to a man of common ſenſe, without producing an exclamation at the inequality of it. 1 *Bro. C. R.* 9. A ſtrong argument in ſupport of this rule may be drawn from thoſe caſes in which loſing bargains have been actually eſtabliſhed and decreed. See 2 *Vern.* 423. 1 *Eq. Ab.* 170. But though courts of equity will not relieve againſt agreements merely on the ground of the conſideration being inadequate, yet if there be ſuch inadequacy as to ſhew that the perſon did not underſtand the bargain he made, or was ſo oppreſſed that he was glad to make it, knowing its inadequacy, it will ſhew a command over him which may amount to a fraud. 2 *Vez.* 155. 2 *P. Wms.* 203.

A. being tenant in tail, remainder to his brother B. in tail, A. not knowing of the intail, makes a ſettlement on his wife for life for her jointure, without levying a fine, or ſuffering a recovery, which B. who knew of the intail ingroſſes, but does not mention any thing of the intail, becauſe, as he confeſſed in his anſwer, if he had ſpoke any thing of it, his brother, by a recovery, might have cut off the remainder, and barred him; and although after A.'s death, B. recovered in ejectment againſt the widow by force of the intail; yet ſhe was relieved in chancery, and a perpetual injunction granted for this fraud in B. in concealing the intail, which if it had been diſcloſed, the ſettlement might have been made good by a recovery. *Preced. Chanc.* 35. So where a mother being abſolute owner of a term, the ſame being limited to her in tail, is preſent at a treaty for her ſon's marriage, and hears her ſon declare, that the term was to come to him at his mother's death, and is a witneſs to the deed, whereby the reverſion of the term is ſettled on the iſſue of the marriage after the mother's death; ſhe was compelled in equity to make good the ſettlement. 2 *Vern.* 150.

Where the defendant, on a treaty of marriage for his daughter with the plaintiff, ſigned a writing compriſing the terms of the agreement, and afterward deſiring to elude the force thereof, and get looſe from his agreement, ordered his daughter to put on a good humour, and get the plaintiff to deliver up that writing, and then marry him, which ſhe accordingly did, and the defendant ſtood by at the corner of a ſtreet to ſee them go by to be married; the plaintiff was relieved on the point of fraud. 1 *Eq. Ab.* 20. 2 *Vern.* 373. It ſeems agreed that if a woman on the point of marriage, charge or convey her property to a mere ſtranger, for whom ſhe was not under even a moral obligation to provide, that ſuch conveyance will be decreed a fraud on the marital rights. 2 *C. R.* 41.

If A. has a prior incumbrance on an eſtate, and is a witneſs to a ſubſequent mortgage, but does not diſcloſe his own incumbrance; this is ſuch a fraud in him for which his incumbrance ſhall be poſtponed. 2 *Vern.* 151. So if A. having a mortgage on a leaſehold eſtate lends the mortgage deed to the mortgagor, with an intent to borrow more money, that is ſuch a fraud in the mortgagee, for which his mortgage ſhall be poſtponed to the ſubſequent incumbrance. 2 *Vern.* 726. See the article MORTGAGE.

Since the caſes of Kerrick *v.* Branſby, (*Bro. P. C.*) and Webb *v.* Cleverden, (2 *Ath.* 424,) it appears to have been ſettled that a will cannot be ſet aſide in equity for fraud and impoſition; becauſe a will of perſonal eſtate may be ſet aſide for fraud in the eccleſiaſtical court, and a will of real eſtate may be ſet aſide at law; for in ſuch caſes, as the *animus teſtandi* is wanting, it cannot be conſidered as a will. 2 *Ath.* 324. Though equity will not ſet aſide a will for fraud, nor reſtrain the probate of it in the proper court, yet if the fraud be proved, it will not aſſiſt the party practiſing it, but will leave him to make what advantage he can of it. 2 *Vern.* 76. But if the validity of the will has been already determined and acted upon, equity will reſtrain proceedings in the prerogative court, to controvert its validity. 1 *Ath.* 628. That the party prejudiced by the fraud may file a bill in equity for a diſcovery of all its circumſtances is unqueſtionable: the invariable practice in ſuch caſes is to ſeek relief, and the iſſue directed is to furniſh the ground upon which the court is to proceed in giving relief. *Fonblanque's Treat. Eq.* c. 2.

If a ſecurity be obtained from a perſon by fraud and practice, upon a pretence of a demand that is fictitious, it will be relieved againſt in equity. 2 *Vern.* 123. There are likewiſe ſeveral inſtances where a parol agreement intended to be reduced into writing, but prevented by fraud, has been decreed in equity, notwithſtanding the ſtatute of frauds and perjuries; as where upon a marriage treaty, inſtructions were given by the huſband to draw a ſettlement, which he privately countermanded, and afterwards drew in the woman by perſuaſions and aſſurances of ſuch ſettlement to marry him: it was decreed, that he ſhould make good the ſettlement. So where a parol agreement was concerning the lending of money on a mortgage, and the covenants propoſed were an abſolute deed from the mortgagor and a deed of defeaſance from the mortgagee, and after the mortgagee had got the deed of conveyance, he refuſed to execute the defeaſance: it was decreed againſt him on the point of fraud. 1 *Eq. Ab.* 90.

By 1 Rich. II. c. 9, no gift or feoffment of lands or goods ſhall be made by fraud for maintenance. And the diſſeiſees ſhall have their recovery againſt the firſt diſſeiſors

as well of their lands as of double damages, without regard to ſuch alienations. See alſo 4 *Hen.* IV. c. 7. 11 *Hen.* IV. c. 3, and the article DISSEISIN, vol. v. p. 887.

By 3 Hen. VII. c. 4, all deeds of gift made in truſt for the uſe of perſons making the ſaid gifts, with intent to defraud creditors, ſhall be null and void. And by 13 Eliz. c. 5, made perpetual by 29 Eliz. c. 5, every feoffment, gift, alienation, and conveyance, of lands or goods, leaſes, rents, &c. and every bond, judgment, and execution, with intent to defraud creditors or others, ſhall be of none effect; all parties and privies to ſuch conveyances, bonds, &c. ſhall forfeit one year's value of the lands and the whole of the goods, or money contained in the bond, half to the crown and half to the party grieved; and ſuffer half a year's impriſonment.—This ſtatute not to extend to any eſtate made on good conſiderations *bonâ fide* to perſons not having notice of ſuch fraud.

By 29 Car. II. c. 3, commonly known by the name of *The Statute of Frauds*, all leaſes, eſtates of freehold, or terms for years, or any uncertain intereſt in lands, made by livery and ſeiſin only, or by parol, and not put in writing and ſigned by the parties or their agents, ſhall have the force of leaſes at will only: except leaſes not exceeding the term of three years at two-thirds of the improved value. And no leaſes, eſtates, or intereſts of lands, either of freehold or terms of years, or any uncertain intereſt, not being copyhold, ſhall be aſſigned, granted, or ſurrendered, unleſs by deed or note in writing ſigned by the parties or their agents: or by the operation of law.

By 3 Will. & Mary, c. 14, made perpetual by 6 Will. III. c. 14, all wills or appointments of lands, or of any rent, &c. out of the ſame, ſhall be deemed, only as againſt creditors by bond or ſpecialty binding the heir, to be fraudulent and void. And every ſuch creditor ſhall have his action of debt upon his bonds and ſpecialties againſt the heir at law of ſuch obligors, and ſuch deviſees jointly. This ſtatute however excepts diſpoſitions for the payment of debts and raiſing portions for children in purſuance of marriage contracts made before marriage. It further provides that where any heir at law ſhall be liable to pay his anceſtor's debt, in reſpect of lands deſcended to ſuch heir, and ſhall alien the ſame before action brought, ſuch heir ſhall be anſwerable to the creditor in an action of debt to the value of the land aliened; but the lands *bonâ fide* aliened before the action brought ſhall not be liable. Every deviſee however, made liable by the ſtatute, ſhall be chargeable, in the ſame manner as the heir, though the lands deviſed ſhall be aliened before action brought.

A diſtinction has been taken between the claims of real creditors, and a debt founded *in maleficio*; for A. having brought an action againſt B. for criminal converſation with A's wife, B. aſſigned his eſtates to truſtees in truſt to pay the ſeveral debts mentioned in a ſchedule, and ſuch other debts as he ſhould name. A. recovered five thouſand pounds damages, and brought his bill to ſet aſide this deed as fraudulent, but the court held that it was not fraudulent either in law or equity; for the plaintiff was no creditor at the time of making the deed: and though it were made with an intent to prefer his real creditors before this debt when it ſhould come to be ſuch, yet it was conſcientious ſo to do. But the plaintiff was held to have an intereſt in the ſurplus after payment of the other debts. *Pre. Ch.* 105.

The following caſes may ſerve to elucidate the foregoing principles:—If a man ſeiſed of land in fee, make a feoffment of it to divers uſes, with remainders over, &c. with power of revocation by writing under hand and ſeal; here, if he for good conſideration doth enter into a recogniſance, the land ſhall be charged with the ſame: ſo if A. reſerves to himſelf power to revoke by the aſſent of B. and then bargains to another. *Bridg.* 22. *Lane*, 22. And where one hath made an eſtate with the power of revocation, and after with intent to deceive a purchaſer he makes a feoffment, &c. to a ſtranger, to extinguiſh the power, and then ſells the land for a valuable conſideration; in this caſe both the conveyances ſhall be fraudulent as to the purchaſer. 2 *Rep.* 83.

A man made a leaſe for twenty-one years, in truſt for his daughter till marriage; and if ſhe married with his conſent then to her during the term; this, till marriage, has been held fraudulent as to a purchaſer: but after marriage it is good, becauſe marriage is an advancement to the daughter, and taking effect made it upon valuable conſideration, which a marriage is always taken to be, and the huſband was drawn in by this conveyance to marry her. 1 *Sid.* 133.

If a father makes a feoffment to another, for the advancement of daughters, or his younger ſons, or for payment of his debts; and afterwards infeoffs his eldeſt ſon or heir, that is not fraud or colluſion within the ſtatute, for he is bound in law to make proviſion for his children: but where there is a grandfather, father, and two ſons, and the grandfather (living the father) conveys his land to either of the ſons, this is out of 32 Hen. VIII. c. 1, becauſe it is not a common thing ſo to do, and the father ought to have the immediate care of his children; though if he is dead, then it belongs to the grandfather. 6 *Rep.* 76. If a man levy a fine to the uſe of himſelf for life, remainder to his ſon in tail, and after ſells the fee-ſimple to another, he as a purchaſer ſhall avoid this conveyance upon 27 Eliz. c. 4, becauſe it was voluntary, and therefore fraudulent; ſo it had been if he had ſettled the remainder on his wife, unleſs there had been a conſideration on a precedent marriage. 3 *Salk.* 174.

An infant promiſed, on his marriage, to ſettle his eſtate when he came of age, upon himſelf and his iſſue; and this was held a ſufficient conſideration, though an infant by law is not compellable to fulfil ſuch promiſe. 2 *Lev.* 147. A perſon, in conſideration that his ſon is to marry the daughter of A. B. covenants to ſtand ſeiſed of lands to the uſe of his ſon for life; and after to other ſons in reverſion or remainder: the uſes thus limited in remainder, ſhall be fraudulent as to any purchaſer of the land, though the firſt be upon good conſideration. And although the conſideration of marriage is good; if there be a power to revoke annexed to the deed, it will be void as to purchaſers. *Lane*, 22.

If a man after marriage, make a voluntary conveyance of land for a jointure, or maintenance for his wife, and afterwards ſell the land for money, to one that hath no notice of it; in this caſe the conveyance, made to the uſe of the wife, ſhall be ſaid to be fraudulent: and yet if a perſon upon a marriage, before the marriage and in conſideration thereof, or after marriage in conſideration of a portion given or money paid, convey his land to the uſe of his wife, &c. it will not be a fraudulent deed. *Cro. Jac.* 158. A feme covert joins with her huſband in the alienation of her jointure, and hath a new deed of ſettlement of other lands dated the ſame day in lieu thereof, without articles or agreement precedent to this ſecond ſettlement; this is not fraudulent againſt a purchaſer, though the lands in the new ſettlement are more in value than thoſe in the firſt; for the old ſettlement being deſtroyed, and a new one made on the ſame day, it ſhall be preſumed that there was an agreement for it. 2 *Lev.* 70, 71.

The huſband who married a wife an inheritrix, promiſed, that if ſhe would join with him in a ſale of her land, and let him have the money to pay his debts, that he would leave her four hundred pounds at his death; about ſix months after the lands were ſold, he gave bond to a ſtranger to leave his wife the four hundred pounds. And it was adjudged, that this was not fraudulent as to creditors, but good againſt them. 2 *Lev.* 148. A perſon makes a voluntary conveyance, and then mortgages the ſame land, and the firſt deed is upon a trial found fraudulent; then he to whom the deed was made, exhibited his bill in equity to redeem the mortgage; and it was held, that though the firſt deed was fraudulent, *quoad* the mortgage

mortgage money, yet it was good to paſs the equity of redemption. *Chan. Rep.* 59.

Where a leaſe is made with a proviſo that if the leſſor pays ten ſhillings the leaſe ſhall be void; becauſe ten ſhillings is not the value of the leaſe and land, but only limited as a power of revocation, it is fraudulent as to a purchaſer. *Cro. Jac.* 455. And if a man makes an aſſignment of his leaſe, and yet keeps poſſeſſion of the lands, the deed of aſſignment will be adjudged fraudulent. In chancery it has been decreed, that if a man conveys his land to friends in truſt, to the uſe of his children, &c. to defraud a purchaſer, the truſt ſhall go in equity to the purchaſer; alſo it ſhall be liable for debts, to ſatisfy the ſame. *Tothil*, 43, 44. A huſband aſſigned a term of his wife's, in truſt for his wife; and it was held fraudulent againſt purchaſers. *Chan. Rep.* 225.

By the common law, an eſtate made by fraud, ſhall be avoided only by him who hath a former right, title, intereſt, debt, or demand. 3 *Rep.* 83. If one indebted do really ſell lands, though to avoid payment of debts; if the vendee be not privy to the intent, the ſale to him is good: for as to the vendee, there is no fraud in the caſe. A man gives his goods to his ſon, they are nevertheleſs liable as to his creditors; but if he gives them to one of his creditors, without any truſt or covin, it ſhall not be fraudulent to make him liable to other creditors. 3 *Salk.* 174.

If tenant for life commit a forfeiture, and he in the reverſion enters, this ſhall be as a fraudulent conveyance with reſpect to creditors. *Vent.* 257. Fraudulent gifts, or grants of goods to defraud the lord of his heriot, ſhall be void; and the value of the goods forfeited, under 13 Eliz. c. 5.

Fraudulent conveyances to multiply votes at election of knights of the ſhire, ſhall be taken againſt the perſons making them as free and abſolute; and all ſecurities for redeeming and reſtoring, &c. to be void. 10 *Anne*, c. 23. A preſentation to a benefice, or adminiſtration of goods, obtained by fraud, are void; and ſo is ſale of goods by fraud, although in open market, &c. Where a fraudulent deed or conveyance is aſſigned upon a valuable conſideration, the fraud is purged thereby. 1 *Ld. Raym.* 88.

Groſs criminal frauds are puniſhable by way of indictment or information; ſuch as playing with falſe dice, cauſing an illiterate perſon to execute a deed to his prejudice, &c. for theſe and ſuch like offences the party may be puniſhed not only with fine and impriſonment, but alſo with ſuch farther infamous puniſhment as the judges in their diſcretion ſhall think proper.

FRAUDA'TION, *ſ.* [from *fraud*, but not uſed.] The act of defrauding. *Bailey.*

FRAUD'FUL, *adj.* Treacherous; artful; trickiſh; deceitful; ſubtle:

He, full of *fraudful* arts,
This well-invented tale for truth imparts. *Dryden.*

FRAUD'FULLY, *adv.* Deceitfully; artfully; ſubtilly; treacherouſly; by ſtratagem.

FRAUD'ULENCE, or FRAUDULENCY, *ſ.* [*fraudulentia*, Lat.] Deceitfulneſs; trickiſhneſs; proneneſs to artifice.—We admire the providence of God in the continuance of Scripture, notwithſtanding the endeavours of infidels to aboliſh, and the *fraudulence* of heretics always to deprave the ſame. *Hooker.*

FRAUD'ULENT, *adj.* [*frauduleux*, Fr. *fraudulentus*, Lat.] Full of artifice; trickiſh; ſubtle; deceitful:

He with ſerpent tongue
His *fraudulent* temptation thus began. *Milton.*

She mix'd the potion, *fraudulent* of ſoul;
The potion mantled in the golden bowl. *Pope.*

Performed by artifice; deceitful; treacherous:

Now thou haſt aveng'd
Supplanted Adam,
And fruſtrated the conqueſt *fraudulent*. *Milton.*

FRAUDU'LENTLY, *adv.* By fraud; by deceit; by artifice; deceitfully.—He that by fact, word, or ſign, either *fraudulently* or violently, does hurt to his neighbour, is bound to make reſtitution. *Taylor.*

FRAUDU'LENTNESS, *ſ.* The ſtate or quality of being fraudulent. *Scott.*

FRAU'ENBACH, a river of Germany, in the circle of Upper Saxony, which runs into the Loſſa two miles ſouth-weſt of Colleda, in Thuringia.

FRAU'ENBERG, a town of Bohemia, in the circle of Pilſen: five miles ſouth-weſt of Hayd.

FRAU'ENBERG, a town of Germany, in the circle of Bavaria, and palatinate of Neuburg: nine miles north-weſt of Ratiſbon.

FRAUENBREITUN'GEN, a town of Germany, in the circle of Franconia, and county of Henneberg, ſituated on the Werra: four miles weſt of Schmalkalden.

FRAU'ENBURG, a town of Pruſſia, in the province of Ermeland, ſituated on the Friſch-Haff, built in the year 1279. Copernicus, the celebrated aſtronomer, died here in 1543: thirty-eight miles ſouth-weſt of Koniglberg.

FRAU'ENBURG, a town of the duchy of Courland: twenty miles ſouth-ſouth-eaſt of Goldingen.

FRAU'ENFELD, a town of Swiſſerland, and capital of Thurgow; taken from the houſe of Auſtria in 1460, by the Swiſs, who left the town in poſſeſſion of its own laws. It is the reſidence of a bailiff, who has no authority in the town. The proteſtants and Roman catholics have each a church; and the magiſtracy is compoſed of the profeſſors of both religions. A great part of the town was burnt down in 1771: twenty miles north-eaſt of Zurich, and fourteen ſouth-weſt of Conſtance.

FRAU'ENMARCK, a town of Hungary: ſix miles north-eaſt of Levens.

FRAU'ENSTEIN, a citadel of Germany, in the duchy of Carniola, five miles north of Crainberg.

FRAU'ENSTEIN, a town of Germany, in the circle of Upper Saxony, and territory of Erzgeburg, on the Mulda: eleven miles ſouth-ſouth-eaſt of Freyburg, and eighteen ſouth-ſouth-weſt of Dreſden.

FRAU'ENTHAL, a town of Germany, in the duchy of Stiria: ten miles ſouth of Voitſburg.

FRAUGHT, *particip. paſſ.* [from *fraight*, now written *freight*.] Laden; charged:

And now approach'd their fleet from India, *fraught*
With all the riches of the riſing ſun,
And precious ſand from ſouthern climates brought. *Dryd.*

Filled; ſtored; thronged.—The Scripture is *fraught* even with laws of nature. *Hooker.*

By this ſad Una, *fraught* with anguiſh ſore,
Arriv'd, where they in earth their blood had ſpilt. *Spenſ.*

FRAUGHT, *ſ.* [from the participle.] A freight; a cargo:

Yield up, oh love, thy crown and parted throne
To tyrannous hate! ſwell, boſom, with thy *fraught*;
For 'tis of aſpic's tongues. *Shakeſpeare.*

To FRAUGHT, *v. a.* [for *freight*, by corruption.] To load; to crowd:

Hence from my ſight:
If after this command thou *fraught* the court
With thy unworthineſs, thou dy'ſt. *Shakeſpeare.*

FRAUGHT'AGE, *ſ.* Lading; cargo. *A low word.*

Our *fraughtage*, Sir,
I have convey'd aboard. *Shakeſpeare.*

FRAU'HEIM, a town of Germany, in the duchy of Stiria: four miles north of Windiſch Weiſtritz.

FRAU'HOFEN, a town of Germany, in Lower Bavaria: three miles ſouth of Landſhut.

FRAUN'BERG, a town of Germany, in the duchy of Stiria: ſeven miles eaſt-ſouth-eaſt of Oberwoltz.

FRAU'REUTH,

FRAU'REUTH, a town of Germany, in the circle of Upper Saxony, and county of Reus: ſix miles north-eaſt of Greitz.

FRAUS LE'GIS. In the Engliſh juriſprudence, if a perſon, having no manner of title to a houſe, procure an affidavit of the ſervice of a declaration in ejectment, and thereupon gets judgment; and, by virtue of a writ of *hab. fac. poſſeſſionem*, turns the owner out of poſſeſſion of the houſe, and ſeizes and converts the goods therein to his own uſe, he may be puniſhed as a felon; becauſe he uſed the proceſs of the law with a felonious purpoſe, *in fraudem legis. Raym.* 276.

FRAU'STADT, or WSCHOWA, a town of Poland, in the palatinate of Poſen, built and inhabited by Germans, on the borders of Sileſia, and containing three proteſtant churches: the chief commerce is in cattle and wool: forty-eight miles ſouth-weſt of Poſen.

FRAU'STADT, or FRAUENTHAL, a town of Poland, on the frontiers of Sileſia, remarkable for a battle fought here in 1706, in which the Saxons were defeated by the Swedes: ſeventy miles north-weſt of Breſlau, and twenty north-eaſt of Glogau.

FRAXINEL'LA, *ſ.* in botany. See DICTAMNUS.

FRAX'INUS, *ſ.* [of Pliny, from φραξις, Gr. a hedge; or from *frago*, Lat. becauſe it grows in *locis fragoſis*.] The ASH-TREE; in botany, a genus of the claſs polygamia, order dioecia, or claſs trioecia, order diandria, natural order ſepiariæ, (jaſmineæ, *Juſſ.*) The generic characters are—I. Hermaphrodite. Calyx: none; or a perianthium one-leafed, four-parted, upright, ſharp, ſmall. Corolla: none; or petals four, linear, long, ſharp, upright. Stamina: filaments two, upright, much ſhorter than the corolla; antheræ upright, oblong, four-furrowed. Piſtillum: germ ovate, compreſſed; ſtyle cylindric, upright; ſtigma thickiſh, bifid. Pericarpium: none, except the cruſt of the ſeed; (capſule two-celled, leafy, and flatted at the top. *G.*) Seed: lanceolate, flatted, and membranaceous, one-celled. II. Female. The ſame, except that it has no ſtamens.—*Eſſential Character.* Hermaphrodite: Calyx none or four-parted; corolla none or four-petalled; ſtamina two; piſtillum one; ſeed (or capſule) one, lanceolate. Female: piſtillum one, lanceolate.

Species. 1. Fraxinus excelſior, or common aſh-tree: leaflets lanceolate, ſerrate, ſeſſile; flowers without petals. The leaves have generally five pairs of leaflets, and one odd one, of a dark green. The flowers are produced in looſe ſpikes from the ſide of the branches, and are ſucceeded by flat ſeeds which ripen in autumn. The lateral buds produce the flowers, and the terminating one the leaves. There are not only hermaphrodite and female flowers, but alſo male ones, ſo that this ſpecies ſhould ſeem referable to the order trioecia. Care ſhould be taken in obſerving the flowers; for in thoſe which are hermaphrodite, the germ which lies between the two ſtamens, does not grow up till ſome days after they appear, ſo that at firſt they appear to be male flowers. What Linnæus calls a ſeed, others call a capſule; the ſeed being covered with a leathery kind of cruſt, which does not ſplit or open.

The aſh in German and Dutch is *eſche* or *aſche*; in Daniſh and Swediſh, *aſke*; in French, *fréne*; in Italian, *fraſſino*; in Spaniſh, *freſno*; in Portugueſe, *freixo*; in Ruſſian, *jas*, *jaſen*, *jaſſen*; which name prevails in the dialects of the Sclavonian. The Engliſh is from the Saxon, æſc. Ray ſays it has its name from the colour of the bark.

We muſt be careful not to confound, as ſome have done, this tree with the mountain aſh, which is totally different from it. This has the epithet *excelſior*, from the loftineſs of the trunk; that of *mountain*, from the loftineſs of the ſituation which it delights in. Its uſual form of flowering is in March and April, ſometimes ſo late as May; of leafing from April 22 to May 15. Both are ſometimes much injured by ſpring froſts.

The timber of the aſh is next in value to the oak, and in ſome places equal to it. It is hard and tough, and of excellent uſe to the coach-maker, wheel-wright, and cart-wright, for ploughs, axle-trees, fellies, harrows, and many other implements of huſbandry; for ladders, oars, blocks for pullies, &c. &c. It makes a very ſweet fuel, with little ſmoke, but is apt to crack and fly in burning. Anciently it was in great requeſt for ſpears. For drying herrings no wood is like it, and the bark is good for the tanning of nets; being not apt to ſplit and ſcale, it is excellent for tenons and mortiſes; alſo for the cooper, turner, and thatcher: nothing is like it for palliſade hedges, hop-yards, poles, and ſpars; handles and ſtocks for tools, ſpade-trees, &c. When curiouſly veined, the cabinet-makers uſe it, and call it green ebony. The tranſverſe ſection of a branch is ſhewn in the Botany Plate II. fig. 1, 2. vol. iii. 238, 9.

By a remark in Harriſon's Deſcription of England, prefixed to Hollinſhed, chap. 19. edit. 1586, it is plain, that the aſh was then eſteemed the propereſt tree for hop-poles: "Poles are accounted to be their greateſt charge (of hops). But ſith men have learned of late to ſow aſhen keies in aſh-yards by themſelves, that inconvenience in ſhort time will be redreſſed." Aſh-pollards are of great ſervice where fuel is ſcarce; a few of them will produce many loads of lop. The loppings make the ſweeteſt of all fires, and will burn well either green or dry; only if the branches are ſuffered to grow too large, the lopping will proportionably injure the tree. If a wood of theſe trees be rightly managed, it will turn greatly to the advantage of its owner; for by the underwood, which will be fit to cut every ſeven or eight years for hoops, or every fourteen years for hop-poles, &c. there will be a continual income more than ſufficient to pay the rent of the ground, and all other charges, and ſtill there will be a ſtock preſerved for timber, which in a few years will be worth forty or fifty ſhillings the tree. The beſt ſeaſon for felling the aſh is from November to February; for if it be done either too early in autumn, or too late in the ſpring, the timber will be ſubject to be infeſted with worms, and other inſects; but for lopping pollards, the ſpring is preferable for all ſoft woods. Mr. Boutcher recommends February. The aſhes of the wood afford very good pot-aſh. The bark is uſed for tanning calf-ſkin: a ſlight infuſion of it appears of a pale yelloviſh colour when viewed againſt the light, but when looked down upon or placed between the eye and an opake object, it is blue. This blueneſs is deſtroyed by the addition of an acid, and alkalies recover it again. It will give a good green to cloths which have been blued.

In the north of Lancaſhire they lop the aſh to feed the cattle in autumn, when the graſs is upon the decline; the cattle peeling off the bark. In queen Elizabeth's time, the inhabitants of Colton and Hawkſhead fells remonſtrated againſt the number of forges in the country, becauſe they conſumed all the loppings and croppings, which were the ſole winter food for their cattle. In foreſts, the keepers browze the deer on ſummer evenings with the ſpray of aſh, that they may not ſtray too far from their walk. The leaves have been gathered to mix with tea; and poor people in ſome places have made a conſiderable advantage by collecting them for this purpoſe. An infuſion of them, from half an ounce to an ounce and an half, is a very good purge; and a decoction of two drams of the bark or ſix drams of the leaves, has been uſed to cure agues. If any cows eat of the leaves or ſhoots, the butter which is made of their milk will be rank; which is always the caſe with the butter which is made about Guildford and Godalmin, and in ſome other parts of Surrey, where there are aſh-trees growing about all their paſtures: and in good dairy countries they never ſuffer an aſh-tree to grow. The truth of this fact is doubted by others; for it is certain that there is no taſte in aſh-leaves to countenance the aſſertion, and that this is the next tree after the elm which the Romans recommended for fodder. Cream is apt to turn bitter at the fall of the leaf, and the reaſon is generally thought to be,

that

that the cattle then pick up the decayed leaves, particularly of the aſh: but the caſe is the ſame in the great low paſtures which are open and without trees, as in upland incloſures, which abound in them. The only way to avoid the ill taſte in butter at that ſeaſon, is to churn oftener, and to ſpend the butter whilſt it is new.

The aſh is, however, a very improper tree for hedge-rows and the borders of arable land: the drip of it is very unfavourable to all other vegetable productions; it exhauſts the ſoil very much; and the roots ſpread widely near the ſurface: ſo that it injures the hedges, and impoveriſhes the crops that are ſown near them. Nor, though it be a handſome tree, ought it by any means to be planted for protection or ornament, becauſe the leaves come out late, and fall early. The fertile trees alſo generally exhauſt themſelves ſo much in bearing keys or fruit, that their foliage is ſcanty, and their appearance unſightly. The trees, however, which bear female flowers only, have a full and verdant foliage, and make a handſome figure, though late in the ſeaſon. It is well calculated for ſtandards and clumps in large parks and plantations, and for groves and woods. If planted by ditch ſides, or in low boggy meadows, the roots act as underdrains, and render the ground about them firm and hard; the timber, however, is in this caſe but of little value. It was natural that our remote anceſtors, when the iſland was over-run with wood, ſhould value trees rather for their fruit than their timber: it is no wonder, then, that by the laws of Howel Dda, the price of an oak or a beech ſhould be 120 pence; while the aſh, becauſe it furniſhed no food for ſwine, was valued only at four-pence. The Edda of Woden, however, holds the aſh in the higheſt veneration; and man is deſcribed as being formed from it. Heſiod, in like manner, deduces his brazen race of men from the aſh; and in his Theogany, has nymphs of the name μελιαι. It is probably owing to the remains of Gothic veneration for this tree, that the country people, in the ſouth-eaſt part of the kingdom, ſplit young aſhes, and paſs their diſtempered children through the chaſm, in hopes of a cure. They have alſo a ſuperſtitious cuſtom of boring a hole in an aſh, and faſtening in a ſhrew-mouſe: a few ſtrokes with a branch of this tree is then accounted a ſovereign remedy againſt cramps and lameneſs in cattle, which are ignorantly ſuppoſed to proceed from this harmleſs animal. In many parts of the highlands of Scotland, at the birth of a child, the nurſe or midwife puts one end of a green ſtick of this tree into the fire, and, while it is burning, receives into a ſpoon the ſap or juice which oozes out at the other end, and adminiſters this as the firſt ſpoonful of liquor to the new-born babe.

It is not common to ſee the aſh of a very great ſize: inſtances, however, of large trees, are not wanting. Dr. Plot mentions one of eight feet diameter, valued at thirty pounds. Mr. Marſham informs us of another in Benel church-yard, near Dunbarton, in Scotland, meaſuring, in 1768, ſixteen feet nine inches in girth, at five feet from the ground. Mr. Evelyn ſays, that divers were lately ſold in Eſſex, in length one hundred and thirty-two feet. Mr. Arthur Young, in his Iriſh tour, mentions ſome of ſeventy and eighty feet in height, which were only of thirty-five years growth. The trunk of one on the bank of the Avonmore, was above fourteen feet round, and carried nearly the ſame dimenſions for eighteen feet. An aſh at Dunganſtown is twelve feet round, and quite clear of branches for thirty feet, where it meaſures ten feet round, and the arms extend in beautiful forms twenty-eight yards. At Tiny-park is another, the circumference of which, in the ſmalleſt part, ſomewhat exceeds nineteen feet, or ſix feet four inches diameter. At Luttrelſtown, the ſeat of the earl of Carhampton, are ſeveral aſh-trees from eleven to thirteen feet ſix inches round; one here was ſold for 13l. At Leixlip-caſtle is a row of eighteen aſh-trees, on a very bleak expoſure, meaſuring from nine to twelve feet round, with fair ſtems of conſiderable height, and fine branching heads. At Donirey, near Clare-caſtle, in the county of Galway, is an old aſh, that at four feet from the ground meaſures forty-two feet in circumference, at ſix feet high thirty-three feet; the trunk has long been quite hollow, a little ſchool having been kept in it; there are few branches remaining, but theſe are freſh, and very vigorous. Near Kennity-church, in the King's-county, is an aſh whoſe trunk is twenty-one feet ten inches round, and it is ſeventeen feet high before the branches break out; theſe are of enormous bulk. When a funeral of the lower claſs paſſes by, they lay the corpſe down for a few minutes, ſay a prayer, and then throw a ſtone to increaſe the heap, which has been accumulating round the root. Finally, in the church-yard of Lochabar, in Scotland, Dr. Walker meaſured the trunk of a dead aſh, which at five feet from the ſurface of the ground, was fifty-eight feet in circumference.

It is pleaſant to obſerve, that amidſt the deplorable deſtruction of valuable timber, the planting of this ſo extenſively uſeful tree has lately not been neglected; as will appear from the following account: Twenty acres, by William Wollaſton, eſq. at Great Finborough, Suffolk; thirty-five acres, by Thomas White, eſq. at Butsfield, Lancheſter, Durham; ſixteen acres, by Mr. David Day, Frindſbury, Kent; 63,000 trees, by Edward Loveden Loveden, eſq. Buſcot, near Farringdon, Berks; 6000, by John Sneyd, eſq. Belmont, Staffordſhire, between 1784 and 1786; 20,000, by Dr. Richard Watſon, biſhop of Llandaff, near Ambleſide, in Weſtmoreland, 1788; 42,000, by George Roſs, eſq. Cromarty; 57,500, by the earl of Fife, in the county of Murray.

The facility with which the aſh is propagated, and adapts itſelf to any ſoil or ſituation, even the worſt; the quickneſs of its growth, and the general demand for the timber in every part of the country, for a variety of rural and economical purpoſes, recommend this tree very much to the planter. As a farther encouragement, Mr. Boutcher has given an inſtance of the great profit of an aſh plantation, in a ſmall experiment, which he thus relates: On half a rood of heavy meadow, chiefly barren red clay and moſs, he planted aſh-trees ſix years old, and eight feet high, in rows four feet aſunder, and two feet diſtance in the row; after four years he cut them down within five or ſix inches of the ground. Having more than he wanted, in ſeven years he ſold half for pollards and hoops for 40s. In ſix years he cut them again, and ſold them for 50s. In ſix years after this he cut them again, and ſold them at the ſame price. There remained now twenty trees, intended to ſtand for timber, but he was obliged to ſell them at twenty-three years growth for 7s. a tree. Thus would an acre of indifferent ground properly ſituated for ſale yield in twenty-three years 115l. 10s. without any other expence than digging the ground for the firſt five or ſix years, and cutting the coppice. Care ſhould be taken to cut them ſlanting, with a ſharp inſtrument, leaving all the wounds ſmooth and clean. Obſerve, that no price is mentioned for the firſt cutting, which he uſed himſelf; and that he found he ſhould have had at leaſt one-third more for the price of the laſt cutting. He alſo found that he had planted too thick, and that he ſhould have had more wood, if the rows had been ſix feet aſunder, and the ſets three feet diſtant in the row.

The varieties of the common aſh-tree are, 1. That with ſimple leaves, which, however, ſometimes has them lobed and even ternate. 2. With pendulous branches, called the *weeping aſh*. 3. With variegated leaves, both yellow and white; or gold-ſtriped and ſilver-ſtriped, as the nurſerymen call them. Micheli has ſome other varieties, from the different ſhape of the fruit, the ſize and form of the leaves, &c. *Nov. Gen.* 223.

2. Fraxinus rotundifolia, or manna aſh-tree: leaflets roundiſh, acutiſh, doubly ſerrate, ſubſeſſile; flowers with petals. The ſhoots of the manna-aſh are much ſhorter, and the joints cloſer together, than the common aſh: the leaflets are ſhorter, with deeper ſerratures on their edges,

and of a lighter green; the flowers come out from the ſide of the branches, are of a purple colour, and appear in the ſpring before the leaves come out. This tree is of humble growth, ſeldom riſing to more than fifteen or ſixteen feet in height in England. The lower parts of the mountains in Calabria abound with the manna-aſh, which grows ſpontaneouſly, and without any culture; except that the woodmen cut down all the ſtrong ſtems that grow above the thickneſs of a man's leg. Towards the end of July, the gatherers of manna make an horizontal gaſh, inclining upwards, in the bole of the tree. As the liquor never oozes out the firſt day, another cut is given on the ſecond, and then the woodman fixes the ſtalk of a maple-leaf in the upper wound, and the end of the leaf in the lower one, ſo as to form a cup to receive the gum as it diſtils from each flaſh. The ſeaſon continues about a month. The men have only three carlines (1s. 1½d.) for every rotolo; which quantity, containing thirty-three ounces and a third, is ſold for twenty-four carlini and three-quarters, or ſomewhat more than ten ſhillings; if it be in tubular pieces, the price riſes one-third. Theſe pieces are called *manna in cannoli*, and theſe regular tubes are produced, by applying to the inciſion thin ſtraw, or ſmall bits of ſhrubs, upon which the manna runs as it oozes out. The trees ſucceed beſt in an eaſtern expoſure, in order to warm the juices in the morning, and to inſpiſſate thoſe which the heat has ſweated out in the evening.

3. Fraxinus ornus, or flowering aſh-tree: leaflets ovate-oblong, ſerrate, petioled; flowers with petals. Mr. Miller makes two ſpecies out of this; his F. paniculata has only or chiefly male flowers. He thus deſcribes them: F. ornus is a low tree, about the ſame height as the preceding; the leaves are much ſmaller and narrower than thoſe of our common aſh, but are ſerrate, and of the ſame dark colour; the flowers have petals. F. paniculata was raiſed, before 1730, by Dr. Uvedale, at Enfield, from ſeeds which were brought from Italy by Dr. William Sherard. The leaves have but three or four pairs of leaflets, which are ſhort, broad, ſmooth, of a lucid green, and irregularly ſerrate; the midrib is jointed, and ſwells where the leaflets come out. The flowers grow in looſe panicles at the ends of the branches, are of a white herbaceous colour, moſtly males, and appear in May. The fructification is ſeen on the Botany Plate X. fig. 23.

4. Fraxinus Americana, or American aſh-tree: leaflets quite entire, petioles cylindric. The fruits or keys are the ſame as in the common aſh, but much ſmaller, and narrow. Mr. Miller has two ſorts of this alſo, which he thus deſcribes: F. Novæ Angliæ was raiſed from ſeeds ſent from New England in the year 1724 by Mr. Moore. The leaves have but three, or at moſt four, pairs of leaflets, which are placed far diſtant from each other, and the odd leaflet runs out into a very long point; they are of a light green, and have no ſerratures on their edges. This tree ſhoots into ſtrong irregular branches, but does not grow to a large ſize in the trunk. F. Caroliniana was raiſed from ſeeds ſent from Carolina in the year 1724 by Mr. Cateſby. The leaves have ſeldom more than three pairs of leaflets, the lower being the leaſt, and the upper the largeſt; theſe are about five inches long and two broad, of a light green colour, and ſlightly ſerrate; the midrib is taper, and has ſhort downy hairs on it: the ſeeds are broader than thoſe of the common aſh, and are of a very light colour. The firſt of theſe is alſo called the *white aſh*, and the ſecond the *red aſh*. A third named the *black aſh*, and other varieties, may be found in the nurſeries.

Propagation and Culture. The common aſh propagates itſelf in plenty by the ſeeds which ſcatter in the autumn, ſo that where the ſeeds happen to fall in places where cattle do not come, there will be plenty of the plants come up in the ſpring; but, if you would have a conſiderable wood of aſh at once, prepare your ground as you would for corn, and ſow good ſtore of keys, ſome crab-kernels, &c. with oats. Take off your crop of corn in its ſeaſon, and the year following the ground will be covered with young aſhes, which will either be fit to ſtand, or be tranſplanted for divers years after. And theſe you will find to be far better than any you can gather out of the woods, eſpecially ſuckers which are worth nothing. The ſooner they are removed, the better; and aſhes of two years thus taken out of the nurſery, ſhall out-ſtrip thoſe often taken out of the hedge. You may keep the keys in ſand for a winter before you ſow them, in a covered airy place. Gather the ſeeds or keys from healthy young thriving trees in October or November; having prepared the beds, lower them about an inch, by raking ſome of the earth into the alleys; ſow the ſeed moderately thick, and then throw the earth back again lightly with a ſpade, or ſift it over them an inch thick, and rake it level. In ſpring, with a very ſmall light iron rake, the teeth about an inch aſunder, rake off the moſs, pull up the weeds, and ſift a little earth over them again. The ſecond ſpring, in the firſt open weather in February, rake off the earth as before very gently, ſift freſh over them half an inch thick, and in March and April the young plants will appear in plenty. In October ſift ſome coal-aſhes half an inch thick over them. Next ſpring prepare ſome beds ſix feet wide, with a path of two feet between each: plant all of a ſize in each bed, at one foot ſquare, firſt ſhortening the tap roots, and alſo the ſide ones. They muſt then be planted out into your nurſery in rows three feet aſunder, and each plant at one foot diſtance, where they are to remain till they are finally planted out.

Mr. Boutcher recommends the ſeeds being ſpread in an airy loft, and turned till dry, which will be in three or four weeks, and then mixed with ſand; to be ſown the beginning of April, on freſh mellow ſoil, on beds three and a half feet broad, with alleys eighteen inches, and covered three quarters of an inch deep. The ſeeds will not appear till the ſucceeding ſpring; during this time the beds muſt be kept clean, and in February they muſt be raked over: if a little rich mould is thrown over them, it will much promote the growth of the ſeedlings. The following February or March remove them, and plant them in drills eighteen or twenty inches aſunder, and eight or nine inches in the drill. In October remove them again, planting them in lines three and a half feet aſunder, and fifteen or ſixteen inches in the line, where they may remain three years. The trees will now be ſeven or eight feet high, of a proper ſize for extenſive plantations. Where large ones are wanted, remove them every fourth year.

Stocks for budding ſhould be planted out in the nurſery, a foot aſunder, and two feet diſtant in the rows. When they are one year old, and about the thickneſs of a bean ſtraw, they will be of a proper ſize for working. A little after Midſummer is the time for the operation, and care muſt be obſerved not to bind the eye too tight. They need not be unlooſed before the end of September. In March the head of the ſtock ſhould be taken off a little above the eye, and by the end of the ſummer following, if the land be good, they will have made ſtrong ſhoots. The variegated ſorts can be increaſed only in this manner.

The other ſorts are commonly propagated in the nurſeries by budding or ingrafting upon the common aſh; but are not ſo valuable as thoſe which are raiſed from ſeeds, becauſe the ſtock grows much faſter than the grafts; ſo that the lower part of the trunk, ſo far as the ſtock riſes, will often be twice the ſize of the upper; and if the trees ſtand much expoſed to the wind, the grafts are frequently broken off from the ſtock, after they are grown to a large ſize. F. paniculata is generally planted for ornament, the flowers making a fine appearance when they are in beauty, for almoſt every branch is terminated by a large looſe panicle; ſo that when the trees are large, and covered with flowers, they are diſtinguiſhable at a great diſtance. All the other ſorts ſerve to make a variety in plantations, but have little beauty to recommend them;

and as their wood ſeems to be greatly inferior to that of the common aſh, there ſhould be few of theſe planted, becauſe they will only fill up the ſpace where better trees might grow.

FRAY, *ſ.* [*effrayer*, to fright, Fr.] A battle; a fight:

He left them to the fates in bloody *fray*,
To toil and ſtruggle through the well-fought day. *Pope.*

A duel; a combat:

Since, if we fall before th' appointed day,
Nature and death continue long their *fray*. *Denham.*

A broil; a quarrel; a riot of violence:

I'll ſpeak between the change of man and boy
With a reed voice, and turn two mincing ſteps
Into a manly ſtride; and ſpeak of *frays*,
Like a fine bragging youth. *Shakeſpeare.*

To FRAY. *v. a.* [*effrayer*, Fr.] To fright; to terrify.—Theſe vultures prey only on carcaſes, on ſuch ſtupid minds as have not life and vigour to *fray* them away. *Government of the Tongue.*

[*Frayer*, Fr.] To rub.—A deer is ſaid to *fray* her head, when ſhe rubs it againſt a tree. *Whalley's Notes on B. Jonſon.*

FRA'YING, *ſ.* [from *fray*, v.] Peel of a deer's horn:

For by his ſlot, his entries, and his port,
His *frayings*, fewmets, he doth promiſe ſport. *B. Jonſon.*

FRAYLES, an iſland near the coaſt of New-Andaluſia, Terra Firma.

FRAYLES (Los), a clump of rocks which riſe above water on the ſouth ſide of the iſland of St. Domingo, in the Weſt Indies, four leagues north-weſt of the iſland of Beate, nearly oppoſite the iſles called the Seven Brothers, in the bay of Monte Chriſt, on the north ſide of the iſland. Theſe rocks are alſo called the Brothers or Monks. The rapidity of the currents renders this part of the coaſt very dangerous.

FRAY'PONT, a town of Germany, in the circle of Weſtphalia, and biſhopric of Liege, on the river Weze: eight miles ſouth-eaſt of Liege.

FRAZE, a town of France, in the department of the Eure and Loire, and chief place of a canton, in the diſtrict of Nogent-le-Rotrou: four leagues eaſt of Nogent-le-Rotrou.

FRA'ZERSBURGH. See FRASERSBURGH.

FREAK, *ſ.* [*frech*, Germ. ſaucy, petulant; φρηξ, Sax. fugitive.] A ſudden and cauſeleſs change of place. A ſudden fancy; a humour; a whim; a capricious prank.—When that *freak* has taken poſſeſſion of a fantaſtical head, the diſtemper is incurable. *L'Eſtrange.*

To vex me more, he took a *freak*
To ſlit my tongue, and make me ſpeak. *Swift.*

To FREAK, *v. a.* To variegate; to checquer.—The white pink and the panſy *freakt* with jet. *Milton.*

There fury nations harbour:
Sables of gloſſy black, and dark embrown'd,
Or beauteous, *freak'd* with many a mingled hue. *Thomſon.*

FRE'AKISH, *adj.* Capricious; humourſome.—It may be a queſtion, whether the wife or the woman was the more *freakiſh* of the two; for ſhe was ſtill the ſame uneaſy ſop. *L'Eſtrange.*

FRE'AKISHLY, *adv.* Capriciouſly; humourſomely.

FRE'AKISHNESS, *ſ.* Capriciouſneſs; humourſomeneſs; whimſicalneſs.

To FREAM, *v. n.* [*fremore*, Lat. *fremir*, Fr.] To growl or grunt as a boar. *Bailey.*

FREAM, *ſ.* in agriculture, land that has been worn out with tillage and laid down to recover itſelf. *Scott.*

FRECHIL'LA, a town of Spain, in the province of Leon: ſeventeen miles north-weſt of Palencia.

FRECKEL'BEN, a town of Germany, in the circle of Upper Saxony, and principality of Anhalt Deſſau: thirty miles weſt-ſouth weſt of Deſſau.

FRECK'ENHORST, a town of Germany, in the circle of Weſtphalia, and biſhopric of Munſter: one mile ſouth-weſt of Warendorff.

FRECK'LE, *ſ.* [*flech*, a ſpot, Germ. whence *flecke*, *freckle*.] A ſpot raiſed in the ſkin by the ſun:

Ruddy his lips, and freſh and fair his hue;
Some ſprinkled *freckles* on his face were ſeen.
Whoſe duſk ſet off the whiteneſs of the ſkin. *Dryden.*

Any ſmall ſpot or diſcoloration.—The farewell froſts and eaſterly winds now ſpot your tulips; therefore cover ſuch with mats, to prevent *freckles*. *Evelyn.*

The cowſlips tall her penſioners be;
In their gold coats ſpots you ſee:
Thoſe be rubies fairy favours;
In thoſe *freckles* live their favours. *Shakeſpeare.*

Freckles are apt to affect people of fine complexions, who have red hair, more than others, in thoſe parts expoſed to the ſun: in winter they generally diſappear. Juice of lemons, mixed with ſugar, and borax, finely powdered and digeſted for eight days, forms an uſeful compoſition for their removal. Homberg alſo recommends bullock's gall mixed with alum, and after the alum has precipitated, expoſed three or four months in the ſun in a cloſe vial, as one of the beſt remedies for clearing the ſkin from theſe appearances.

FRECK'LED, *adj.* Spotted; maculated; diſcoloured with ſmall ſpots:

Sometimes we'll angle at the brook,
The *freckled* trout to take. *Drayton.*

Now thy face charms ev'ry ſhepherd,
Spotted over like a leopard;
And, thy *freckled* neck diſplay'd,
Envy breeds in ev'ry maid. *Swift.*

FRECK'LY, *adj.* Full of freckles.

FRED. The ſame with *peace*; upon which our forefathers called their ſanctuaries *fredſtole*, *i. e.* the ſeats of peace. So *Frederic* is powerful or wealthy in peace; *Winfred*, victorious peace; *Reinfred*, ſincere peace. *Gibſon's Camden.*

FRED'DO, a river of Sicily, in the valley of Demona, which runs into the ſea.

FRE'DEBURG, a town of Germany, in the circle of the Lower Rhine, and duchy of Weſtphalia: fourteen miles ſouth of Brilon, and fifty-two eaſt of Cologne.

FREDEGA'IRE, ſirnamed *the Scholaſtic*, the moſt ancient of the French hiſtorians after Gregory of Tours, is ſuppoſed to have been a Burgundian by birth, and to have lived at leaſt as low down as 658. Nothing is known of his hiſtory or profeſſion. He compoſed a Chronicle in five books, the firſt four of which contain a chronological hiſtory from the creation to the death of Chilperic I. the fifth brings down the hiſtory to the fourth year of Clovis II. A.D. 641. It has been continued by different authors to 768. It is written in a barbarous ſtyle, defective in conſtruction and arrangement, yet it is indiſpenſable as authority for the hiſtory of three of the early kings. This chronicle is printed in the Collections of Ancient Hiſtorians, by Du Cheſne and Bouquet.

FREDEGON'DE, a woman famous in early French hiſtory for her political talents and her great crimes. She was the wife of Chilperic I. king of France. See the article FRANCE, vol. vii. p. 651.

FRE'DELAND, a town of Pruſſia, in Pomerelia: ſixty miles ſouth-ſouth-weſt of Dantzick.

FRE'DENWALDE, a town of Germany, in the circle of Upper Saxony, and Ucker Mark of Bradenburg: eleven miles ſouth of Prenzlow.

FRED'ERIC, a proper name of men.

FREDERIC THE GREAT, king of Pruſſia, born at Berlin, January 24, 1712. He was baptiſed by the name of *Charles Frederic*, but afterwards choſe entirely to drop the former of theſe names. When a child, he was committed to the care of a French governeſs, from whom he derived

derived a readineſs in that language, and a predilection for it, which he retained during life. In the progreſs of education, he enjoyed but few advantages; for it was his father's principal object to render him thoroughly verſed from childhood in military diſcipline, and in this he ſucceeded at the expence of other acquiſitions. As he grew towards manhood, however, a decided taſte for polite literature began to diſplay itſelf. It was formed by the French books which were put into his hands, and to which all his reading was confined; and it foſtered thoſe poliſhed manners which diſtinguiſhed him through life. He became likewiſe a great lover and a practitioner of muſic; as well as a voluminous writer. For a conſiderable time he purſued his ſtudies in retirement, and added mathematics and other ſolid attainments to the more amuſing branches of literature. His father's ſuccour to the imperial army in 1734, gave him the treat of a converſation with prince Eugene on military affairs; and a viſit in 1735 to Staniſlaus, king of Poland, then a fugitive at Konigſberg, gratified him with the friendſhip of an amiable and lettered ſovereign. His connection with men of letters was now extended; and in 1736 he began a correſpondence with the great object of his admiration, Voltaire, who had ſo conſiderable a ſhare in forming his taſte and opinions. Whether he derived more benefit or injury from the leſſons of this celebrated man, will be differently determined by different judges; but it was Voltaire who principally impreſſed him with that ſpirit of religious toleration which ever diſtinguiſhed his reign. Baron Bielfeld, and other perſons of literary diſtinction, formed a part of the prince's little court at Rheinſberg, which is repreſented as being at once the ſeat of the muſes and the graces; and the character ſuſtained by the prince himſelf at this period, was that of one of the moſt polite and faſcinating young men in Germany.

When he aſcended the throne of Pruſſia in 1740, his liberal and enlightened mind diſplayed itſelf in the inſtitution of a new order of knighthood, called that *of merit*, which was to admit perſons of deſert in arms or arts, without diſtinction of birth or country. He wrote to ſeveral of the moſt eminent men of letters in different ſtations, inviting them to ſettle in his dominions; and he recalled the philoſopher Wolf, and made him head of the univerſity of Halle. Voltaire, with Maupertuis and Algarotti, had an interview with him near Cleves; the two latter ſoon after took up their reſidence with him. He now alſo publiſhed "Anti-Machiavel," a work intended to refute the diſhoneſt maxims of the celebrated Italian, relative to the morals of ſovereigns.—He always employed the intervals of improving the internal government of his dominions, and in forming eſtabliſhments calculated to promote their proſperity. The academy of ſciences founded at Berlin by Frederic I. had, through the diſcouragements of the ſucceeding reign, fallen to decay. He inſtituted it anew, gave it a more enlarged plan, compriſing the belles-lettres and ſpeculative philoſophy, as well as pure ſcience, provided it with able members, and wrote an ode in honour of its renovation.

About the year 1746, he appeared as an author in two works, which are among thoſe that have done him moſt honour. They are written in French, the only language which he uſed in the capacity of a man of letters; for he ſeems ever to have diſliked his native tongue, and to have deſpiſed German literature. His *Mémoires pour ſervir à l'Hiſtoire de la Maiſon de Brandebourg*, is a conciſe account of his electoral and royal houſe, written in a good taſte, and with much apparent impartiality. His Poem on the Art of War, in ſix books, is the moſt conſiderable of his productions of that claſs, and may rank among the moſt ſplendid and beſt planned of didactic works in verſe. The compoſition of theſe and other literary pieces, his various ſtudies and amuſements, and the journeys he occaſionally made to different parts of his dominions, occupied all the leiſure he could command from thoſe royal duties which he always performed with the greateſt exactneſs. He had, from his acceſſion, entirely debarred himſelf from the pleaſures of the chace, by which the time of ſo many princes is uſeleſsly conſumed. If he could be ſaid in any reſpect to be waſteful of his hours, it was in the practice of muſic: all his other relaxations partook of ſomething mental. He indulged his taſte for the fine arts in decorating the royal palaces, and erecting many ſplendid edifices at Berlin and Potzdam, which during his reign became, in their exterior, equal to the fineſt places in Europe. Their internal opulence and comfort, however, did not keep an equal pace; indeed, the richeſt architectural beauties were often laviſhed upon buildings which were in reality only military barracks.

In 1750 Frederic was made happy in a viſit from the great object of his admiration, Voltaire. No literary man was probably ever received by a ſovereign with more diſtinction and cordiality; and for a time his preſence ſeemed to inſpire the monarch with all that pleaſure which a perpetual flow of wit, ſeaſoned with good ſenſe and refined taſte, was calculated to produce in a cultivated mind. He likewiſe derived from him much inſtruction in the arts of writing and criticiſm, and much uſeful correction in his own compoſitions. It will rather belong to the life of a wit, than of a king, to give a detail of thoſe literary ſquabbles, and other circumſtances of diſguſt, which terminated in Voltaire's diſmiſſion from the court of Berlin in 1753. Both of them loſt credit by their connection; the king, perhaps, the leaſt; though the arreſtation of Voltaire at Frankfort, upon his return, was a very unhandſome meaſure, and too much favoured of German deſpotiſm. The monarch was afterwards however reconciled, and renewed a literary commerce with him before his death, which happened in 1786, though their mutual eſteem and affection appears never to have been perfectly reſtored. As a man of letters, Frederic would probably have ſhone even independently of his rank, or rather, perhaps, the more, had he merely had the education and employment of a man of letters. Beſides the works already mentioned as written by him, he publiſhed Military Inſtructions; and a variety of pieces in verſe and proſe, on miſcellaneous topics, all compoſing four volumes 8vo. under the title of *Œuvres Primitives*. After his death appeared his *Œuvres Poſthumes*, in fifteen volumes 8vo. of which the principal are the Hiſtory of his own Time; the Hiſtory of the Seven Years' War; Memoirs from the Peace of Hubertſburg to the Partition of Poland in 1775: all theſe contain much valuable information, with as much impartiality as could be expected. Of his correſpondence alone there are ſeven volumes, much of it very intereſting. For his great military exploits, deep policy, and ſucceſsful reign, ſee the article PRUSSIA.

FREDERIC, a county of the American States, in Maryland, bounded north by Pennſylvania, weſt and north-weſt by Waſhington, eaſt by Baltimore, and ſouth-weſt by Potowmack river. On the Monocacy river and its branches are about thirty-ſeven griſt-mills, a furnace, iron forge, and a glaſs manufactory, called the Etna glaſs works, which are in a thriving ſtate. This county is about thirty miles each way, reckoning from the extreme parts. The Cotoctiny mountain extends from the Potowmack in a north direction through this county into Pennſylvania, between the ſouth mountain and Monocacy Creek; the eaſtern parts are generally level. It contains 30,791 inhabitants. Chief town, Frederic-town.

FREDERIC, a county of the American States, in Virginia, bounded north by Berkley, ſouth by Shanandoah, weſt by Hampſhire, and eaſt by Shanandoah river, which ſeparates it from Loudon county. It is thirty miles in length, and twenty in breadth, and contains 19,681 inhabitants. Iron ore is found here in great plenty; and works have been erected which produce 160 tons of bar iron, and 650 tons of pig, annually. Pots and other utenſils, caſt thinner than uſual of this iron, may be ſafely thrown into or out of the waggon, in which they are tranſported. Both this and Berkley county have a good ſoil.

Between

Between the waters of Opeckan creek and the Shanandoah is the richeſt limeſtone land in the eaſtern parts of the ſtate. Near the north mountain in this county is a curious cave, by ſome called *Zaney's Cave*. Its entrance is on the top of an extenſive ridge. You deſcend thirty or forty feet as into a well, from whence the cave then extends, nearly horizontally, four hundred feet into the earth, preſerving a breadth of from twenty to fifty feet, and a height of from five to twelve feet. After entering this cave, the mercury, which, in the open air, was at 50, roſe to 57 of Fahrenheit's thermometer. Here is alſo a natural well, ſomewhat larger than a common well, and riſes as near the ſurface of the earth as in the neighbouring artificial wells; but is of a depth, as yet unknown. It is ſaid there is a current in it tending ſenſibly downwards. Chief town is Wincheſter.

FREDERIC, a townſhip of the American States, in Montgomery county, Pennſylvania.

FREDERIC, a town of the American States, of the north ſide of Saſſafras river in Cecil county, Maryland, and ſeparated by that river from George Town in Kent county. It lies ſix miles ſouth-weſt of Warwick, and fourteen eaſt of Grove point in Cheſapeak bay. Lat. 39. 22. 30. N.

FREDERIC-FORT, a fort of the American States in Waſhington county, Maryland, ſituated on the north-eaſt bank of Potowmack river, near the ſouth line of Pennſylvania.

FREDERIC-HOUSE, a trading ſtation in Upper Canada, on the head water of Abbitibbe river. Lat. 48. 35. N. lon. 82. 6. W.

FREDERI'CA, a town of the American States in Kent county, ſtate of Delaware, ſituated between the two main branches of Mother Kill, a ſtream which falls into Delaware ſeven miles from the town, and three ſouth-eaſt of James's creek, which leads up to Dover: twelve miles eaſt of Dover, and eighty eight from Philadelphia.

FREDERI'CA, a town of the American States in Glynn county, Georgia, ſituated on St. Simon's iſland, in a very pleaſant ſituation, built by general Oglethorpe. The fortreſs was beautiful and regular, but is now in ruins. The town ſtands on an eminence, upon a branch of Alatamaha river, which waſhes the weſt ſide of this agreeable iſland, and forms a bay before the town, affording a ſafe and commodious harbour for veſſels of the largeſt burden, which may lie along the wharf. It was ſettled by ſome Scotch highlanders, about the year 1735, who accepted of an eſtabliſhment both here and at Darien, to defend the colony, if needful, againſt the neighbouring Spaniards. Lat. 31. 15. N. lon. 80. W.

FRED'ERICHRODE, a town of Germany, in the circle of Upper Saxony, and principality of Gotha: ſix miles ſouth Gotha.

FRED'ERICHSHULE, a town of Germany, in the circle of Upper Saxony, and duchy of Croſſen: five miles ſouth-eaſt of Zulichau.

FRED'ERICHSTHAL, a town of Germany, in the circle of Upper Saxony, and margraviate of Meiſſen: ſix miles weſt of Senftenberg.

FRED'ERICHSWALDE, a town of Germany, in the circle of Upper Saxony, and duchy of Pomerania, on the Ihna: three miles north-weſt of Stargard.

FREDERI'CIA, a ſtrong ſeaport town of Denmark, in North Jutland, and dioceſe of Ripen; it is ſituated on the Little Belt, with a cuſtom-houſe, where all veſſels pay a toll. The circumference is extenſive, but not filled with houſes or people. It was firſt begun in 1651, by Frederic III. but the fortifications were ſcarcely completed, and the town built and properly inhabited, when the Swedes, in 1657, took it by ſtorm, and burnt a great part of it. At the concluſion of the war, both the fortifications and the town were repaired, and, in order to increaſe the number of its inhabitants, Chriſtian V. in 1682, granted a charter, which rendered Fredericia an aſylum for all bankrupts, whether natives or foreigners, and allowed the Calviniſts, Papiſts, and Jews, the free exerciſe of their religion. This town was formerly exempt from the exciſe, which it now pays. The fortifications are of ſo large a compaſs that they require a numerous garriſon to defend them. Fredericia has alſo ſeveral commercial privileges, but as it wants a good harbour, it cannot improve them to the beſt advantage. Here are two Lutheran churches (in one of which the ſervice is alternately performed in the Daniſh and German languages), a Calviniſt church, a popiſh church, a ſynagogue, a grammar-ſchool, and good arſenal. A conſiderable quantity of tobacco is planted both within and without the walls. Lat. 55. 37. N. lon. 9. 44. E. Greenwich.

FREDERICK'ENBURG, a town of Germany, in the circle of Upper Saxony, and principality of Anhalt Zerbſt: one mile ſouth-weſt of Zerbſt.

FRED'ERICSBURG, a town of Germany, in the circle of Upper Saxony, and duchy of Pomerania, formerly called *Quarckenburg*: thirty miles ſouth-ſouth-weſt of Colberg, and twenty-five north-north-eaſt of Stargard.

FRED'ERICSBURG, a poſt town of the American States, in Spotſylvania county, Virginia; ſituated on the ſouth-weſt bank of Rappahannock river, 110 miles from its mouth in Cheſapeak bay. It is an incorporated town, and regularly laid out into ſeveral ſtreets; the chief of which runs parallel with the river, and contains two tobacco warehouſes, and ſeveral ſtores of well aſſorted goods. Its public buildings are an epiſcopal church, an academy, court-houſe, and gaol. It is a place of conſiderable trade, and contains about 2000 inhabitants. A forge in this neighbourhood made ſome time ago, about 300 tons of bar iron in a year, from pigs imported from Maryland. It is fifty miles ſouth-ſouth-weſt of Alexandria, ſixty-eight north by eaſt of Richmond, 102 ſouth-weſt of Baltimore, and 205 ſouth-weſt of Philadelphia. Lat. 38. 22. N. lon. 77. 36. W.

FRED'ERICSHALL, a ſeaport town of Norway, on the frontiers of Sweden, ſituated at the mouth of the river Tiſte, in a bay called the *Swineſund*; the harbour would be ſafe and commodious, but from the quantity of ſaw-duſt brought down the river from the ſaw-mills up the country, which it is neceſſary to remove at leaſt yearly. The town contains about 3000 inhabitants. Near it is the fortreſs of Oever-Bierget, or Fredericſtein, in the ſiege of which the heroic Charles XII. loſt his life. The principal commerce is in timber: fifty miles north of Uddevalla, and fifty-two ſouth of Chriſtiania.

FRED'ERICSHOLM, a fortreſs of Norway; three miles ſouth of Chriſtianſtand.

FRED'ERICSSUND, a ſeaport town of Denmark, in the iſland of Zealand; the chief trade is in corn: nineteen miles north-weſt of Copenhagen. Lat. 55. 50. N. lon. 12. 13. E. Greenwich.

FRED'ERICSTADT, a fortreſs and ſeaport town of Norway, ſituated on the river Glomme, containing a well-ſupplied arſenal, built in 1567, and ſince ſtrengthened and fortified, till it is now the moſt regular fortreſs in the ſouthern part of Norway. The number of inhabitants is leſs than 1000, who carry on ſome trade in planks, maſts, and timber: forty-three miles ſouth Chriſtiania. Lat. 59. 2. N. lon. 11. 1. E. Greenwich.

FRED'ERICSTADT, a town of Denmark, in the duchy of Sleſwick, ſituated on the north coaſt of the Eider, founded by ſome Dutch Arminian emigrants, immediately after the ſynod of Dort. The inhabitants are compoſed of Arminians, Lutherans, Calviniſts, Anabaptiſts, Quakers, and Jews. They are principally employed in manufactures of ſilk and woollen, navigation and commerce: eighteen miles weſt-ſouth-weſt of Sleſwick. Lat. 54. 26. N. lon. 9. 10. E. Greenwich.

FRED'ERICSTADT. See BERLIN.

FRED'ERICSTOWN, a townſhip of the American States, in the Dutcheſs county, New York, which contains, by the cenſus, 5932 inhabitants, of whom 188 are qualified to be electors.

FRED'ERICSVORN, a town of Norway, in the province of Aggerhuus: three miles ſouth of Laurvig.

FRED'ERICSWERK, a ſeaport of Denmark, ſituated in a bay on the north coaſt of the iſland of Zealand; where

is a cannon-foundery, and manufactures of military articles, eſtabliſhed in 1756.

FRED'ERICTON, a conſiderable townſhip of the American States, in the province of New-Brunſwick, ninety miles up St. John's river, which is ſo far navigable for ſloops.

FRED'ERICTOWN, a poſt town of the American States, in Maryland, and capital of Frederic county, ſituated on both ſides of Carroll's creek, a ſtream that empties into Monocacy river, over which are two bridges. The ſtreets are regularly laid out, interſecting each other at right angles. The dwelling-houſes, chiefly of ſtone and brick, are about 700 in number, many of which are handſome and commodious. The arſenal of the ſtate of Maryland is placed here, the ſituation being ſecure and central. The public edifices are, one church for Preſbyterians, two for German Lutherans and Calviniſts, and one for Baptiſts, an elegant court-houſe, a goal, and a market-houſe. It is a very flouriſhing town, and has conſiderable trade with the back ſettlements. The Etna glaſs-works are ſituated four miles above the town, on Tuſkarora creek. Frederictown is four miles eaſt of Cotoctin mountain, forty-ſeven weſt by north of Baltimore, twenty-four eaſt of Sharpſburg, and 148 ſouth-weſt by weſt of Philadelphia. Lat. 39. 24. N.

FRE'DUM, *ſ.* in the ancient law, a compoſition made by a criminal, to be freed from proſecution, of which the third part was paid into the exchequer. Formerly compoſitions were paid for crimes in general, particularly for murder. The magiſtrate was to determine the compoſition, and protect the offender againſt the violence of reſentment. See *Monteſquieu's Spirit of Laws*, l. 30. c. 20.

FREE, *adj.* [ꝼɼeah, Saxon; *vry*, Dutch.] At liberty; not a vaſſal; not enſlaved; not a priſoner; not dependent.—A *free* nation is that which has never been conquered, or thereby entered into any condition of ſubjection. *Temple.*

Free to herſelf my potent mind remains,
Nor fears the victor's rage, nor feels his chains. *Prior.*

Uncompelled; unreſtrained:

Do faithful homage, and receive *free* honours,
All which we pine for now. *Shakeſpeare.*

Not bound by fate; not neceſſitated:

Freely they ſtood who ſtood, and fell who fell;
Not *free*, what proof could they have given ſincere
Of true allegiance, conſtant faith, or love? *Milton.*

Permitted; allowed:

To gloomy cares my thoughts alone are *free*,
Ill the gay ſports with troubled thoughts agree. *Pope.*

Licentious; unreſtrained:

I know there are to whoſe preſumptuous thoughts
Thoſe *freer* beauties, ev'n in them, ſeem faults. *Pope.*

Open; ingenuous; frank:

Caſtalio, I have doubts within my heart;
Will you be *free* and candid to your friend? *Otway.*

Acquainted; converſing without reſerve:

'Tis not to make me jealous,
To ſay my wife is fair, feeds well, loves company,
Is *free* of ſpeech, ſings, plays, and dances, well:
Where virtue is, theſe make more virtuous. *Shakeſpeare.*

Liberal; not parſimonious: with *of*.—Alexandrian verſes, of twelve ſyllables, ſhould never be allowed but when ſome remarkable beauty or propriety in them atones for the liberty: Mr. Dryden has been too *free* of theſe in his latter works. *Pope.*

Glo'ſter too, a foe to citizens,
O'ercharging your *free* purſes with large fines,
That ſeeks to overthrow religion. *Shakeſpeare.*

Frank: not gained by importunity; not purchaſed.—We wanted words to expreſs our thanks: his noble *free* offers left us nothing to aſk. *Bacon.*—Clear from diſtreſs:

Who alone ſuffers, ſuffers moſt i'th' mind,
Leaving *free* things and happy ſhows behind. *Shakeſp.*

Guiltleſs; innocent.—My hands are guilty, but my heart is *free*. *Dryden.*

Make mad the guilty, and appall the *free*,
Confound the ign'rant. *Shakeſpeare.*

Exempt; with *of* anciently; more properly *from*:

Such allow'd infirmities, that honeſty
Is never *free of*. *Shakeſpeare.*

Who fears not to do ill, yet fears the name;
And *free from* conſcience, is a ſlave to fame. *Denham.*

Inveſted with franchiſes; poſſeſſing any thing without vaſſalage; admitted to the privileges of any body: with *of*:

What do'ſt thou make a ſhipboard? To what end
Art thou *of* Bethlem's noble college *free*?
Stark-ſtaring mad, that thou ſhould'ſt tempt the ſea?
Dryden.

Without expence; by charity, as a *free-ſchool*. [Applied to a horſe.] Willing to move.—Raunging the foreſt wide on courſer *free*. *Spenſer.*

To FREE, *v. a.* [from the adjective.] To ſet at liberty; to reſcue from ſlavery or captivity; to manumit; to looſe.—He recovered the temple, *free'd* the city, and upheld the laws which were going down. 2 *Mac.* ii. 22.

Should thy coward tongue
Spread its cold poiſon through the martial throng,
My jav'lin ſhall revenge ſo baſe a part,
And *free* the ſoul that quivers in thy heart. *Pope.*

To rid from; to clear from any thing ill; with *of* or *from*.—It is no marvail, that he could think of no better way to be *free'd of* theſe inconveniencies the paſſions of thoſe meetings gave him, than to diſſolve them. *Clarendon.*

Hercules
Free'd Erymanthus *from* the foaming boar. *Dryden.*

To clear from impediments or obſtructions:

Fierce was the fight; but haſt'ning to his prey,
By force the furious lover *free'd* his way. *Dryden.*

To baniſh; to ſend away; to rid. *Not in uſe:*

Never any ſabbath of releaſe
Could *free* his travels and afflictions deep. *Daniel.*

To exempt.—For he that is dead is *free'd* from ſin. *Romans* vi. 7.

FREE-BENCH, *ſ.* in law, that eſtate in copyhold lands which the wife hath on the death of her huſband for her dower, according to the cuſtom of the manor: but it is ſaid that ſuch wife ought to be eſpouſed a virgin; and is to hold the land only ſo long as ſhe lives ſole and continent. *Kitch.* 102. Of this free-bench ſeveral manors have ſeveral cuſtoms; and Fitzherbert calls it a cuſtom, whereby in certain cities the wife ſhall have the whole lands of the huſband for her dower, &c. *F. N. B.* 150. In the manors of Eaſt and Weſt Embourne in the county of Berks, and the manor of Torre in Devonſhire, and other parts of the weſt of England, there is a cuſtom, that when a copyhold tenant dies, his widow ſhall have her free-bench in all his cuſtomary lands, *dum ſola & caſta fuerit*; but if ſhe commits incontinency, ſhe forfeits her eſtate.

FREE-CHAPEL, *ſ.* a chapel that is exempt from the juriſdiction of the dioceſan. Thoſe chapels are properly free-chapels which are of the king's foundation, and by him exempted from the ordinary's viſitation; alſo chapels founded within a pariſh for the ſervice of God, by the devotion and liberality of pious men, over and above the mother-church, and endowed with maintenance by the founders, which were free for the inhabitants of the pariſh to come to, were therefore called free-chapels. *Reg. Orig.* 40. The free-chapel of St. Martin-le-grand is mentioned

tioned in 3 Edw. IV. c. 4, as are others likewiſe by ancient ſtatutes: but theſe chapels were given to the king, with the chantries, &c. by 1 Edw. VI. c. 14.

FREE-MA'SON, *ſ.* See MASON.

FREE-TOWN, a town erected by the Engliſh ſettlers on the peninſula of Sierra Leone in Africa.

FREE-TOWN, a thriving townſhip of the American States, in Briſtol county, Maſſachuſetts, incorporated in 1683, contains 2202 inhabitants, and lies fifty miles ſoutherly of Boſton.

FREE-WAR'REN, *ſ.* See WARREN.

FREEBO'RD, *ſ.* in law, ground claimed in ſome places more or leſs beyond or without the fence: it is ſaid to contain two foot and a half. *Mon. Ang. Tom.* 2. p. 141.

FREEBOOT'ER, *ſ.* A robber; a plunderer; a pillager. See the article BUCANEER, vol. iii. p. 472–476. —Perkin was not followed by any Engliſh of name: his forces conſiſted moſtly of baſe people and *freebooters*, fitter to ſpoil a coaſt than to recover a kingdom. *Bacon.*

FREE'BOOTER's POINT, a cape at the weſtern extremity of the iſland of Anagada, in the Weſt Indies.

FREEBOOT'ING, *ſ.* Robbery; plunder; the act of pillaging.—Under it he may cleanly convey any fit pillage that cometh handſomely in his way; and when he goeth abroad in the night on *freebooting*, it is his beſt and ſureſt friend. *Spenſer.*

FREE'BORN, *adj.* Not a ſlave; inheriting liberty.—I ſhall ſpeak my thoughts like a *freeborn* ſubject, ſuch things perhaps as no Dutch commentator could, and I am ſure no Frenchman durſt. *Dryden.*

O baſeneſs, to ſupport a tyrant's throne,
And cruſh your *freeborn* brethren of the world. *Dryden.*

FREE'COST, *ſ.* Without expence; free from charges.

FREED'MAN, *ſ.* A ſlave manumitted:

The *freedman* joſtles, and will be preferr'd;
Firſt come, firſt ſerv'd, he cries. *Dryden.*

FREE'DOM, *ſ.* Liberty; exemption from ſervitude; independence:

O *freedom!* firſt delight of human kind!
Not that which bondmen from their maſters find,
The privilege of doles; nor yet t' inſcribe
Their names in this or t'other Roman tribe:
That falſe enfranchiſement with eaſe is found;
Slaves are made citizens by turning round. *Dryden.*

Privileges; franchiſes; immunities:

By our holy ſabbath have I ſworn
To have the due and forfeit of my bond:
If you deny it, let the danger light
Upon your charter, and your city's *freedom*. *Shakeſpeare.*

Power of enjoying franchiſes.—This prince firſt gave *freedom* to ſervants, ſo as to become citizens of equal privileges with the reſt, which very much increaſed the power of the people. *Swift.*—Exemption from fate, neceſſity, or pre-determination.—In every ſin, by how much the more free will is in its choice, by ſo much is the act the more ſinful; and where there is nothing to importune, urge, or provoke the will to any act, there is ſo much an higher and perfecter degree of *freedom* about that act. *South.*

I elſe muſt change
Their nature, and revoke the high decree
Unchangeable, eternal, which ordain'd
Their *freedom*; they themſelves ordain'd their fall. *Milton.*

Unreſtraint.—I will that all the feaſts and ſabbaths ſhall be all days of immunity and *freedom* for the Jews in my realm. 1 *Mac.* x. 34.—The ſtate of being without any particular evil or inconvenience.—The *freedom* of their ſtate lays them under a greater neceſſity of always chuſing and doing the beſt things. *Law.*—Eaſe or facility in doing or ſhowing any thing. [In colloquial language.] Any mark of aſſumed familiarity. In this ſenſe the word has a plural.

"FREEDOM's the jewel all men wiſh to hold:
For none love fetters, tho' they're made of gold."

The Latins ſay, *Dico tibi verum, libertas optima rerum. Nunquam ſervili ſub nidu vivito fili.*

We, who live in this much-favoured land of liberty, hardly know or are ſenſible of our happy ſtate. Yet thoſe who have travelled, and ſeen in what ſlavery and ſervile ſubjection the lower orders and middling rank of people live, under the deſpotic government of foreign princes, and the pride and inſolence of their miniſters and officers, daily admoniſh us of the ſuperior advantages of the Britiſh conſtitution, and of the bleſſings derived from it.

FRE'ED-STOOL, *ſ.* a ſeat in our monaſteries, made of ſtone, whereon, when ſeated, it proved a ſanctuary for thoſe who had fled there for protection. The firſt granted was by Athelſtan to John de Beverley, in which minſter it now remains; another is in the priory church of Hexham.

FREEFOOT'ED, *adj.* Not reſtrained in the march:

We will fetters put upon this fear,
Which now goes too *freefooted*. *Shakeſpeare.*

FREEHEART'ED, *adj.* Liberal; unreſtrained:

Love muſt *freehearted* be, and voluntary;
And not inchanted, or by fate conſtrain'd. *Davies.*

FREE'HOLD, *ſ.* in law, conſiſts of land or tenement which a man holds in fee-ſimple, fee-tail, or for term of life. *Bract. lib.* 2. c. 9. It is deſcribed to be of two ſorts: *freehold in deed*, and *freehold in law*; the firſt being the real poſſeſſion of lands, &c. in fee, or for life; the other, the right a perſon hath to ſuch lands or tenements, before his entry or ſeiſure. Freehold is alſo extended to offices, which a man holds either in fee, or during life: and, in the regiſter of writs it is ſaid, that he who holds land upon an execution of a ſtatute-merchant until he is ſatisfied the debt, holds as freehold to him and his aſſigns, and the ſame of a tenant by *elegit*; but ſuch tenants are not in fact freeholders, only as freeholders for their time, till they have received the profits of the land to the value of their debt. *Reg. Judic.* 68. A leaſe for ninety-nine years, &c. determinable upon a life or lives, is not a leaſe for life to make a freehold, but a leaſe for years, or chattel determinable upon life or lives; and an eſtate for one thouſand years is not a freehold, or of ſo high a nature as an eſtate for life. *Co. Lit.* 6. He that hath an eſtate for the term of his own life, or the life of another, hath a freehold, and no other of a leſs eſtate; though they of a greater eſtate have a freehold, as tenant in fee, &c. *Lit.* 57.

When a man pleads *liberum tenementum* generally, it ſhall be intended that he hath an eſtate in fee; and not a bare eſtate for life. *Cro. Eliz.* 87. An eſtate of freehold cannot by the common law commence *in futuro*; but it muſt take place preſently in poſſeſſion, reverſion, or remainder. 5 *Rep.* 94.

A man made a deed of gift to his ſon and his heirs, of lands after his death, and no livery was made; now if there had been livery, it had been void, becauſe a freehold cannot commence *in futuro*; and it has been held, that it ſhall not enure as a covenant to ſtand ſeiſed, by reaſon of the word *give*; by which was intended a tranſmutation of the eſtate, and not to paſs it by way of uſe. *March. Rep.* 50. Whatſoever is part of, or fixed to, the freehold goes to the heir; and glaſs windows, wainſcot, &c. affixed to the houſe are parcel of the houſe, and cannot be removed by tenants. 4 *Rep.* 63. But it hath been adjudged, that if things neceſſary for trade, &c. are affixed to the freehold by the leſſee, he may take them down and remove them, ſo as he do it before the end of the term, and he do not thereby injure the freehold. 1 *Salk.* 368.

Any thing fixed to the freehold may not be taken in diſtreſs for rent or in execution, &c. It is not felony at common law, only treſpaſs, to ſteal or take any thing annexed to the freehold; ſuch as lead on a church, or houſe, corn or graſs growing on the ground, apples on a tree, &c.

Though

Though if they are ſevered from the freehold, whether by the owner or a thief, if he ſevered them at one time, and took them away at another, it was larceny to take them. 1 *Hawk. P.C.* But now, by 4 Geo. II. c. 32, to ſteal lead on houſes, &c. is made felony.

The ſtatute of Magna Charta, c. 29, ordains, "that no perſon ſhall be diſſeiſed of his freehold but by judgment of his peers, or according to the law of the land;" which does not only relate to common diſſeiſins, but the king may not otherwiſe ſeize into his hands the freehold of the ſubject. *Wood's Inſt.* 614. None ſhall diſtrain any freeholders to anſwer for their freeholds, or any thing touching the ſame, without the king's writ. 52 *Hen.* III. c. 22. Nor ſhall any perſon be compelled to anſwer for his freehold, before any lord of a manor. 15 *Rich.* II. c. 12. —For the freehold qualifications neceſſary in certain caſes, ſee the article PARLIAMENT; and for the definition and deſcription of freehold eſtates, ſee the article ESTATES, vol. vii. p. 25.

FREE'HOLD, a town of the American States, in Monmouth county, New Jerſey, fifteen miles weſt of Shrewſbury, and twenty ſouth-eaſt by ſouth of New Brunſwick. In this town was fought the obſtinate battle called the Monmouth battle, on the 28th of June, 1778, between the American army under general Waſhington, and the Engliſh under the command of general ſir Henry Clinton, who was retreating from Philadelphia. This town contains 3785 inhabitants.

FREE'HOLD, a townſhip of the American States, in Albany county, New York, containing 1822 inhabitants, of whom 562 are qualified to be electors.

FREE'HOLDER, *ſ.* One who has a freehold.—As extortion did baniſh the old Engliſh *freeholder*, who could not live but under the law; ſo the law did baniſh the Iriſh lord, who could not live but by extortion. *Davies.*

FREE'LY, *adv.* At liberty; without vaſſalage; without ſlavery; without dependence. Without reſtraint; heartily; with full guſt.—If my ſon were my huſband, I would *freelier* rejoice in that abſence wherein he won honour, than in the embracements of his bed, where he would ſhew moſt love. *Shakeſpeare.*—Plentifully; laviſhly:

I pledge your grace; and if you knew what pains
I have beſtow'd to breed this preſent peace,
You would drink *freely*. *Shakeſpeare.*

Without ſcruple; without reſerve:

Let ſuch teach others who themſelves excel,
And cenſure *freely* who have written well. *Pope.*

Without impediment.—To follow rather the Goths in rhyming than the Greeks in true verſifying, were even to eat acorns with ſwine, when we may *freely* eat wheat-bread among men. *Aſcham.*

The path to peace is virtue: what I ſhow,
Thyſelf may *freely* on thyſelf beſtow:
Fortune was never worſhipp'd by the wiſe;
But ſet aloft by fools, uſurps the ſkies. *Dryden.*

Without neceſſity; without predetermination.—He leaves us to chuſe with the liberty of reaſonable beings: they who comply with his grace, comply with it *freely*; and they who reject it, do alſo *freely* reject it. *Rogers.*—Frankly; liberally; without coſt.—By nature all things have an equally uncommon uſe: nature *freely* and indifferently opens the boſoms of the univerſe to all mankind. *South.*—Spontaneouſly; of its own accord.

FREE'MAN, *ſ.* One not a ſlave; not a vaſſal.—If to break looſe from the conduct of reaſon, and to want that reſtraint of examination and judgment which keeps us from chuſing or doing the worſt, be liberty, true liberty, madmen and fools are the only *freemen*. *Locke.*—One partaking of rights, privileges, or immunities:

He made us *freemen* of the continent,
What nature did like captives treat before. *Dryden.*

What this union was is expreſſed in the preceding verſe, by their both having been made *freemen* on the ſame day. *Addiſon.*

In the diſtinction of a freeman from a vaſſal under the feudal policy, *liber homo* was commonly oppoſed to *vaſſus* or *vaſſalus*; the former, denoting an allodial proprietor; the latter, one who held of a ſuperior. See the article TENURE.

FREEMIND'ED, *adj.* Unperplexed; without load of care.—To be *freeminded*, and cheerfully diſpoſed, at hours of meat, ſleep, and exerciſe, is one of the beſt precepts of long laſting. *Bacon.*

FREEMO'NT, a cape on the north coaſt of the iſland of Jerſey: five miles north of St. Helier.

FREE'NESS, *ſ.* The ſtate or quality of being free. Openneſs; unreſervedneſs; ingenuouſneſs; candour.—The reader may pardon it, if he pleaſe, for the *freeneſs* of the confeſſion. *Dryden.*—Generoſity; liberality.—I hope it will never be ſaid that the laity, who by the clergy are taught to be charitable, ſhall in their corporations exceed the clergy itſelf, and their ſons, in *freeneſs* of giving. *Sprat.*

FREE'PORT, a townſhip of the American States, in Cumberland county, diſtrict of Maine, ſituated at the head of Caſco-bay; adjoining to Durham on the north-eaſt and to North Yarmouth on the ſouth-weſt: about ten miles north-eaſt of Portland, and 140 north by eaſt of Boſton. It was incorporated in 1789, and contains 1330 inhabitants.

FREE'SCHOOL, *ſ.* A ſchool in which learning is given without pay.—To give a civil education to the youth of this land in the time to come, proviſion was made by another law, that there ſhould be one *freeſchool* at leaſt erected in every dioceſe. *Davies.*

FREE'SPOKEN, *adj.* Accuſtomed to ſpeak without reſerve.

FREE'STONE, *ſ.* Stone commonly uſed in building, as ſand-ſtone, Portland-ſtone, &c.—Freeſtone is ſo named from its being of ſuch a conſtitution as to be wrought and cut freely in any direction. *Woodward.*—The ſtreets are generally paved with brick or *freeſtone*, and always kept very neat. *Addiſon on Italy.*

FREE'THINKER, *ſ.* A libertine; a contemner of religion.—Of what uſe is freedom of thought, if it will not produce freedom of action, which is the ſole end, how remote ſoever in appearance, of all objections againſt Chriſtianity? And therefore the *freethinkers* conſider it as an edifice, wherein all the parts have ſuch a mutual dependance on each other, that if you pull out one ſingle nail, the whole fabric muſt fall to the ground. *Swift.*

FREEWILL', *ſ.* The power of directing our own actions without reſtraint by neceſſity or fate.—We have a power to ſuſpend the proſecution of this or that deſire: this ſeems to me the ſource of all liberty; in this ſeems to conſiſt that which is improperly called *freewill*. *Locke.* Voluntarineſs; ſpontaneity.—I make a decree, that all they of the people of Iſrael in my realm, which are minded of their own *freewill* to go up to Jeruſalem, go with thee. *Ezra*, vii. 13.

FREE'WILL-ISLAND, an iſland in the Eaſtern Indian Ocean. Lat. 0. 50. N. lon. 137. 51. E. Greenwich.

FREE'WOMAN, *ſ.* A woman not enſlaved.—All her ornaments are taken away; of a *freewoman* ſhe is become a bondſlave. 1 *Mac.* ii. 11.

To FREEZE, *v. n.* preter. *froze*; [*vrieſen*, Dut.] To be congealed with cold. See the articles FREEZING, FROST, and ICE.—The aqueous humour of the eye will not *freeze*, which is very admirable, ſeeing it hath the perſpicuity and fluidity of common water. *Ray.*—To be of that degree of cold by which water is congealed.—Thou art all ice, thy kindneſs *freezes*. *Shakeſpeare.*

Heav'n *froze* above ſevere, the clouds congeal,
And thro' the cryſtal vault appear'd the ſtanding hail.
Dryden.

To FREEZE, *v. a.* pret. *froze*; part. *frozen* or *froze*.

To

To congeal with cold.—O'er many a *frozen*, many a fiery alp. *Milton.*—To kill by cold.—My maſter and miſtreſs are almoſt *frozen* to death. *Shakeſpeare.*—To chill by the loſs of power or motion:

Death came on amain
And exercis'd below his iron reign;
Then upward to the ſeat of life he goes;
Senſe fled before him, what he touch'd he *froze*.' *Dryden.*

FREEZE, *ſ.* See FRIEZE.

FREEZ'ING, or CONGELATION, *ſ.* the fixing of a fluid body into a firm or ſolid maſs by the action of cold; as water when it freezes into ice. But it differs from cryſtallization, which is rather a ſeparation of the particles of a ſolid from a fluid in which it had been diſſolved more by the moiſture than the action of heat. The proceſs of congelation is always attended with the emiſſion of heat, as is found by experiments on the freezing of water, wax, ſpermaceti, &c. for in ſuch caſes it is always found that a thermometer dipt into the fluid maſs, keeps continually deſcending as this cools, till it arrive at a certain point, being the point of freezing, which is peculiar to each fluid, where it is rather ſtationary, and then riſes for a little, while the congelation goes on. But by what means it is that fluid bodies ſhould thus be rendered ſolid by cold, or fluid by heat, or what is introduced into the bodies by either of thoſe principles, are matters the learned have never yet been able to diſcover, or to ſatisfy themſelves upon. The following phenomena however are uſually obſerved.

Water, and ſome other fluids, ſuddenly dilate and expand in the act of freezing, ſo as to occupy a greater ſpace in the form of ice than before, in conſequence of which it is that ice is ſpecifically lighter than the ſame fluid, and floats in it. And the degree of expanſion of water, in the ſtate of ice, is by ſome authors computed at about $\frac{1}{10}$ of its volume. Oil however is an exception to this property, and quickſilver too, which ſhrinks and contracts ſtill more after freezing. Mr. Boyle relates ſeveral experiments of veſſels made of metal, very thick and ſtrong; in which, when filled with water, cloſe ſtopped, and expoſed to the cold, the water being expanded in freezing, and not finding either room or vent, burſt the veſſels. A ſtrong barrel of a gun, with water in it cloſe ſtopped and frozen, was rent the whole length. Huygens, to try the force with which it expands, filled a cannon with it, whoſe ſides were an inch thick, and then cloſed up the mouth and vent, ſo that none could eſcape; the whole being expoſed to a ſtrong freezing air, the water froze in about twelve hours, and burſt the piece in two places. Mathematicians have computed the force of the ice upon this occaſion; and they ſay, that ſuch a force would raiſe a weight of 27720 pounds. Major Edward Williams, of the royal artillery, made many experiments on the force of it, at Quebec, in the years 1784 and 1785. He filled all ſizes of iron bomb-ſhells with water, then plugged the fuze hole cloſe up, and expoſed them to the ſtrong freezing air of the winter in that climate; ſometimes driving in the iron plugs as hard as poſſible with a ſledge hammer; and yet they were always thrown out by the ſudden expanſion of the water in the act of freezing, like a ball ſhot by gunpowder, ſometimes to the diſtance of between 400 and 500 feet, though they weighed near three pounds; and when the plugs were ſcrewed in, or furniſhed with hooks or barbs, to lay hold of the inſide of the ſhell by, ſo that they could not poſſibly be forced out, in this caſe the ſhell was always ſplit in two, though the thickneſs of the metal of the ſhell was about an inch and three quarters. It is farther remarkable, that through the circular crack, round about the ſhells, where they burſt, there ſtood out a thin film or ſheet of ice, like a fin; and in the caſes when the plugs were projected by freezing water, there ſuddenly iſſued out from the fuze-hole, a bolt of ice, of the ſame diameter, and ſtood over it to the height ſometimes of eight inches and a half. And hence we need not be ſurpriſed at the effects of ice in deſtroying the ſubſtance of vegetables and trees, and even ſplitting rocks, when the froſt is carried to exceſs.

It is alſo obſerved that water loſes of its weight by freezing, being found lighter after thawing again, than before it was frozen. And indeed it evaporates almoſt as faſt when frozen, as when it is fluid. It is ſaid too that water does not freeze in vacuo; requiring for that purpoſe the preſence and contiguity of the air. But this circumſtance is liable to ſome doubt, and it may be ſuſpected that the degree of cold has not been carried far enough in theſe inſtances; as it is found that mercury in thermometers has even been frozen, though it requires a vaſtly greater degree of cold to freeze mercury than water. That water which has been boiled, freezes more readily than that which has not been boiled; and that a ſlight diſturbance of the fluid diſpoſes it to freeze more ſpeedily; having ſometimes been cooled ſeveral degrees below the freezing point, without congealing when kept quite ſtill, but ſuddenly freezing into ice on the leaſt motion or diſturbance. That the water, being covered over with a ſurface of oil of olives, does not freeze ſo readily as without it; and that nut oil abſolutely preſerves it under a ſtrong froſt, when olive oil would not. That rectified ſpirit of wine, nut oil, and oil of turpentine, ſeldom freeze. That the ſurface of the water, in freezing, appears all wrinkled; the wrinkles being ſometimes in parallel lines, and ſometimes like rays, proceeding from a centre to the circumference.

FREEZING MIX'TURE, a preparation for the artificial congelation of water, and other fluids. According to Mr. Boyle, all kinds of ſalts, whether alkaline or acid; and even all ſpirits, as ſpirit of wine, &c. as alſo ſugar, and ſaccharum ſaturni, mixed with ſnow, are capable of freezing moſt fluids; and the ſame effect is produced, in a very high degree, by a mixture of oil of vitriol, or ſpirit of nitre, with ſnow. M. Homberg remarks the ſame of equal quantities of corroſive ſublimate, and ſal ammoniac, with four times the quantity of diſtilled vinegar. Many artificial freezing mixtures are uſed in preparing ice under different forms for the table; for which ſee the article ICE.

Very extraordinary inſtances of artificial freezing have been made in Ruſſia, at Hudſon's-bay, and other parts, by which quickſilver was frozen into a ſolid maſs of metal. And the ſame thing had before happened from the natural cold of the atmoſphere alone, in Siberia. In the winter of 1733, profeſſor Gmelin, with two other gentlemen of the Ruſſian academy, were ſent to explore thoſe inhoſpitable regions. In the winter of 1734–5, Mr. Gmelin being at Yeneſeiſk in 58° 30′ north lat. and 92° lon. eaſt from Greenwich, firſt obſerved ſuch a deſcent of the mercury, as muſt have been attended with congelation, being far below its freezing point —40 of Fahrenheit's thermometer. "Here, (ſays he), we firſt experienced the truth of what various travellers have related with reſpect to the extreme cold of Siberia; for, about the middle of December, ſuch ſevere weather ſet in, as we were ſure had never been known in our time at Peterſburg. The air ſeemed as if it were frozen, with the appearance of a fog, which did not ſuffer the ſmoke to aſcend as it iſſued from the chimneys. Birds fell down out of the air as dead, and froze immediately, unleſs they were brought into a warm room. Whenever the door was opened, a fog ſuddenly formed round it. During the day, ſhort as it was, parhelia and haloes round the ſun were frequently ſeen; and in the night mock moons, and haloes about the moon. Finally, our thermometer, not ſubject to the ſame deception as the ſenſes, left us no doubt of the exceſſive cold; for the quickſilver in it was reduced, on the 5th of January, old ſtyle, to —120° of Fahrenheit's ſcale, lower than it had ever been obſerved in nature."

A ſimilar inſtance happened at Yakutſk, in 620° north lat. and 150° eaſt lon. The weather here was unuſually mild for the climate, yet the thermometer fell to —72°; and one perſon informed the profeſſor by a note,

that the mercury in his barometer was frozen. He haſtened immediately to his houſe to behold ſuch a ſurpriſing phenomenon; but though he was witneſs to the fact, obſerving that the mercury did not continue in one column, but was divided in different places as into little cylinders, which appeared frozen, yet the prejudice he had entertained againſt the poſſibility of the congelation, would not allow him to believe it.

Another ſet of obſervations, in the courſe of which the mercury muſt frequently have been congealed, were made by profeſſor Gmelin at Kirenga fort, in 57½ north lat. and 108 eaſt lon. his thermometer, at different times, ſtanding at —108, —86, —100, —113, and many other intermediate degrees, in the courſe of the winter of 1737–8. On the 27th of November, after the thermometer had been ſtanding for two days at —46°, he found it ſunk at noon to —108. Suſpecting ſome miſtake, after he had noted down the obſervation, he inſtantly ran back, and found it at —102; but aſcending with ſuch rapidity, that in the ſpace of half an hour it had riſen to —19°. This phenomenon, which appeared ſo ſurpriſing, doubtleſs depended on the expanſion of the mercury frozen in the bulb of the thermometer, and which now melting, forced upwards the ſmall thread in the ſtem. And ſimilar appearances were obſerved on other days afterwards, when the thread of quickſilver in the thermometer was ſeparated about 6 degrees. A ſecond inſtance where a natural congelation of mercury has certainly been obſerved, is recorded in the tranſactions of the royal academy of ſciences at Stockholm, as made by Mr. Andrew Hellant. The weather, in January 1760, was remarkably cold in Lapland; ſo that on the 5th of that month, the thermometers fell to —76, —128, or lower; on the 23d and following days they fell to —58, —79, —92, and below —238 entirely into the ball. This was obſerved at four different places in Lapland, ſituated between the 65th and 78th degrees of north lat. and the 21ſt and 28th degree of eaſt longitude.

But the congelation of quickſilver, by an artificial freezing mixture, was firſt obſerved, and put beyond doubt, by Mr. Joſeph Adam Braun, profeſſor of philoſophy at Peterſburg. This gentleman, wiſhing to try how many degrees of cold he could produce, availed himſelf of a good opportunity which offered for that purpoſe on the 14th of December 1759, when the mercury in the thermometer ſtood in the natural cold at —34, which it is now known is only 5 or 6 degrees above its point of congelation. Aſſiſting this natural cold therefore with a mixture prepared of aquafortis and pounded ice, his thermometer was ſunk to —69. Part of the quickſilver muſt now have been really congealed, but unexpected by him, and he only thought of purſuing his object of producing ſtill greater degrees of cold; and having expended all his pounded ice, he was obliged to uſe ſnow inſtead of it. With this freſh mixture the mercury ſunk to —100, —240, and —350°. Taking the thermometer out, he found it whole, but the quickſilver fixed, and it continued ſo for twelve minutes. On repeating the experiment, with another thermometer which had been graduated no lower than —220, all the mercury ſunk into the ball, and became ſolid as before, and did not re-aſcend till after a ſtill longer interval of time. Mr. Braun now ſuſpected that the quickſilver was really frozen, and prepared for making a deciſive experiment. This was accompliſhed on the 25th of the ſame month, and the bulb of the thermometer broken as ſoon as the metal was congealed; when it appeared that the mercury was changed into a ſolid and ſhining metallic maſs, which flatted and extended under the ſtrokes of a peſtle, being rather leſs hard than lead, and yielding a dull ſound like that metal. Mr. Æpinus made ſimilar experiments at the ſame time, employing as well thermometers as tubes of a larger bore; in which laſt he remarked, that the quickſilver fell ſenſibly on being frozen, aſſuming a concave ſurface, and likewiſe that the congealed pieces ſunk in fluid mercury: alſo, in their farther experiments, they invariably found that the mercury ſunk lower when the whole of it was congealed, than if any part of it remained fluid: all ſhewing that, contrary to water, mercury contracted in freezing. It was farther obſerved, that the mercury when congealed looked like the moſt poliſhed ſilver, and when beaten flat, it was eaſily cut with a penknife, like ſoft thin ſheet lead.

The fact being thus eſtabliſhed, and fluidity no longer to be conſidered as an eſſential property of quickſilver, Mr. Braun communicated an account of his experiments to the Peterſburg academy, on the 6th of September, 1760; of which a large extract was inſerted in the Philoſophical Tranſactions, vol. lii. p. 156. He afterwards declared that he never ſuffered a winter to paſs without repeating the experiment of freezing quickſilver, and never failed of ſucceſs when the natural cold was of a ſufficient ſtrength for the purpoſe; and this degree of natural cold he ſuppoſes at —10 of Fahrenheit; though ſome commencement of the congelation might be perceived when the temperature of the air was as high as +2.

The reſults of all his experiments were, that with the abovementioned frigorific mixtures, and once with rectified ſpirits and ſnow, when the natural cold was at —280, he congealed the quickſilver, and diſcovered that it is a real metal that melts with a very ſmall degree of heat. However, not perceiving the neceſſary conſequence of its great contraction in freezing, he always confounded its point of congelation with that of its greateſt contraction in freezing, and thus marked the former a great deal too low. In the proceſs of his obſervations, Mr. Braun found that double aquafortis was more effectual than ſpirit of nitre; but with this ſimple ſpirit, which ſeldom brings the mercury lower than —148, this metal may be frozen in the following manner: ſix glaſſes being filled with ſnow as uſual, and the thermometer put in one of them, the ſpirit of nitre was poured upon it; when the mercury would fall no lower in this, the thermometer was removed to the ſecond, and ſo on to the third and fourth, in which fourth immerſion the mercury was congealed.

Mr. Æpinus gives the following direction for uſing the fuming ſpirit of nitre: Take ſome of this ſpirit, cooled as much as poſſible, and put it into a wine glaſs till it be about half full, filling it up with ſnow, and ſtirring them till the mixture become of the conſiſtence of pap; by which means you obtain, almoſt in an inſtant, the neceſſary degree of cold for the freezing of quickſilver.

It is remarked by Mr. Braun, that by the mixture of ſnow and ſpirit of nitre, which froze the mercury, he never was able to bring thermometers, filled with the moſt highly rectified ſpirit of wine, lower than —148; ſo that the cold which will freeze mercury, will not freeze ſpirit of wine; and therefore ſpirit thermometers are the moſt fit to determine the degree of coldneſs in frigorific mixtures, till we can conſtruct ſolid metallic thermometers with ſufficient accuracy. Mr. Braun tried the effects of different fluids in his frigorific mixtures: he always found that Glauber's ſpirit of nitre and double aquafortis were the moſt powerful; and from a number of experiments made when the temperature of the air was between 21 and 28 of Fahrenheit, he concludes, that ſpirit of ſalt pounded upon ſnow increaſed the natural cold 360; ſpirit of ſal ammoniac, 12; oil of vitriol, 42; Glauber's ſpirit of nitre, 70; aquafortis, 48; ſimple ſpirit of nitre, 36; dulcified ſpirit of vitriol, 24; Hoffman's anodyne liquor, 38; ſpirit of hartſhorn, 12; ſpirit of ſulphur, 12; ſpirit of wine rectified, 24; camphorated ſpirit, 18; French brandy, 14; and ſeveral kinds of wine increaſed the naturalcold to 7, 8, or 9, degrees.

The moſt remarkable freezing of mercury by natural cold, was that related by Dr. Peter Simon Pallas, who had been ſent by the empreſs of Ruſſia, with ſome other gentlemen, on an expedition ſimilar to that of Mr. Gmelin. Being at Kraſnoyarſk in 1772, in north lat. 560 30′, and eaſt lon. 93°, he had an opportunity of obſerving the phenomenon very accurately. On the 6th and 7th of December that year, ſays he, there happened the greateſt

cold

cold I have ever experienced in Siberia: the air was calm at the time, and ſeemingly thickened; ſo that, though the ſky was in other reſpects clear, the ſun appeared as through a fog. I had only one ſmall thermometer left, in which the ſcale went no lower than —7°; and on the 6th in the morning, I remarked that the quickſilver in it ſunk into the ball, except ſome ſhort columns which ſtuck faſt in the tube. When the ball of the thermometer, as it hung in the open air, was touched with the finger, the quickſilver roſe; and it could plainly be ſeen that the ſolid columns ſtuck and reſiſted a good while, and were at length puſhed upward with a ſort of violence. He alſo placed upon the gallery, on the north ſide of his houſe, ſome quickſilver in an open bowl. Within an hour he found the edges and ſurface of it frozen ſolid; and ſome minutes afterward the whole was condenſed by the natural cold into a ſoft maſs very much like tin. While the inner part was ſtill fluid, the frozen ſurface exhibited a great variety of branched wrinkles; but in general it remained pretty ſmooth in freezing. The congealed mercury was more flexible than lead; but on being bent ſhort, it was found more brittle than tin; and when hammered out thin, it ſeemed ſomewhat granulated. When the hammer was not perfectly cooled, the quickſilver melted away under it in drops; and the ſame thing happened when the metal was touched with the finger, by which alſo the finger was immediately benumbed. When the frozen maſs was broken to pieces in the cold, the fragments adhered to each other and to the bowl in which they lay. In the warm room it thawed on its ſurface gradually, by drops, like wax on the fire, and did not melt all at once. Although the froſt ſeemed to abate a little towards night, yet the congealed quickſilver remained unaltered, and the experiment with the thermometer could ſtill be repeated. On the 7th of December he had an opportunity of making the ſame obſervations all day; but ſome hours after ſunſet, a northweſt wind ſprung up, which raiſed the thermometer to —46°, when the maſs of quickſilver began to melt.

The experiments of Mr. Braun were ſucceſsfully repeated at Gottingen, in 1774, by M. Blumenbach; being encouraged to this attempt by the exceſſive cold of the winter that year, eſpecially the night of January the 11th, when he made the experiment, the thermometer ſtanding at —10 in the open air. M. Blumenbach at five in the evening, put three drachms of quickſilver into a ſmall ſugar glaſs, and covered it with a mixture of ſnow and Egyptian ſal ammoniac, ſetting the glaſs out in the air upon a mixture alſo of ſal ammoniac. At one the next morning, the mercury was found frozen quite ſolid, and hard to the glaſs; and did not melt again till ſeven or eight the next morning. The colour of the frozen mercury was a dull pale white with a bluiſh caſt, like zinc, very different from the natural appearance of quickſilver.

In 1775, by ſimilar means, quickſilver was twice frozen by Mr. Hutchins, governor of Albany fort, in Hudſon's bay, viz. in the months of January and February of that year. And the ſame was done on the 28th of January, 1776, by Dr. Lambert Bicker, ſecretary of Rotterdam. The temperature of the atmoſphere was then at +2°; and the loweſt it could reduce the thermometer by artificial cold, was —94; when, on breaking the glaſs, the mercury was found frozen.

In the beginning of 1780, M. von Elterlein, of Vytegra, a town of Ruſſia, in lat. 61° north, and lon. 36° eaſt, froze quickſilver by natural cold. On the 4th of January, 1780, the cold being increaſed to —34 that evening at Vytegra, he expoſed to the open air three ounces of very pure quickſilver in a china tea-cup, covered with paper pierced full of holes. Next day, at eight in the morning, he found it ſolid, and looking like a piece of caſt lead, with a conſiderable depreſſion in the middle. On attempting to looſen it in the cup, his knife raiſed ſhavings from it as if it had been lead, which remained ſticking up; and at length the metal ſeparated from the bottom of the cup in one maſs. He then took it in his hand to try if it would bend: it was ſtiff like glue, and broke into two pieces; but his fingers immediately loſt all feeling, and could ſcarcely be reſtored in an hour and a half by rubbing with ſnow. At eight o'clock the thermometer ſtood at —57; but half after nine it was riſen to —40; and then the two pieces of mercury which lay in the cup had loſt ſo much of their hardneſs, that they could no longer be broken, or cut into ſhavings, but reſembled a thick amalgam, which, though it became fluid when preſſed by the fingers, immediately afterwards reſumed the conſiſtence of pap. With the thermometer at —39, the quickſilver became fluid. The cold was never leſs on the fifth than —28, and by nine in the evening it had increaſed again to —33. This experiment ſeems to fix the freezing point of mercury at —40 of Fahrenheit's thermometer, or 40 below 0; which is 72° below the freezing point of water.

In the winter of 1781–2, Mr. Hutchins reſumed the ſubject of freezing quickſilver by artificial cold, with ſuch ſucceſs, that from his experiments and thoſe of M. von Elterlein, laſt mentioned, the freezing point of mercury is now almoſt as well ſettled, viz. at —40, as that of water is at +32. Other philoſophers indeed had not been altogether inattentive to this ſubject. Profeſſor Braun himſelf had taken great pains to inveſtigate it; but for want of a proper attention to the difference between the contraction of the fluid mercury by cold, and that of the congealing metal by freezing, he could not determine any thing certain concerning it.

An inſtance of the natural congelation of quickſilver alſo occurred in Jemptland, one of the provinces of Sweden, on the 1ſt of January, 1782; and again, on the 26th of the ſame month, Mr. Hutchins obſerved the ſame effect of the cold at Hudſon's bay; when he found that at the point of its freezing a mercurial thermometer ſtood at —40, and a ſpirit thermometer at —30. On this ſubject, ſee the Philoſophical Tranſactions, vol. li. p. 672; lii. 156; lxvi. 174; lxxiii. 303 and 325; lxxvi. 241; lxxvii. 285; lxxviii. 43; and ſeveral others, particularly lxxix. 199, &c. being experiments on the congelation of quickſilver in England, by Mr. Richard Walker, where he proves that mercury may be frozen not only in England in ſummer, but even in the hotteſt climate, at any ſeaſon of the year, and without the uſe of ice or ſnow.

FREEZ'ING POINT, the point or degree of cold, ſhewn by a mercurial thermometer, at which certain fluids begin to freeze, or, when frozen, at which they begin to thaw again. On Fahrenheit's thermometer, this point is at +32 for water, and at —40 for quickſilver, theſe fluids freezing at thoſe two points reſpectively. It would alſo be well if the freezing points for other fluids were aſcertained, and the whole arranged in a regular table.

FREEZ'LAND PEAK, a cape on Sandwich Land, in the South Pacific Ocean. Lat. 59. 2. S. lon. 27. W. Greenwich.

FREGEL'LA, in ancient geography, a famous town of the Volſci in Italy on the Liris, deſtroyed for revolting from the Romans. *Livy.*

FREGE'NE, a town of Etruria. *Pliny.*

FRE'HER (Marquard), an eminent juriſt, born in 1565, at Augſburg, of a family diſtinguiſhed in the law and magiſtracy. He ſtudied firſt at Altdorff, and was thence ſent to Bourges, where he received his licence in law from the celebrated Cujas, in 1585. He was made a counſellor to the elector palatine, John-Caſimir, and in 1596 obtained the profeſſorſhip of law in the univerſity of Heidelberg. The elector Frederic IV. employed him in various important concerns, and created him vice-preſident of the ſenate. He diſtinguiſhed himſelf by his dexterity in negociations at the courts of the king of Poland and ſeveral German princes; at the ſame time he did not neglect his literary purſuits, which were particularly turned to hiſtory and antiquity. He died at Heidelberg in 1614, at the age of forty-nine, leaving behind him a variety

variety of works eſteemed by the learned. Of theſe the principal are, 1. *De Re monetaria veterum Romanorum, & hodierni apud Germanos Imperii, Lib. II.* 2. *Parergon, Lib. II.* 3. *Rerum Bohemicarum Scriptores varii.* 4. *Rerum Germanicarum Scriptores a Carolo Magno ad Fredericum III.* 5. *Corpus Hiſtor. Franciæ.* And 6. *Originum Palatinorum Comment.* He was a collector of ancient paintings, and poſſeſſed a well-choſen cabinet of conſular and imperial medals, ſeveral of which he elucidated in his writings.

FREIDD'EGG, a town of Germany, in the archduchy of Auſtria: ſeven miles ſouth-ſouth-weſt of Ips.

FREID'NAU, a town of Germany, in the duchy of Stiria: ſix miles weſt of Rakelſpurg.

FRE'JENAL, or FREXENEL, a town of Spain, in the county of Seville: forty-ſeven miles north of Seville.

FREIN'STEIN, a town of Germany, in the circle of Franconia, and county of Erbach, ten miles ſouth of Erbach.

FRIEN'WALDE, a town of Germany, in the circle of Upper Saxony, and duchy of Pomerania: fifteen miles north-eaſt of Stargard, and thirty-four ſouth-ſouth-eaſt of Cammin.

To FREIGHT, *v. a.* preter. *freighted*; part. *fraught*; which being now uſed as an adjective, *freighted* is adopted: [*fretter*, Fr.] To load a ſhip or veſſel of carriage with goods for tranſportation:

Nor is, indeed, that man leſs mad than theſe,
Who *freights* a ſhip to venture on the ſeas;
With one frail interpoſing plank to ſave
From certain death, roll'd on by ev'ry wave. *Dryden.*

To load as the burthen; to be the thing with which a veſſel is freighted:

I would
Have ſunk the ſea within the earth, or ere
It ſhould the good ſhip ſo have ſwallow'd, and
The *freighting* ſouls within her. *Shakeſpeare.*

FREIGHT, *ſ.* Any thing with which a ſhip is loaded:

He clears the deck, receives the mighty *freight*;
The leaky veſſel groans beneath the weight. *Dryden.*

The money due for tranſportation of goods.

Ships are freighted either by the ton, or by the great; and in reſpect of time, the freight is agreed for, at ſo much per month, or at a certain ſum for the whole voyage. If a ſhip freighted by the great, happens to be caſt away, the freight is loſt; but if a merchant agrees by the ton, or at ſo much for every piece of commodities, and by any accident the ſhip is caſt away, if part of the goods is ſaved, it is ſaid ſhe ought to be anſwered her freight *pro rata*: and when a ſhip is inſured and ſuch a misfortune happens, the inſured commonly transfer thoſe goods over to the aſſurers, towards a ſatisfaction of what they make good. *Lex Mercat.*

If freight is agreed for the lading and unlading of cattle at ſuch a port, and ſome die before the ſhip arrives there, the whole freight ſhall be paid for the living and the dead; but if the agreement be for tranſporting them, freight ſhall be only paid for the living: it is the ſame of ſlaves. *Ibid.* 85. The lading of a ſhip in conſtruction of law, is bound for the freight; the freight being in point of payment preferred before any other debts to which the goods ſo laden are liable, though ſuch debts as to time were precedent to the freight. *Hil.* 27 *Car.* II. *B.R.* If part of the lading be on ſhip-board, and through ſome misfortune happening to the merchant, he has not his full lading aboard at the time agreed, the maſter ſhall have freight by way of damage, for the time thoſe goods were on-board; and is at his liberty to contract with another, leſt he loſe his ſeaſon and voyage: and where a ſhip is not ready to take in, or the merchant not ready to lade his goods aboard, the parties are not only ſo at liberty, but the perſon damnified may bring an action againſt the other, and recover his damages ſuſtained. *Leg. Rhod.*

If the freighter of a ſhip ſhall lade on-board prohibited goods, or unlawful merchandize, whereby the ſhip is detained, or the voyage impeded; he ſhall anſwer the freight agreed for. *Style* 220. And when goods are laden aboard, and the ſhip hath broke ground, the merchant may not afterwards unlade them; for if he then changes his mind, and reſolves not to venture, but will unlade again, by the marine law the freight becomes due. If a maſter freights out his ſhip, and afterwards ſecretly takes in goods unknown to the firſt laders, by the law marine he forfeits his freight: and if a maſter of a ſhip ſhall put into any other port than what the ſhip was freighted to, he ſhall anſwer damages to the merchant; unleſs he is forced in by ſtorm, enemies, or pirates; and in that caſe he is obliged to ſail to the port agreed, at his own expence. *Leg. Oleron.* A ſhip is freighted ſo much out and ſo much in, there ſhall be no freight due till the voyage is performed; ſo that, if the ſhip be caſt away coming home, the freight outwards, as well as inwards, are both gone. 1 *Brownl.* 21. *Dougl.* 541. Where a ſhip periſhes, the whole freight from the laſt place or time of payment will be loſt. And if no freight be payable till the return, if the ſhip is loſt returning, the freight outwards ſhall be loſt as well as that inwards. *Mal.* 98.

The goods carried, generally, are a ſecurity for the freight, and the maſter is not bound to deliver them without payment. *Dougl.* 104. If a freighted ſhip becomes diſabled without the maſter's fault, he has his option to re-fit, (if poſſible, in convenient time,) or to hire another ſhip to carry the goods. If the merchant will not agree to this, the maſter is entitled to the full freight for the whole voyage. 2 *Burr.* 882. 1 *Bl. Rep.* 190.

The maſter ſhall have his freight though the goods are ſpoiled, if the merchant takes them. The merchant may abandon all, though all are not loſt: but he cannot abandon ſome and take ſome: if he abandon all, he is excuſed freight. If the ſhip is diſabled or taken when part of the voyage is performed, without fault of the maſter, he ſhall be paid a rateable proportion of the freight. 2 *Burr.* 882. See the article CHARTER-PARTY, vol. iv. p. 119.

FREIGHT'ER, *ſ.* [*fretteur*, Fr.] He who freights a veſſel.

FREIGNE', a town of France, in the department of the Mayne and Loire: twenty miles weſt of Angers.

FREI'MERSHEIM, a town of Germany, in the palatinate of the Rhine, taken by the French in 1794: four miles north-north-eaſt of Landau.

FREIND (John), a learned Engliſh phyſician, born in 1675, at Croton in Northamptonſhire, of which place his father was rector. He was educated at Weſtminſter-ſchool, under Dr. Buſby, and went thence, in 1690, to Chriſt-church college, Oxford. He became one of the ornaments of that ſeminary, and was ſelected, together with Mr. Foulkes, for the taſk of publiſhing a Latin tranſlation of the oration of Æſchines againſt Cteſiphon, and of Demoſthenes de Corona. Soon after, he edited a corrected edition of the Delphin Ovid's Metamorphoſes. A Latin ode addreſſed to Dr. Hannes upon the death of the duke of Glouceſter in 1700, diſtinguiſhes the name of Freind as a polite ſcholar, in the *Muſæ Anglicanæ*. Before this time he had commenced the ſtudy of phyſic, and in 1699 communicated to the royal ſociety an account of a remarkable hydrocephalus, which is publiſhed in their Memoirs. Another communication to the ſociety, in 1701, contains a relation of ſingular convulſive and ſpaſmodic ſymptoms affecting two poor families in Oxfordſhire. A work which immediately brought him into notice as a phyſician and phyſiologiſt was his *Emmenologia, in quâ Fluxus muliebris menſtrui phænomena, periodi, vitiæ, cum medendi methodo, ad rationes mechanicas, exiguntur*, 8vo. 1703. In this piece he took his ſtation among the mechanical phyſicians, whoſe ſect then flouriſhed under the auſpices of Baglivi and other learned men. Deriving the cauſe of the evacuation in queſtion from plethora, he conſiders the effects of lentor in the blood and rigidity in the veſſels on the

the one hand, and of the oppoſite ſtates in both, on the other, and adapts his pathological and curative ideas to this theory. The work was very favourably received, and though it met with oppugners, raiſed him into general reputation. In 1704 he was appointed to read chemical lectures before the univerſity. In theſe he attempted to explain all chemical operations upon mechanical and phyſical principles. Dr. John Keil was the firſt who made this attempt, and Freind purſued it with ingenuity and clearneſs of method, though his ſucceſs has not been ſufficient to place him high among chemical philoſophers. The lectures were ſome years afterwards publiſhed, with a dedication to ſir Iſaac Newton. In 1705 he accompanied the earl of Peterborough in his Spaniſh expedition, in quality of phyſician to the Engliſh troops. He was abroad nearly two years, and returned through Italy, taking Rome in his way, where he viſited the eminent phyſicians Baglivi and Lanciſi. It appears that he was much in the confidence of lord Peterborough, whoſe conduct he vindicated after his return, in a publication printed in 1707. During that year he was created doctor of phyſic by diploma, and publiſhed his chemical lectures. He was afterwards admitted into the royal ſociety. In 1712 he attended the duke of Ormond as his phyſician in his campaign in Flanders. From this time he reſided chiefly in London, where he roſe to high profeſſional reputation, and was received as fellow of the college of phyſicians in 1716. He publiſhed in that year the firſt and third books of *Hippocrates de Morbis Popularibus*, Greek and Latin, ſubjoining to them a Commentary on Fevers. This is a performance of great erudition, affording a perſpicuous view of the practice of the Greek phyſicians, of which he is for the moſt part a zealous defender. It alſo touches upon ſome points of modern practice, and in particular recommends the uſe of purgatives in the ſecondary fever of the confluent ſmallpox. This opinion was animadverted upon by Dr. Woodward in a publication entitled The State of Phyſic and Diſeaſes, written with unbecoming acrimony. To this, Dr. Freind firſt oppoſed a ludicrous reply, in the name of that noted empyric, Byfield. At length he thought proper to give a ſerious anſwer, in a Latin letter addreſſed to Dr. Mead, entitled *De Purgantibus in ſecunda Variolarum Confluentium Febre*, 8vo. 1719; which contains many valuable obſervations elegantly expreſſed, and much contributed to eſtabliſh the practice for which he contended. He paſſed through the offices of the college during this period, and in 1720 delivered a Harveian oration, which was much applauded. We are not acquainted with the reaſons which induced him, while purſuing with ſo much ſucceſs his medical career, to engage in political life; but in 1722 he entered into parliament as burgeſs for Launceſton. His connexions were with the party at this time in oppoſition to the court; and as the times were critical, and his attachments warm, his conduct ſoon expoſed him to ſuſpicion. Biſhop Atterbury's plot for the reſtoration of the Stuart family was the leading topic of this period, and when a motion againſt the prelate was made in the houſe of commons, Dr. Freind was among the ſpeakers in his favour. As the circumſtances of the time had given the miniſtry a pretext for the ſuſpenſion of the habeas corpus act, ſeveral perſons of conſequence were committed to cuſtody, among whom was Dr. Freind, charged with ſuſpicion of high-treaſon. The oppoſition ſuggeſted that the only ground for this was his parliamentary conduct; but Walpole declared privately to ſeveral perſons, that there was poſitive proof of the blackeſt treaſon againſt him. This, however, was never brought forward; and, after a confinement in the Tower from March 15, 1723, to June 21 of the ſame year, he was liberated. He now laid the plan of his greateſt work, of which the firſt part appeared in 1725, and the ſecond in 1726. This was The Hiſtory of Phyſic from the time of Galen to the Beginning of the Sixteenth Century, chiefly with Regard to Practice, in a Diſcourſe written to Dr. Mead, 2 vols. 8vo. This learned performance was meant as a kind of ſupplement to the Hiſtory of Phyſic by Daniel Le Clerc. It is divided into three parts, treating reſpectively of the Greek phyſicians after Galen, of the Arabians, and of the moderns.

Whatever political ſuſpicions might have fallen upon Dr. Freind in conſequence of his connections, the ſtain of diſaffection to the reigning family muſt be regarded as obliterated by his appointment, on the acceſſion of George II. to the poſt of phyſician to queen Caroline. He did not long, however, enjoy this honourable truſt, for a decline of his conſtitution put a period to his life in July, 1728, in his fifty-ſecond year. The Latin works of Dr. Freind were publiſhed by Dr. Wigan, in a folio volume, London, 1733, with a Latin verſion of the Hiſtory of Phyſic, and a Life of the author prefixed. Several foreign editions of the ſame have been given.

FREIN'DORFF, a town of Germany, in the archduchy of Auſtria: four miles ſouth-eaſt of Tulln.

FREIN'SHEIM, a town of Germany, in the circle of the Lower Rhine, and palatinate of the Rhine: ten miles weſt-north-weſt of Manheim, and twenty weſt-north-weſt of Heidelberg.

FREIN'SHEIM (John), born at Ulm, in Suabia, in 1608. He ſtudied at the univerſities of Marpurg and Gieſſen, whence he was transferred to Straſburg. Some German poems of his compoſition made him known to Matthew Bernegger, who took him into his houſe, and gave him the uſe of his library. The young ſtudent improved this advantage with inceſſant diligence, and carried his reſearches into every part of literature. His knowledge of languages was uncommonly extenſive, comprehending not only thoſe of antiquity, but moſt of the modern European dialects. In 1634 he was invited to Metz, as interpreter to the king's ſecretaries. After occupying it for three years, he returned, and married the daughter of Bernegger, with whom he took up his reſidence. He accepted, in 1642, the profeſſorſhip of politics and eloquence at Upſal. There he continued five years, when queen Chriſtina engaged him at a liberal ſtipend to act as her librarian and hiſtoriographer. In 1651 he requeſted permiſſion, on account of his health, to return to Germany; and in the next year he was invited to Heidelberg by the elector Charles-Louis, and created electoral counſellor, and honorary profeſſor in the univerſity. In this ſituation he cultivated an extenſive correſpondence with the learned throughout Europe, and was honoured with the friendſhip and eſteem of many perſons of rank. He died at Heidelberg in 1660, at the age of 52. This diſtinguiſhed profeſſor rendered himſelf eminent by his ſervices to claſſical literature. He illuſtrated with learned commentaries, tables, &c. the Latin hiſtorians Florus, Q. Curtius, and Tacitus; and compoſed ſupplements for the loſt books of Livy, which are much eſteemed. He alſo publiſhed many Latin orations, poems, and diſſertations. He was aſſiſted in ſome of his claſſical labours by his brother, Melchior Freinſheim.

FREIRE DE ANDRA'DA (Hyacinth), a Portugueſe writer, born about 1597, of a noble family at Beja. He was brought up at the univerſity of Coimbra, where he took the degree of doctor in canon law, and applied to the ſtudy of theology. He likewiſe took a part in political diſcuſſion, and wrote a treatiſe in Spaniſh, entitled *Portugal Reſtaurado*, in which he maintained the right of the houſe of Braganza to the crown. After receiving prieſt's orders, he went to the court of Spain, where he was well received by the firſt miniſter of Philip IV. who conſulted him upon affairs of importance, and conferred upon him a valuable abbacy in the province of Beira. His patriotic freedom of ſpeech, however, deſtroyed his proſpects of advancement, and brought him into perſonal danger. Being interrogated reſpecting the pretenſions of the king of Spain to the crown of Portugal, he replied, "That they were only thoſe of force and uſurpation;" and having compoſed a work in favour of the title of Ca-

tharine ducheſs of Braganza, orders were iſſued for his arreſtation. He had time, however, to eſcape to his abbey, where he remained till the acceſſion of John IV. to the crown of Portugal in 1640. Upon that event he repaired to Liſbon, where he was received with diſtinction by the king and the prince of Brazil, and was offered the poſt of preceptor to the prince Alfonſo, which he declined. Upon the death of his father he returned to Liſbon to ſettle his family affairs, and continued there, devoted to his ſtudies, till his death, in 1657. Freire de Andrada was an elegant writer in his own language; and his Life of Don John de Caſtro is reckoned one of the beſt compoſed works in the Portugueſe language. It has been tranſlated into Latin. He alſo wrote ſome poems, which are contained in a collection printed at Liſbon in 1717, under the title of *Fenix Renacida*. He was of a frank and generous character, pleaſant in converſation, liberal to the poor, and attached to his friends, whom he defended in their abſence, though he would freely reproach them with their faults face to face.

FREI'SACH, a town of Germany, in the duchy of Carinthia, belonging to the archbiſhopric of Salzburg, ſituated on the Metnitz. It has a caſtle, college, a convent of Dominicans, and a commandery of the Teutonic order: four miles north-north-eaſt of Gurck, and eight north of St. Veit.

FREISCH'BACH, a town of Germany, in the palatinate of the Rhine, taken by the French in 1794: ſix miles eaſt-north-eaſt of Landau.

FRE'JUS, or FREJULS, a town of France, and principal place of a diſtrict, in the department of the Var; formerly a ſeaport, but now at two miles from the ſea. It was flouriſhing as early as the time of Julius Cæſar, being then called *Forum Julii*, and is ſuppoſed to have been founded by a colony from Marſeilles; and many monuments of its ancient grandeur ſtill remain, ſuch as an aqueduct, an amphitheatre, ſtatues, inſcriptions, &c. Before the revolution, it was a ſee of a biſhop, ſuffragan of Aix: ten poſts ſouth-weſt of Nice, and 115 ſouth-ſouth-eaſt of Paris. Lat. 43. 28. N. lon. 24. 24. E. Ferro.

FREIXIE'RA, a town of Portugal, in the province of Entre Duero e Minho: two leagues and a half north-eaſt of Amarante.

FREI'XEL, a town of Portugal, in the province of Tra los Montes: five leagues ſouth of Mirandela.

FRE'MINET (Martin), a French painter, born at Paris in 1567. He was brought up under his father, a painter of little merit, but ſoon diſplayed a genius ſuperior to his education. At the age of twenty-five he viſited Italy, in which country he remained ſixteen years. He was captivated with the ſublime character of Michael Angelo, and with the ſtyle of Parmegiano in the contour of his figures and air of his heads. He was employed in the palace of the duke of Savoy; but returning at length to his own country, he was made firſt painter to Henry IV. who committed to him the decoration of his chapel at Fontainbleau. After the death of that king, he was continued in the ſame employment by Louis XIII. who created him a knight of the order of St. Michael. He is reckoned to have excelled in compoſition, and to have been well acquainted with anatomy, perſpective, and architecture. But he delighted in ſhewing his ſkill by giving extraordinary outlines to his figures, by marking the muſcles and ſinews with great diſtinctneſs, and putting them into violent and conſtrained motions. Hence his ſtyle of painting is hard, and there is little of beauty or ſoftneſs in his works. He died in 1619, while finiſhing the chapel of Fontainbleau. The ceiling of this edifice is the moſt conſiderable of his works: it is divided into ſeveral compartments, forming different pictures on ſacred ſubjects. Nine valuable prints of ſcripture pieces have been engraved from this maſter.

FREMONA, a town of Abyſſinia, in the kingdom of Tigré, where the Portugueſe miſſionaries took up their firſt reſidence; 135 miles from the iſland of Maſſua.

FREMO'NT D'ABLANCOURT (Nicholas de), nephew of the celebrated Perrot d'Ablancourt. He was carefully educated under his uncle, and early diſtinguiſhed himſelf by his knowledge and talents. Through the recommendation of M. de Turenne he was appointed, in 1663, envoy from France to the court of Portugal; and in 1675, official reſident at Straſburg. After the death of his patron he returned to France, and ſpent his time in ſtudy and the ſociety of the learned. As he was a ſteady Proteſtant, the revocation of the edict of Nantes cauſed him to quit his country, and he took up his abode in Holland. He was highly eſteemed by the prince and princeſs of Orange, and obtained a penſion from them, with the title of hiſtoriographer. One of his principal correſpondents was the learned Richard Simon, in whoſe letters he is uſually deſignated under the name of *Caraïte*. This eſtimable perſon died in 1693. He added to his uncle's tranſlation of Lucian, the Dialogue between the Letters of the Alphabet, and the Supplement to the True Hiſtory. In 1664 he publiſhed ſome elegant Dialogues. He defended his uncle's tranſlation of Tacitus againſt the ſtrictures of Amelot de la Houſſaye in a publication in 1686, written with an acrimony not expected from one of his mildneſs in converſation. He publiſhed a French Catechiſm; and after his death appeared his Memoirs concerning the Hiſtory of Portugal, from the Treaty of the Pyrenées to 1668, 12mo. Paris, 1701.

FRE'MUND, [ƿeoh, free, and Mund, peace, Sax.] A proper name.

FREN, *ſ.* A ſtranger. An old word wholly forgotten here; but retained in Scotland. *Beattie.*

But now from me his madding mind is ſtart,
And wooes the widow's daughter of the glen;
And now fair Roſalind hath bred his ſmart,
So now his friend is changed for a *fren*. *Spenſer.*

FRENAY'-LE-VICOMTE, a town of France, and principal place of a diſtrict, in the department of the Sarte: three leagues ſouth-ſouth-weſt of Alençon, and ſix north le Mans. Lat. 48. 17. N. lon. 17. 41. E. Ferro.

FRENAY'E (La), a town of France, in the department of the Sarte, and chief place of a canton, in the diſtrict of Mamers: two leagues eaſt of Alençon.

FRENCH, *adj.* Any thing produced in, or belonging to France: the French language, French cuſtoms, polity, &c. See the article FRANCE.

FRENCH, a river of North America, in Maſſachuſetts, has its ſource in a ſmall pond, on the borders of Leiceſter and Spenſer, in Worceſter county, and runs through Oxford and joins Quinebauge river, in Thompſon townſhip, in Connecticut. It derives its name from the French Proteſtants, who obtained a ſettlement in the town of Oxford, after the revocation of the edict of Nantz, in 1685.

FRENCH AMERICA. The only part of the continent which the French nation now poſſeſs, is the diſtrict or province of Cayenne, and the iſland of the ſame name on its coaſt, in South America. In the Weſt Indies the French claim the following iſlands, though ſeveral of them are taken by the Engliſh; to which the reader is referred for a particular deſcription: St. Domingo, or Hiſpaniola, now called, by Deſſalines, Hayti; Gaudaloupe, St. Lucia, Tobago, St. Bartholomew, Deſeada, and Marigalante. The French were among the laſt nations who made ſettlements in the Weſt Indies; but they made ample amends by the vigour with which they purſued them, and by that chain of judicious meaſures which they uſed in drawing from them every advantage that the nature of the climate would yield, and in contending againſt the difficulties which it threw in their way.

FRENCH BEAN. See PHASEOLUS.

FRENCH BROAD, a navigable river of North America, in Tenneſſee, which riſes on the ſouth-eaſt ſide of the Great Iron and Bald mountains, in North Carolina. It is formed by two main branches, which receive ſeveral

ſtreams

ſtreams in their courſe. Theſe unite about fifty-eight miles from the ſource of the Nolachucky, the eaſtern branch; thence it flows north-weſterly about twenty-five miles, and joins the Holſton eleven miles above Knoxville, and is from 400 to 500 yards wide. The navigation of this branch is much interrupted by rocks, as is alſo the Tenneſſee branch, which joins the main river fifty miles below this. A large, clear, medicinal ſpring, ſaid to be efficacious in curing many diſeaſes, has been lately diſcovered on the waters of this river, about thirty miles in a direct line from its mouth. The water is ſo hot, that a patient at firſt going into it can ſcarcely bear it. Nearer the mouth of the river, a valuable lead-mine has been diſcovered.

FRENCH CHALK, *ſ.* An indurated clay, extremely denſe, of a ſmooth gloſſy ſurface, ſoft and unctuous to the touch; of a greyiſh white colour, variegated with a duſky green. See MINERALOGY.

FRENCH CREEK, a north-weſtern water of Alleghany river in North America, into which it falls along the north ſide of Fort Franklin, eighty miles north by eaſt of Pittſburg. It affords the neareſt paſſage to lake Erie. It is navigable with ſmall boats to Le Beuf, by a very crooked channel; the portage thence to Preſque Iſle, from an adjoining peninſula, is fifteen miles. This is the uſual route from Quebec to Ohio.

FRENCH HONEYSUCKLE, *ſ.* in botany. See HEDYSARUM CORONARIUM.

FRENCH-HORN, *ſ.* [a French improvement on the horn.] An inſtrument of wind-muſic made of metal.—A flute, a violin, a hautboy, and a *French-horn*, may all ſound the ſame tone, and be eaſily diſtinguiſhable. *Reid's Inquiry.*

FRENCH LICK, in Tenneſſee, North America, is a large ſalt ſpring, near which the town of Naſhville now ſtands.

FRENCH MARYGOLD, *ſ.* in botany. See TAGETES.

FRENCH RIVER, a river of Upper Canada, which runs from lake Herou to lake Nippiſſing.

FRENCH TOWN, a town of the American States in Cecil county, Maryland, on the eaſt ſide of Elk river, a mile ſouth of Elkton, from which it is ſeparated by Elk Creek, ſix miles below Elk-ferry. This town was laid out at the expence of ſeveral philanthropic perſons in Pennſylvania, as a place of retreat for the unfortunate French emigrants who fled to America.

To FRENCH'IFY, *v. a.* [from *French.*] To infect with the manner of France:

Has he familiarly diſſik'd
Your yellow ſtarch, or ſaid your doublet
Was not exactly *Frenchified.* *Shakeſpeare.*

FRENCH'MAN, *ſ.* a native of France.

FRENCHMAN's BAY, a town of the American States, on the ſea-coaſt of Lincoln county, Maine, and is formed by Mount Deſert iſland on the weſtward, and the peninſula of Goldſborough townſhip on the eaſtward. Round Mount Deſert iſland it has an inland circular communication with Blue Hill bay.

FRENCHMAN's BAY, a bay on the ſouth coaſt of the iſland of Jamaica, between Great Pedro bay and Starvegut bay.

FRENCKE, a river of Germany, in the circle of the Upper Rhine, which runs into the Ergetz, near Lichſtall, in the biſhopric of Bale.

FREND'WITE, [from Sax. ꝑneond, *amicus*, and ꝑiꝛe, *multa.*] A mulct or fine formerly exacted of him who harboured his outlawed friend. *Blount.*

FRENE, a town of France, in the department of the Upper Marne, and chief place of a canton, in the diſtrict of Bourbonne les Bains: four miles eaſt-ſouth-eaſt of Bourbonne.

FRENET'IC, *adj.* [*frenetique*, Fr. φρενητικος, Gr. generally therefore written *phrenetic.*] Mad; diſtracted:

He himſelf impotent,
By mean of his *frenetic* malady. *Daniel.*

FRENEU'SE-LAKE, a large lake of North America, through which St. John's river in New-Brunſwick paſſes.

FREN'ICLE DE BESSY (Bernard), a celebrated French mathematician in the 17th century, the intimate companion of Des Cartes, Fermat, Merſenne, and of other learned mathematicians who were contemporaries with them at Paris. He particularly excelled in the ſcience of arithmetic; and Des Cartes frequently expreſſed his ſurpriſe at his expertneſs in ſolving the moſt difficult problems without the aid of algebra. He was choſen a member of the French Academy of Sciences in 1666, and died in 1675. In the fifth volume of the Ancient Memoirs of the Academy, ſeveral of his pieces are inſerted: among which are, 1. A Method of reſolving Problems by Excluſions. 2. A Treatiſe of right-angled Triangles in Numbers. 3. A Short Treatiſe on Combinations. 4. Tables of Magic Squares, &c. In the *Commercium Epiſtolicum de Quæſtionibus quibuſdam Mathematicis*, printed at Oxford in 1658, the reader may find ſeveral of his letters written in the Latin language.

FRENI'GERENT, *adj.* [from the Lat. *frænum*, a bridle, and *gero*, to carry.] Guiding the bridle. *Cole. Not much uſed.*

FRENOY-LE-GRAND, a town of France, in the department of the Oiſe, and chief place of a canton, in the diſtrict of Compeigne: ſeven miles ſouth-weſt of Compeigne.

FRENS'WEGEN, a town of Germany, in the circle of Weſtphalia, and county of Bentheim: three miles north-north-weſt of Northorn.

FRENTA'NI, in ancient geography, a people of Italy, near Apulia, who received their name from the river *Frento*, now *Fortore*, which runs through the eaſtern part of their country, and falls into the Adriatic oppoſite the iſlands of Diomede. *Livy.*

FREN'ZY *ſ.* [φρενιτις, Gr. *phrenitis*, Lat. whence *phrenetiſy*, *phrenetſy*, *phrenzy*, or *frenzy.*] Madneſs; diſtraction of mind; alienation of underſtanding; any violent paſſion approaching to madneſs.—Why ſuch a diſpoſition of the body induceth ſleep, another diſturbs all the operations of the ſoul, and occaſions a lethargy or *frenzy*: this knowledge exceeds our narrow faculties. *Bent.*

True fortitude is ſeen in great exploits,
That juſtice warrants, and that wiſdom guides:
All elſe is touring *frenzy*: and diſtraction. *Addiſon.*

FREN'ZY, *adj.* [from the ſubſtantive.] Diſtracted; mad. *Not much uſed.*

FRE'QUENCE, *ſ.* [*frequence*, Fr. *frequentia*, Lat.] Crowd; concourſe; aſſembly:

He, in full *frequence* bright
Of angels, thus to Gabriel ſmiling ſpake. *Milton.*

FRE'QUENCY, *ſ.* [*frequentia*, Lat.] Common occurrence; the condition of being often ſeen or done.—Should a miracle be indulged to one, others would think themſelves equally entitled to it; and if indulged to many, it would no longer have the effect of a miracle: its force and influence would be loſt by the *frequency* of it. *Atterbury.* Concourſe; full aſſembly:

Thou cam'ſt ere while into this ſenate: who,
Of ſuch a *frequency*, ſo many friends
And kindred thou haſt here, ſaluted thee? *Ben Johnſon.*

FRE'QUENT, *adj.* [*frequent*, Fr. *frequens*, Lat.] Often done; often ſeen; often occurring:

An ancient and imperial city falls;
The ſtreets are fill'd with *frequent* funerals. *Dryden.*

Uſed often to practice any thing.—Every man thinks he may pretend to any employment, provided he has been loud and *frequent* in declaring himſelf hearty for the government. *Swift.*—Full of concourſe.—*Frequent* and full. *Milton.*

To FREQUE'NT, *v. a.* [*frequento*, Lat. *frequenter*, Fr.] To viſit often; to be much in any place; to reſort often to.

10.—There were ſynagogues for men to reſort unto: our Saviour himſelf and the apoſtles *frequented* them. *Hooker.*

To ſerve my friends, the ſenate I *frequent*;
And there what I before digeſted, vent. *Denham.*

FREQUENT'ABLE, *adj.* Converſable; acceſſible. *A word not uſed, though not inelegant.*—While youth laſted in him, the exerciſes of that age and his humour not yet fully diſcovered, made him ſomewhat the more *frequentable* and leſs dangerous. *Sidney.*

FREQUENTA'TION, *ſ.* [*frequentatio*, Lat.] Habit of frequenting.—The *frequentation* of courts checks this petulancy of manner. *Cheſterfield.*

FREQUENT'ATIVE, *adj.* [*frequentatif*, Fr. *frequentativus*, Lat.] A grammatical term applied to verbs ſignifying the frequent repetition of an action.

FREQUENT'ER, *ſ.* One who often reſorts to any place.—Perſons under bad imputations are no great *frequenters* of churches. *Swift.*

FREQUENT'ING, *ſ.* [from the participle.] The act of viſiting frequently.

FRE'QUENTLY, *adv.* [*frequenter*, Lat.] Often; commonly; not rarely; not ſeldom; a conſiderable number of times; manifold times.—I could not without much grief obſerve how *frequently* both gentlemen and ladies are at a loſs for queſtions and anſwers. *Swift.*

FRE'QUENTNESS, *ſ.* Frequency.

FRE'REN, or VREREN, a town of Germany, in the circle of Weſtphalia, and county of Lingen: ſix miles ſouth-eaſt of Lingen.

FRERET' (Nicholas), born at Paris in 1688, was the ſon of a ſolicitor in parliament. He was brought up to the bar, and through complaiſance to his family took an advocate's gown, without any inclination to the profeſſion. His favourite ſtudies were hiſtory and chronology, which he purſued with ſo much ardour and ſucceſs, that he obtained admiſſion into the Academy of Inſcriptions at the age of twenty-five. He ſignaliſed his entrance by a Diſcourſe on the Origin of the French, a learned but bold performance; which, in conjunction with ſome imprudent language on the quarrel between the princes of the blood and the regent, cauſed him to be impriſoned in the Baſtile. During his confinement, almoſt the only author given him to read was Bayle. He peruſed him ſo often, that he had him almoſt by heart; and the ſceptical principles of this philoſopher impreſſed him ſo deeply, that they were never obliterated. Their influence appeared in two of his works, the Letters from Thraſybulus to Leucippus, and the Examination of the Apologiſts of Chriſtianity; the latter a poſthumous piece, printed in 1767. After his liberation he addicted himſelf entirely to his former ſtudies. The fruits of theſe were, many Memoirs, inſerted in different volumes of the collection of papers by the Academy of Inſcriptions, and replete with profound erudition and curious diſcuſſion: the preface, notes, and a part of the tranſlation, of the Spaniſh romance entitled Tirante the White: ſeveral light pieces, on ſubjects which ſerved him as a relaxation from ſeverer taſks. He wrote with order and perſpicuity, but was fond of maintaining ſingular opinions. He died in 1749.

FRERON' (Elie-Catherine), born at Quimper in 1719. He entered young among the Jeſuits, and his literary taſte was cultivated by the fathers Brumoi and Bougeant. Upon ſome diſguſt he quitted the Jeſuits in 1739, and became a coadjutor of the abbé Des Fontaines in his periodical publications. He then publiſhed a critical journal of his own, under the title of *Lettres de Mad. la Compteſſe*, 1746, 12mo. in which he treated with freedom the literary reputation of ſome authors, who had the credit to procure the ſuppreſſion of his work. It re-appeared, however, in 1749, under the title of *Lettres ſur quelques Ecrits de ce Tems*, and was well received by the public, who were amuſed by the livelineſs and ſeverity of its ſtrictures. King Staniſlaus gave his protection to the author, and took pains to free the work from the interruptions it occaſionally met with. After publiſhing thirteen volumes of this journal, he dropt it in 1754 for a new one, entitled *L'Année Littéraire*; and of this he continued to iſſue eight volumes yearly as long as he lived. The ſpirit of his journal was that of attachment to ancient principles, and of zeal againſt the new philoſophy, as well as againſt innovation and neologiſm of all kinds. This was ſupported by a conſiderable fund of wit and gaiety, and general good taſte, when his judgment was not warped by prejudice. His own ſtyle was pure, but not free from college pedantry. He had the misfortune of uniting againſt him ſome of the principal writers of the time, of whom the moſt formidable was Voltaire. Freron had long carried on a warfare againſt this diſtinguiſhed author without provoking his notice. At length, on the occaſion of a ſevere criticiſm upon his comedy of *La Femme qui a Raiſon*, the wrath of the dramatiſt broke forth. He brought Freron upon the ſtage in his *Ecoſſaiſe*; and never omitted any opportunity of throwing odium and contempt upon him and his works. It is ſaid, however, that Voltaire acknowledged him to poſſeſs taſte, and extenſive acquaintance with French literature. Beſides his periodical works, he publiſhed *Opuſcules*, three volumes 12mo. conſiſting of pieces in proſe and verſe, the latter of which are judged to be compoſitions of labour rather than of genius. He alſo wrote *Les vrais Plaiſirs, ou les Amours de Venus et Adonis*, tranſlated from the Italian of Marino; and he began a tranſlation of Lucretius. He died in 1776.

FRES'CA, *ſ.* in old records, freſh water.

FRESCAD'ES, *ſ.* from the Italian, cool walks, ſhady places. *Scott.*

FRESCA'TI, or FRASCATI, a ſmall town of Italy, ſituated on the brow of a hill, about twelve miles to the eaſtward of Rome. It derives its name from the coolneſs of the air, and freſh verdure of the fields around. It is built on the ruins of the ancient Tuſculum; and the Tuſculan villa where Cicero wrote his famous queſtions is at a place now called *Grotta Ferrata*, about two miles diſtant. There is a fine proſpect from this town into the neighbouring country, which abounds with the ſeats and chateaus of the nobility. It is the ſee of a biſhop, who is one of the ſix ſenior cardinals.

FRESCLO'NE, a town of Italy, in the kingdom of Naples, and province of Moliſe: two miles ſouth-weſt of Moliſe.

FRES'CO, *ſ.* [Italian.] Coolneſs; ſhade; duſkineſs, like that of the evening or morning:

Helliſh ſprites
Love more the *freſco* of the nights. *Prior.*

A picture uſually drawn upon the ſides of rooms, upon lofty walls, or in alcoves, &c.

Here thy well-ſtudy'd marbles fix our eye;
A fading *freſco* here demands a ſigh. *Pope.*

Painting in FRESCO is performed with water-colours on freſh plaſter, or on a wall laid with mortar not quite dry. This mode of painting has a great advantage by incorporating with the mortar, and drying along with it, by which means it becomes very durable. *Vitruvius*, lib. vii. cap. 4. calls it *udo tectorio*. The art is very ancient, having been practiced in the early ages of Greece and Rome. It is chiefly performed on walls newly ſtuccoed, plaſtered with lime and ſand; but the ſtucco is only to be laid as the painting goes on; no more being to be done at once than the painter can diſpatch in a day, while it dries. Before he begins to paint, a cartoon or deſign is uſually made on paper, to be calked, and transferred to the wall, about half an hour after the plaſter is applied.

FRESH, *adj.* [ꝼꝛeꝛc, Sax. *fraiſche*, Fr.] Cool; not vapid with heat:

I'll cull the fartheſt mead for thy repaſt;
The choiceſt herbs I to thy board will bring,
And draw thy water from the *freſheſt* ſpring. *Prior.*

Not ſalt.—They keep themſelves unmixt with the ſalt water; ſo that, a very great way within the ſea, men may

may take up as *freſh* water as if they were near the land. *Abbot.*—New; not had before:

No borrowed bays his temples did adorn,
But to our crown he did *freſh* jewels bring. *Dryden.*

New; not impaired by time:

That love which firſt was ſet, will firſt decay;
Mine of a *freſher* date will longer ſtay. *Dryden.*

In a ſtate like that of recentneſs:

We will revive thoſe times, and in our memories
Preſerve and ſtill keep *freſh*, like flowers in waters.
Denham.

Thou ſun, ſaid I, fair light!
And thou enlighten'd earth, ſo *freſh* and gay! *Milton.*

Recent; newly come:

Amidſt the ſpirits Palinurus preſs'd;
Yet *freſh* from life, a new admitted gueſt. *Dryden.*

Repaired from any loſs or diminution:

Nor lies ſhe long; but as her fates ordain,
Springs up to life; and *freſh* to ſecond pain;
Is ſav'd to-day, to-morrow to be ſlain. *Dryden.*

Florid; vigorous; cheerful; unfaded; unimpaired:

Two ſwains
Freſh as the morn, and as the ſeaſon fair. *Pope.*

Healthy in countenance; ruddy.—It is no rare obſervation in England to ſee a *freſh*-coloured luſty young man yoked to a conſumptive female, and him ſoon after attending her to her grave. *Harvey.*

Haſt thou beheld a *freſher* gentlewoman,
Such war of white and red within her cheeks? *Shakeſpeare.*

Briſk; ſtrong vigorous.—As a *freſh* gale of wind fills the ſails of a ſhip. *Holder.*—Faſting; oppoſed to eating or drinking. *A low word.* Sweet; oppoſed to ſtale or ſtinking. Unpractiſed.—How green and *freſh* you are in this old world. *Shakeſpeare, K. John.*—In this ſenſe of the word members of the univerſity of Oxford for a ſhort period after their entrance are nick-named *freſhmen. Maſon's Supplement.*

FRESH, *ſ.* Water not ſalt:

He ſhall drink nought but brine; for I'll not ſhew him
Where the quick *freſhes* are. *Shakeſpeare.*

To FRESH, *v. a.* [from the *adjective.*] To refreſh:

But quickly ſhe it overpaſt, ſo ſoone
As ſhe her face had wypt to *freſh* her blood. *Spenſer.*

FRESH DISSEIS'IN, in law, that diſſeiſin which a man might formerly ſeek to defeat of himſelf, and by his own power, without reſorting to the king, or the judicature; as where it was not above fifteen days old, or of ſome other ſhort continuance. *Britton, c.* 5. Of this, *Bracton* writes at large, concluding it to be arbitrary. *Lib.* 4. *c.* 5. See the article DISSEISIN, vol. v. p. 887.

FRESH FORCE, *ſ.* in law, a force newly done in any city, borough, &c. And if a perſon be diſſeiſed of any lands or tenements within ſuch a city, or borough, he who hath a right to the land, by the uſage and cuſtom of the ſaid city, &c. may bring his *aſſiſe*, or *bill of freſh force*, within forty days after the *force* committed; and recover the lands. *F. N. B.* 7. This remedy may alſo be had where any man is deforced of any lands, after the death of his anceſtor, to whom he is heir; or after the death of tenant for life, or in tail, in dower, &c. within forty days after the title accrued; and in a bill of *freſh force*, the plaintiff or demandant ſhall make proteſtation to ſue in the nature of what writ he will, as *aſſiſe* of *mortdanceſtor*, of *novel diſſeiſin, intruſion, &c. New Nat. Br.* 15. The aſſiſe or bill of *freſh force* is ſued out without any writ from the chancery; but after the forty days, there is to be writ out of chancery, directed to the mayor, &c. But this writ is obſolete ſince ejectments have come in uſe for recovering the poſſeſſion of lands, &c.

FRESH SUIT, in law, is ſuch a preſent and earneſt following of an offender, where a robbery is committed, as never ceaſes from the time of the offence done or diſcovered, until he be apprehended. And the benefit of ſuch purſuit of a felon is, that the party purſuing ſhall have his goods reſtored to him; which otherwiſe are forfeited to the king. *Staundf. Pl. Cor. lib.* 3. *c.* 10. When an offender is thus apprehended, and indicted, upon which he is convicted, the party robbed ſhall have reſtitution of his goods; and though the party robbed do not apprehend the thief preſently, but that it be ſome time after the robbery, if the party did what in him lay to take the offender; and notwithſtanding in ſuch caſe he happen to be apprehended by ſome other perſon, it ſhall be adjudged *freſh purſuit. Terms de Ley.* It has been anciently holden, that to make a *freſh ſuit*, the party ought to make *hue and cry* with all convenient ſpeed, and to have taken the offender himſelf, &c. But at this day, if the party hath been guilty of no groſs negligence, but hath uſed all reaſonable care in inquiring after, purſuing, and apprehending, the felon, he ſhall be allowed to have made ſufficient *freſh ſuit. 2 Hawk. P. C. c.* 23. Alſo it is ſaid, that the judging of *freſh ſuit* is in the diſcretion of the court, though it ought to be found by the jury; and the juſtices may, if they think fit, award reſtitution without making any inquiſition concerning the ſame. *2 Hawk. P. C. c.* 23.

Where a gaoler immediately purſues a felon, or other priſoner, eſcaping from priſon, it is *freſh ſuit*, to excuſe the gaoler: and if a lord follow his *diſtreſs* into another's ground, on its being driven off the premiſes, this is called *freſh ſuit*; ſo where a tenant purſues his cattle, that eſcape or ſtray into another man's lands, &c. *Freſh ſuit* may be either within the *view*, or without; as to which the law makes ſome difference: and it has been ſaid, that *freſh ſuit* may continue for ſeven years. *3 Rep. S. P. C.*

To FRESH'EN, *v. a.* To make freſh:

Preclufive drops let all their moiſture flow
In large effuſion o'er the *freſhen'd* world. *Thomſon.*

To FRESH'EN, *v. n.* To grow freſh:

A *freſhening* breeze the magic power ſupply'd,
While the wing'd veſſel flew along the tide. *Pope.*

FRESH'ES, *ſ.* in ſea-language, denotes the impetuoſity of an ebb-tide, increaſed by heavy rains, and flowing out into the ſea, often diſcolouring it to a conſiderable diſtance, and forming a line that ſeparates the two colours, and which may be diſtinctly perceived for a great length along the coaſt. The word is of common uſe in America, where the inundations ſo called are of great ſervice. They bring down the ſoil to the intervals below, and form a fine mould, producing corn, grain, and herbage, in the moſt luxuriant plenty. They alſo afford another benefit, in regard to many rivers in America, viz. in equalizing the ſurface of the ſtream where rapid falls, or caſcades, obſtruct the navigation; ſo that rafts of timber and other merchandize are floated down to the ſea-ports.

FRESH'ET, *ſ.* A pool of freſh water:

All fiſh from ſea or ſhore,
Freſhet or purling brook, or ſhell or fin. *Milton.*

FRESH'LY, *adv.* Coolly; newly; in the former ſtate renewed:

Then ſhall our names,
Familiar in their mouth as houſhold words,
Be in their flowing cups *freſhly* remember'd. *Shakeſpeare.*

With a healthy look; ruddily.—Looks he as *freſhly* as he did the day he wreſtled. *Shakeſpeare.*

FRESH'NESS, *ſ.* Newneſs; vigour; ſpirit; the contrary to vapidneſs.—Moſt odours ſmell beſt broken or cruſhed; but flowers preſſed or beaten, do loſe the *freſhneſs* and ſweetneſs of their odour. *Bacon.*—Freedom from diminution by time; not ſtaleneſs.—For the conſtant *freſhneſs* of it, it is ſuch a pleaſure as can never cloy or overwork the mind; for ſurely no man was ever weary of

thinking that he had done well or virtuouſly. *South.*—Freedom from fatigue; newneſs of ſtrength.—The Scots had the advantage both for number and *freſhneſs* of men. *Hayward.*—Coolneſs:

She laid her down to reſt,
And to the wind expos'd her glowing breaſt,
To take the *freſhneſs* of the morning air. *Addiſon.*

Ruddineſs; colour of health:

The ſecret venom, circling in her veins,
Works through her ſkin, and burſts in bloating ſtains;
Her cheeks their *freſhneſs* loſe and wonted grace,
And an unuſual paleneſs ſpreads her face. *Granville.*

FRESH'WATER, [a compound word of *freſh* and *water*, uſed as an adjective.] Raw; unſkilled; unacquainted. A low term borrowed from the ſailors, who ſtigmatiſe thoſe who come firſt to ſea as *freſhwater* men, or novices.—Thoſe nobility, as *freſhwater* ſoldiers which had never ſeen but ſome light ſkirmiſhes, in their vain bravery made light account of the Turks. *Knolles.*—When applied to pure water, it means that which riſes inland, and forms rivers; or that which is taken from the pump or well, and not tinctured with gaſeous or ſaline particles. It is commonly oppoſed to *ſalt*-water.

FRESH'WATER, a river of Wales, in the county of Pembroke, which runs into the ſea: ſix miles ſouth-eaſt from Pembroke Haven, forming a bay at its mouth, to which it gives name.

FRESH'WATER BAY, a bay in the Straits of Magellan. Lat. 53. 27. N. lon. 72. 13. W. Greenwich.

FRESH'WATER BAY, a bay on the ſouth-weſt coaſt of the Iſle of Wight. Lat. 50. 37. N. lon. 1. 31. W. Greenwich.

FRESH'WATER BAY, a bay on the eaſt coaſt of Newfoundland. Lat. 49. 10. N. lon. 53. 30. W. Greenwich.

FRESHWATER SOL'DIER, in botany. See STRATIOTES.

FRESNE, a town of France, in the department of the Meuſe, and chief place of a canton, in the diſtrict of Verdun: three leagues and a half ſouth-eaſt of Verdun, and four north-north-eaſt of St. Mihiel.

FRESNE ST. MAMETZ, a town of France, in the department of the Upper Saône, and chief place of a canton, in the diſtrict of Gray: four leagues north-eaſt of Gray, and four ſouth-weſt of Veſoul.

FRESNEAU', a town of France, in the department of the Oiſe, and chief place of a canton, in the diſtrict of Chamont: ten miles ſouth of Beauvais.

FRESNES, a town of France, in the department of the Straits of Calais, and chief place of a canton, in the diſtrict of Arras: two leagues and a half north-eaſt of Arras.

FRESNES, a town of France, in the department of the Calvados: twelve miles ſouth of Vire.

FRESNIL'LO, a town of Mexico, in the province of Zacatecas: forty miles north of Zacatecas.

FRES'NO, a town of Spain, in Old Caſtile: five miles ſouth of Borgo d'Oſma.

FRES'NO, a town of Spain, in Andaluſia: twenty miles north of Cordova.

FRESNOY', a town of France, in the department of the Oiſe: ſeven miles ſouth-weſt of Compiegne.

FRESNOY' (Charles-Alphonſe du), ſon of an apothecary in Paris, where he was born in 1611. Deſtined by his father to the medical profeſſion, he was carefully educated for that purpoſe, and diſtinguiſhed himſelf at college by his progreſs in literature. But the prizes which he obtained for his poetical exerciſes, nouriſhed his paſſion for that art, and inſpired him with diſguſt to the ſtudy of phyſic. To a love for poetry he joined that for its ſiſter art, painting; and notwithſtanding all the rigours of parental authority, he perſevered in his purpoſe of following the latter as his profeſſion. He practiſed for two years in the ſchools of Perrier and Vouet, and at the age of twenty-one departed for Italy. At Rome he employed himſelf in drawing ruins and pieces of architecture, amidſt the greateſt pecuniary difficulties, deſtitute as he was of all ſupport from his irritated relations. He had paſſed two years in this manner, when his youthful companion and friend Mignard arrived in that capital. Every thing was ſoon in common between them: they lodged, worked, and ſtudied, together, and obtained the name of *the inſeparables*. They copied for the cardinal of Lyons all the fine pictures of the Farneſe palace; but the principal objects of their ſtudy were the works of Raphael, and the relics of antiquity. Of the two friends, Mignard had the readieſt hand, but Du Freſnoy poſſeſſed the moſt learning, and the profoundeſt knowledge in the theory of his art. He continued to pay his devoirs to the muſes; and as he painted, he wrote down his obſervations, which were the ground-work of the poem on painting, by which he has acquired his chief celebrity. Though he wrought ſlowly, and his pictures are few in number, he is thought to have approached more nearly than almoſt any artiſt to Titian, whom he imitated in his colouring, as he did the Caracci in deſign. After paſſing ſome time at Venice, where Mignard joined him, he returned to Paris in 1656. He took up his abode with a friend, and painted a few altar-pieces, landſcapes, and cabinet pictures. On the return of Mignard, Du Freſnoy rejoined his old friend, and continued with him till his laſt illneſs. He did not ceaſe to beſtow additional touches upon his poem, which he forbore to publiſh till he had a French verſion to appear along with it. This was at length undertaken by De Piles, and Du Freſnoy had begun a commentary upon it, when he was carried off by a paralytic ſtroke, at the age of fifty-four, in 1665. His poem *De Arte Graphica*, appeared three years afterwards. His tranſlator, Maſon, is ſo little its encomiaſt as to ſay, "Nobody, I ſhould ſuppoſe, ever read Freſnoy to admire, or even criticiſe, his verſification, but either to be inſtructed by him as a painter, or improved as a virtuoſo." It has nevertheleſs kept a reſpectable place among modern Latin poems; and beſides the French verſion of De Piles, which was well received, it has been thought worthy of tranſlation into Italian and Engliſh; in the latter language, firſt by Dryden, and lately, with much more correctneſs, by Maſon, who has ſubjoined ſome valuable notes.

FRES'QUEL, a river of France, which runs into the Aude, near Carcaſſonne.

FRESSELI'NES, a town of France, in the department of the Creuſe, and chief place of a canton, in the diſtrict of La Souterraine, on the Creuſe: five leagues north-north-weſt of Gueret.

FRESSENVIL'LE, a town of France, in the department of the Somme: ten miles weſt of Abbeville.

FRESSIN', a town of France, in the department of the Straits of Calais, and chief place of a canton, in the diſtrict of Montreuil: one league and a half north of Heſdin.

FRES'TA, a town of Sweden, in the province of Upland: twenty-one miles ſouth-eaſt of Upſal.

FRES'WICK WATER, a ſmall river of Scotland, which runs into the ſea, near Wick-town, in the county of Caithneſs.

FRET, *ſ.* [Of this word the etymology is very doubtful: ſome derive it from ϸnetan, to eat; others from ϸnetϸan, to adorn; ſome from φείττω; *Skinner* more probably from *fremo*, or the French *fretiller*: perhaps it comes immediately from the Latin *fretum*.] A frith; or ſtrait of the ſea; where the water by confinement is always rough.—Euripus generally ſignifieth any ſtrait, *fret*, or channel of the ſea, running between two ſhores. *Brown.*—Any agitation of liquors by fermentation; confinement; or other cauſe.—The blood in a fever, if well governed, like wine upon the *fret*, diſchargeth itſelf of heterogeneous mixtures. *Derham.*—That ſtop of the muſical inſtrument which cauſes or regulates the vibrations of the ſtring.—It requireth good winding of a ſtring before it will

will make any note; and, in the tops of lutes, the higher they go, the leſs diſtance is between the *frets*. *Bacon.*

The harp
Had work, and reſted not: the ſolemn pipe
And dulcimer, all organs of ſweet ſtop,
All ſounds on *fret* by ſtring or golden wire,
Temper'd ſoft tunings, intermix'd with voice
Choral or uniſon. *Milton.*

Work riſing in protuberances.—The *frets* of houſes, and all equal figures, pleaſe; whereas unequal figures are but deformities. *Bacon.*—We take delight in a proſpect well laid out, and diverſified with fields and meadows, woods and rivers, in the curious *fret*-works of rocks and grottos. *Spectator.*—Agitation of the mind; commotion of temper; paſſion:

Calmneſs is great advantage: he that lets
Another chafe, may warm him at his fire,
Mark all his wand'rings, and enjoy his *frets*
As cunning fencers ſuffer heat to tire. *Herbert.*

To FRET, *v. a.* To agitate violently by external impulſe or action:

You may as well forbid the mountain pines
To wag their high tops, and to make a noiſe
When they are *fretted* with the guſts of heav'n. *Shakeſpeare.*

To wear away by rubbing.—In the banks of rivers, with the waſhing of the water, there were divers times *fretted* out big pieces of gold. *Abbot.*—To hurt by attrition:

Antony
Is valiant and dejected; and, by ſtarts,
His *fretted* fortunes gave him hope and fear
Of what he has and has not. *Shakeſpeare.*

To corrode; to eat away.—It is *fret* inward, whether it be bare within or without. *Lev.* xiii. 55.

The painful huſband, plowing up his ground,
Shall find all *fret* with ruſt, both pikes and ſhields,
And empty helms under his harrow found. *Hakewill.*

To form into raiſed work:

Nor did there want
Cornice or freeze, with boſſy ſculptures grav'n;
The roof was *fretted* gold. *Milton.*

To variegate; to diverſify:

Yon grey lines,
That *fret* the clouds, are meſſengers of day. *Shakeſpeare.*

To make angry; to vex.—Becauſe thou haſt *fretted* me in all theſe things, behold I will recompenſe thy way upon thine head. *Ezek.* xvi. 43.—Injuries from friends *fret* and gall more, and the memory of them is not ſo eaſily obliterated. *Arbuthnot.*

To FRET, *v. n.* To be in commotion; to be agitated:

Th' adjoining brook, that purls along
The vocal grove, now *fretting* o'er a rock,
Now ſcarcely moving through a ready pool. *Thomſon.*

To be worn away; to be corroded.—Take a piece of glovers' leather that is very thin, and put your gold therein, with ſal armoniac, binding it cloſe, and then hang it up: the ſal armoniac will *fret* away, and the gold remain behind. *Peacham.*—To make way by attrition or corroſion.—It inflamed and ſwelled very much; many wheals aroſe, and *fretted* one into another with great excoriation. *Wiſeman.*—To be angry; to be peeviſh; to vex himſelf.—His heart *fretteth* againſt the Lord. *Prov.* xix. 3.

Helpleſs, what may it boot
To *fret* for anger, or for grief to moan! *Spenſer.*

Be lion-mettled, proud, and take no care
Who chafes, who *frets*, or where conſpirers are. *Shakeſp.*

FRET'EVAL, a town of France, in the department of the Loir and Cher: two leagues north-eaſt of Vendome, and ſix north of Blois.

FRET'FUL, *adj.* Angry; peeviſh; in a ſtate of vexation.—They are extremely *fretful* and peeviſh, never well at reſt; but always calling for this or that, or changing their poſture of lying or ſitting. *Harvey.*

Thy knotty and combined locks to part,
And each particular hair to ſtand on end,
Like quills upon the *fretful* porcupine. *Shakeſpeare.*

FRET'FULLY, *adv.* Peeviſhly.

FRET'FULNESS, *ſ.* Paſſion; peeviſhneſs; a diſeaſe or diſturbance of the mind. It is not eaſy to imagine, how a temper ſo abhorrent to all ſociability, can inſinuate itſelf into the heart of man; but life is pregnant with examples of it. Perhaps, where it does not proceed from a ſullen ſelfiſhneſs, from an unſympathiſing ſpirit; it may generally owe its birth and growth to an exceſs of care and anxiety; in ſome inſtances, to too delicate and faſtidious feelings; and, what may ſeem ſtrange, in a few, to even an exceſs of tenderneſs and love. An undue attachment to any one object ſo weds the heart to this ſingle object, ſo magnifies the importance of it, ſo inflames, and gives ſuch a corroding anxiety to, our hopes, that we live for no other object; we loſe the reliſh for the thouſand pleaſantries of life; we fear an enemy in every thing around us, in the ordinary occurrences of life; the cheerful tone of the mind is gone; and, with all the deſire of joy and happineſs, joy and happineſs hide themſelves from us, as if they fled from our preſence. An over-anxious attachment to children has robbed many a parent of all the affections of their children; and many a one has driven away a friend by an over-nice delicacy and jealous attention to the punctilios of friendſhip. All the benevolent charities of life love to breathe a free, unreſtrained, and pleaſant, air; their natural food is good-humour and cheerfulneſs, which the peeviſh, the fretful, and diſcontented, man has not to give. As the diſeaſe ariſes from ſuffering the affections to be narrowed and contracted to one or a few objects, ſo there is no cure to be expected but from the enlargement of the ſoul; we muſt ſet limits to the attachment which has monopoliſed us, by counteracting its influence, by throwing open the heart anew to the ten thouſand agreeable objects with which God has been pleaſed to enrich his world. We muſt lay ourſelves out to find the agreeable and the good in many ways, as well as one; and by indulging to the diverſified charities, bring back good temper and cheerfulneſs to the mind. This cure is indeed hard to be effected, ſuch is the ſullen obſtinacy of the diſeaſe; but it is poſſible to him who will attempt it; while the repreſentation of the ill is at leaſt of uſe to thoſe, whom it has not invaded. It ſhews the neceſſity of not ſuffering our hearts to be ſtolen away by one uſurping object from all the other allowable good and comfort which the Creator has been pleaſed to ſpread before man. He, who gives way to the unhappy ſpirit of fretfulneſs, will ſoon loſe every friend whom he has acquired in his better days, and never know the happineſs of gaining a new one.

FRETH'UN, a town of France, in the department of the Straits of Calais: one league ſouth of Calais.

FRET'OY (Le), a town of France, in the department of the Oiſe, and chief place of a canton, in the diſtrict of Noyon: five miles north-weſt of Noyon.

FRET'TY, *adj.* Adorned with raiſed work.

FREU'DENBERG, a town of Germany, in the circle of Weſtphalia, and principality of Naſſau Siegen: five miles weſt-north-weſt of Siegen.

FREU'DENBERG, a town of Germany, in the circle of Bavaria, and Upper Palatinate: four miles eaſt of Amberg.

FREU'DENBERG, a town of Germany, in the circle of Franconia, and county of Wertheim, on the Main: eight miles north of Wertheim, and twenty-eight north-eaſt of Heidelberg.

FREU'DENSTADT, a town of Germany, in the circle of Swabia, and duchy of Wurtenberg, founded in the year 1600, as an aſylum for the Proteſtants who were perſecuted

fecuted in Germany; it is ſituated in the Black Foreſt, fortified in the modern manner, and defended by a citadel: thirty-ſix miles ſouth-weſt of Stuttgart, and twenty-four ſouth-eaſt of Straſburg. Lat. 48. 23. N. lon. 26. E. Ferro.

FREU'DENTHAL, a town of Sileſia, in the principality of Troppau, celebrated for its breed of horſes, and manufacture of fine linen. It was taken by the Pruſſians in 1741 and 1744, and afterwards reſtored to the houſe of Auſtria: ſeventeen miles weſt of Troppau, and eleven ſouth-weſt of Jagendorf.

FREU'DENTHAL, or BRISTRA, a village of Carniola, with a Carthuſian monaſtry, ſituated near the riſe of the Feiſtritz: five miles north of Cirknitz.

FRE'VENSTEIN, a town of Germany, in the duchy of Stiria: three miles north-eaſt of Windiſch Weiſtritz.

FREVE'NT, a town of France, in the department of the Straits of Calais, and chief place of a canton, in the diſtrict of St. Pol: two leagues and a half ſouth of St. Pol, and ſix weſt of Arras.

FREVIL'LE, a town of France, in the department of the Lower Seine, and chief place of a canton, in the diſtrict of Caudebec: one league and a half north-eaſt of Caudebec.

FREUND'SBERG, a town of Germany, in the county of Tyrol: two miles eaſt of Schwatz.

FREUND'SHEIM, a town of Germany, in the county of Tyrol: twenty-four miles weſt of Innſpruck.

FREX'ENAL. See FREJENAL.

FREY (John-Cecil), a German philoſopher and phyſician, born at Keiſerſtul, a town in the county of Baden, towards the end of the 16th century. He applied himſelf particularly to the ſtudy of philoſophy, and, going to Paris, delivered public lectures at Montague college, in that city. In one of his pieces, Frey boaſts of having been the firſt perſon in Europe who maintained philoſophical theſes in the Greek language, and of having been the means of bringing this mode of diſputation into general eſteem. Afterwards he applied himſelf to the ſtudy of medicine, and was admitted to the degree of doctor in that faculty. He died of the plague at Paris, in 1631. He lived on terms of great intimacy with Baleſdens, who was one of the firſt members of the French academy, and who publiſhed a collection of his friend's philoſophical pieces, entitled *Joanni Cæcilii Frey, Doctoris Medici Pariſienſis Facultatis, necnon Philoſophorum ejuſdem Academiæ Decani, Opera quæ reperiri potuerunt, in unum Corpus collecta*, 8vo. 1645. In 1646, a ſecond collection of the *Opuſcula* of Frey, on philoſophical and medical ſubjects, was publiſhed at Paris, in 8vo.

FREY'A, one of the Saxon idols.

FREY'BERG, a mountain of Swiſſerland, in the canton of Glaris, ſeven miles ſouth of Glaris.

FREY'BERG. See FRIBURG.

FREY'BERG, or FRIEDBERG, a town of Germany, in the circle of Upper Saxony, and margraviate of Meiſſen, and capital of the circle of Erzgeburg, ſituated on a branch of the Muldaw, near ſome mountains which ſeparate the country from Bohemia. It contains ſix churches, 2000 houſes, and 60,000 ſouls. In the environs are mines of copper, tin, lead, and ſilver, which employ a great many hands, and produce about 10,000 rix dollars a-year. The ſoil, though mountainous, is fertile. Here is the general ſepulture of the princes of the electoral houſe of Saxony. It was taken by the Imperial troops in 1632; and in 1762 the Pruſſians here obtained an advantage over the Auſtrians: nineteen miles weſt-ſouth-weſt of Dreſden, and eighteen ſouth-ſouth-weſt of Meiſſen. Lat. 50. 53. N. lon. 31. 1. E. Ferro.

FREY'BORG, or PRIBOR, a town of Moravia, in the circle of Prerau: twenty-eight miles eaſt-north-eaſt of Prerau, and thirty-ſix eaſt of Olmutz.

FREY'BURG. See FRIBURG.

FREY'BURG, a town of Sileſia, in the principality of Schweidnitz, near the river Polſnitz: ſeven miles weſt of Schweidnitz.

FREY'BURG, a town of Germany, in the circle of Upper Saxony, and circle of Thuringia: ſixteen miles ſouth of Halle, and four north-north-weſt of Naumburg.

FREYE AEMTER, a country of Swiſſerland, ſurrounded by the cantons of Zurich, Bern, Lucerne, and Zug, and the county of Baden. It was anciently called the *County of Rori*, or *Wagghenthal*, and belonged to the counts of Habſburg, from whom the Swiſs conquered it, in 1415, and kept it. The inhabitants are Roman Catholics; their chief employment is the cultivation of their fields and vineyards. The country is about ſeven or eight leagues in length, and three or four in breadth. The number of inhabitants is about 20,000.

FREY'ENSTADT, a town in Germany, in the circle of Bavaria, and lordſhip of Breiteneck, ſituated on the Schwarzach: twenty miles ſouth-eaſt of Nuremberg, and thirty-one north-weſt of Ratiſbon. Lat. 49. 9. N. lon. 29. 8. E. Ferro.

FREY'ENSTEIN, a town of Germany, in the circle of Upper Saxony, and Mark of Prignitz: four miles ſouth-eaſt of Meyenburg.

FREY'ENTHURN, a town of Germany, in Middle Carniola, on the Kulp: ſeven miles ſouth of Rudolfſworth.

FREY'ENWALDE, a town of Germany, in the circle of Upper Saxony, and Middle Mark of Brandenburg, on the Oder; the inhabitants carry on a conſiderable trade in fiſh, corn, beer, linen, medicinal waters, and alum: thirty-two miles north-eaſt of Berlin, and twenty-four north-weſt of Cuſtrin.

FREY'HAN, a town of Sileſia, in the principality of Oels: ſix miles north-north-eaſt of Militſch.

FREY'HEIL, a town of Bohemia, in the circle of Konigingratz; in the neighbourhood are ſome warm baths: ſix miles north-weſt of Trautenau.

FREY'HOFF, a town of Germany, in the duchy of Carniola, ſituated on the Kulp: ſeven miles ſouth-weſt of Landſtraſs.

FREY'HUNG, a town of Germany, in the circle of Bavaria, and principality of Sulzbach: eleven miles north of Amberg, and ten north-eaſt of Sulzbach.

FREY'LA, a town of Spain, in the country of Granada: eighteen miles north-north-eaſt of Guadix.

FREYL'ING, a town of Germany, in the archduchy of Auſtria: four miles eaſt-ſouth-eaſt of Efferding.

FREYSIN'GEN, or FREISINGEN, or FRISINGEN (Biſhopric of), an eccleſiaſtical principality of Germany, in the circle of Bavaria, ſituated between the cities of Munich and Landſhut, founded by St. Corbinien, who was conſecrated biſhop by pope Conſtantius III. about the year 710. As a prince of the empire, his aſſeſſment amounts to 464 florins, and his tax to the imperial chamber 152 rixdollars nineteen kruitzers. The territories include the town of Freyſingen, the county of Iſmaning, the lordſhip of Burgkrain, and the county of Werdenfels.

FREYSIN'GEN, a town of Germany, in the circle of Bavaria, and reſidence of the biſhop of Freyſingen, of which it is the capital, ſituated on the Moſach, not far from the Iſer, one part at the foot of a mountain, and the other on its ſummit. The epiſcopal palace and cathedral church are beautiful edifices, and both ſituated in the upper part of the town. When the biſhopric was firſt founded, this town appears to have been the capital of Upper Bavaria. In 1116, it was deſtroyed by Guelpho II. duke of Bavaria: ſeventeen miles north-north-eaſt of Munich, and eighteen ſouth-weſt of Landſhut. Lat. 48. 20. N. lon. 29. 29. E. Ferro.

FREY'STADT, a town of Pruſſia, in the province of Oberland: eighty miles ſouth-weſt of Konigſberg.

FREY'STADT, a town of Sileſia, in the principality of Glogau; containing a Roman Catholic church, a convent, and a Lutheran church and ſchool, the privilege for the two latter was purchaſed for 90,000 florins. Here is a manufacture of good cloth: nineteen miles weſt-north-weſt of Gros-Glogau, and fourteen north-eaſt of Sagan.

FREY'STADT, a town of Sileſia, in the principality of Teſchen: ſeven miles north-north-weſt of Teſchen.

FREY'STATT, or FREUSTADT, a town of Germany, in the archduchy of Auſtria: eighty-two miles weſt of Vienna, and thirteen north of Ens. Lat. 48. 25. N. lon. 32. 8. E. Ferro.

FREY'STATTL, a town and caſtle of Hungary, on the Waag: two miles north-eaſt of Leopoldſtadt.

FREY'STETT, or FREYSTAETT, a town of Germany, in the circle of the Upper Rhine, and county of Catzenelnbogen, on the Main; where Roman Catholics, Lutherans, and Calviniſts, are allowed the free exerciſe of their religion: twelve miles north-weſt of Darmſtadt.

FREY'TAG (Frederic Gotthelf), a burgomaſter of Nuremberg, born at Schulpforten in 1723. He made himſelf celebrated by the ſervice which he rendered to the ſciences, and died on the 12th of February, 1776. His acquaintance with the hiſtory of literature was not only extenſive, but profound; and his works relative to this ſubject will be laſting monuments of his erudition and diligence. The principal of them are: 1. *Rhinoceros veterum ſcriptorum Monumentis deſcriptus*, Lip. 1747, 8vo. 2. *Analecta literaria, de Libris rarioribus*, ibid. 1751, 8vo. 3. *Oratorum et Rhetorum Græcorum quibus Statuæ honoris Cauſa poſitæ fuerunt*, Decas Lip. 1752, 8vo. 4. *Apparatus literarius, ubi Libri partim antiqui, partim rari, recenſentur*, tom. i. Lip. 1752; tom. ii. 1753; tom. iii. 1756. This is a continuation of the *Analecta literaria*. 5. *Specimen hiſtoriæ literatæ, quo Virorum Feminarumque μητροδιδακτων Memoriam recolit*, ibid. 1765, 8vo. 6. An Account of ſcarce and remarkable Books, vol. i. Gotha, 1776, 8vo. The author left two other volumes in manuſcript ready for the preſs, which have not been publiſhed. Beſides theſe, Freytag was the author of many tranſlations from the French, and of various eſſays and papers publiſhed in the *Acta Acad. Erford*, the *Schriftſteller nach der mode*; the *Naturforſcher*; and other periodical works.

FREY'UNG, a town of Germany, in the circle of Bavaria, and biſhopric of Paſſau: fourteen miles north of Paſſau.

FREY'WALDE, a town of Sileſia, in the principality of Grotkau, reſerved by the houſe of Auſtria, in 1742: fifteen miles ſouth of Neiſſe.

FREZI'ER (Amedée-Francis) born at Chamberry in 1682, of a family diſtinguiſhed in the long robe, originally from Scotland (probably one of the Frazers). He firſt ſtudied juriſprudence at Paris, but his inclination leading him to mathematics, he entirely devoted himſelf to that ſcience, and entered the corps of engineers in 1707. The court employed him in a ſurvey of the Spaniſh colonies of Peru and Chili in 1711; and on his return from thoſe countries he publiſhed a Voyage to the South-Sea, 4to. 1716; a work in good eſteem. He was afterwards entruſted with the ſuperintendence of the fortifications at St. Malo, St. Domingo, and Landau, and was rewarded with the croſs of St. Louis, and a lieutenant-colonelcy. In 1740 he was appointed director of all the fortified places in Brittany. He fixed his reſidence in Breſt, where he died in 1772. The other works of Frezier are, *Traité des Feux d'Artifice*, 8vo. 1747. *Elemens de Stereotomie*, two volumes 8vo. 1759: and the latter enlarged under the title of *Theorie et Pratique de la Coupe des Pierres et des Bois*, three volumes, 4to. 1769. Theſe are accounted uſeful and accurate works; the laſt is eſpecially eſteemed.

FRIABI'LITY, *ſ.* Capacity of being eaſily reduced to powder.—Hardneſs, *friability*, and power to draw iron, are qualities to be found in a loadſtone. *Locke.*—It is ſuppoſed that friability ariſes from hence, that the body conſiſts wholly of dry parts irregularly combined, and which are readily ſeparated, as having nothing unctuous or glutinous to bind them together.

FRI'ABLE, *adj.* [*friable*, Fr. *friabilis*, Lat.] Eaſily crumbled; eaſily reduced to powder.—The liver, of all the viſcera, is the moſt *friable*, and eaſily crumbled or diſſolved. *Arbuthnot.*

FRI'AR, *ſ.* [A corruption of *frere*, Fr.] A religious; a brother of ſome regular order.—He's but a *friar*, but he's big enough to be a pope. *Dryden.*

All the prieſts and *friars* in my realm,
Shall in proceſſion ſing her endleſs praiſe. *Shakeſpeare.*

Friars are generally diſtinguiſhed into four principal branches, viz. 1. Minors, grey friars, or franciſcans. 2. Auguſtines. 3. Dominicans, or black friars. 4. White friars or carmelites. From theſe four the reſt of the orders deſcended. See FRANCISCANS, AUGUSTINES, &c. Friar, in a more peculiar ſenſe, is reſtrained to ſuch monks as are not prieſts; for thoſe in orders are uſually dignified with the appellation of *father*.

FRI'AR's COWL, *ſ.* The trivial name of a plant. It agrees with arum, from which it differs only in having a flower reſembling a cowl.

FRIAR's HOOD, a mountain of the iſland of Ceylon, near the eaſt coaſt: ſixty-eight miles eaſt of Candi.

FRIAR's ISLAND, an iſland in the Atlantic, near the weſtern coaſt of Ireland: three miles ſouth from Inis Boffin.

FRI'ARLIKE, *adj.* Monaſtic; unſkilled in the world.—Their *friarlike* general would the next day make one holyday in the Chriſtian calendars, in remembrance of thirty thouſand Hungarian martyrs ſlain of the Turks. *Knolles.*

FRI'ARLY, *adj.* Like a friar, or man untaught in life.—Seek not proud riches, but ſuch as thou may'ſt get juſtly, uſe ſoberly, diſtribute cheerfully, and leave contentedly; yet have no abſtract nor *friarly* contempt of them. *Bacon.*

FRI'ARY, *ſ.* A monaſtery or convent of friars.

FRI'ARY, *adj.* Like a friar.—Francis Cornfield did ſcratch his elbow when he had ſweetly invented to ſignify his name, St. Francis, with a *friary* cowl in a corn field. *Camden.*

FRI'AS, a town of Spain, in Old Caſtile, ſituated on an eminence near the Ebro: twenty miles north-north-eaſt of Burgos, and 138 north of Madrid. Lat. 42. 42. N. lon. 13. 24. E. Ferro.

FRIA'TION, *ſ.* [*frio*, Lat. to crumble.] The act of crumbling; the act of reducing to powder. *Scott. Not much uſed.*

FRI'AUVILLE, a town of France, in the department of the Moſelle, and chief place of a canton, in the diſtrict of Briey: two leagues and a quarter ſouth of Briey, and four and a quarter weſt of Metz.

FRIB'BLE, *ſ.* A fop; an inſignificant fellow.

To FRIB'BLE, *v. n.* To trifle:

Though cheats, yet more intelligible
Than thoſe that with the ſtars do *fribble*. *Hudibras.*

FRIB'BLER, *ſ.* A trifler.—A *fribbler* is one who profeſſes rapture for the woman, and dreads her conſent. *Spectator.*

FRI'BURG, or FREYBURG, a town of Germany, in the circle of Swabia, and capital of the Auſtrian Briſgau, ſituated at the foot of a ſtony mountain, on the river Traiſam, founded in 1118, by Berthold III. duke of Zahringen, from whom it came to the counts of Furſtenberg, with whom it had many diſputes on account of its privileges, and at laſt purchaſed its freedom for twenty thouſand marks of ſilver. This ſum was advanced by the houſe of Auſtria, by which means the town became ſubject to that family. It was formerly an important fortreſs; but being taken ſeveral times by the Swedes and the French, it was diſmantled by the latter, in 1744. The ſtreets are broad and well paved. The principal church is a ſuperb edifice. Here is an univerſity, founded in 1457, by Albert IV. duke of Auſtria, with an academy and five colleges depending on it. Here are beſides ten

convents, a commandery of the Teutonic order, and thirteen churches. The principal buſineſs carried on is poliſhing cryſtals and precious ſtones: thirty-four miles ſouth-ſouth-eaſt of Straſburg, and thirty north-north-eaſt of Bale. Lat. 48. 2. N. lon. 35. 34. E. Ferro.

FRI'BURG, or FREYBURG, called *Friburg in Uchland*, to diſtinguiſh it from *Friburg in the Briſgau*, a town of Swiſſerland, and capital of a canton to which it gives name, built in 1179, by Berthold IV. duke of Zahringen, whoſe uncle, Berthold III. had built a town of the ſame name, in the Briſgau, and whoſe ſon, Berthold V. was the founder of Bern. Theſe princes, who are vicars of the empire in the provinces of the ancient kingdom of Burgundy, had great difficulty to ſupport an authority always diſputed by the grand vaſſals. In fact, they poſſeſſed only that part of the kingdom which lay to the weſt of Mount Jura; and the circumſtance of their being ſtrangers made the nobility obey them with reluctance. It was therefore political wiſdom in them to ſtrengthen the part of the common people, to ſerve as a counterpoiſe to the unruly ambition of the nobility. Theſe dukes gave their new towns charters, or bulls, on the model of the city of Cologne. Thus a great number of families of the inferior nobility and neighbouring inhabitants, went with joy to eſtabliſh themſelves in an aſylum, which protected them againſt the tyranny of the greater barons. Berthold IV. granted to this Friburg the ſame privileges that his uncle had granted to Friburg in the Briſgau. After the houſe of Zahringen became extinct, by the death of Berthold V. in 1218, the two towns of Bern and Friburg met with a different fate. Bern made an important ſtep towards independence, in putting itſelf under the immediate protection of the empire. Friburg came under the power of count Ulrich, of Kiburg, who had married the ſiſter of the laſt duke of Zahringen, without impeachment or derogation of their privileges. From the family of Kiburg it came into the poſſeſſion of the count of Habſburg, who was called to the empire, and became chief of the houſe of Auſtria, to which family it continued its attachment till the year 1449, when it put itſelf under the protection of the duke of Savoy, with a reſervation of its privileges and immunities. In 1481, it joined the grand confederacy, and became one of the cantons of Swiſſerland. The length of the whole canton is about forty miles, and its breadth about twenty. It is almoſt ſurrounded by the canton of Bern, except a narrow part which touches the lake of Neufchatel. The north-weſt part of the country is more level than the reſt, and produces abundance of corn and fruit; the other parts are mountainous, but contain good paſtures, which feed great herds of cattle. The cheeſe made in this canton, particularly in the bailiwick of Gruyeres, is the beſt produced in Swiſſerland, and great quantities are exported to France and other countries. In ſome places they cultivate vineyards and make wine. There are ſeveral medicinal ſprings. The principal rivers are the Sanen, the Senſen, and the Broye, or Bruw. The inhabitants are Roman Catholics, under the biſhop of Lauſanne, in number 72,800, which are divided into ſeven towns, and 103 pariſhes. The language of the inhabitants in the town of Friburg is principally German; in the reſt of the canton, partly German and partly Patois, which is a mixture of German and French. The town of Friburg is ſituated on the Sanen, and almoſt ſurrounded by it. Part of it is built on an elevated rock, part of it in a deep valley, and towards the weſt it occupies a ſmall plain. The ſtreets are irregular, ſteep, clean, and tolerably wide; the houſes are well built, and ſome of them handſome; there are ſeveral churches and convents. It is ſurrounded with walls, towers, and ſharp rocks. Friburg contains ſome manufactures, but none that are important. Sixteen miles ſouth-weſt of Bern, and twenty-ſeven north-eaſt of Lauſanne. Lat. 46. 50. N. lon. 24. 40. E. Ferro.

FRI'BURG, a town of Germany, in the circle of Upper Bavaria: eighteen miles eaſt-ſouth-eaſt of Burkhauſen, and fifteen ſouth-ſouth-eaſt of Brannau.

FRI'BURG, or FREYBURG, a town of Germany, belonging to the electorate of Saxony, in Thuringia: five miles north of Naumburg.

FRI'BURG L'EVE'QUE, a town of France, in the department of the Meurte, and chief place of a canton, in the diſtrict of Dieuze: two leagues and a half weſt of Sarburg, and two eaſt of Dieuze.

FRI'BUS, a town of Bohemia, in the circle of Elnbogen: nine miles weſt of Joachimſthal.

FRICAN'DOES, *ſ.* [*fricandeau*, Fr.] In cookery, a ſort of Scotch collops.

FRICASSE'E, *ſ.* [French.] A diſh made by cutting chickens or other ſmall things in pieces, and dreſſing them with ſtrong ſauce:

Oh, how would Homer praiſe their dancing dogs,
Their ſtinking cheeſe, and *fricaſſee* of frogs!
He'd raiſe no fables, ſing no flagrant lye,
Of boys with cuſtard choak'd at Newberry. *King.*

To FRICASSE'E, *v. a.* [from the noun.] To dreſs in fricaſſee:

Sir-loins and rumps of beef offend my eyes,
Pleas'd with frogs *fricaſeed*. *Bramſton.*

FRICA'TION, *ſ.* [*fricatio*, Lat.] The act of rubbing one thing againſt another.—Gentle *frication* draweth forth the nouriſhment, by making the parts a little hungry, and heating them: this *frication* I wiſh to be done in the morning. *Bacon.*

FRICEN'TI, a town of Italy, in the kingdom of Naples, and province of Principato Citra; the ſee of a biſhop, united with Avellino: twelve miles north-weſt of Conza.

FRICHE, or FRISCHE (James du), a learned French benedictine monk of the congregation of St. Maur, born at Sees in Normandy, in 1641. He had diligently applied to literature before he embraced the eccleſiaſtical life, which was at the age of twenty-two; and his ſubſequent improvement was ſuch, that his ſuperiors conſidered him as a proper perſon to be ſelected for ſuperintending ſome of the noble editions of the fathers which they ſent into the world. They fixed upon him to publiſh from collated manuſcripts the works of St. Ambroſe, and aſſociated with him in this taſk father Nicholas de Nourri, known to the learned world by other valuable works. This edition of St. Ambroſe was publiſhed at Paris, in two volumes, folio; the firſt in 1686, and the ſecond in 1690; both enriched with notes, various readings, remarks, &c. When this work was completed, father Friche was employed to prepare for the preſs a new edition of the works of St. Gregory Nazianzen; but he had ſcarcely formed his plan, before his labours were terminated by his death, which took place at Paris in 1693, when about fifty-two years of age. He was alſo the author of The Life of St. Auguſtine, prefixed to the benedictine edition of the works of that father, in writing which he had availed himſelf of the aſſiſtance of father Hughes Vaillant.

FRIC'TION, *ſ.* [*friction*, Fr. *frictio*, from *frico*, Lat.] The act of rubbing two bodies together.—Do not all bodies which abound with terreſtrial parts, and eſpecially with ſulphureous ones, emit light as often as thoſe parts are ſufficiently agitated, whether the agitation be made by heat, *friction*, percuſſion, putrefaction, or by any vital motion? *Newton.*—The reſiſtance in machines cauſed by the motion of one body upon another. Medical rubbing with the fleſh-bruſh, or cloths.—*Frictions* make the parts more fleſhy and full, as we ſee both in men and in the currying of horſes; for that they draw a greater quantity of ſpirits to the parts. *Bacon.*

The phenomena ariſing from the friction of divers bodies, under different circumſtances, are very numerous and

and conſiderable. Mr. Hawkſbee gives a number of experiments of this kind; particularly of the attrition or friction of glaſs, under various circumſtances; the reſult of which was, that it yielded light, and became electrical. Indeed all bodies by friction are brought to conceive heat; many of them to emit light; particularly a cat's back, ſugar, beaten ſulphur, mercury, ſea water, gold, copper, &c. but above all, diamonds, which when briſkly rubbed againſt glaſs, gold, or the like, yield a light equal to that of a live coal when blown by the bellows.

FRICTION, in mechanics, denotes the reſiſtance a moving body meets with from the ſurface on which it moves.

Friction ariſes from the roughneſs or aſperity of the ſurface of the body moved on, and that of the body moving; for ſuch ſurfaces conſiſting alternately of eminences and cavities, either the eminences of the one muſt be raiſed over thoſe of the other, or they muſt be both broken and worn off: but neither can happen without motion, nor can motion be produced without a force impreſſed. Hence the force applied to move the body is either wholly or partly ſpent on this effect; and conſequently there ariſes a reſiſtance, or friction, which will be greater as the eminences are greater, and the ſubſtance the harder; and as the body, by continual friction, becomes more and more poliſhed, the friction diminiſhes.

As the friction is leſs in any body that rolls, than when it ſlides, hence in machines, leſt the friction ſhould employ a great part of the power, care is to be taken that no part of the machine ſlide along another, if it can be avoided; but rather that they roll, or turn upon each other. With this view it may be proper to lay the axes of cylinders, not in a groove or concave matrix, as uſual, but between little wheels, called friction wheels, moveable on their reſpective axes; for by this contrivance, the friction is transferred from the circumference of thoſe wheels to their pivots. And in like manner the friction may be ſtill farther diminiſhed, by making the axis of thoſe wheels reſt upon other friction wheels that turn round with them. This was long ſince recommended by P. Caſabus; and experience confirms the truth of it. Hence alſo it is, that a pulley moveable on its axis reſiſts leſs than if it were fixed, and the cord ſliding over the circumference. And the ſame may be obſerved of the wheels of coaches, and other carriages. Indeed about twenty years ago, friction balls or rollers were placed within the naves of carriage wheels by ſome perſons, particularly a Mr. Varlo; and lately Mr. Garnett had a patent for an improved manner of applying friction wheels to any axis, as of carriages, blocks or pulleys, ſcale beams, &c. in which the incloſed wheels or rollers are kept always at the ſame diſtance by connecting rods or bars. From theſe principles, with the aſſiſtance of the higher geometry, Olaus Roemer determined the figure of the teeth of wheels that ſhould make the leaſt reſiſtance poſſible, which he found ſhould be epycloids. And the ſame was afterwards demonſtrated by De la Hire, and Camus.—See the article MECHANICS.

FRICTION, in a medical ſenſe, if duly repeated, will do more in the recovery of health, and towards the ſupport of it, than is generally apprehended; it promotes perſpiration, quickens the circulation, and opens the finer veſſels through which thoſe diſcharges are made, on which health and vigour much depend. Friction contributes not only to the conveyance of medicine into the body, but alſo to their action and uſefulneſs when introduced. This means of health is beſt uſed when the *primæ viæ* are moſt empty, when the chylopoetic organs are too languid. Frictions with rough cloths over the whole belly, when the patient is faſting, produces advantageous effects. Gentle friction with pinguious ſubſtances relax; but ſtrong friction with rough dry cloths ſtrengthen. It has been conſidered particularly uſeful in caſes of aſcites, and many others, where the action of the abſorbent ſyſtem is neceſſary to be promoted.

FRIDAW', a town of Germany, in the duchy of Stiria: nine miles eaſt-ſouth-eaſt of Pettaw, and 104 ſouth of Vienna. Lat. 46. 30. N. lon. 33. 57. E. Ferro.

FRI'DAY, *ſ.* [ꝼꝛıꝺ bæg, Sax.] The ſixth day of the week, ſo called from *Friga*, or *Friya*, a goddeſs worſhipped by the Saxons on this day. It is a faſt-day, in memory of our Saviour's crucifixion, unleſs Chriſtmas-day happen to fall on Friday, when it is the greateſt feſtival in the year.—*Good Friday* is that next before Eaſter, on which day our Saviour was crucified.—Among aſtrologers, Friday has been generally conſidered as the moſt changeable and unſettled day in the week; whence the poet, in a peeviſh humour, caſt the metaphor at the ladies:

For Venus, like her day, will change her cheer,
And ſeldom ſhall we ſee a *Friday* clear. *Dryden.*

FRID'BERG, a town of Germany, in the duchy of Stiria: thirty-two miles eaſt of Pruck, and forty-two ſouth of Vienna. Lat. 47. 32. N. lon. 33. 58. E. Ferro.

FRID'BERG, or FRIEDBERG, a town of Germany, in the circle of Upper Bavaria. This town was ſacked by the Swedes in 1632, and taken by the Auſtrians in 1743: four miles ſouth-eaſt of Augſburg, and twenty-eight weſt-north-weſt of Munich. Lat. 48. 20. N. lon. 28. 37. E. Ferro.

FRID'BERG, or FRIEDBERG, an imperial town of Germany, in the circle of the Upper Rhine, on the Eſbach, in the Witteravia, which holds the twelfth ſeat on the bench of the imperial towns of the Rhine, and ſits and votes at the diets of the Upper Rhine. In the matricula of the empire it is charged twenty-four florins, and to the chamber of Wetzlar twenty-nine rix-dollars twenty-nine kruitzers: twelve miles north of Frankfort on the Maine, and twenty-eight eaſt-north-eaſt of Mentz. Lat. 50. 14. N. lon. 26. 23. E. Ferro.

FRI'DECK, a town of Pruſſia, in the territory of Culm: twelve miles eaſt of Culm.

FRI'DECK, a town of Sileſia, in the principality of Teſchen: ten miles weſt-ſouth-weſt of Teſchen, and ten ſouth of Oderberg.

FRI'DEGAST, an idol worſhipped by the ancient Britons.

FRID'ERICHSBERG, a fort and colony on the coaſt of Guinea: about twenty-five leagues from Cape Coaſt Caſtle.

FRID'ERICHSHALL. See FREDERICSHALL.

FRID'ERICH's-ODE, a town of Denmark, in Jutland, built by Frederic III. near the ſea. It was taken by the Swedes, in 1657: fifty miles north of Sleſwick.

FRI'DEWALDE, a town of Germany, in the circle of Weſtphalia, and county of Sayn; endowed, in 1324, with the ſame privileges as Frankfort, but not to ſo much advantage: it is a fief of Heſſe Darmſtadt: nine miles ſouth of Siegen.

FRI'DEWALDE, a town of Germany, in the circle of the Upper Rhine, and principality of Heſſe Caſſel: eighteen miles weſt of Eiſenach, and thirty-five ſouth-ſouth-eaſt of Caſſel.

FRI'DING, a town of Germany, in the Auſtrian Swabia, on the Danube: twenty miles ſouth-eaſt of Tubingen.

FRID'LAND, a town of Pruſſia, in the province of Natangen: twenty miles ſouth-eaſt of Konigſberg.

FRID'MAN, a town of Hungary: ſeventeen miles north-north-weſt of Palotza.

FRI'DO, a town of Italy, in the kingdom of Naples, and province of Baſilicata: ſeven miles eaſt-ſouth-eaſt of Potenza.

FRID'RICHSTEIN, a town of Germany, in the duchy of Carniola: one mile north-weſt of Gottſchee.

FRID'STOLL, *ſ.* [Sax. ꝼꝛıꝺ, *pax*, and ꝑꝛol, *ſedes.*] A ſeat, chair, or place of peace, where, in ancient times, criminals flew for ſafety and protection. In the charter of immunities granted to the church of St. Peter in York by Henry I. and confirmed anno 5 Hen. VII. fridſtoll is expounded *cathedra pacis & quietudinis, &c.* And there were many ſuch in England; but the moſt famous was

at

at Beverley, which had this inſcription: *Hæc ſedes lapidea* freedſtoll *dicitur*, i. e. *pacis cathedra, ad quam reus fugiendo perveniens, omnimodam habet ſecuritatem.*

FRIED'BERG, a town of Sileſia, in the principality of Neiſſe: ſix miles ſouth-weſt of Ziegenhals.

FRIED'BERG, or FRIEDENBURG, a town of Sileſia, in the principality of Jauer, on the Queiſs: eleven miles ſouth-weſt of Lowenberg, and fourteen weſt-north-weſt of Hirſchberg.

FRIED'BERG HO'HEN, a town of Sileſia, in the principality of Schweidnitz, where the king of Pruſſia defeated the Auſtrians, on the 4th of June, 1745: five miles ſouth-weſt of Striegau, and ten north-weſt of Schweidnitz.

FRIED'BURG, a Moravian ſettlement in Wachovia, or Surrey county, North Carolina.

FRIE'DEBERG, a town of Germany, in the circle of Upper Saxony, and New Mark of Brandenburg: forty-ſix miles north-eaſt of Frankfort on the Oder, and eighty-two eaſt-north-eaſt of Berlin.

FRIE'DEBURG, a town of Germany, in the circle of Upper Saxony, and county of Mansfeld: four miles eaſt of Gerbſtadt.

FRIE'DEBURG, a town of Germany, in the circle of Weſtphalia, and county of Eaſt Frieſland: twenty-two miles eaſt-north eaſt of Embden. Lat. 53. 30. N. lon. 25. 8. E. Ferro.

FRIE'DELAND, a town of Sileſia, in the principality of Schweidnitz: ſixteen miles ſouth-weſt of Schweidnitz.

FRIE'DENSHUETTEN, a Moravian ſettlement, whoſe name ſignifies *Tents of Peace*, ſituated on Suſquehannah river, in Pennſylvania, about twenty-four miles below Tioga point; eſtabliſhed by the United Brethren in 1765. It then conſiſted of thirteen Indian huts, and upwards of forty houſes, built after the European manner, with a neat chapel. Next to the houſes the ground was laid out in gardens; and between the ſettlement and the river about 250 acres were divided into regular plantations of Indian corn.

FRIE'DENSTADT, or *Town of Peace*, a Moravian ſettlement which was eſtabliſhed between Great Beaver and Yellow creeks: about forty miles north-weſt of Pittſburg. It was abandoned in 1773.

FRIE'DEWALDE, a town of Sileſia, in the principality of Neiſſe: ſix miles ſouth of Grotkau.

FRIE'DERICKSTÆD, a town on the weſt coaſt of the iſland of Santa Cruz. Lat. 17. 48. N. lon. 93. 25. W. Greenwich.

FRIED'LAND, a town of Moravia, in the circle of Olmutz: eighteen miles north-north-eaſt of Olmutz.

FRIED'LAND, a town of Luſatia, on a canal which communicates with the Spree: eight miles north of Lieberoſe.

FRIED'LAND, a town of Bohemia, in the circle of Boleſlau: nine miles north-eaſt of Krottau.

FRIED'LAND, a town of Germany, in the circle of Upper Saxony, and duchy of Mecklenburg: fourteen miles north-eaſt of New Brandenburg.

FRIED'LAND, a Moravian ſettlement in Wachovia.

FRIED'LINGEN, or FRIDLINGEN, a town and fort of Germany, in the circle of Swabia, near the Rhine, between Huningue and Bale. In 1702, a battle was fought here between the Imperialiſts under the command of prince Louis of Baden, and the French under the marquis de Villars, in which the latter were victorious, and afterwards took the town.

FRIE'LED, a town of Sweden, in the province of Smaland, thirty-three miles north-weſt of Wexio.

FRIEND, *ſ.* [*vriend*, Dut. ꝼꝛeonb, Sax.] This word, with its derivatives, is pronounced *frend*, *frendly*: the *i* totally neglected. One joined to another in mutual benevolence and intimacy: oppoſed to foe or enemy.

—Some man is a *friend* for his own occaſion, and will not abide in the day of thy trouble. *Ecclus*, vi. 8.

God's beniſon go with you, and with thoſe
That would make good of bad, and *friends* of foes.
Shakeſpeare.

Wonder not to ſee this ſoul extend
The bounds, and ſeek ſome other ſelf a *friend*. *Dryden.*

One without hoſtile intentions:

Who comes ſo faſt in ſilence of the night?
—A *friend*.—What *friend*? your name. *Shakeſpeare.*

One reconciled to another: this is put, by the cuſtom of the language, ſomewhat irregularly in the plural number:

He's *friends* with Cæſar,
In ſtate of health thou ſay'ſt, and thou ſay'ſt free. *Shakeſp.*

An attendant or companion:

The king ordains their entrance, and aſcends
His regal ſeat, ſurrounded by his *friends*. *Dryden.*

Favourer; one propitious.—Aurora, riding upon Pegaſus, ſheweth her ſwiftneſs, and how ſhe is a *friend* to poetry, and all ingenious inventions. *Peacham.*—A familiar compellation.—*Friend*, how cameſt thou in hither? *Matthew*, xxii. 12.

What ſupports me, do'ſt thou aſk?
The conſcience, *friend*, t' have loſt mine eyes o'erply'd
In liberty's defence. *Milton.*

A quaker.

The FRIENDS, or *Quakers*, are a ſect of diſſenters from the church of England, which, from the ſtriking difference they exhibit in appearance, manners, and worſhip, from the generality of their countrymen, among whom they nevertheleſs live in commercial and ſocial intercourſe, forms an intereſting ſubject of enquiry to the contemplative and obſerving mind. In our account of them, we ſhall firſt advert to that which is moſt immediately obvious; their conduct with reſpect to the reſt of the world: in the next place, to their more domeſtic economy, and their dealings with each other. It will then be proper to trace theſe practices to the principles from which they have proceeded; and, laſtly, a ſketch of the hiſtory and preſent ſtate of this people, will complete the account.

The firſt thing which occurs to an obſerver in ſeeing a quaker, is his unornamented, and ſometimes unfaſhionable, dreſs: for the former, a deſire to avoid that which is ſuperfluous, and a fear to adopt that which is thought to promote perſonal pride, are the aſſigned motives; and with regard to the latter ſingularity, it may be obſerved that faſhion, ever varying, rather leaves the quaker, who thinks frequent change inconſiſtent with a religious character, than the quaker forſakes the faſhion. If we ſtep into their houſes, we obſerve more or leſs of the ſame ſimplicity in their furniture, and their tables, and the like abſtinence from ſuperfluity in the time ſpent in convivial enjoyments. If we next obſerve their converſation, it will be found to be void of the compliments, and hyperbolical deſcription, which are ſo much the ſeaſoning of modern diſcourſe; but that which gives it the greateſt appearance of ſingularity, is the practice of uſing the ſecond perſon ſingular in ſpeaking to one; their diſuſe of the appellations Mr. Mrs. Sir, Madam, &c. and, when they mention the months or days of the week, calling them by numerical names, as firſt month, ſecond day, and the like. In conformity with this ſtrictneſs of domeſtic life, they forbear alſo to join with their neighbours in public amuſements; and indeed they inveigh againſt them, as not only a waſte of much time, which might be employed to beneficial purpoſe, and often deſtructive of health, but alſo as the means of enfeebling the mind and unfitting it to bear the difficulties which are the lot of human nature; and further, as an introduction to diſſipation, and licentiouſneſs of conduct. They nevertheleſs join with the reſt of the community in many objects of

public

public concern, in which utility to mankind is the leading motive; but in ſome caſes of this kind they forbear to intermeddle; either when an oath is required to be taken, from which they ſcrupulouſly refrain, or when the buſineſs leads to ſome promotion of the claims of the clergy, from the acknowledgment of whoſe right to pecuniary pay they are pertinaciouſly averſe. In uniſon with this latter ſcruple, they have adopted among themſelves a mode of marriage, which the legiſlature hath recogniſed; and they inter among themſelves, without ceremony, the remains of their dead: at the ſame time alſo it ſhould be mentioned, that they ſupport their own poor, without claiming for them their inherent right to parochial maintenance. For theſe, and other purpoſes, which naturally occur in a ſociety ſo much embodied in itſelf as this is, they have a regular ſyſtem of diſcipline, which is ſimple in its conſtruction, efficacious in its operation, and in general well and diſintereſtedly ſupported, and without expence to their community for the pay of officers.

The execution of this diſcipline is by monthly meetings of the members of certain diſtricts, in which meetings every member of orderly conduct hath a ſeat. Here the wants of the poor are attended to; applications from perſons deſirous of joining the ſociety received and determined; diſorderly members diſunited; collections for the common exigencies ordered, and regiſters kept. As it is evident that ſome or moſt of theſe purpoſes may require attention beyond that which can be given in a ſitting of a few hours, and where information on many points may be wanted, committees are there formed to ſupply theſe wants: and, generally ſpeaking, as the quakers proceed with great deliberation in moſt things they do, the uſe and continuance of theſe committees are very great.

Several of theſe diſtricts are ſuperintended by a quarterly meeting; and all the quarterly meetings in the country are under the direction of a yearly meeting; which may not only be conſidered as the legiſlative body, but as the deciſive court of appeal: for as perſons conceiving themſelves to be aggrieved by the deciſion of a monthly meeting, may appeal to the quarterly meeting, ſo from this latter lies an appeal, but a final one, to the yearly meeting. This general meeting requires from the quarterly meetings an annual account of the ſtate of the ſociety, which is given in the form of anſwers to certain queries, relative to the conduct of the members at large, and their conformity with their principles; and theſe queries are alſo put by the quarterly to the monthly meetings: thus a conſtant connection is preſerved. Beſides the concourſe of members which attend theſe laſt-mentioned meetings, repreſentatives are alſo appointed, on whom the tranſmiſſion of accounts is particularly entruſted; but great latitude is given in this ſociety for the employment of all well-qualified members in the management of their public concerns. Such is the general outline of the quakers' diſcipline. There are, nevertheleſs, a few other particulars on which it may be proper briefly to touch.

Monthly meetings are themſelves often ſub-divided, when they conſiſt of more than one congregation for worſhip. The ſub-diviſions are called preparative meetings, becauſe they prepare buſineſs for their monthly meeting; but they are not allowed to keep records of their proceedings, and ſeldom to decide on any point. In ſeveral of the countries in which yearly meetings are eſtabliſhed, theſe meetings have dependent bodies ſettled in the principal town, who watch during the intervals of the yearly meeting over what may affect the welfare of the whole, particularly the operation of the politics of the day, or of pendent, as well as of exiſting, laws; and theſe meetings, or rather the oldeſt of them, (that of London,) which was inſtituted in a time of perſecution, are called "meetings for ſufferings." The approved miniſters alſo of this ſociety, and certain other experienced members denominated *elders*, have meetings by themſelves attached to the meetings for diſcipline, under the appointment of which they are held. In theſe meetings of miniſters and elders, the conduct of that part of the body is enquired into, and advice applied without unneceſſary public expoſure.

This ſociety alſo aſſigns to women a conſiderable ſhare in the management of their diſcipline, believing that in many caſes concerning their own ſex their aſſiſtance is peculiarly proper. The women, therefore, at the ſame time, and in the ſame town, with the men, hold monthly, quarterly, and yearly, meetings; in which the buſineſs is conducted according to rules preſcribed to them by the men's meetings. The quakers think, that in a religious Chriſtian ſociety there is no ſubordination of man to man, but that the ſpirit of Chriſt alone ought to preſide: therefore, in no one of their meetings have they any preſident or chairman.

With reſpect to their peculiar doctrines, we give them nearly in the words of a ſhort account, publiſhed a few years ſince, entitled A Summary of the Hiſtory, Doctrine, and Diſcipline, of Friends, written at the deſire of the Meeting for Sufferings in London.

"We agree (ſay they), with other profeſſors of the Chriſtian name, in the belief of one Eternal God, the creator and preſerver of the univerſe; and in Jeſus Chriſt, his ſon, the Meſſiah, and *mediator of the new covenant. Heb.* xii. 24. When we ſpeak of grace, of the miraculous conception, birth, life, miracles, death, reſurrection, and aſcenſion, of our Saviour, we prefer the uſe of ſcripture terms; and contented with that which divine wiſdom hath ſeen meet to reveal, we attempt not to explain thoſe myſteries which remain under the veil: nevertheleſs, we acknowledge and aſſert the divinity of Chriſt, who is *the wiſdom and power of God unto ſalvation.* 1 *Cor.* i. 24. To Chriſt alone, and not to the Scriptures, we give the title of the *Word* of *God*; *John*, i. 1. although we highly eſteem thoſe ſacred writings, in ſubordination to the Spirit, from which they were given forth; 2 *Pet.* i. 21. and we hold that they are able to make *wiſe unto ſalvation through faith in Chriſt Jeſus.* 2 *Tim.* iii. 15. We reverence thoſe moſt excellent precepts which are recorded to have been delivered by our great Lord, and we firmly believe that they are practicable, and binding on every Chriſtian; and that in the life to come every man will be rewarded *according to his works. Matt.* xvi. 27. And further, it is our belief that, in order to enable mankind to put in practice theſe ſacred precepts, many of which are contradictory to the unregenerate will of man, *every man coming into the world* is endued with a meaſure of the *light*, grace, or good ſpirit, of Chriſt, *John*, i. 9, by which, as it is attended to, he is enabled to diſtinguiſh good from evil, and to correct the diſorderly paſſions and corrupt propenſities of his fallen nature, which mere reaſon is altogether inſufficient to overcome. For all that belongs to man is fallible, and within the reach of temptation; but this divine grace, which comes by him who hath *overcome the world*, *John*, xvi. 33, is to thoſe who humbly and ſincerely ſeek it, an all-ſufficient and preſent help in time of need. By this the ſnares of the enemy are detected, and deliverance is experienced through faith in its operation, whereby the ſoul is tranſlated out of the kingdom of darkneſs, into the marvellous light and kingdom of the Son of God.

"Being thus perſuaded that man, without the ſpirit of Chriſt inwardly revealed, can do nothing to the glory of God, or to effect his own ſalvation, we think this influence eſpecially neceſſary to the performance of the higheſt act of which the human mind is capable, even the worſhip of the Father of Lights and of Spirits, in ſpirit and in truth; therefore we conſider as obſtructions to pure worſhip all forms which divert the attention of the mind from the ſecret influence of this *unction from the Holy-one*, 1 *John*, ii. 20, 27; and, in the performance of worſhip, we dare not depend for our acceptance with him, on a formal repetition of the words and experiences of others; but, ceaſing from the activity of the imagination, we believe

it to be our duty, when assembled for that purpose, to wait in silence, to have a true sight of our condition bestowed upon us; believing even a single sigh, arising from such a sense of our infirmities, and of the need we have of divine help, to be more acceptable to God, than any performances, however specious, which originate in the will of man. *Rom.* viii. 26.

"As that which is needful for a man's own direction, and for his acceptance with God, must be eminently so, to enable him to be helpful to others, we believe the renewed assistance of the light and power of Christ to be indispensably necessary for all true ministry; and that this holy influence is not at our command, or to be procured by study; but is the free gift of God to chosen and devoted servants. Hence arises our testimony against preaching for hire; and hence our conscientious refusal to support such ministers as receive wages by tithes or other means. As we dare not encourage any ministry but that which we believe to spring from the influence of the Holy Spirit; so neither dare we attempt to restrain this ministry to persons of any condition in life, or to the male sex alone; but, as male and female are one in Christ, we hold it proper that such of the female sex as we believe to be endued with a right qualification for the ministry, should exercise their gifts for the general edification of the church: and this liberty we esteem a peculiar mark of the gospel dispensation, as foretold by the prophet Joel, chap. ii. 28, 29; and noticed by the apostle Peter, *Acts*, ii. 16, 17.

"There are two ceremonies in use amongst most professors of the Christian name; water-baptism, and what is termed the Lord's supper. The first is esteemed the means of initiating into the church of Christ; the latter, of maintaining communion with him. But as we have been convinced that nothing short of his redeeming power inwardly revealed can set the soul free from the thraldom of sin; by this power alone we believe salvation to be effected. We hold that, as there is one Lord, and one faith, so his *baptism is one*; *Eph.* iv. 5. that nothing short of it can make us members of his mystical body; and that the baptism with water, administered by his forerunner John, belonged, as John confessed, to an inferior and decreasing dispensation. *John*, iii. 30. With respect to the other rite, we believe that communion between Christ and his church is not maintained by that, nor any other, external performance; but only by a real participation of his divine nature through faith; *2 Peter*, i. 4. that this is the supper alluded to in the Revelation, *Behold I stand at the door, and knock. If any man hear my voice, and open the door, I will come in to him, and will sup with him, and he with me*; *Rev.* iii. 20. and that where the substance is attained, it is unnecessary to attend to the shadow, which doth not confer grace; and concerning which opinions so different, and animosities so violent, have arisen.

"Now as we thus believe that the grace of God, which comes by Jesus Christ, is alone sufficient for salvation, we can neither admit that it is conferred on a few only, whilst others are left without it; nor, thus asserting its universality, can we limit its operation to a partial cleansing of the soul from sin even in this life. We entertain worthier notions of the power and goodness of our Heavenly Father, and believe that he doth vouchsafe to assist the obedient to experience a total surrender of the natural will to the guidance of his pure unerring spirit, *Matt.* v. 48; through whose renewed assistance they are enabled to bring forth fruits unto holiness, and to stand perfect in their present rank. *Eph.* iv. 13. *Col.* iv. 12.

"With respect to oaths, we abide literally by Christ's positive injunction, *Swear not at all*, *Matt.* v. 34. delivered in his sermon on the mount; from which also, from our Lord's example, and from the correspondent convictions of his spirit in our hearts, we are confirmed in the belief, that wars and fightings are, in their origin and effects, utterly repugnant to the gospel; which still breathes peace and good-will to men. *Matth.* v. 39-44. xxvi. 52, 53. *Luke*, xxii. 51. *John*, xviii. 11. We are also clearly of the judgment, that if the benevolence of the gospel were generally prevalent in the minds of men, it would prevent them from oppressing, much more enslaving, their brethren, (of whatever colour or complexion;) for whom, as for themselves, Christ died: and would even influence their treatment of the brute creation, which would no longer groan the victims of their avarice, and of their false ideas of pleasure.

"Some of our tenets have, in former times, subjected our friends to much suffering from government; though our principles are a security to it; as they inculcate submission to the laws in all cases wherein conscience is not violated. But we hold, that as Christ's kingdom is not of this world, it is not the business of the civil magistrate to interfere in matters of religion. We therefore think persecution, even in the smallest degree, unwarrantable.

"We think necessary that those who are admitted into membership with us, should be previously convinced of those doctrines which we deem essential; yet we require no formal subscription to any articles, either as the condition of membership, or to qualify for the service of the church. We prefer the judging of men by their fruits, in a dependance on the aid of him, who, by his prophet, hath promised to be *a spirit of judgment to him that sitteth in judgment*. *Isai.* xxviii. 6. Without this there is a danger of receiving numbers into outward communion, without any addition to that spiritual sheepfold, whereof our blessed Lord declared himself to be both the *door* and the *shepherd*; that is, of such as know his voice, and follow him in the paths of obedience." *John*, x. 7-11.

If we date the origin of this people from the time that George Fox, who is generally reckoned the first quaker, publicly preached their doctrines, we must fix it in or about the year 1647. Fox was then about twenty-three years of age. He had been from his childhood of a cast so serious, that his mother had wished him to be educated for the ministry. He was, as well as several of his most early adherents, an illiterate man, although very well read in the Bible, which he quoted on all occasions with great readiness. He has been described as melancholy and enthusiastic; but some of his conversations preserved in his journal seem to contradict the former assertion: the latter will always be repeated, or at least believed, by those who deny the quaker doctrine before-mentioned, of the immediate and indispensable agency of Christ's spirit on the human mind. He has been charged with magnifying his own attainments, his mission, and the union in which he believed himself to be with the divine nature, in terms of extravagance if not of blasphemy: however, from the latter charge he may at least be cleared in the instances which are adduced from such of his writings as are extant in the original editions. George Fox led a life of almost incessant exertion until the year 1690, when he died possessed of the love and esteem of the body, then fully established; which he had seen arise from the principles he had published forty-three years before. See Fox, vol. vii. p. 633.

A people so singular, so different in their customs from the rest of the nation; and above all, so opposed to the generally-received notions concerning worship and ministry, soon attracted the notice and opposition of such whose tenets they oppugned, and of none more, nor with more inconvenience to themselves, than of the ministers. It was not long, however, before persons, above the vulgar rank in station and learning, became converts to their doctrines. About the years 1652, 1653, and 1654, Francis Howgill and Thomas Lawson, both ministers in the North of England, Anthony Pearson, a justice of the peace in Westmorland, John Stubbs, a man skilled in Greek and oriental languages, and George Whitehead and William Caton, persons employed in the tuition of youth, were convinced of the doctrines of Fox; and not only so, but soon became preachers themselves. Many others, nearly

at

at the ſame time, having adopted the principles, betook themſelves to ſpread the doctrine of the quakers, ſo that previous to the reſtoration of Charles II. they were a numerous body.

Perſecution, the too common lot of diſſent, and which the experience of former ages had not taught the people of that day to view as the nurſe of it, was early and vigorouſly, although vainly, employed to overthrow them. During the commonwealth, impriſonment and ſtripes from the magiſtrate, each ſometimes attended with circumſtances of extraordinary ſeverity; and, from the unreſtrained rabble, other and various kinds of perſonal abuſe, were the returns which their doctrines met with from their countrymen. After the reſtoration, the oath of allegiance coming ſo much into uſe, it proved an additional cauſe of vexation to the quakers, who ſcrupled to ſwear; and when other methods failed, was uſed as a trap whereby to ſhut them up in priſons and purſue them to premunire. Laws alſo were made in this reign, particularly levelled againſt them, the penalty of one of which was baniſhment. In theſe rigorous meaſures the king ſeemed rather to be led than to lead; and much of the reſpite from perſecution which the quakers experienced during his reign, ſeems to have ariſen from his willingneſs to relieve.

Their ſufferings in England, however, great as they were, did not equal thoſe which they underwent in America, particularly in the province of Maſſachuſſetts, from a people who themſelves too had fled, in the former reign, from the ſcourge of perſecution. Here, for a quaker to reſide, would incur puniſhment. The tender bodies even of women and girls were lacerated with ſtripes, expoſed to the rigours of a wintry climate, and ſometimes denied food, except on the condition of a ſubmiſſion to the perſecutor's will, with which the perſecuted ſcrupled to comply. But theſe ſeverities did not intimidate the quakers, nor ſatisfy the zealots who oppreſſed them. In the next place, therefore, they had recourſe to maiming, by cutting off the ears, a practice they had learned by ſuffering at home; but as this produced not the effect they wiſhed, the penalty of death was enacted for ſuch quakers as ſhould return into the colony after baniſhment. In conſequence of this law, two men, ſometime after a woman, and next another man, were hanged at Boſton. At length one of the baniſhed perſons, by name Samuel Shattock, came to England, and found means to prefer his complaints to king Charles. "There is a vein of innocent blood (ſaid Burrough, an eminent and zealous quaker, to the king, on repreſenting to him the cruelties of the coloniſts) opened in thy dominions, which, if it be not ſtopt, will overrun all."—"But I will ſtop that vein," ſaid Charles; and without delay he iſſued an order to the New England governor, and appointed the baniſhed Shattock his deputy for its tranſmiſſion to the colony. Thus the effuſion of innocent blood was ſtopped, ſo far as to prevent further capital puniſhment; but, notwithſtanding the king's prohibition, it long continued to be drawn by the ſcourge.

On the acceſſion of James II. the penal laws againſt diſſenters, or rather the execution of them, was ſuſpended; and on that of William and Mary, they were tolerated by law; at the ſame time to the affirmation of the quakers was allowed, in many caſes, the legal force of an oath.

The quakers, whom ſome people would brand with the charge of ſuperior obſtinacy, and to whom others would allow the merit of firmer adherence to their principles than moſt other men, ſtill complain of their ſufferings, although they do not now conſider themſelves as perſecuted. Conſiſtently with the ſcruple mentioned in the account of their doctrines, they refuſe to pay tithes to the clergy; and the laws for recovering them (having been made in times when oppoſition to the clergy and ſacrilege were nearly ſynonymous) being oppreſſive in their operation, it is no extraordinary thing in the preſent century for the coſts to exceed the demand, and for the doors of a priſon to be ſhut upon a conſcientious quaker. Eaſier means of recovery were provided in the reigns of William, and George I. but theſe laws are limited to tithes of ſmall amount; and it is at the option of the claimant to uſe them, or have recourſe to the exchequer, or to the biſhop's court: the ultimatum of which laſt is excommunication.

The preſent reigning family of Great Britain has, as occaſion offered, ſhewn itſelf friendly to the quakers; and has received many public profeſſions of its attachment. This ſociety is alſo now conſidered by the government, and the legiſlature, as an uſeful and valuable part of the community; for, whilſt their principles forbid them to defend their country by the uſe of arms, the ſame peaceful tenets, ſo far as they prevail, infure her internal tranquillity. Although they ſupport their own poor, they bear of courſe their proportion of the parochial aſſeſſments; and they may be ſaid to contribute to the proſperity of the nation by their induſtry and their morality.

Meetings of this people are ſcattered over Great Britain, Ireland, and North America. The European continent has alſo thoſe who bear their name and own their doctrine, and who are known to their tranſmarine brethren, although not all of them fully connected with them in ſociety, particularly the north-eaſt parts of Germany, and the ſouth of France.

The yearly meeting for Great Britain is held in London; that for Pennſylvania and New Jerſey at Philadelphia; and there are alſo on that continent five others, namely, New England, New York, Maryland, and Virginia; the two Carolinas with Georgia have the other.

It will be generally thought that, although the writings of the quakers are numerous, that ſociety hath not produced many eminent authors. The moſt celebrated are their apologiſt, Robert Barclay, of Urie in Scotland, who died in 1690; and William Penn, the founder of Pennſylvania, whoſe deceaſe was in 1718. Thoſe who deſire further information concerning the quakers' principles, would do well to conſult theſe writings; and for their hiſtory, that by William Sewell, of which the edition in 1800, and that by John Gough in 1789, contain ample information. There has alſo been publiſhed in the laſt year (1805) a conciſe and clear account of their doctrine, entitled The Principles of Religion as profeſſed by the Society of Chriſtians called Quakers, by Henry Tuke. In the catalogue of their writers, it may alſo be proper to mention Benezet and Woolman, both inhabitants of America, who took an early part in expoſing the iniquity of negro-ſlavery, and the ſlave-trade practices, of which the quakers have been ſtrenuous oppoſers. Thoſe who deſire only an outline of the quakers' riſe, progreſs, and tenets, may conſult the ſummary before-mentioned, firſt publiſhed in 1790, and ſeveral times ſince: and the quakers are in general very liberal in the diſtribution of their books, for the information of thoſe who wiſh to be acquainted with them.

The name of quaker appears to have been given to this people by one Gervas Bennett, a juſtice of the peace in Derbyſhire, in 1650; at firſt rather as a retort upon George Fox, who had bid him quake or tremble at the word of the Lord; but, ſuiting with the contempt in which they were then held, the appellation ſpread and became general: nevertheleſs, they themſelves give to each other the ſimple appellation of FRIENDS; by which name alſo they begin to be called by modern authors.

To FRIEND, *v. a.* To favour; to befriend; to countenance; to ſupport.—I know that we ſhall have him well to *friend*. *Shakeſpeare.*

When vice makes mercy, mercy's ſo extended,
That, for the fault's love, is th' offender *friended*. *Shakeſp.*

"Tell thy FRIEND thy ſecret, and he'll lay his foot on thy throat." The Spaniards ſay, *Dio tuo amigo tuo ſecreto,*

gli tenerte ha el piè on el peſcue. Too much familiarity breeds contempt.—And yet, "A FRIEND in need is a FRIEND indeed." The Latins ſay, *Amicus certus in re incerta cernitur*; the French, *On connoit l'ami en beſoin*; the Germans, *Ginen guten freund erhenner man in der noht.*—It is good, however, according to another proverb, "To prove our FRIENDS before we have need," leſt in times of abſolute neceſſity, we find our confidence miſplaced, and all our ſupport reſting on a broken reed: for, according to another proverb, "All are not FRIENDS who ſpeak us fair." Therefore, "Be a FRIEND to thyſelf, and others will befriend thee." If by induſtry and frugality, ſobriety and economy, we make our own circumſtances eaſy and affluent, ſo as not to be for ever wanting friends on pecuniary occaſions, we ſhall then generally find friends enough: whereas, on the contrary, ſay the Latins, *Infelicibus nulli ſunt cognati, nec amici*; The unhappy, the poor, and the wretched, have neither friends nor relations.

"Be a FRIEND to one, and an enemy to none." The Spaniards ſay, *Amigo de uno, enemigo de ningúno*; that is, Have one boſom friend, and carry it fair and candidly to the whole world.—Yet, "Never truſt much to a new FRIEND, or an old enemy." A very wholeſome and ſeaſonable proverb; for it is hard to diſcover how far the firſt can be confided in, or on what principle of cordial affection the other might have been induced to forego his enmity. The Latins ſay, *Subita amicitia raro ſine pœnitentia colitur*; the Spaniards, *De amigo reconciliádo guándate del como del diablo*; Be as wary of a reconciled friend, as you would be of the grand deceiver.—But, "A FRIEND in the way, is better than a penny in the purſe." The Spaniards ſay, *Aquéllos ſon ricos que tiénen amigos*; Thoſe are rich who have friends at hand. Friends do indeed not unfrequently ſupply the place of riches; but it is pretty certain that riches oftener ſupply the place of friends, or are made the inſtrument of procuring them: hence riches, when judiciouſly managed, are always a bleſſing.

FRIEND, Dr. See FREIND.

FRIEND'ED, *adj.* Well diſpoſed; inclined to love:

Not *friended* by his wiſh to your high perſon,
His will is moſt malignant, and it ſtretches
Beyond you to your friends. *Shakeſpeare.*

FRIEND'ING, *ſ.* Friendlineſs:

And what ſo poor a man as Hamlet is
May do, to expreſs his love and *friending* to you,
God willing, ſhall not lack. *Shakeſpeare.*

FRIEND'LESS, *adj.* Wanting friends; wanting ſupport; without countenance; deſtitute; forlorn.—Alas! I am a woman, *friendleſs*, hopeleſs. *Shakeſpeare.*

To ſome new clime, or to thy native ſky,
Oh *friendleſs* and forſaken virtue fly. *Dryden.*

To what new clime, what diſtant ſky,
Forſaken, *friendleſs*, will ye fly? *Pope.*

FRIEND'LESS MAN. The Saxon term for him whom we now call an outlaw, becauſe he was, upon his excluſion from the king's peace and protection, denied all help of friends.

FRIEND'LINESS, *ſ.* A diſpoſition to friendſhip. Exertion of benevolence.—Let all the intervals be employed in prayers, charity, *friendlineſs* and neighbourhood, and means of ſpiritual and corporal health. *Taylor.*

FRIEND'LY, *adj.* Having the temper and diſpoſition of a friend; kind; favourable; benevolent.—They gave them thanks, deſiring them to be *friendly* ſtill unto them. 2 *Mac.* xii. 31.

Let the Naſſau-ſtar in riſing majeſty appear,
And guide the proſp'rous mariner
With everlaſting beams of *friendly* light. *Prior.*

Diſpoſed to union; amicable:

Like *friendly* colours found our hearts unite,
And each from each contract new ſtrength and light. *Pope.*

Salutary; homogeneal:

Not that Nepenthe, which the wife of Thone
In Egypt gave to Jove-born Helena,
Is of ſuch power to ſtir up joy as this,
To life ſo *friendly*, or ſo cool to thirſt. *Milton.*

FRIEND'LY, *adv.* In the manner of friends; with appearance of kindneſs; amicably:

Here between the armies,
Let's drink together *friendly*, and embrace;
That all their eyes may bear thoſe tokens home,
Of our reſtored love and amity. *Shakeſpeare.*

FRIEND'LY I'SLANDS, a cluſter of iſlands in the Southern Pacific Ocean, ſo named by captain Cook in 1773, on account of the friendſhip which appeared to ſubſiſt among the inhabitants, and from their courteous behaviour to ſtrangers. Abel Janſen Taſman, an eminent Dutch navigator, firſt touched here in 1643, and gave names to the principal iſlands. Captain Cook laboriouſly explored about ſixty of them; but the whole cluſter are found to be upwards of 150 in number. The three iſlands which Taſman ſaw he named New Amſterdam, Rotterdam, and Middleburgh. The firſt is the largeſt, and extends about twenty-one miles from eaſt to weſt, and about thirteen from north to ſouth. Theſe iſlands are inhabited by a race of Indians, who cultivate the earth with great induſtry. The iſland of Amſterdam is interſected by ſtraight and pleaſant roads, with fruit-trees on each ſide, which provide ſhade from the ſcorching heat of the ſun. The chief iſlands are Annamooka, Tangataboo, the reſidence of the ſovereign and the chiefs, Lefooga, and Eooa. Lefooga is about ſeven miles long, and in ſome places not above two or three broad. It is in many reſpects ſuperior to Annamooka. The plantations are both more numerous and more extenſive; and incloſed by fences which, running parallel to each other, form fine ſpacious public roads, which would appear beautiful in countries where rural conveniences have been carried to the greateſt perfection. They are, in general, highly cultivated, and well-ſtocked with the ſeveral roots and fruits which theſe iſlands produce; and captain Cook endeavoured to add to their number by planting Indian corn, and the ſeeds of melons, &c. Eooa, when viewed from the ſhip at anchor, formed one of the moſt beautiful proſpects in nature, and very different from the others of the Friendly Iſles; which being low and perfectly level, exhibit nothing to the eye but the trees which cover them; whereas here, the land riſing gently to a conſiderable height, preſents groves of trees interſperſed at irregular diſtances, in beautiful diſorder; but covered with graſs near the ſhores, abounding with fruit-trees, amongſt which are the habitations of the natives. To obtain a view of as great a part of the iſland as poſſible, captain Cook and his officers walked up to the higheſt point of land, from whence they beheld many beautiful meadows of prodigious extent, adorned with tufts of trees, and intermixed with plantations of cocoa-nut and bread-fruit trees.

The natives of theſe iſlands ſeldom exceed the common ſtature; but are very ſtrong and well made, eſpecially as to their limbs. They are generally broad about the ſhoulders; and though the muſcular diſpoſition of the men, which ſeems a conſequence of much action, rather conveys the appearance of ſtrength than of beauty, there are ſeveral to be ſeen who are really handſome. The women are not ſo much diſtinguiſhed from the men by their features as by their general form, which is for the moſt part deſtitute of the ſtrong fleſhy firmneſs that appears in the latter; though the features of ſome are ſo delicate, as not only to be a true index of their ſex, but to lay claim to a conſiderable ſhare of beauty and expreſſion; for the bodies and limbs of moſt of the females are

are well proportioned, and ſome abſolutely perfect models of a beautiful figure. But the moſt remarkable diſtinction in the women, is the uncommon ſmallneſs and delicacy of their fingers, which may be put in competition with the fineſt in Europe. The general colour is a caſt deeper than the copper brown; but ſeveral of the men and women have a true olive complexion; and ſome of the laſt are even a great deal fairer. Their countenances very remarkably expreſs the abundant mildneſs which they poſſeſs; and are entirely free from that ſavage fierceneſs which marks nations in a barbarous ſtate. They are frank, cheerful, and good-natured.

Their hair is in general ſtraight, thick, and ſtrong, though a few have it buſhy or frizzled. The natural colour is black; but the greateſt part of the men, and ſome of the women, have it ſtained of a brown or purple colour, and a few of an orange caſt. They wear it variouſly cut. Some have it cut off on one ſide of the head only; others have it entirely cut off except a ſingle lock; the women in general wear it ſhort. The men have their beards cut ſhort; and both men and women ſtrip the hair from the arm-pits. The men are ſtained from about the middle of the belly to about half-way down the thighs with a deep blue colour. The women have only a few ſmall lines or ſpots thus imprinted on the inſide of their hands. Their kings, as a mark of diſtinction, are exempted from this cuſtom. The men uſe circumciſion. The dreſs of both men and women is the ſame, which conſiſts of a piece of cloth or matting, about two yards wide, and two and a half long; at leaſt ſo long as to go once and a half round the waiſt, to which it is confined by a girdle or cord. The ornaments worn by both ſexes are necklaces, made of the fruit of the pandanus, and various ſweet-ſmelling flowers, which go under the name of *kahulla*. Others are compoſed of ſmall ſhells, the wing and leg bones of birds, ſhark's teeth, all which hang looſe upon the breaſt; rings of tortoiſe ſhells on the fingers; and a number of theſe joined together as bracelets on the wriſts. The lobes of the ears are perforated with two holes, in which they wear cylindrical bits of ivory about three inches long.

Yams, plantains, and cocoa-nuts, compoſe the greateſt part of their vegetable diet. Of their animal food, the chief articles are, hogs, fowls, fiſh, and all ſorts of ſhell-fiſh; but the lower people eat rats. The two firſt vegetable articles, with bread-fruit, are what may be called the baſis of their food, at different times of the year, with fiſh and ſhell-fiſh; for hogs, fowls, and turtle, ſeem only to be occaſional dainties, reſerved for their chiefs. Their food is generally dreſſed by baking; and they have the art of making, from different kinds of fruit, ſeveral diſhes which are eſteemed very good. The generality of them lay their victuals upon the firſt leaf they meet with; but when food is ſerved up to the chiefs, it is commonly laid upon green plantain leaves. The women are not excluded from eating with the men; but there are certain ranks or orders amongſt them that can neither eat nor drink together. This diſtinction begins with the king; but where it ends could not be learnt. They ſeem to have no ſet time for meals. They go to bed as ſoon as it is dark, and riſe with the dawn in the morning. Their private diverſions are chiefly ſinging, dancing, and muſic, performed by the women. The bulk of the people are ſatisfied with one wife; the chiefs, however, have commonly ſeveral women.

They appear to have little conception of future puniſhment; but they believe that they are juſtly puniſhed upon earth; and conſequently uſe every method to render their divinities propitious. The Supreme Author of all things they call *Kallafootaonga*; who, they ſay, is a female reſiding in the ſky, and directing the thunder, wind, rain, and in general all the changes of weather. They believe that when ſhe is angry with them, the productions of the earth are blaſted; that many things are deſtroyed by lightning; and that they themſelves are afflicted with ſickneſs and death as well as their hogs and other animals. When this anger abates, they ſuppoſe that every thing is reſtored to its natural order.

Of the nature of their government, no more is known than the general outline. According to the information received, the power of the king is unlimited, and the life and property of the ſubject are at his diſpoſal; and inſtances enough were ſeen to prove that the lower order of people have no property, nor ſafety for their perſons, but at the will of the chiefs to whom they reſpectively belong. When any one wants to ſpeak with the king, he advances and ſits down before him with his legs acroſs; which is a poſture to which they are ſo much accuſtomed, that any other mode of ſitting is diſagreeable to them. To ſpeak to the king ſtanding would be accounted a ſtriking mark of rudeneſs. It is a particular privilege annexed to his ſovereignty, not to be punctured nor circumciſed, as all his ſubjects are. The climate is healthy; and the population of theſe iſlands is ſuppoſed to amount to about 200,000. Lat. 19. 40. to 21. 30. S. lon. 184. 46. to 185. 45. E. Greenwich.

FRIEND'LY SOCI'ETIES. Aſſociations, chiefly among the inferior claſs of tradeſmen, for the purpoſe of affording each other relief in ſickneſs; and their widows and children ſome aſſiſtance at their death. Theſe have been thought worthy the protection of the legiſlature, to prevent frauds which had ariſen from the irregular principles on which many of them were conducted. The 33 Geo. III. c. 54, provides that any number of perſons may form themſelves into a ſociety, and raiſe among themſelves a fund for their mutual benefit, and make rules and impoſe fines. The rules, declaring the purpoſe for which ſuch ſocieties are eſtabliſhed, are to be exhibited to the quarter ſeſſions, who may annul or confirm them; in which latter caſe they are to be ſigned by the clerk of the peace. No rule thus confirmed to be altered but at a general meeting of the ſociety, and ſubject to the controul of the ſeſſions. Societies may appoint officers, who are to give ſecurities for their truſt, the treaſurer or truſtees by bond to the clerk of the peace, and other perſons to the treaſurer or truſtees; which bonds are exempted from the ſtamp duty. Committee of not leſs than eleven members may be appointed; their powers to be declared by the ſociety and ſubject to their controul. Treaſurers and truſtees are enabled to lay out ſubſcriptions in purchaſe of ſtock, &c. and to ſell and change funds for the uſe of the ſociety; to render accounts, and pay over balances. In caſe of miſbehaviour of truſtees, application to be made to the court of chancery, in which proceedings are to be free of all expence of fees, ſtamps, &c. and counſel to be aſſigned gratis by the court. Executors or aſſignees of truſtees, &c. dying or becoming bankrupt, to pay the demands of the ſociety in the firſt place. Effects of the ſocieties veſted in treaſurers and truſtees, who may bring and defend actions. Societies not to be diſſolved without conſent of five-ſixths of the members; rules entered in a book to be received as evidence. Societies may receive donations. Complaints of members againſt ſtewards, &c. to be ſettled by two juſtices. If rules direct diſputes to be ſettled by arbitration, the award of the arbitrators ſhall be final. Members of ſocieties producing certificates of ſteward, &c. not to be removeable from any pariſh till actually chargeable: and ſimilar proviſions are made relative to this, as to other certificates under the poor laws. Thus have the legiſlature, with that humanity which peculiarly diſtinguiſhes the Britiſh conſtitution, taken under their care a ſet of men who, though generally uſeful and induſtrious, are but too apt not to be ſufficiently conſcious of the benefits conferred upon them, by a form of government in which charity is enforced and regarded as a ruling principle.

FRIEND'SHIP, *ſ.* [*vriendſcap*, Dut.] The ſtate of minds united by mutual benevolence; amity.—There is little *friendſhip* in the world, and leaſt of all between equals. *Bacon.*—Higheſt degree of intimacy:

My ſons, let your unſeemly diſcord ceaſe,
If not in *friendſhip*, live at leaſt in peace. *Dryden.*

Favour; perſonal kindneſs.—Raw captains are uſually ſent, only preferred by *friendſhip*, and not choſen by ſufficiency. *Spenſer.*

His *friendſhips*, ſtill to few confin'd,
Were always of the middling kind. *Swift.*

Aſſiſtance; help:

Gracious, my lord, hard-by here is a hovel:
Some *friendſhip* will it lend you 'gainſt the tempeſt;
Repoſe you there. *King Lear.*

Conformity; affinity; correſpondence; aptneſs to unite.—We know thoſe colours which have a *friendſhip* with each other, and thoſe which are incompatible, in mixing together thoſe colours of which we would make trial. *Dryden.*

Many connections are formed and dignified with the name of *friendſhip*, upon no other principle but the ſordid hope which one or perhaps each of the parties entertains of accompliſhing ſome ſelfiſh purpoſe through the aſſiſtance of the other: but ſuch a connection is ſo baſe in its nature, and ſo tranſitory in its duration, as to render it unworthy of the name of friendſhip. The inſtinctive affection which a parent entertains for his child, as well as that which the child feels for his parent, ſeem intended by nature to form an union between the perſons thus related to each other: but the union between parents and children, when ſupported by no other principle but inſtinct, is different from friendſhip; it extends no farther than to cauſe the parent to provide for his child during his helpleſs years, and the child to look up to his parent for protection and ſupport. We need not mention that appetite which is the foundation of love, and is the proviſion which nature has made for the continuation of our ſpecies. This appetite alone, unaſſiſted by ſome nobler principle, cannot give riſe to any connection worthy of an honourable name.

When two perſons of virtue and abilities contemplate each the other's character and conduct, they cannot but view them with complacency and eſteem. Habits and actions diſplaying prudence, fortitude, moderation, integrity, benevolence, and piety, naturally command the approbation of the impartial ſpectator, and even affect him with delight. Hence the ſociety of ſuch a perſon is ever preferred to one who is diſgraced by the oppoſite qualities. Whenever men of ſuch truly reſpectable characters enjoy opportunities of mutual intercourſe, an attachment naturally takes place between them, entirely diſintereſted, and founded ſolely on the approbation with which the one cannot avoid regarding the conduct of the other. The eſteem which the one is thus induced to entertain for the other will lead them to ſeek frequent opportunities of enjoying each other's ſociety, mutually to aſk and liſten to advice, to truſt their moſt ſecret and important purpoſes to each other's confidence, and to be no leſs concerned each of them for the other's intereſt and honour than for his own. This, and this alone, is genuine friendſhip; founded on virtue, and on that approbation which virtue never fails to command: it is a natural conſequence of intercourſe between virtuous men. Where it is once eſtabliſhed, it cannot die, while thoſe virtues to which it owes its origin continue to adorn the perſons between whom it ſubſiſts.

But to cheriſh and preſerve friendſhip, Dr. Blair inculcates the following excellent admonitions: "It is material to the preſervation of friendſhip, that openneſs of temper and manners, on both hands, be cultivated. Nothing more certainly diſſolves friendſhip, than the jealouſy which ariſes from darkneſs and concealment. If your ſituation oblige you to take a different ſide from your friend, do it openly. Avow your conduct; avow your motives; as far as honour allows, diſcloſe yourſelves frankly; ſeek no cover from unneceſſary and myſterious ſecrecy. Mutual confidence is the ſoul of friendſhip. As ſoon as that is deſtroyed, or even impaired, it is only a ſhow of friendſhip that remains. What was once cordial intimacy, degenerates firſt into formal civility. Conſtraint on both ſides next ſucceeds; and diſguſt or hatred ſoon follows. The maxim that has been laid down by certain crooked politicians, to behave to a friend with the ſame guarded caution as we would do to an enemy, becauſe it is poſſible that he may one day become ſuch, diſcovers a mind which never was made for the enjoyments of friendſhip. It is a maxim which may indeed find place in mere political and party friendſhips, where perſonal advancement is always in view: but it is altogether inconſiſtent with the ſpirit of thoſe friendſhips, which are formed, and underſtood to be nouriſhed, *by the heart.*

"The moſt important object for the preſervation of friendſhip is, to cultivate, in all intercourſe among friends, gentle and obliging manners. It is a common error to ſuppoſe, that familiar intimacy ſuperſedes attention to the leſſer duties of behaviour; and that, under the notion of freedom, it may excuſe a careleſs, or even a rough, demeanour. On the contrary, an intimate connection can only be kept up, by a conſtant wiſh to be pleaſing and agreeable. The nearer and cloſer that men are brought together, the more frequent that the points of contact between them become, there is the greater neceſſity for the ſurface being ſmooth, and every thing being removed that can grate or offend. Let no harſhneſs, no appearance of neglect, no ſupercilious affectation of ſuperiority, occur in the intercourſe of friends. A tart reply, a propenſeſs to rebuke, a captious and contradictious ſpirit, are often known to embitter domeſtic life, and to ſet friends at variance. In thoſe ſmaller articles of behaviour, where men are too apt to be careleſs, and to indulge their humour without reſtraint, the real character is often underſtood to break forth, and ſhew itſelf. It is by no means enough, that, in all matters of ſerious intereſt, we think ourſelves ready to prove the ſincerity of our friendſhip. Theſe occur more rarely. The ordinary tenor of life is compoſed of ſmall duties and offices, which men have occaſion daily to perform; and it is only by rendering daily behaviour agreeable, that we can long preſerve the comforts of friendſhip."

FRI'ER, *ſ.* See FRIAR.

FRI'ER, *ſ.* with printers, a part of a ſheet or page rather grey than black, from a want of ink.

FRIE'RA, a town of Portugal, in the province of Tra-los-Montes: four leagues ſouth-weſt of Outeiro.

FRIER's HEAD, a cape on the eaſt coaſt of the iſland of Antigua. Lat. 17. 11. N. lon. 61. 22. W. Greenwich.

FRI'ERY, *adj.* abounding in ſuch grey ſpots as mentioned above. See FRIER.

FRIESL'AND, one of the ſtates of the United Netherlands, or Batavian republic, ſo called from the Friſons, a warlike people, whoſe country formerly extended from the Scheldt to the Weſer. The country of which we are now ſpeaking, is bounded on the north by the German Ocean, on the eaſt by Groningen and Overiſſel, on the ſouth by Overiſſel and the Zuyder Sea, and on the weſt by the Flie river. Frieſland in its air and ſoil reſembles Holland, eſpecially in the north-weſt parts, which lie lower than the ſea, and are particularly remarkable for fine paſtures, in which, beſides excellent oxen, cows, and ſheep, a great number of large horſes are bred, for ſale into Germany and other countries. In the more elevated parts is found good corn land, and the wheat is particularly eſteemed for the fineneſs of the ears and whiteneſs of the flour. Peat forms one of the principal articles of fuel, and towards the ſouth and ſouth-eaſt there are extenſive heaths and woods. The inhabitants, for want of ſandhills along the ſea-coaſt, are under the neceſſity of ſecuring themſelves by means of dykes; which, though abſolutely neceſſary, yet are attended with vaſt expence. Formerly, when the care of theſe dykes were only the private concern of the proprietors of particular eſtates, they were very low, and frequently

quently suffered to fall to decay, so as to be unable to withstand the impetuosity of the waves, especially when driven by a strong north-westerly wind; and by such breaches the country has been laid under water, and great numbers of persons perished, not to mention the loss of their cattle. In order as much as possible to preserve themselves when under these calamities, the inhabitants raised several eminences, from twenty to twenty-five feet high, and of considerable circumference; to which, unless by the rapidity of the inundations intercepted, they betook themselves with their cattle and household furniture, and there remained till the flood subsided. In process of time, houses, or rather whole villages and towns, were built on these tumuli. In the year 1570, the dykes were ordered to be made higher and wider, at the charge of the public; and since this the irruptions of the sea have been less frequent. Friesland may vie with Holland in the number of canals with which it is in all parts intersected; and great is the convenience of these canals, both for the carrying off the superfluous waters into the sea, and likewise for facilitating traffic and intercourse. The principal reaches from Harlingen through Franeker, as far as Lewarden and Dokkum, and Groningen, and even to the frontiers of East Friesland. In the whole province are eleven towns, and three hundred and thirty-six villages. The inhabitants still retain their old customs and manner of living, even to the ancient Friesen dialect and accent, which latter circumstance renders the language of the country people in particular unintelligible to the other Netherlanders. Friesland is famous for its woollen stuffs, but more especially for its linen, which is the finest in Europe. Friesland had princes of its own, afterwards dukes, and then kings; among whom Radbold II. was particularly famous. These last were succeeded by podestats, elected from among the people. So early as the year 1436, part of Friesland devolved to the house of Burgundy. The greater part of it, however, still continues under podestats. In 1498, the emperor Maximilian I. created duke Albert, of Saxony, hereditary governor of Friesland; and though this was done on condition that he should maintain the people in their ancient liberties, yet would they never acknowledge him. In 1515, Charles V. purchased of George duke of Saxony his claim to this country, and reduced it under his own dominion; but in the days of his son, Philip II. the Friesons recovered their liberty, and acceded to the alliance of Utrecht. Lewarden is the capital.

FRIES'LAND (East), a principality of Germany; bounded on the north by the sea, on the east by the county of Oldenburg, on the south by the bishopric of Munster, and on west by Groningen; about thirty-eight miles from north to south, and thirty-six from east to west. The air is moist and thick, but much purified by sea breezes; the spring and harvests are late, the land is flat, low, and defended by strong and lofty dykes against the waves of the sea. The land along the coasts is rich and fertile, chiefly meadow land, with few corn fields. The cattle are of an extraordinary size and goodness, as are the sheep and horses. It is not uncommon for a ewe to yean four lambs. The butter and cheese are abundant and rich. In the centre of the country the soil is for the most part sandy, interspersed with fens and moors, in which the inhabitants dig peat for fuel, a circumstance of the more importance as wood is scarce. Fowl and game are plentiful, and the geese in particular of an uncommon size, even to weigh as much as twenty-four pounds apiece. The principal river is the Ems, by means of which the trade and navigation of the country are very considerable. The exportation principally consists in large horses, horned cattle, cheese, butter, oats, beans, rape-seed, and fine linen which they sell for Holland. Anciently, East Friesland was divided into a great number of lordships, the greater part of which, in 1430, submitted to Edzard, surnamed Cyrksena, or Sirksena, whose successors became princes of the empire, in 1454, with the title of count. This family becoming extinct, in 1744, Frederic II. king of Prussia seized on it, in consequence of the expectancy granted to the house of Brandenburg by the emperor Leopold, in 1694. On the other hand, the house of Brunswick Luneburg, in the person of George II. king of England, protested against it, and laid claim to the principality, on account of an hereditary union entered into, in 1691, with prince Christian Eberhard; making his pretensions known to the regency of East Friesland and to the aulic chamber of the empire; but the king of Prussia denying the authority of the emperor or regency, and threatening to support his actions by force of arms, he was suffered to remain in possession. The inhabitants are partly Lutherans and partly Calvinists; the Catholics have a free toleration in many towns, and the Moravians at Emden, Leer, and Norden. The Jews have likewise their synagogues. The ancient language of the country is forgotten; High German and Dutch are equally spoken. The nobility, the towns, and the peasants, form the states, whose transactions with their princes, joined to the imperial ordinances, serve for the laws of the country. The states consent to the taxes, and raise them; the excise is in their hands, and they yet retain some privileges. The principal towns are Aurich, Norden, and Emden. The assessment for the roman month is fixed at 192 florins, and the tax to each chamber term 160 rixdollars, eighty-six kruitzers. The revenue to the sovereign is about 300,000 rixdollars.

FRIES'ACH, a town of Germany, in the circle of Upper Saxony, and Middle Mark of Brandenburg. This town was taken by the French, in March 1797: twenty-eight miles north-west of Berlin.

FRIES'EN, a town of Germany, in the duchy of Stiria: nine miles north-north-east of Windischgratz.

FRIE'SNITZ, a town of Germany, in the circle of Upper Saxony, and circle of Newstadt: two miles east of Neustadt.

FRIEZE, [*drap de frise*, Fr.] A coarse warm cloth, made perhaps first in *Friesland*.—He could no more live without his *frieze* coat than without his skin. *Addi*

The captive Germans of gigantic size,
Are rank'd in order, and are clad in *frieze*. *Dryde*

FRIEZE, or FRIZE, *s.* [in architecture.] A large flat member which separates the architrave from the cornice; of which there are as many kinds as there are orders of columns. See ARCHITECTURE, vol. ii. p. 65.

Nor did there want
Cornice or *frieze* with bossy sculptures grav'n;
The roof was fretted gold. *Milton.*

FRIEZ'ED, *adj.* Shagged or napped with frieze.

FRIE'ZELIKE, *adj.* Resembling a frieze.—I have seen the figure of Thalia, the comic muse, sometimes with an entire head piece and a little *friezelike* tower, running round the edges of the face, and sometimes with a mask for the face only. *Addison.*

FRI'GATE, *s.* [*fregate*, Fr. *fregata*, Ital.] A small ship. Ships under fifty guns are generally termed *frigates*. See NAVAL ARCHITECTURE.—The treasure they fought for was, in their view, embezzled in certain *frigates*. *Raleigh.*

On high-rais'd decks the haughty Belgians ride,
Beneath whose shades our humble *frigates* go. *Dryden.*

FRIGATE BA'Y, a bay on the south coast of the island of St. Christopher: two miles east-south-east of Basseterre.

FRIGATOO'N, *s.* a Venetian vessel, commonly used in the Adriatic, built with a square stern, and without any fore-mast, having only a main-mast, mizen-mast, and bow-sprit.

FRIGEFAC'TION, *s.* [*frigus* and *facio*, Lat.] The act of making cold.

To

To FRI'GEFY, *v. a.* [*frigus*, cold, and *facio*, Lat. to make.] To make cold. *Not much uſed.*

To FRI'GERATE, *v. a.* To make cold. *Not uſed.*

FRI'GERATORY, *ſ.* [*frigeratorium*, Lat.] A place to make any thing cold; a place to keep any thing cold.

To FRIGHT, *v. a.* [ꝼꝛıꝿꝺꝛan, Sax.] To terrify; to diſturb with fear; to ſhock with fear; to daunt; to diſmay. This was in the old authors more frequently written *affright*, as it is always found in the ſcripture.—The mind *frights* itſelf with any thing reflected on in groſs, and at a diſtance: things thus offered to the mind, carry the ſhew of nothing but difficulty. *Locke.*

Such a numerous hoſt
Fled not in ſilence through the *frighted* deep,
With ruin upon ruin, rout on rout. *Milton.*

FRIGHT, *ſ.* A ſudden terror:

You, if your goodneſs does not plead my cauſe,
May think I broke all hoſpitable laws,
To bear you from your palace-yard by might,
And put your noble perſon in a *fright*. *Dryden.*

The conſequences of *fright* are often fatal.—The general effects are a great contraction of all the ſmall veſſels, and a repulſion of the blood into the large and internal ones; hence the ſuppreſſion of perſpiration, the general oppreſſion, trembling, and anguiſh, from the heart and lungs being overcharged with blood, &c. After great frights, perſons rarely recover their uſual vivacity; and epilepſies that are cauſed by frights are rarely, if ever, cured. When a perſon is affected with terror, or ſudden or great frights, the principal endeavours ſhould be to reſtore the circulation to its due order, to promote perſpiration, and to allay the agitation or commotion, in which the patient is obſerved to be. The cuſtom of giving cold water in theſe caſes is bad. Place the affrighted perſon in a quiet ſituation; a little warm liquor, as camomile tea or ſuch like, ſhould be given him to drink; the legs may be put into warm water, and there continue for ſome time; the legs ſhould be rubbed, and the camomile tea repeated every ſix or eight minutes; when the ſkin becomes warm, and there is a tendency to perſpiration, ſleep may be promoted by a gentle opiate. See the article FEAR, vol. vii. p. 287.

To FRIGHT'EN, *v. a.* To terrify; to ſhock with dread:

The rugged bear's, or ſpotted lynx's brood,
Frighten the valleys and infeſt the wood. *Prior.*

FRIGHT'FUL, *adj.* Terrible; dreadful; full of terror:

Without aid you durſt not undertake
This *frightful* paſſage o'er the Stygian lake. *Dryden.*

FRIGHT'FULLY, *adv.* Dreadfully; horribly.—This will make a prodigious maſs of water, and looks *frightfully* to the imagination; 'tis huge and great. *Burnet.*—Diſagreeably; not beautifully. *A woman's word:*

Then to her glaſs; and, Betty, pray,
Don't I look *frightfully* to-day? *Swift.*

FRIGHT'FULNESS, *ſ.* The power of impreſſing terror.

FRI'GID, *adj.* [*frigidus*, Lat.] Cold; wanting warmth. In this ſenſe it is ſeldom uſed but in ſcience.—In the torrid zone the heat would have been intolerable, and in the *frigid* zone the cold would have deſtroyed both animals and vegetables. *Cheyne.*—Wanting warmth of affection. Impotent; without warmth of body. Dull; without fire of fancy:

If juſtice Philip's coſtive head,
Some *frigid* rhyme diſburſes,
They ſhall like Perſian tales be read,
And glad both babes and nurſes. *Swift.*

FRIGIDA'RIUM, *ſ.* [Latin.] A place to cool any thing in; a cold bath.

FRIGID ZO'NE, the ſpace about either pole of the earth to which the ſun never riſes for one whole day at leaſt in their winter. Theſe two zones extend to about twenty-three degrees and a half every way from the pole, as their centre.

FRIGI'DITY, *ſ.* [*frigiditas*, Lat.] Coldneſs; want of warmth. Dulneſs; want of intellectual fire.—Driving at theſe as at the higheſt elegancies, which are but the *frigidities* of wit. *Brown.*—Of the two extremes, one would ſooner pardon phrenzy than *frigidity*. *Pope.*—Want of corporeal warmth.—The boiling blood of youth hinders that ſerenity which is neceſſary to ſevere intenſeneſs; and the *frigidity* of decrepit age is as much its enemy, by reaſon of its dulling moiſture. *Glanville.*—Coldneſs of affection.

FRI'GIDLY, *adv.* Coldly; dully; without affection.

FRI'GIDNESS, *ſ.* Coldneſs; dulneſs; want of affection.

FRI'GIFY, *v. a.* [*frigus*, cold, and *facio*, Lat. to make.] To make cold. *Not much uſed.*

FRIGILIA'NA, a town of Spain, in the kingdom of Grenada: thirteen miles eaſt of Velez-Malaga.

FRIGORI'FIC, *adj.* [*frigorificus*, of *frigus* and *facio*, Lat.] Cauſing cold. Some philoſophers, as Gaſſendus, and other corpuſcularians, denying cold to be a mere privation or abſence of heat, contend that there actual frigorific corpuſcles or particles, as well as fiery ones: whence proceed cold and heat. But later philoſophers allow of no other frigorific particles beſide thoſe nitrous ſalts, &c. which float in the air in cold weather, and occaſion freezing.

FRI'KEN, a lake of Sweden, in the province of Warmeland: forty miles in length, but narrow.

FRILL, *ſ.* An edging of fine linen on the boſom of a ſhirt.

To FRILL, *v. a.* [*frilleux*, Fr.] To quake or ſhiver with cold. Uſed of a hawk; as, the hawk *frills*.

FRIM, *adj.* [from ꝼꝛemian, Sax. *proficere.*] In good caſe. *Ray's North Country Words.*—Though not to be met with in books, this is a common word with country-folks in general. *Maſon's Suppl.*

FRINGE, *ſ.* [*friggio*, Ital. *frange*, Fr.] Ornamental appendages added to dreſs or furniture. It is in converſation uſed of looſe and ſeparate threads.—Thoſe offices and dignities were but the facings or *fringes* of his greatneſs. *Wotton.*

The golden *fringe* ev'n ſet the ground on flame,
And drew a precious trail. *Dryden.*

To FRINGE, *v. a.* To adorn with fringes; to decorate with ornamental appendages.—Either ſide of the bank, *fringed* with moſt beautiful trees, reſiſted the ſun's darts. *Sidney.*

Here, by the ſacred bramble ting'd,
My petticoat is doubly *fring'd*. *Swift.*

FRINGE-TREE, *ſ.* in botany. See CHIONANTHUS.

FRINGIL'LA, *ſ.* the FINCHES; [from *frigillago*, Lat. of *frigus*, cold; becauſe theſe birds are many of them attached to the mountains, and can bear an extreme degree of cold.] In ornithology, a genus belonging to the order of paſſeres, the characters of which are: Bill conical, ſharp-pointed, ſtraight. There are no leſs than a hundred and ſixteen ſpecies of this genus now known, named as follows:

1. Fringilla Lapponica, the Lapland finch: head black; body black and grey mixed; eye-brows white; outermoſt tail-feathers marked with a white wedged ſpot; throat and breaſt black; nape of the neck ferruginous; belly, vent, and firſt quill feathers on the outer edge, white. This ſpecies is ſix inches and a half-long; inhabits Europe, Aſia, and America; runs along the ground like a lark, and warbles like it on the wing. The female only differs from the male in being paler. At Hudſon's Bay, where it is called *tecumaſhiſh*, it differs ſomewhat in ſize, meaſuring only five inches. The breaſt is whitiſh, with a len-

FRINGILLA.

1. The American Goldfinch. 2. The white-throated Sparrow. 3. The dusky Linnet.
4. Amadavad Linnet. 5. The Siskin. 6. The Serin.

London. Published as the Act directs. Nov.r 7. 1805. by J. Wilkes.

a longitudinal black ſtreak down it; in other things not greatly different. It is found with us in the neighbourhood of Severn river, in winter only, appearing firſt about November, and is commonly found near juniper trees. Some of the males have more ferruginous about the head. It is alſo met with in Lapland, and the interior of Siberia, being often found near the Uralian chain. It breeds in the northern parts, and unites into flocks: when it changes place, it runs like a lark on the ground; ſings like a linnet, frequently while vibrating in the air, like the lark. It likewiſe inhabits, though leſs frequent, the fields of the inner bays of Greenland, and makes the neſt in June, of moſs and graſs, lined with feathers; lays five or ſix eggs, of a browniſh ſlate, mixed with a duller colour; is ſuppoſed to migrate into America in autumn.

2. Fringilla Surinama, the Surinam finch: bill ſharp, and of a yellow-colour; body grey; the belly whittiſh; quills black, the prime ones near the baſe white, the ſecondaries white both at the baſe and tips; tail blackiſh; the firſt and ſecond feathers have a white ſpot on the inſide; the third, fourth, and ſixth, white at the tips. Inhabits Surinam.

3. Fringilla longiroſtris, the long-billed finch: a ſize bigger than the chaffinch; bill grey brown; head and throat black; round the neck a collar of chefnut; back, wing-coverts, ſcapulars, and rump, brown and yellow mixed; all the under parts orange yellow; quills brown, edged with olive without, and within fringed with yellow; the outer edges of the ſecondaries are alſo fringed with yellow; tail olive; legs grey brown. Inhabits Senegal.

4. Fringilla cælebs, the chaffinch: this bird, ſo well known in England, is called by the Greeks, σπίζα; the Italian names are, *franguello*, *franguеglio*, and *frenguello*; in German, *finck*, *roth finck*, *winche*; in Poliſh, *ſlowick*; in Swediſh, *finke*, *bofincke*; in Bohemian, *penkeway*; in French, *pinçon*, the pincher, on account of its fierce bite; or from *pinch*, its chirp. Theſe are migratory birds, though with us they remain during the winter. They reſort to our dwellings, and viſit our farm-yards to obtain an eaſier ſubſiſtence; they are little paraſites who ſeek to live at our expence, without contributing to our pleaſures; for in that ſeaſon they never ſing. During the reſt of the time they lodge in cloſe hedges, in ever-greens, and in holes, where they are ſometimes found dead when the weather is exceſſively ſevere. Thoſe which migrate into other climates aſſemble often in prodigious flocks. A very remarkable circumſtance in the migration of the chaffinches, is what Geſner mentions of thoſe of Swiſſerland, and Linnæus of thoſe of Sweden: that only the females remove to other climates, and the males reſide in the country during the winter. This ſingular remark is corroborated by the late Mr. White, of Selbourn, in Hampſhire, who found that the vaſt flocks of chaffinches which generally appeared in his neighbourhood about Chriſtmas, were almoſt entirely hens. Yet, as he ſeems not to have diſſected any, he might have been deceived by the change of plumage, which is extremely probable. The migrations vary in different countries. Aldrovandus aſſures us, that the chaffinches ſeldom breed near Bologna, but almoſt all depart about the end of winter, and return the ſucceeding autumn. They are ſpread through the whole of Europe, from the ſhores of the Baltic and Sweden, where they are frequent, and neſtle, to the Straits of Gibraltar, on the coaſts of Africa, and at the Cape of Good Hope.

The chaffinch is a ſprightly bird, and perpetually in motion. It begins to chant very early in the ſpring, and ſeveral days before the nightingale, and gives over about the ſummer ſolſtice. Some connoiſſeurs in ſinging birds very much eſteem the notes of the chaffinch; and Latham ſays, that thoſe bred in Eſſex have the fineſt ſong. If a young chaffinch taken from the neſt be educated under a canary, a nightingale, &c. it will have the ſong of its inſtructors. This facility in learning the ſongs of other birds accounts for the diverſity obſerved in the warble of the chaffinches. In the Netherlands, five or ſix kinds of chaffinches are diſtinguiſhed by the various length of their airs.

Theſe birds conſtruct their neſt very round and compact, and place it in the cloſeſt trees or buſhes; ſometimes they build in our gardens upon the fruit-trees, and conceal the neſt ſo artfully that we can hardly perceive it. It is compoſed of white moſs and ſmall roots on the outſide, and lined with wool, hairs, ſpiders' webs, and feathers. The female lays five or ſix eggs, which are reddiſh grey, ſprinkled with blackiſh ſpots, more frequent near the large end. The male never deſerts his mate in the time of hatching; he ſits at night always at hand; and if during the day he remove to a ſhort diſtance, it is only to procure food. Jealouſy has perhaps ſome ſhare in this exceſſive aſſiduity; for theſe birds are of an amorous complexion: when two males meet in the ſpring, they fight obſtinately, till one of them is vanquiſhed and expelled; and the combat is ſtill more fierce, if they be lodged with only a ſingle female.

The parents feed their brood with caterpillars and inſects: they alſo eat theſe themſelves, but their ordinary ſubſiſtence is ſmall ſeeds, thoſe of the white thorn, poppy, burdock, roſe-tree, and eſpecially beech-maſt, rape and hemp-ſeed. They feed alſo upon wheat and oats, and are expert in ſhelling the grain to obtain the mealy ſubſtance. Though rather obſtinate, they can in time be inſtructed, like goldfinches, to perform ſeveral little feats; they learn to employ their wings and feet to draw up the cup when they want to eat or drink.

This bird is ſomewhat ſmaller than our ſparrow, and is too well known to require a minute deſcription. The ſides of the head, the fore-part of the neck, the breaſt, and the loins, are of a wine colour; the upper part of the head and of the body chefnut; the rump olive; and a white ſpot on the wing. In the female the bill is more ſlender, and the colours leſs bright than in the male; but in both ſexes the plumage is very ſubject to vary. Of the males, ſome have the upper part of the head and neck cinereous, and others of a brown chefnut; in ſome the quills of the tail neareſt the two middle ones are edged with white, and in others they are entirely black; age probably occaſions theſe ſlight differences. One mentioned by Latham was ſhot near London, with coal-black legs. In the north of England they are ſometimes called white-linnets, and flax-finches; by others *ſpink* from their cry.

Several varieties of the chaffinch are mentioned by authors, the principal of which are as follow: 1. The *variegated chaffinch*. In this the head and neck are aſh-coloured; cheeks browniſh; rump greeniſh; the under parts browniſh fleſh-colour; the leſſer and greater wing-coverts white; the middle ones, quills, and tail, black; the two outer ones half-way white on the outer margins. 2. The *white chaffinch*, which is wholly white. 3. The *collared chaffinch*, being of the common colour, except the crown of the head, and a collar round the neck, both of which are white. Added to theſe, are two others, viz. one with the fore-parts white, the hinder ferruginous; another with the back yellowiſh, the under parts very pale, and more white than uſual in the wings.

5. Fringilla montifringilla, the bramble finch: larger than the chaffinch; length ſix inches; bill yellowiſh; tip black; the head, hind part of the neck, and back, are black, margined with rufous brown; rump white; throat, fore-part of the neck, and breaſt, pale rufous orange; lower part of the breaſt and belly white; ſmaller wing-coverts pale rufous; the middle ones rufous white; the great ones black, tipped with white, and thoſe neareſt the body with pale rufous; quills brown, with yellowiſh edges; tail forked; legs grey. The female is plainer in colour, and is brown where the male is black, and rufous grey where he is rufous.

This ſpecies migrates into England at certain ſeaſons,

but does not build here: it is frequently found among the chaffinches, and ſometimes comes in vaſt flocks. They are alſo ſeen, at certain times, in vaſt clouds in France, inſomuch that the ground has been quite covered with their dung, and more than ſix hundred dozen were killed each night. They are ſaid to be particularly fond of beech-maſt, and will eat ſeeds of various other kinds: their fleſh is eaten by many, but is bitter. They are ſaid to breed about Luxemburg, making their neſt on the talleſt fir-trees, compoſed of long moſs without, and lined with wool and feathers within: the eggs are four or five in number, yellowiſh, and ſpotted; and the young are fledged at the end of May. This ſpecies is found more or leſs throughout Europe; is common in the pine foreſts of Ruſſia and Siberia; but thoſe of the laſt are darker in colour, and leſs in ſize.

There is a variety of the brambling, with a black ſtreak over each eye, tending to the hind head; acroſs the back part of the head another, meeting the firſt; on the wing-coverts a bar of reddiſh white, and a ferruginous one below; throat and breaſt tawny; belly and rump white. This was met with off the coaſt of Japan, and is in the collection of ſir Joſeph Banks.

There is alſo another variety of a paler colour than the common brambling, and the head wholly white; found in the Ardennes.

6. Fringilla lulenſis, the lulean finch: brown; breaſt and ſhoulders rufous; wings black with a rufous ſpot; ſize of the gold-finch; bill brown; head and neck above blackiſh-aſh: throat white; belly and vent whitiſh; wing-coverts with alternate rufous and black bands, the laſt white; quill feathers black; tail dark cinereous. Inhabits Sweden.

7. Fringilla erythrocephala, the red-headed finch: length near five inches; bill black; head and neck rich ſcarlet; ſpace round the eyes black; back, breaſt, and belly olive; wings black, with two bars of white on the coverts; tail black; legs grey. Inhabits the iſland of Mauritius.

8. Fringilla pſittacea, the parrot finch: ſize of the ſparrow; bill black; face, to behind the eye, and the throat, deep ſcarlet; rump and tail the ſame; reſt of the body parrot green, lighteſt beneath; the wings, when folded, reach the baſe of the tail; the outer edge of the quills is green, the inner cinereous brown; the tail cuneiform; the two middle feathers deep ſcarlet, with the ſhafts brown; the other five, on each ſide, have only the outer web ſcarlet, the inner brown. Brought by Dr. J. R. Forſter, from New Caledonia.

9. Fringilla carduelis, the goldfinch: beauty of plumage, melody of ſong, ſagacity, and docility, are united in this charming little bird, which, were it rare, and imported from a foreign country, would indeed be highly prized. Crimſon red, velvet black, white, and gold yellow, are the chief colours which gliſten on its plumage; and the mixture of lighter and deeper tints ſtill heightens their luſtre. Hence its names in different languages. In Germany, it is called *ſtieglitz*, *diſtel-vogel*, *kletter*, *truns*, *roth-vogel*; in Holland, *pitter*; in Bohemia, *ſteglick*; in Savoy, *charderaulat*; in Poland, *ſczigil*; in Sweden, *ſtiglitza*; in Italy, *gardello*, *gardellino*, *cardelino*, *carzerino*; in Spain, *ſirguerito*, *ſiele colore*, *ſorte pintacilgo*. The Latin epithet *carduelis* is derived from *carduus*, a thiſtle, on which it feeds; and the French name *chardonneret* is formed from *chardon*, which alſo ſignifies a thiſtle. It is the θρανὶς of Ariſtotle and the ancient Greeks.

When the wings of the goldfinch are cloſed, each appears marked with a train of white points, which are apparent on the dark ground: theſe are the white ſpecks which terminate all the quills of the wing, except the two or three firſt. The quills of the tail are of a ſtill deeper black; the ſix intermediate ones tipt with white, and the two laſt have on each ſide on their inner webs an oval white ſpot, which is conſpicuous. But theſe white points vary in their number and arrangement; and in general the plumage of the goldfinch is far from being conſtant.

The female has leſs red than the male, and no black at all. The young ones do not aſſume their fine red till the ſecond year; they are at firſt ſtained with dirty obſcure colours, and for that reaſon the bird-catchers call them *grey-pates*; but the yellow on the wings appears early, and alſo the white ſpots on the quills of the tail; yet theſe ſpots are of a duller white.

The males have a well-known and pleaſing ſong. They begin about the firſt of March, and continue during the whole of the genial ſeaſon; they chant even in the winter, when kept in warm apartments, where they enjoy the temperature of ſpring. Aldrovandus ranks them the ſecond of the ſinging birds; Daines Barrington admits them only into the ſixth place. In England, the goldfinches from Kent are ſaid by Latham to be the beſt ſingers; but this ſeems very doubtful.

Theſe birds, like the chaffinches, conſtruct the neateſt and moſt compact neſts. They conſiſt of fine moſs, lichens, liver-wort, ruſhes, ſmall roots, and the down of thiſtles, interwoven with great art, and lined with dry graſs, hair, wool, and down; they generally place them in trees, and particularly on pears, plums, and walnuts, and commonly ſelect the weak branches which ſhake the moſt. Sometimes they neſtle in copſes, and ſometimes in thorny buſhes; and it is ſaid that the young goldfinches bred in ſuch ſituations are of darker plumage, but more ſprightly, and ſing better than others. Olina makes the ſame remark in regard to thoſe hatched in the month of Auguſt. The female begins to lay about the middle of ſpring, at firſt five eggs, ſpotted with reddiſh-brown near the large end. If the neſt be demoliſhed, ſhe makes a ſecond, or even a third, hatch, but the number of eggs diminiſhes each time. Theſe birds are much attached to their young: they feed them with caterpillars and inſects; if both be caught together, and ſhut up in the ſame cage, the parents will ſtill continue their care. In breeding theſe birds, the cock goldfinch ought to have only one female. It is ſomewhat ſingular, that the cock goldfinch, when ſhut up in a large breeding cage with different females, is not ſo much diſpoſed to pair with his own female as with the hen canary, or any other female of a warm temperament. Sometimes the hen goldfinch breeds with the cock canary, but this is unfrequent; and on the other hand, the hen canary, if ſeparated from the males, will conſort with the cock goldfinch. The female is the firſt to feel the ardour of paſſion, and endeavours, by alluring arts, and the influence of the genial ſeaſon, to urge her languid paramour to conſummate their pairing. The preliminaries laſt commonly ſix weeks, during which time the hen canary makes a complete laying of addle eggs, for which her inceſſant ſolicitations have not procured fecundation. However, after the union is accompliſhed, he proceeds to diſcharge the duties of a parent; he aſſiſts his mate in conſtructing the neſt, and carries food to her while ſhe is engaged in hatching, or in rearing her young.

Though theſe conſtrained amours will ſometimes ſucceed with a hen canary and a wild goldfinch, it is better to raiſe together thoſe intended for breeding, and not to pair them till they are two years old. The offſpring reſembles more the father in the ſhape of the bill, in the colours of the head and of the wings, and in ſhort in all the extremities, and the mother in the reſt of the body: they have alſo been remarked to be ſtronger, and live longer, and to have a clearer ſong; but to be not ſo docile in adopting the notes of artificial muſic. Theſe hybrids are ſtill capable of propagating, and when they are paired with the hen canary, the ſecond generation has a manifeſt analogy to the ſpecies of the goldfinch: ſo much does the male influence predominate in the act of generation.

The goldfinch flies low, but with an even continued motion, like the linnet; and not by jerks and bounds, like the ſparrow. It is an active and laborious bird; if not

not employed in pecking the heads of poppies, of hemp, or of thiſtles, it is conſtantly buſy in carrying backwards and forwards whatever it can find in its cage. They live in harmony with each other, ſeek each other's ſociety, give marks of regard at all ſeaſons, and ſeldom quarrel but about their food. They are not ſo peaceful with other birds; they beat the canaries and linnets; but, in their turn, they receive the ſame treatment from the titmouſe.

The docility of the goldfinches is almoſt every where known: they can be inſtructed without much trouble to perform ſeveral movements with accuracy, to fire a cracker, and to draw up ſmall cups containing their food and drink; but for this laſt purpoſe they muſt be *clothed*. This clothing conſiſts of a ſmall belt of ſoft leather two lines broad, with four holes, through which the feet and wings are paſſed, and the ends joining under the belly, are held by a ring which ſupports the chain of the cup. In ſolitude it delights to view its image in the mirror, fancying it ſees another of its own ſpecies; and this attachment to ſociety ſeems to equal the cravings of nature; for often it is obſerved to pick up the hemp-ſeed, grain by grain, and advance to eat at the mirror, imagining, no doubt, that it feeds in company.

The goldfinches begin to aſſemble in autumn, and during that ſeaſon they are caught with eaſe. In winter they fly in numerous flocks; they approach the highways near which are thiſtles and wild ſuccory; they ſhake off the ſnow to obtain the ſeeds and the caterpillars. They live to a great age; Geſner ſaw one at Mayence which was twenty-three years old; they were obliged once a-week to ſcrape its nails and bill, that it might drink, eat, and ſit upon its bar; its common food was poppy ſeeds; its feathers were all turned white; it could not fly, but remained in whatever ſituation it was placed. They are ſubject to epilepſy, and to melting of the fat; and the moulting often proves fatal to them.

Their tongue is parted at the tip into ſmall filaments; the bill long; the edges of the lower mandible fitted into the upper; the noſtrils covered with ſmall black feathers; the outer toe connected to the middle one as far as the firſt joint. Total length of the bird five inches and ſome lines; the bill ſix lines; the alar extent eight or nine inches; the tail two inches, and conſiſts of twelve quills; it is a little forked, and projects ten or twelve lines beyond the wings.

Of this ſpecies of goldfinch there are many varieties, the principal of which are as follow:

1. The *white eyed goldfinch*, in all reſpects like the common one, except the fore-part of the head, which is red, and about the eyes white.

2. The *ſtriped-headed goldfinch*, which has the head ſtriped alternately with red and yellow.

3. The *ſwallow goldfinch*, with the bill fleſh-coloured; irides yellow; the head, throat, and neck, black, ſpotted with red near the bill; the breaſt, back, ſcapulars, and rump, yellowiſh-brown; belly, ſides, thighs, and under tail-coverts, white; the reſt as in common; legs fleſh-colour.

4. The *red-and-white goldfinch*; this is red on the forehead, cheeks, and throat; the other parts white, except the wings and tail, which are browniſh aſh-colour; and that part of the wing which in common is yellow, in this is of a dingy hue.

5. The *white goldfinch*; theſe are generally of a pure white, except the outer edge of the quills, which are yellow; a little mixture of the ſame on the wing-coverts; the ends of ſome of the quills half black, and tipped with white; legs white. One in the Leverian Muſeum had the parts which are uſually red, of a very pale red, a little gloſſy. Briſſon alſo ſays he has ſeen birds of this ſort. Buffon mentions one with a black head; the red parts very pale; the under parts greyiſh-white; the wing-coverts pale olive; the yellow of the wings as uſual; wings and tail white; bill and legs reddiſh-white: this was caught at large. There was one alſo in the Leverian Muſeum wholly white; and another all white except the crown of the head, which is mottled with red, and a creſcent of the ſame under the throat; the wings yellowiſh.

6. The *black goldfinch*; which is wholly black, except four of the middle quills, viz. from the fourth to the ſeventh, brimſtone-coloured on the outer edge, and white within from the baſe to the middle; bill and legs whitiſh. Goldfinches entirely black are not uncommon; ſome have the appearance of red about the head, others not. One of the firſt of theſe is in Dr. Latham's collection, which had been a caged bird, and gradually became of that colour. It had hemp-ſeed for its uſual food. Buffon mentions one that changed black all at once, after being four years in a cage. It kept ſo for eight months, when it began to reſume its former colours; and this circumſtance happened three times. An electrified goldfinch loſt the red of the head and yellow on the wings ſix months after.

7. The *black-and-green goldfinch*; which has the bill ſurrounded with a ſaffron-coloured ring; the reſt of the head and upper parts blackiſh; breaſt greeniſh-black; belly and under parts browniſh aſh-colour; edge of the wing greeniſh-black; quills black.

8. The *Canary goldfinch*; the head is not unlike the common goldfinch, but leſs bright; the upper parts of the body yellowiſh-brown; the under parts yellow; wings like the goldfinch; tail yellow, tipped with black.

10. Fringilla melba, the green goldfinch: ſize of the common goldfinch; bill fleſh-coloured; fore-part of the head and throat of a bright red; between the bill and the eye bluiſh aſh-colour; the upper parts of the bird are golden-green; the wing-coverts and ſecondaries greeniſh, with red margins; quills duſky; breaſt olive-green, changing into white on the belly and under the tail; all beneath variegated with broken duſky tranſverſe lines; the rump, and tail, bright red; legs pale brown. The female has a pale yellow bill; top of the head and neck aſh-colour; baſe of the wings and rump yellowiſh-green, inſtead of red; the tail brown, edged with dull red. In other things not unlike the male. This is ſaid to inhabit China and Braſil.

11. Fringilla Afra, the red-faced finch: length near ſix inches; general colour of the plumage deep dull green; cheeks tinged with crimſon; prime quills duſky, with dull orange edges; tail dull crimſon; legs yellow. Inhabits Angola.

12. Fringilla alario, the Cape finch: larger than the houſe ſparrow; bill aſh colour; head and neck black; the black ending in a point on the breaſt; the breaſt, and the reſt of the under parts, white; thighs rufous; upper parts of the body cheſnut; quills blackiſh; inner part of the leſſer ones, and under the wings, cheſnut; tail of this laſt colour; and the four outer feathers marked with a longitudinal blackiſh ſpot at the tip; legs brown. Inhabits the Cape of Good Hope.

13. Fringilla leucotis, the white-eared finch. Oſbeck mentions five ſmall birds, which he takes to be finches, and all varieties of the ſame ſpecies. The firſt with the head, back, and wing-coverts, purple; the inner ſide of the body yellow; prime quills and tail fine blue; the ſecondaries green; on the ears a white ſpot. The ſecond like the former; but the back and tail purple. The third with a green head, and a purple breaſt and tail. Fourth, the breaſt of a light green; the head and leſſer wing-coverts brown. The fifth with the head, back, wing-coverts, and tail, of a fine deep brown; the under ſide of the body, and under wing-coverts, fine crimſon. Each of theſe birds is diſtinguiſhed by a white ſpot on the ears.

14. Fringilla Amandava, the Amadavad finch: ſize of a wren; bill of a dull red; all the upper parts brown, with a mixture of red; the under the ſame, but paler; the middle of the belly darkeſt; all the feathers

of the upper wing-coverts, breaſt, and ſides, have a ſpot of white at the tip; the quills are brown; tail black; legs yellowiſh-white. The female differs in having a mixture of white on the throat and fore part of the neck; and the belly of a pale yellow colour; but in other things reſembles the male. This pretty little bird inhabits Java, Malacca, and other parts of Aſia. See the Plate, fig. 4.

There is a ſmaller variety of this bird, which inhabits Bengal: the bill is reddiſh; general colour of the plumage brown, mixed with a little white on the breaſt; tail duſky black; legs pale yellow.

15. Fringilla granatina, the Braſilian finch: this beautiful bird is near five inches in length; bill like red coral; irides dark; eyelids ſcarlet; ſides of the head, round the eye, bloſſom-coloured violet; baſe of the bill above blue; throat, lower part of the belly, and thighs, greeniſh-black; the reſt of the head and body cheſnut; the back and ſcapulars incline to brown; the rump blue; the quills are brown; tail black; legs pale grey. Theſe often differ in colour: ſome have a ſpot of brown between the bill and eye; and the hinder parts of the body, both above and beneath, violet; others are of the ſame colour on the lower belly and thighs as on the upper parts. In ſome parts the tail is reddiſh. The female has the red bill; a little purple under the eyes; the top of the head fulvous; the back grey-brown; throat and under parts pale fulvous; the lower part of the belly and vent whitiſh; the reſt as in the male, but leſs bright. This curious bird inhabits Braſil, has an agreeable ſong, and is frequently kept in cages by all the Europeans, being a very lively bird.

16. Fringilla Zeylonica, the Ceylon finch: this is very ſmall; bill and head black; the whole body yellow, inclining to green on the back; the under parts white and duſky; quills and tail duſky; the outer edges yellow. Inhabits China, and the iſland of Ceylon. There is a variety, with the bill black; head tawny; back green; breaſt and belly yellowiſh-white; wings and tail duſky. Perhaps only of a different ſex, as both inhabit the ſame regions.

17. Fringilla fuſcicollis, the brown-throated finch: bill red; crown of the head green; from the eyes a line of white, paſſing backwards; throat pale brown; beneath a patch of aſh-colour; then a ſpot of pale red; the back ferruginous; rump and vent green; wings duſky; on the lower part of the quills a yellow ſpot; tail half yellow, half black; legs yellow. Native of China.

18. Fringilla ignita, the fire finch: ſize of the ſmaller redpole: bill duſky; general colour of the plumage gloſſy browniſh red; vent rather darker; quills duſky; tail the ſame; legs fleſh-colour. The female is of a pale reddiſh-brown; forehead and between the eyes crimſon; tail reddiſh, with the end duſky. Inhabits Gambia, in Africa.

19. Fringilla triſtis, the American goldfinch: ſize of the chaffich; bill white; irides hazel; fore part of the head black; the reſt of the body bright ſhining yellow; thighs and tail-coverts yellowiſh-white; the wing-coverts black, croſſed with a band of white; quills black; the edges and tips of the leſſer ones white; tail black; legs white. The female wants the black on the head; the upper parts are olive green; throat, breaſt, and rump, pale yellow: belly and vent white; wings and tail like the male, but leſs bright. The young bird is at firſt like the female in all things, except in having the black forehead. See the Plate, fig. 1. Theſe inhabit North America, particularly about New York, where they are called *York yellows*. They are ſummer birds, and feed on thiſtles like our goldfinch. The ſame beautiful ſpecies is found at Surinam and Guiana, in the ſavannas. It is ſaid they loſe their fine yellow in the winter, and conſtantly reſume it again in the ſpring, with new luſtre.

20. Fringilla zena, the Bahama finch: length ſix inches and a quarter; bill lead-colour; irides pale; the head, fore part of the neck, back, and ſcapulars, black; on each ſide of the head two ſtreaks of white; under the chin a large yellow ſpot; the hind part of the neck, rump, and upper tail-coverts, dull red; breaſt orange-coloured; belly, thighs, and vent, white; wings brown; on the coverts a band of white; tail brown; legs lead-colour. In the female the colours are leſs vivid; the head and neck aſh-colour; the under parts of the body are paler than the upper, and a tinge of aſh-colour runs through the whole of the plumage. Natives of the Bahama iſlands, Jamaica, and other parts of the Weſt Indies and South America.

21. Fringilla lepida, the lepid finch: leſs by one-half than the canary bird; the general colour is greeniſh-brown; bill and eyes black; above the eyes a fulvous ſtripe, and a leſſer one of the ſame beneath them; the chin fulvous; breaſt black; legs grey. Inhabits the woods about Havannah, in the iſland of Cuba, and is eaſily tamed: it is very frequently ſinging, but in ſo weak a voice as ſcarcely to be heard, except almoſt cloſe to it.

22. Fringilla Carthaginienſis, the Carthagenian finch: a little larger than the canary-bird; bill pale brown; general colour of the plumage cinereous, ſpotted with brown and yellow; legs brown. Found in the woods of Carthagena, in South America, and has a note not unlike that of a chaffinch. Feeds on ſeeds.

23. Fringilla Æthiops, the negro finch; colour deep black; irides rufous. It inhabits the woods of South America; feeds on fruits and ſeeds, and is eaſily tamed. It ſings with the feathers of the head erected.

24. Fringilla autumnalis, the autumnal finch: of a greeniſh-colour; the top of the head ferruginous; vent teſtaceous; and the tail even at the end. Inhabits Surinam.

25. Fringilla citrinella, the citril finch: rather larger than the canary-bird; bill brown; plumage on the upper parts yellowiſh-green ſpotted with brown; the under and rump greeniſh-yellow; the breaſt of the male much inclined to yellow; leſſer wing-coverts greeniſh, the greater duſky edged with green; quills much the ſame; as are the feathers of the tail; legs fleſh-colour. This ſpecies is common in the ſouth of France, and about Rome; found alſo in Greece, Turkey, and other neighbouring parts. It is remarkable for its ſong, which is ſaid to be as fine as that of the canary-bird, to which it ſeems to have great affinity.

26. Fringilla ſerina, the ſerin finch: ſize of the canary; the upper mandible grey-brown, the under whitiſh; the plumage on the upper part of the body brown, mixed with yellowiſh-green; beneath of a greeniſh-yellow, marked on the ſides with longitudinal ſpots of brown; on the wings a greeniſh band; the quills and tail brown, margined with greeniſh-grey; legs brown. Inhabits Italy, Auſtria, Styria, and is not uncommon in the ſouth of France. The Italians highly value this bird, for its melodious ſong: whence ſome have derived the original of *ſerenade*, to ſound ſoft and pleaſant muſic. This bird is ſhewn at fig. 6. Scopoli obſerves that it is gregarious in ſpring, and frequents orchards; is fond of cabbage and hemp-ſeed; frequently takes ſudden flights upwards, and, after fluttering in the air for a little while, and warbling at the ſame time, alights with expanded wings nearly on the ſame ſpot from whence it roſe.

27. Fringilla Senegala, the Senegal finch: very little bigger than a wren: bill reddiſh, edged all round with brown; and beneath the under mandible a line of brown quite to the tip; the ſame alſo is ſeen on the ridge of the upper mandible; the upper part of the head, throat, fore part and ſides of the neck, breaſt, and upper part of the belly, ſides, rump, and upper tail-coverts, are of a vinaceous red-colour; the lower part of the belly, thighs, and under tail-coverts, greeniſh-brown; the hind part of the head and neck, the back, ſcapulars, and wing-coverts, are brown; tail black; legs grey. There is one brought from

from Abyſſinia, by Mr. Bruce, which he calls *danbik*, in which the red wholly covers the neck and wing coverts, as well as the under parts; and ſpotted on the ſides of the breaſt and wing-coverts with white. Theſe are natives of Senegal, and other parts of Africa; and feed on millet. This affords the natives an eaſy method of catching them: they ſupport a large hollowed gourd, the bottom uppermoſt, on a ſtick, with a ſtring leading to ſome covered place, and ſtrew under it ſome millet; the little birds, haſtening in numbers to pick it up, are caught beneath the trap, by the ſtick being pulled away by the obſerver at a diſtance. The females are ſaid to ſing nearly as well as the males. They are familiar birds; and when once uſed to the climate, will live five or ſix years in a cage. They are bred in Holland by the bird-fanciers.

28. Fringilla noctis, the rufous-chinned finch: length four inches and three-quarters; bill black; irides red; the whole plumage is black, except the chin, juſt under the bill, which is of a rufous orange-colour, and a ſpot of the ſame between the bill and eye; the legs blackiſh. Inhabits Jamaica, Martinique, Mexico, and other parts of South America.

There is a variety which is lead-blue, the quill and tail feathers blackiſh.

29. Fringilla Martinenſis, the Martinico finch: general colour black; throat rufous; a black patch on the breaſt. Native of Martinico, and feeds on graſs-ſeeds.

30. Fringilla nitens, the gloſſy finch: leſs than a ſparrow; bill fleſh-colour; irides white; plumage wholly blue black, with a poliſhed ſteel gloſs; legs fleſh-colour. The female has the feathers on the upper parts blackiſh, margined with yellowiſh brown; behind the eye a blackiſh ſtreak; the rump grey; beneath duſky yellowiſh brown; tail black, edged with grey; legs reddiſh. There is a variety of this ſpecies wholly black; bill and legs duſky. Native of Cayenne.

31. Fringilla melanictera, the black-and-orange finch: ſize of a linnet; bill pale brown; general colour of the plumage black, except the wings and tail, the edges of which are deeply margined with ferruginous; on the belly a few ſpots of white; legs brown. This is ſaid to come from Macao, and feeds on ants.

32. Fringilla melanoleuca, the white-breaſted finch: ſize of the preceding; general colour black, except an irregular bar of white acroſs the breaſt; bill and legs paliſh-brown. Native of Java.

33. Fringilla pecoris, the cow-pen finch: bigger than the mountain finch; bill blackiſh; head and neck duſky brown; back, wings, body, and tail, fine black, gloſſed with green and blue; legs brown. The female is deep brown; breaſt and belly light cinereous; chin white; wings and tail duſky. It arrives at New York in May, lays five eggs in June, and migrates ſouthward in Auguſt. In the winter time it is found in Virginia and Carolina. It delights to feed in the pens among the cattle, whence the name.

34. Fringilla Sinica, the olive finch: ſize of a linnet; bill yellowiſh; the upper parts of the body olive brown, with a tinge of rufous on the wing-coverts, back, and rump; round the bill, the throat, and fore-part of the neck, olive green; the reſt of the under parts rufous, tinged with yellow on the belly; under tail-coverts, and under wing-coverts, of a fine yellow; the greater wing-coverts fartheſt from the body black; tail black, with the baſe of the feathers yellow; legs yellowiſh. The female differs only in that the colours are leſs vivid.

35. Fringilla forficata, the fork-tailed finch: neck, breaſt, and rump, pale yellow; back olive; tail long, forked, blueiſh-black; head with a black pendent creſt. Dr. Shaw doubts whether it might not with more propriety be conſidered as a ſpecies of Muſcicapa, or fly-catcher. Inhabits Ceylon.

36. Fringilla melanocephala, the black-headed finch: length four inches; bill red; back, wings, and tail, ferruginous brown; head, and fore-part of the neck, black; ſides of the neck, and ſides under the wings, a little ſtreaked with black; hind part of the neck and belly white; quills black; legs lead-colour.

37. Fringilla fuſca, the brown finch: ſize of a wren; bill duſky upper parts of the plumage brown; the feathers edged with dark brown; under parts browniſh white; legs duſky. This and the laſt are natives of China.

38. Fringilla nævia, the white-cheeked finch: ſize of a ſparrow; bill pale aſh-colour; head, neck, and under parts, the ſame, marked on the upper parts and neck with duſky ſtreaks; under parts plain; back and wings pale rufous, with duſky ſtreaks; ſides of the head white; through the eye a reddiſh ſtreak, bounded on the under part with black; on the under jaw a ſtreak of black, which joins the black above the eye at the hinder part; tail duſky; legs black. Inhabits the Cape of Good Hope.

39. Fringilla Euſtachia, the Euſtatian finch: ſize of a chaffinch; bill red; the head, neck, and upper parts, of a fine yellow; on each ſide of the head, under the eye, is a ſpot of blue; the breaſt and under parts orange; wings, tail, and legs, red. Inhabits the iſle of St. Euſtatia.

40. Fringilla variegata, the variegated finch: length five inches three-quarters; bill yellowiſh; the head of a pale red, mixed with purple; the breaſt pale yellow, ſhaded deeper; the body covered with feathers, marbled with red, yellow, blue, and white; quills and tail variegated like the back; legs red. Inhabits New Spain, where it is known by the name of *twite*.

41. Fringilla nivalis, the ſnow finch: length ſeven inches; bill black; head and hind part of the neck cinereous; back, ſcapulars, and rump, grey brown; the margins paleſt; upper tail-coverts black; the thighs pale aſh-colour; all the under parts of the body are as white as ſnow, as are the wing-coverts and ſecondary quills, except the two neareſt the body, which are brown; the baſtard wing and greater quills black; the two middle feathers of the tail are black; the others white, tipped with black. This ſpecies inhabits various parts of the European continent, particularly near Dauphiny, in France; alſo about the ſnowy tops of the Caucaſian mountains, and thoſe of Perſia, deſcending from thence into the plains in winter.

42. Fringilla montiola, the mountain finch: ſize of a ſparrow; bill reddiſh; the upper parts brown, mixed with darker brown; quills and tail, darkeſt, edged with a paler colour; acroſs the wings two bars of white; the crown of the head cheſnut, mixed in the middle with grey brown; ſides of the head and neck, and all the under parts white; legs brown. Inhabits Canada.

43. Fringilla Caſpa, the Caſpian finch: this has a ſhort thick bill; the upper mandible black, the under yellowiſh; about the gape a few briſtles; the fore-part of the head, and throat, are white; the reſt of the head, the neck, the upper and under parts of the body, grey, inclining to red, but moſt ſo on the breaſt; the wings and tail are black; legs yellowiſh. This bird is met with in Abyſſinia, and is alſo found in Barbary, to the ſouth of Tunis; it flies in flocks, and is frequent about farm-yards and granaries, like our ſparrow; often ſeen in the date villages to the weſt of the lake of Marks; has an exceeding fine note, ſuperior to that of a canary-bird; but will not bear tranſporting from its native place.

44. Fringilla arcuata, the creſcent finch: length ſix inches; bill black; the head, and neck before as far as the breaſt, are alſo black; at the eye begins a ſtreak of white, which paſſes down on each ſide of the neck, and, growing broader, paſſes round the fore-part, like a creſcent; hind part of the neck pale brown; back, ſcapulars, and leſſer wing-coverts, cheſnut; the middle coverts black, tipped with white; the greateſt, and quills, brown, edged with grey; tail deep brown; legs brown. Inhabits the Cape of Good Hope.

45. Fringilla elegans, the elegant finch: ſize of the houſe ſparrow; bill red, a little bending, forehead, all round

round the bill, and throat, red; breaſt yellow; hind part of the head and neck duſky aſh-colour; back and wings green; tip of the quills duſky; breaſt, belly, and ſides, croſſed with irregular lines of white ſpots; the lower belly, thighs, and vent, white; rump and tail red, inclining to cheſnut; legs fleſh-colour. Inhabits Africa.

46. Fringilla formoſa, the lovely finch: colour green; chin and throat yellowiſh; belly barred with white and black; bill and legs red; tail-feathers blackiſh. Perhaps the other ſex of the laſt. Inhabits India.

47. Fringilla butyracea, the yellow finch: ſize of the canary; bill dark brown: irides hazel; plumage on the upper parts olive green; rump and under parts yellow; over the eye a yellow ſtreak; a ſmaller ſtreak or two beneath the eye: and one of green paſſing through it; the quills olive green; edged with white; the tail yellowiſh green; legs brown. Inhabits the Eaſt Indies.

48. Fringilla canaria, the canary finch, or canary bird. If the nightingale be the ſongſter of the grove, the canary finch is the muſician of the chamber. The melody of the former is derived from nature alone, that of the latter is directed and improved by inſtruction. With a weaker voice, with leſs extent of modulation, with leſs variety of notes, the canary has a finer ear, greater facility of imitation, and a more retentive memory; and, as the characters of animals depend principally on the quality of their perceptions, this delicate bird, alive to every impreſſion, becomes alſo more ſocial, more gentle; forms acquaintance, and even ſhews attachment. It feeds on grain, like the other domeſtic birds; and is more eaſily bred than the nightingale, which lives only on fleſh and inſects, and which requires its meal to be purpoſely prepared. Its education is attended alſo with greater ſucceſs: it readily lays aſide the melody of its native airs to adopt the harmony of our voices and inſtruments; it eagerly follows the notes, and improves and heightens their delicacy. The nightingale, proud of its nocturnal ſong, ſeems deſirous to preſerve its purity; at leaſt, he ſlights our muſic, and perpetually recurs to the rich beauties of nature. His ever-varied ſong cannot be altered by man; but that of the canary is more pliant, and can be modelled by our taſte. The one therefore contributes more than the other to the comforts of ſociety; the canary ſings at all times, recreates our ſpirits in the gloomieſt retreats, and even adds to our happineſs; it amuſes all young people, and infuſes cheerfulneſs into innocent and captive minds; and its little loves, which are manifeſt when it breeds, have a thouſand and a thouſand times awakened the tenderneſs of ſympathizing and feeling hearts.

To the happy climate of the Heſperides, this pleaſing bird owes its birth, or, at leaſt, its perfection; for, in Italy, there is a ſpecies ſmaller than that of the canaries, called the *citril*, and in Provence another almoſt as large, called the *ſerin*; but both theſe are more ruſtic, and may be regarded as the wild branches of a poliſhed ſtem. All the three intermix in a ſtate of captivity; but in the range of nature, each propagates in its peculiar climate.

The colour of the common canary is uniform, and of a grey citron yellow on all the upper parts of the body, and even on the belly; but it is only the tips of the feathers that are tinged with that delicate hue, the reſt of them being entirely white. The female is of a paler yellow than the male; but this citron-colour verging more or leſs on white, which the canary aſſumes in France, and ſome other countries, is not the tint of its native climate; for it varies according to the different temperatures. "I have obſerved, (ſays Buffon,) that the canary finch, which becomes entirely white in France, is in Teneriffe of almoſt as deep a grey as the linnet; this change of colour is owing probably to the coldneſs of the climate." This ſuppoſition, however, ſeems in part erroneous, becauſe the colour can be varied by the difference of food, by confinement, and above all by the mixture of breeds.

In the beginning of the eighteenth century, the curious in birds reckoned twenty-nine varieties of canaries, all of them diſtinctly deſcribed, as follows: 1. The common grey canary. 2. The grey canary, with down, and white feet. 3. The white-tailed canary. 4. The common flaxen canary. 5. The flaxen canary, with red eyes. 6. The golden flaxen canary. 7. The flaxen canary, with down. 8. The white-tailed flaxen canary. 9. The common yellow canary. 10. The yellow canary, with down. 11. The white-tailed yellow canary. 12. The common agate canary. 13. The agate canary, with red eyes. 14. The white-tailed agate canary. 15. The agate canary, with down. 16. The common pink canary. 17. The pink canary, with red eyes. 18. The golden pink canary. 19. The pink canary, with down. 20. The white canary, with red eyes. 21. The common variegated canary. 22. The variegated canary, with red eyes. 23. The flaxen variegated canary. 24. The flaxen variegated canary, with red eyes. 25. The black variegated canary. 26. The jonquil-black variegated canary, with red eyes. 27. The jonquil black variegated canary, of a regular plumage. 28. The full canary, (that is entirely of a jonquil-yellow,) which is the rareſt. 29. The creſt canary, (or rather the crowned,) which is one of the moſt beautiful.

The primitive ſtock from which theſe were deſcended is the common canary. All thoſe which have other uniform colours derive them from the difference of climate. Thoſe which have red eyes are more or leſs inclined to a pure white plumage; and the variegated are rather artificial than natural. The ſhades and arrangement of the colours of the variegated canaries differ exceedingly; ſome are black on the head, others not; ſome are ſpotted irregularly, and others with great regularity. The differences of colour are commonly perceived only on the upper part of the bird; they conſiſt of two large black ſpots on each wing, the one before and the other behind, in a large creſcent of the ſame colour placed on the back, pointing its concavity towards the head, and joining by its horns to the two anterior black ſpots of the wings. The tail is ſurrounded behind by an half collar of grey, which ſeems to be a compound colour reſulting from the intimate mixture of black and yellow. The tail and its coverts are almoſt white.

But, beſides theſe primary varieties, which ſeem to have been introduced by the change of climate, and ſome ſecondary ones that have ſince appeared, there are others more apparent, which reſult from the union of the canary with the ſerin, and with the cini; for not only do theſe three birds breed together, but the young hybrids are capable of procreation. The ſame may be ſaid in regard to the fruits of the commerce of the canary with the ſiſkin, with the goldfinch, with the linnet, with the yellow-hammer, with the chaffinch, and even it is ſaid with the ſparrow; for d'Arnault aſſured Salerne, that he ſaw at Orleans a grey hen canary which had eſcaped from an aviary, couple with a ſparrow, and make her hatch in a ſparrow-can, placed againſt a houſe, which thrived. Theſe birds, though very different from each other, and apparently diſcriminated widely from the canaries, can by proper care and attention be made to pair with them. The canary muſt be removed from thoſe of its own ſpecies; and the experiment ſeems to ſucceed better when performed with the female than with the male. The ſiſkin and goldfinch are the only birds with which it is well aſcertained that the male canary can propagate.

When we wiſh to pair canaries with goldfinches, ſays Buffon, we muſt take the goldfinches at ten or twelve days old, and put them in the neſt with canaries of the ſame age; we muſt raiſe them together in the ſame aviary, and accuſtom them to the ſame food. It is uſual to lodge the male goldfinches with the female canaries, and they aſſociate much more readily than if the female goldfinches were joined with the male canaries. We may obſerve, however, that the union is more tardy, becauſe the goldfinch is later in pairing than the canary; on the contrary,

contrary, if the female goldfinch be placed beſide the male canary, they ſooner couple. It is found that the ſiſkin is the only bird, of which the male and female propagate equally with thoſe of the male or female canaries. The female canary alſo breeds readily with the goldfinch; not ſo eaſily with the cock linnet; and even produces, though with more difficulty, under the male chaffinches, yellow-hammers, and ſparrows; whereas the male canaries cannot impregnate the females of theſe birds. Nature is therefore more uniform and permanent in the male than in the female; in the former, the characters are deeply imprinted; in the latter, the qualities are modified by the influence of external cauſes.

When canaries are paired of an uniform colour, that of their young is alſo uniform. If the parents be of different colours, the fruits of their commerce will have a richer plumage; and as the combinations that can take place are numerous, an immenſe variety of tints may be produced. But when the canaries of an uniform colour are croſſed with thoſe which are variegated, the changes are prodigiouſly multiplied, and there is ſcarcely any limit to theſe ſportive modifications.

With reſpect to the intercourſe of the canary with birds of other ſpecies, we ſhall here ſtate the moſt authentic obſervations. Of all the canaries, the cock cini, or green canary, has the ſtrongeſt voice, and appears to be the moſt vigorous, and the moſt ardent in propagation; it is ſufficient for three female canaries, and while they are ſitting in the neſts, it ſupplies them and their young with food. The ſiſkin and the goldfinch are neither ſo powerful nor ſo aſſiduous, and a ſingle female canary ſatisfies their appetite. The croſs breed of the cini, of the ſiſkin, and of the goldfinch, with the hen canary, are ſtronger than the canaries, ſing longer, and their notes are fuller and more ſonorous; but they are ſlower in receiving inſtruction; for the moſt part, they whiſtle imperfectly, and ſeldom one can be found that can repeat a ſingle air complete.

When we wiſh to have a breed of the goldfinch with the hen canary, the former ſhould be two years old, and the latter one, for the canary arrives ſooner at maturity. It will be better if both be reared together, though that precaution is not abſolutely neceſſary; for the author of the Treatiſe on Canaries miſtakes in aſſerting, that the hen muſt never have had commerce with a male of her own ſpecies, and that this would prevent her from receiving thoſe of a different kind. The following fact is directly contrary to this opinion: for Buffon relates that twelve canaries were put together, four males and eight females. Groſs chickweed killed three of theſe males, and all the females loſt their firſt hatch. Inſtead of theſe cock canaries, three male goldfinches were ſubſtituted, and put into the aviary in the beginning of May. Towards the end of July they had two neſts of young, which thrived well: and in the following year there were three hatches of each cock goldfinch with the female canaries. Theſe commonly do not breed with the goldfinch, except from the age of one to four; while they continue prolific with their own males till eight or nine: and it is only the variegated female that breeds with the goldfinch after its fourth year. Thus it appears that the hen canaries, though accuſtomed to the commerce of their own ſpecies, liſten to the invitation of the male goldfinches, and ſubmit without reluctance to their embraces. The union is even as productive as with their proper mates, ſince they have three hatches a-year with the goldfinch. The caſe is different in the intercourſe of the cock linnet with the canary, there being commonly but one hatch, very ſeldom two, in the year.

The progeny of the canaries with the ſiſkins, with the goldfinches, &c. are prolific, and can breed not only with both the ſpecies from which they ſprung, but likewiſe with each other; and thus may perpetuate an endleſs variety. Sprengel has made many obſervations with regard to the croſs-breeds of the canaries with other ſpecies, and particularly with the goldfinches; he has ſhewn that the progeny always continued to propagate with each other, and with the parent races. The proof which he has adduced is complete, though before him theſe hybrids were conſidered as ſterile. We muſt own, however, that the fruits of the intermixture in theſe hybrids are far from being ſo certain or ſo numerous as in the pure ſpecies; they generally have only one hatch a-year, ſeldom two, their eggs are often addle, and the ſucceſs depends on many minute circumſtances, which it would be impoſſible to obſerve, and ſtill leſs to deſcribe with preciſion. Theſe hybrids, which are ſtronger than the canaries, and have a louder voice, are alſo longer lived. But there is an obſervation which applies alike to all, that the period of their lives is abridged by their ardour in propagation. A cock canary raiſed by itſelf, and without intercourſe with the female, lives generally thirteen or fourteen years; and the croſs-breed of the goldfinch will reach its eighteenth or nineteenth year. The croſs-breed of the ſiſkin, if kept apart from the females, live fifteen or ſixteen years. Whereas the cock canary, which has one or ſeveral females, ſeldom lives longer than ten or elven years; the croſs-breed of the ſiſkin eleven or twelve, and that of the goldfinch fourteen or fifteen. It is alſo neceſſary to part them from the females after the time of hatching; that is, from the month of Auguſt to that of March: elſe the heat of their deſires would waſte them, and abridge their lives by two or three years.

The beſt way to breed from theſe birds, is to give them a chamber, having a ſunny aſpect, and facing the eaſt in winter. For in the cage they will often break the eggs to repeat their embrace; but, when they are lodged in an apartment where there are more females than males, they will pay their addreſſes to another, and allow the firſt to hatch undiſturbed. Beſides, the males, from jealouſy, will not ſuffer diſorders to be committed; and when one is prompted by ardour to teaſe his female and break her eggs, they will give him a beating, ſufficient to allay his concupiſcence. The materials given to build their neſt, are the ſcrapings of fine linen rags, cows and ſtags hair, moſs, and ſlender dry ſtalks of hay. The goldfinches and ſiſkins, when lodged with the hen canaries, to obtain a croſs-breed, make uſe of the moſs and hay, but the canaries prefer the hair and lint; but theſe muſt be well divided, leſt the fibres, ſticking to their feet, ſhould occaſion the eggs to be broken. To feed them, a crib is placed in the chamber, which is pierced all round with holes that admit the head; and into it a portion of this mixture is put; three pints of rape-ſeed, two of oats, two of millet, and a pint of hemp-ſeed; and the crib is repleniſhed every twelve or thirteen days, taking care that the grains be well cleaned and winnowed. This food is proper when they are only ſitting; but the day before the young are excluded from the ſhell, the parents ought to have a dry cake baked without ſalt, and after eating it, they ſhould have hard boiled eggs; one being ſufficient for two males and four females, and two for four males and eight females, and ſo in proportion. To vary ſomewhat their diet, they ſhould every three days be preſented on a plate with a bit of white bread ſoaked in water, and ſqueezed in the hand; this being not ſo rich as the cake, will prevent them from growing too fat while breeding. It would alſo be proper to give them a few canary ſeeds, but only once in two days, leſt they be heated too much. Sugar biſcuit commonly produces that effect, and is attended with another ſtill worſe, that the hens fed on it lay eggs that are addle, or too ſmall and tender. When the eggs are ſmall, the rape-ſeed ſhould be boiled every day to blunt its acrimony. After the hatch, the canaries ought to be purged with plaintain and lettuce-ſeeds; but care muſt be taken to remove the young birds, which would be greatly weakened by this regimen, and the parents muſt not be confined to it longer than two days. When you want to feed them with the ſtick, you ought not, as moſt bird-catchers adviſe, leave them with the mother till the eleventh

eleventh or twelve day; you ought to remove them with their neſt as early as the eighth day. The food for the young canaries ought to be prepared before hand; it is a paſte compoſed of boiled rape-ſeed, yolks of eggs, and crumbs of cake, mixed together, and beaten up with a little water. It ought to be given every two hours, and put into their bill. It muſt not be too liquid, leſt it turn ſour, and it muſt be made freſh every day till the young can eat without aſſiſtance.

The produce of theſe captive birds is not ſo regular, but appears to be more numerous than it probably would be in the ſtate of liberty. Some females have four or five hatches annually, and lay four, five, ſix, or ſeven, eggs each time; and generally they have three hatches, and the moulting hinders them from another. Some however ſit even during moulting, if they happen to be laying before that ſeaſon. The birds of the ſame hatch do not all moult at the ſame time. The weakeſt firſt drop their feathers, and the ſtrongeſt more than a month afterwards. In jonquil canaries this change of plumage is tedious, and commonly more dangerous than in the other kinds. The female jonquils have only three hatches, each of three eggs; the flaxen-coloured canaries are too delicate, and their brood ſeldom thrives. The pink ſhew a reluctance to pair with each other; in a large aviary the male but rarely couples with the female of his own colour, and to form the union, they muſt be confined together in a cage. The white ſort are commonly valuable in every reſpect; they lay and breed as well, or better than the others, and the variegated white are the hardieſt of all.

Whatever differences there may be in the diſpoſitions and prolific powers of theſe birds, the period of incubation is the ſame; all of them ſit thirteen days; and when the excluſion of the young is a day earlier or later, it is owing to ſome particular circumſtance. Cold retards the proceſs, and heat forwards it; accordingly the firſt hatch, which is in April, requires thirteen days and a half, or even fourteen days, if the weather is chilly; but the third, which happens during the heats of July and Auguſt, is effected in twelve days and a half, or even twelve days. It would be proper to ſeparate all the good eggs from the bad; and, to do this with certainty, we ought to wait to the eighth or ninth day, and take each gently by the two ends for fear of breaking it, and examine it in a ſtrong light, or by a candle, and reject all that are addle, which if left would only fatigue the hen. By this trial we may often reduce three hatches to two; and in that caſe the third female may be liberated, and permitted to begin a ſecond neſt.

The young canaries differ from the old ones both in the colour of their plumage, and in ſome other circumſtances. As the bird grows up, the arrangement, and the ſhades of colour, change; the old ones can be diſtinguiſhed from the young by their ſtrength, their plumage, and their ſong; the tints are deeper and more lively; their toes are rougher, and incline more on black, if they are of the grey kind; their nails are alſo thicker and longer than thoſe of the young ones. The female is often ſo like the male that they cannot at firſt be diſtinguiſhed; however, the colours are always deeper in the male, the head rather thicker and longer, and the temples of a yellow more inclined to orange; and under the bill there is a ſort of yellow flame which deſcends lower than in the female; its legs are alſo ſtronger, and it begins to warble almoſt as ſoon as it is able to feed itſelf. It is true that ſome females chant at that tender age, with almoſt as much ſpirit as the males: but, joining all theſe marks together, we may be able, even before the firſt month, to decide which are males or females; after that time there is no more uncertainty in that reſpect, for the ſong of the males then begins to decide their ſex.

The young canaries drop their feathers the firſt year ſix weeks after they are hatched; they become low-ſpirited, appear bloated, and conceal the head in their plumage; at this time the down only falls; but the following year they loſe the quills, even thoſe of the wings and of the tail. The young birds of the later hatches which happen in September or after, ſuffer much more from the moulting, than thoſe which are excluded in the ſpring; in that delicate condition the cold is extremely pernicious, and they would all periſh if not kept where it is temperate, or even pretty warm. As long as the moulting laſts, nature labours at the production of new feathers: and hence the exuberance of life being diverted into different channels, their ardour ceaſes, and the buſineſs of propagation is for the time ſuſpended.

The moſt fatal and the moſt common diſtemper, eſpecially in young canaries, is what is called the ſwallow *(avalure)*, in which the bowels ſeem to be ſwallowed, and drawn to the extremity of their body; the inteſtines are perceived through the ſkin of the belly in the ſtate of inflammation, redneſs, and diſtenſion; the feathers on that part drop, the bird pines, gives over eating, though always ſitting beſide the food, and dies in a few days. The ſource of the diſeaſe is the exceſſive abundance or richneſs of the aliments. All remedies are vain, and the change of regimen is the only thing which can recover a few out of a great number. The bird is put into a ſeparate cage, and given water and lettuce ſeeds; thus the heat that conſumes it is tempered, and evacuations are ſometimes performed which ſave its life. This diſtemper alſo is the fruit of their artificial education, for it ſeldom attacks thoſe which are trained by their parents; we ought therefore to take the greateſt care not to overfeed them with the ſtick; boiled rape-ſeed, and ſome chickweed, are proper, but no ſugar or biſcuit; and in general we ſhould give them too little rather than too much. When the canary utters a frequent feeble cry, which ſeems to come from the bottom of its breaſt, it is ſaid to be aſthmatic; it is alſo ſubject to a certain obſtruction of voice, eſpecially after moulting. This ſort of aſthma is cured by giving it the ſeeds of plantain, and hard biſcuit ſoaked in white wine; and to reſtore its voice it ought to have generous food, ſuch as yolks of eggs beat up with crumbs of bread; and for drink, liquorice-water, that is, water in which that root has been ſteeped and boiled. The canaries are alſo ſubject to a ſort of ſhanker on the bill. This diſorder is owing to the ſame cauſe with the ſwallow, the abundance or richneſs of food producing an inflammation, which, inſtead of affecting the inteſtines, ſometimes extends to the throat or palate, the ſame cooling remedies muſt be applied; they ſhould have lettuce-ſeeds and bruiſed melon-ſeeds mixed with their drink. The mites and the ſcab, with which theſe ſmall birds are ſometimes affected, are generally owing to the dirtineſs with which they are kept. Care muſt be taken to preſerve them clean, to give them water to bathe in, to avoid putting old or bad wood in their cages, and to cover them only with new cloth that is not moth-eaten; and the ſeeds and herbs with which they are to be fed ſhould be fanned and waſhed. We muſt pay this attention, if we would wiſh them to be neat and healthy. In the ſtate of nature they would themſelves preſerve cleanlineſs; but impriſoned, they are ſubject to the loathſome diſorders incident to that ſtate: however, many of theſe birds, though reduced to captivity, are never ſick, and in theſe, habit ſeems to have become a ſecond nature. In general, the ſource of their diſeaſes is the heat of their conſtitution. They always need water: and if a plate with ſnow be placed in the cage, or in the aviary, they will roll in it ſeveral times with expreſſions of pleaſure, though in the coldeſt weather. This proves that it is rather pernicious than uſeful to keep them in very hot places. But there is another diſtemper to which the canaries and many other birds are ſubject, eſpecially in the ſtate of confinement: this is the epilepſy. The yellow canaries in particular are oftener than the others ſeized with the falling ſickneſs, which attacks them ſuddenly, and even ſurpriſes them in the midſt of their moſt impaſſioned ſong. Thoſe that eſcape the firſt attack of this epilepſy, live a long time after, and

ſometimes attain the ſame age with thoſe which have never been affected by that diſtemper. It is ſaid that a ſmall inciſion in the toes would be beneficial, for in that way parrots are cured of the epilepſy.

The hen canaries can, like the females of other birds, lay eggs without commerce with the male. The egg, in itſelf, is only a matrix which the bird excludes, and will remain unprolific if not impregnated with the ſeed of the male; and the heat of incubation, inſtead of quickening it, only haſtens its putrefaction. If the females be entirely ſeparated from the males, ſo as not to ſee and hear them, they very ſeldom lay; for they oftenеſt drop their eggs when melted by the view or the ſong of the males: ſo much do even diſtant objects act upon feeling animals, and ſo many are the ways in which the ſubtle flame of love is communicated.

Moſt of the canary birds which are imported from Tyrol, have been educated by parents, the progenitor of which was inſtructed by a nightingale; our Engliſh canary birds have commonly more of the titlark notes. The traffic in theſe birds makes a ſmall article of commerce, as four Tyroleſe generally bring over to England ſixteen thouſand every year; and though they carry them on their backs one thouſand miles, as well as pay twenty pounds duty for ſuch a number, yet upon the whole it anſwers to ſell theſe birds at five ſhillings a-piece. The chief place for breeding canary birds is Inſpruck and its environs, from whence they are ſent to Conſtantinople, as well as every part of Europe. Phil. Tranſ. vol. lxiii. part 2.

The Moſambique canary, mentioned by Buffon as brought from Moſambique in Africa, is a variety of this ſpecies, and ſomewhat ſmaller; the body is brown above; eyebrows yellow.

49. Fringilla flaveola, the ſaffron-fronted finch: ſize of a canary-bird; general colour yellow; bill convex, of a pale colour, with a brown tip: the forehead ſaffron-colour; the back inclines to green; quills and tail edged with yellow; legs pale.

50. Fringilla ſpinus, the ſiſkin. Of all the granivorous birds, the ſiſkin is reckoned the moſt akin to the goldfinch; both have the bill elongated and ſlender near the point; both are gentle, docile, and lively. The fruits of their intermixture are alſo deſirable to propagate. Some naturaliſts have been induced, by theſe analogies, to regard them as two contiguous varieties belonging to the ſame ſpecies; indeed all the granivorous birds may be claſſed together; for their croſs breeds are prolific. Since this general character extends to them all, it becomes the more neceſſary to ſelect the diſtinguiſhing features, and to trace the preciſe boundaries of each family. Fig. 5, on the Plate, is a correct likeneſs of the ſiſkin. It is ſmaller than the goldfinch; its bill is proportionally ſhorter, and its plumage is entirely different; its head is not red, but black; its throat brown; the fore part of its neck, its breaſt, and the lateral quills of its tail, yellow; the belly yellowiſh-white; the under part of the body olive-green, ſpeckled with black, which aſſumes a yellow caſt on the rump, and ſtill more yellow on the ſuperior coverts of the tail. But in the more intimate qualities, which reſult directly from organization or inſtinct, the differences are ſtill greater. The ſiſkin has a ſong peculiar to itſelf, and much inferior to that of the goldfinch; it is very fond of alder-ſeeds, which the goldfinch will never touch, and the ſiſkin, in its turn, is indifferent about thiſtle-ſeeds; it creeps along the branches, and ſuſpends itſelf from their extremity like a titmouſe. It is a bird of paſſage, and in its migrations flies at a great height, and is heard before it can be ſeen; but the goldfinch continues with us the whole year, and never flies very high; nor are theſe two birds ever obſerved to aſſociate together. The ſiſkin can be taught, like the goldfinch, to draw up the little bucket; it is equally docile, and, though not ſo active, it is more cheerful; for it begins always the earlieſt in the morning to ſing, and to rouſe the other birds. But, as it has an unſuſpicious temper, it is eaſily decoyed into all ſorts of ſnares, traps, ſprings, &c. and it is more eaſily trained than any other bird caught in the adult ſtate. We need only to offer it habitually the proper ſort of food in the hand, and it will ſoon become as tame as the moſt familiar canary. We may even accuſtom it to perch upon the hand at the ſound of a bell; for if at firſt we ring at each meal, the ſubtle aſſociation of perceptions, which obtains alſo among the animals, will afterwards rouſe it to the call. Though the ſiſkin appears to ſelect its food with care, it conſumes much; but its voracious appetite is ſubordinate to a noble paſſion; it has always in an aviary ſome favourite of its own ſpecies, or if that is not to be obtained, a bird of another ſpecies, which it cheriſhes and feeds with the fondneſs of a parent. It drinks often, but ſeldom bathes; it only approaches the margin of the water, and dips its bill and breaſt, without much fluttering, except perhaps in hot weather.

It is ſaid that it breeds on the iſlands in the Rhine, in Swiſſerland, Greece, and Hungary, and that it prefers the mountain foreſts. It is a common practice with bird-fanciers to croſs them with the canary; but very frequently the eggs are addle; for the temperament of the ſiſkin wants much of the warmth of the canary. The hybrids reſemble both parents.

In Germany, the ſiſkins begin to migrate in October, or even earlier; at this time they eat the hop-ſeeds, to the great injury of the proprietors; and the places where they halt are ſtrewed with leaves. They entirely diſappear in December, and return in February. In Burgundy, they arrive at the ſeaſon of vintage, and repaſs when the trees are in flower; they are particularly fond of the bloſſoms of the apple-tree. In autumn they deſcend from the mountains, and appear in flocks of more than two hundred, and ſit all upon the ſame tree, or at a very little diſtance from each other. The paſſage continues fifteen or twenty days, after which ſcarcely any more are ſeen. Their immenſe flights happen only once in the courſe of three or four years, and ſome have ſuppoſed them to be brought by the wind.

The ſong of the ſiſkin is very agreeable, though much inferior to that of the goldfinch, which it acquires, it is ſaid, with tolerable facility; it alſo copies the canary, the linnet, the pettychaps, &c. if it has an opportunity of hearing them when young. According to Olina, this bird lives ten years, and is but little ſubject to diſeaſes, except the melting of the fat, when fed with hemp ſeed.

The male ſiſkin has the top of the head black, the reſt of the upper part of the body olive, and ſlightly variegated with blackiſh; the ſmall upper coverts of the tail entirely yellow; the great coverts olive, terminated with cinereous; ſometimes the throat is brown, and even black; the cheeks, the fore-part of the neck, the breaſt, and the lower coverts of the tail, of a fine lemon yellow; the belly yellowiſh-white; the flanks the ſame, but ſpeckled with black; there are two olive or yellow tranſverſe ſtripes on the wings, the quills of which are blackiſh, edged exteriorly with an olive-green; the quills of the tail yellow, except the two intermediate ones, which are blackiſh, edged with olive-green; they have all a black ſhaft; the bill has a brown point, the reſt white, and the legs are grey. In the female, the upper part of the head is variegated with grey, and the throat is white.

This bird is pretty common throughout Europe, and found not unfrequently in England in the winter ſeaſon; but in ſome years much ſcarcer than in others. During the time of its being in England, it may be met with mixed with the leſſer redpole, on alder-trees, ſometimes in great numbers; it often runs on the under part of the branches, feeding on the ſeeds of theſe trees; and departs in ſpring. No one has deſcribed the neſt. It is ſuppoſed to conceal it with great cunning; nor has it ever been known to breed with us. In Suſſex it is called the *barley bird*, as being ſeen in that ſeed time. About

London it is known by the name of *aberdevine*. In the weſtern and ſouthern parts of Ruſſia this bird is found in plenty; but is not met with towards the Uralian chain, nor in Siberia.

There are three varieties of this ſpecies of the ſiſkin: 1. The *black ſiſkin*, with a yellowiſh crown; met with in Sileſia. Buffon mentions one taken at large, which he thought to be a mixed breed between a canary and the ſiſkin. 2. The *black-and-yellow ſiſkin*; the top of the head black; throat, round the neck, and breaſt, yellow; the rump yellow, changing into white on the upper tail-coverts; the back olive-brown; wings and tail black, edged with white; belly and vent whitiſh; legs pale. The female is very like the male, but the colours leſs bright: found about New York. 3. The *olive ſiſkin*; bill cinereous; pupil of the eye bluiſh; upper parts of the body pale olive; beneath yellow; head black; quills black, edged with yellow; and a ſtripe of the ſame on the wings; legs cinereous. The female has the crown grey-brown; cheeks and throat pale yellow. Found in the woods about Buenos Ayres, and in the Straits of Magellan. It is ſaid to ſing better than any other bird of South America.

51. Fringilla Mexicana, the Mexican ſiſkin: ſize of the common ſiſkin; upper parts greeniſh-brown; the under yellowiſh-white; quills and tail green, like the back. Inhabits Mexico, where it is called *acatechichictli*.

52. Fringilla catotol, the catotol ſiſkin: ſize of the preceding; the upper parts variegated with yellow and blackiſh; the under white; legs aſh-colour. Inhabits the plains of Mexico, and is ſaid to ſing agreeably.

53. Fringilla barbata, the bearded ſiſkin: the general plumage is pale yellow; wings green, ſpotted with black and red; chin bearded; bill white, at the baſe tipt with black; head black; chin, in the young bird, yellow, when half a year old covered with black hairs, and when full grown appearing as if bearded. Inhabits the mountains of Chili, and in winter deſcends into the plains; it is eaſily tamed, ſings charmingly, and imitates the notes of other birds; builds in trees; ſize of the canary bird. The female is, without the beard, cinereous; wings here and there ſpotted with yellow.

54. Fringilla diuca, the Chilian ſiſkin: ſize of the preceding; general plumage blue; chin white. Inhabits Chili, about houſes; ſings finely, eſpecially at ſun-riſe.

55. Fringilla Sinenſis, the Chineſe ſiſkin: leſs than the ſparrow; bill and head black; hind part of the neck, and back, olive-green; the fore-part, belly, and vent, yellow; wing-coverts the ſame; the leſſer croſſed with two black bands, the larger tipped with a ſpot of black; the quills are black, but the greater ones are yellow halfway from the baſe; tail half black half yellow, like the quills; legs black. Inhabits China.

56. Fringilla flammea, the flame-coloured finch: length four inches; bill pale brown; the head of a deep flame-colour, inclining to crimſon, and the feathers ſomewhat longer than the reſt; the plumage on the upper parts of the body brown; beneath pale crimſon, or roſe-colour; legs pale brown. This is ſaid by Linnæus to have come from Norland: deſcribed by him from Rudbeck's paintings. It ſeems to be confined to the northern regions, though not aſcertained by the leaſt hiſtory annexed to either of the ſpecimens in the Britiſh or Leverian muſeums.

57. Fringilla flaviroſtris, the Arctic finch: bill yellow like wax, with a brown tip; the male is wholly of an obſcure ſooty-brown colour, paleſt beneath; the breaſt-feathers have frequently the tips varied with garnet-colour; quills and tail duſky, edged with grey; legs black. The female inclines to brown; otherwiſe like the male. This ſpecies is found in Norway, and in the north-eaſt part of Siberia. In winter it migrates to the ſouth, frequenting inhabited places, and is ſeen about barns, being a tame ſpecies; it is frequent about the Jeniſei in the ſevereſt part of the winter, and returns north earlier than the ſnow bunting; it is not ſeen in Ruſſia.

58. Fringilla cannabina, the greater redpole: leſs than the common linnet, but about the ſame length; the bill is duſky; irides hazel; on the forehead is a blood-coloured ſpot; the reſt of the head and neck aſh-colour; the breaſt tinged with a fine roſe-colour; back, wing-coverts, and ſcapulars, bright reddiſh-brown; the firſt quill feather black; the exterior and interior edges of the eight following white, forming a bar of white on the wing; the ſides are yellow; middle of the body white; tail duſky, edged with white; legs brown. The head of the female is aſh-coloured, ſpotted with black; back and ſcapulars of a browniſh red; breaſt and ſides yellow, ſtreaked with duſky lines. This bird is frequently met with in flocks on the ſea-coaſts, and in flight-time near London; and is alſo common on the continent of Europe, like the former, but found more northward than that bird, in which parts it breeds. It breeds alſo in the northern parts of England and Scotland, upon the mountains: alſo in Cumberland. It makes its neſt on the ground, and lays three bluiſh-white eggs, mottled with yellow, and ſpeckled with brown. It is likewiſe found in America, where it ſhifts its quarters according to the ſeaſon, and unites into flocks, in the ſame manner as in Europe. It inhabits alſo Hudſon's Bay.

59. Fringilla linota, the common linnet. Few birds are better known than the linnet; but ſtill fewer, perhaps, unite more amiable qualities: a pleaſing ſong, docility of diſpoſition, and ſuſceptibility of attachment. Endowed with ſuch talents, it could not long preſerve its freedom; and ſtill leſs, when nurſed in cages, could it retain the beauties of its original plumage. In fact, the red colour with which nature has painted its head and breaſt, and which in the ſtate of liberty ſparkles with great luſtre, wears off, and ſoon diſappears entirely in our cages and aviaries. There remain only a few obſcure veſtiges after the firſt moulting.

This bird poſſeſſes ſtrong powers of imitation. Some have even ſucceeded in teaching it to ſpeak different languages, that is, to articulate ſome Italian, French, and Engliſh, words, with conſiderable fluency. Many perſons have, from curioſity, gone from London to Kenſington merely to hear an apothecary's linnet, which articulated the words *pretty boy*. The fact is, it had been taken out of the neſt when only two or three days old, before it had time to acquire the parent ſong; and juſt beginning to liſten with attention, it was ſtruck with the ſound of *pretty boy*, and learned it from imitation. This fact ſeems to eſtabliſh the opinion of the late Daines Barrington, that birds have no innate ſong; and that the warble peculiar to the different ſpecies and its varieties, have nearly the ſame origin with the languages and the dialects of various nations.

The linnet, in the wine countries, often builds its neſt in vineyards, and hence it has been called the *vine-linnet*, or wine-bird. It builds alſo in juniper, hawthorn, blackthorn, and hazel-nut, trees, in young copſes, &c. Their neſts are compoſed of ſlender roots, ſmall leaves, and moſs, on the outſide; and lined with feathers, hairs, or wool; they lay five or ſix eggs, of a dull white, ſpotted with brown-red at the large end. The linnets have ſeldom more than two hatches, except their neſts be robbed, which obliges them to renew their labours; and in this way they may be made to lay four times in the year. The mother feeds the young by diſgorging into their bill what had been prepared and half-digeſted in her craw.

After the hatching is over, and the family raiſed, the linnets go in numerous flocks, which are formed about the end of Auguſt, when the hemp, on which they delight to feed, is arrived at maturity; and at this time ſixty have been caught in one drawing of the net. They continue to live thus in ſociety during the whole winter; they fly very crowded, alight and riſe together, perch on the ſame trees, and about the beginning of ſpring they all begin to chant. They live alſo upon all kinds of ſmall ſeeds, particularly thoſe of thiſtles, &c. and hence they

haunt indiſcriminately uncultivated lands, and ploughed fields.

The ſong of the linnet is announced by a ſort of prelude. In Italy the linnets of Abruzzo and of the Marche of Ancona are preferred. It is generally ſuppoſed in France that the warble of the red linnet is ſuperior to that of the grey. The females are naturally deſtitute of ſong, nor can they ever acquire it. The adult males caught in the net profit as little by inſtruction; and the young males taken out of the neſt are alone ſuſceptible of education. They are fed with oatmeal-gruel, and rape-ſeed ground with milk or ſugared water; and in the evening they are whiſtled to in the weak light of a candle, care being taken to articulate diſtinctly the words or notes which they are to repeat. Sometimes, to begin them, they are held on the finger before a mirror, in which they view their image, and believe they ſee another bird of their own ſpecies; they ſoon fancy that they hear the notes of a companion, and this illuſion produces a ſort of emulation which animates their ſong, and quickens their progreſs. It is ſuppoſed that they ſing more in a ſmall cage than in a large one.

The name of theſe birds points out their proper food. They are called linnets *(linariæ)* becauſe they prefer linſeed to all other food, though they feed on the ſeeds of panic, rape, hemp, millet, canary-graſs, raddiſh, cabbage, poppy, plantain, beet, and ſometimes on thoſe of the melon. Geſner ſays, that if poppy-ſeeds alone be given for food either to linnets or goldfinches, they will become blind. Some give them ſweet cake, prickly-ſorrel, chickweed, ears of wheat, oats pounded, and even a little ſalt; but all theſe muſt be properly varied. They break the ſmall grains in their bill, and reject the ſhell: they ought to have very little hemp-ſeed, for it fattens them too much; and exceſſive fat occaſions their death, or at leaſt renders them unfit for ſinging. In thus feeding and raiſing them, we may not only teach them what airs we chuſe with a canary-whiſtle, a flageolet, &c. but we alſo tame them. They readily diſtinguiſh thoſe who are kind to them, become fond of them, alight on them in preference, and behold them with an affectionate air. They have been known to live upwards of ſeventeen years.

The linnet is a pulverulent bird, and it would be proper to ſtrew in the bottom of the cage a layer of fine ſand, and renew it occaſionally; there ought alſo to be a ſmall bath.—The total length of the bird is five inches and a few lines; its alar extent nearly nine inches; its bill five lines; its tail two inches, ſomewhat forked, and ſtretching an inch beyond the wings. In the male the top of the head and the breaſt are red; the throat, and the under part of the body, ruſty white; the upper, cheſnut; almoſt all the feathers of the tail and of the wings are black, edged with white; and hence when the wings are cloſed there is a white ray parallel to the feathers. The female has commonly none of the red that we have mentioned; and the plumage is more varied than in the male.

There are two varieties mentioned of this bird. The one white; the quills and tail black, edged with white, as in the common. The other, with a greeniſh bill; the legs black, and a very forked tail; otherwiſe like the common linnet. One, wholly white, was alſo ſhewn in the Leverian Muſeum.

60. Fringilla linaria, the ſmaller redpole: this is about half the ſize of the greater redpole; bill duſky; irides hazel; on the forehead is a rich ſpot of purpliſh red; breaſt of the ſame colour, but leſs bright; back duſky, edged with reddiſh-brown; ſides yellowiſh or aſh-colour, marked with narrow duſky lines; quills and tail duſky, edged with dirty white; on the wing-coverts are two whitiſh bars; legs duſky. The female is leſs lively in colour; has no red on the breaſt, and the ſpot on the forehead is of a ſaffron-colour. This ſpecies is alſo common in England, and makes its neſt chiefly in the mountains of Wales; and is now and then found in other parts of this iſland. They are ſeen upon the coaſt of Kent in great numbers in November, about which time they migrate into England in large flocks. A neſt of this ſpecies was found on an alder ſtump, near a brook, about two or three feet from the ground; the outſide compoſed of dry ſtalks, and other plants, intermixed with wool, and lined with hair and feathers. The eggs are four in number, of a pale bluiſh-green, thickly ſprinkled near the blunt end with ſmall reddiſh ſpots. The bird was ſo tenacious of her neſt, as to ſuffer herſelf to be taken off by the hand, and when releaſed would not forſake it. This bird is known about London by the name of *ſtone redpole*. Linnæus, Kramer, and others, mention its being very fond of the ſeeds of alder. This we have ſeen frequently; for whole flocks of theſe birds, mixed with the ſiſkin, frequent many places where alders grow, for the ſake of picking the catkins; they generally hang like the titmouſe, with the back downwards, and in this ſtate are ſo intent on their work, that they may be entangled one after another by dozens, by means of a twig ſmeared with birdlime, faſtened to the end of a fiſhing-rod, or other long pole. This ſpecies ſeems to be in plenty throughout Europe, from the extreme parts of Ruſſia on the one hand, to Italy on the other. Is very common in Greenland, and was alſo met with by our late voyagers at Oonalaſhka. In America it is likewiſe well-known. Hence it ſeems to be a bird common to the whole of the northern part of the globe without exception.

61. Fringilla montium, the mountain linnet: length ſix inches and a half; bill pale; irides hazel; the feathers on the upper part of the body duſky; thoſe on the head edged with aſh-colour, the others with browniſh-red; the rump pale crimſon; the under parts of the body pale; thoſe of the throat and breaſt blackiſh, with pale edges; wings and tail duſky; tips of the greater coverts and ſecondaries whitiſh; legs brown. The female wants the red mark on the rump.

The *twite linnet* is a variety of the above: length only four inches and a half: bill yellowiſh, with a brown tip; the top of the head and rump are both red; over the eyes a rufous band; the upper parts black, edged with rufous; the under rufous, ſpotted with black on the throat; belly white; legs brown; between the bill and eye a dark brown ſpot, and on the chin another. The female wants the red ſpot on the rump. Twites are taken in the flight ſeaſon near London, along with other linnets. It is probable that the name has been taken from their twittering note, having no muſic in it; and indeed the bird-catchers can tell at ſome diſtance whether there be any twites mixed among linnets, merely from this circumſtance. The twite is ſuppoſed to breed in the more northern parts of our iſland.

62. Fringilla caudacuta, the ſharp-tailed finch: varied with rufous and brown; eyebrows, chin, and neck above, rufous; tail entire, the feathers all pointed at the tips; length four inches and a half; bill and legs pale; irides brown; feathers of the body brown, edged with pale rufous; chin and ſtreak above the eyes pale rufous. Inhabits Georgia.

63. Fringilla Georgiana, the Georgian finch: brown, beneath whitiſh; leſſer wing-coverts wholly, quill and tail-feathers on the outer webs rufous; chin and throat mouſe-colour; under the arm-pits a black ſtreak: length ſix inches; bill duſky; irides brown; head brown, a little tumid; middle of the back blackiſh; legs brown. Inhabits Georgia.

64. Fringilla argentoratenſis, the Straſburgh linnet: ſize of the common linnet; head and upper parts, as far as the rump, brown; beneath, as far as the upper part of the belly, and ſides, rufous ſpotted with brown; the belly and vent whitiſh; quills and tail brown; legs reddiſh. Inhabits the environs of Straſburgh, where it is called *gyntel*; and is ſaid to lay four eggs.

65. Fringilla Angolenſis, the Angola linnet: ſize of the chaffinch; bill brown; the feathers round the baſe black; upper parts of the head, neck, and body, brown-

iſh

iſh aſh-colour, each feather darker in the middle; round the eyes, and on each ſide of the throat, white; the under parts dull orange; the rump, and upper tail-coverts, bright yellow; greater wing-coverts and quills brown, edged with yellow; tail edged with grey; legs fleſh-colour. The female has the upper parts rufous brown, each feather darkeſt in the middle; ſides of the head pale rufous; near the baſe of the bill a brown mark, which paſſes towards the hind head; from the breaſt to the vent pale rufous, ſpotted with brown; the reſt like the male. Theſe come from Angola, where the male bears the name of *negral*, or *tobaque*; the female, *benguelinha*. This is perhaps the *vengoline*, mentioned by the Hon. Daines Barrington, which he ſays ſings better than any bird that is not European, except the American mocking bird.

66. Fringilla atra, the duſky linnet: this ſmall but elegant ſpecies is ſhewn in the Plate at fig. 3. Length only four inches; bill aſh-colour; general colour of the plumage duſky brown, inclining to red; aſh-colour on the breaſt and rump; all the feathers have the tips of a lighter colour; legs duſky. This is a native of Angola and Braſil; and has a ſweet ſong.

67. Fringilla macroura, the long-tailed linnet: length ſeven inches and a half; bill brown; the upper part of the plumage like that of a ſky-lark; the middle of each feather very dark; the under parts of the body pale aſh-colour; tail long, and cuneiform in ſhape; the two middle feathers narrow, and ſharp at the ends, of a greeniſh-brown; quills brown, with greeniſh margins; legs brown. Native of Cayenne.

68. Fringilla petronia, the ring ſparrow: larger than the common ſparrow; bill ſtrong; the upper mandible brown, the other pale grey, with a brown tip; the head, and upper part of the neck and back, grey ſpotted with brown; all beneath, grey and white mixed; the fore-part of the neck yellow; round the head, above the eyes, a ring of dirty white; quills and tail duſky, edged with grey. This bird frequents Europe, chiefly Germany, in ſome parts of which it is pretty numerous: it is alſo found in Italy; and is migratory, except in the warmer climates, where it frequents woods, and builds in the holes of trees. It has one brood in a year, and lays four or five eggs. At the end of July collects into flocks, and remains ſo till ſpring. It is a tender bird, often found dead in the hollows of trees in hard winters. It lives both on ſeeds and inſects. This ſpecies was found in Norton Sound, by our late circumnavigators.

There are two varieties: 1. Above varied with black and reddiſh; beneath white-aſh; wings barred with white; tail feathers grey-brown. 2. Neck and collar whitiſh.

69. Fringilla ſtulta, the fooliſh ſparrow: ſize of the houſe-ſparrow: rufous grey above, ſpotted with ruſt-colour; over the eye a white ſtreak, and a yellow ſpot on the throat; beneath yelloviſh; two bands of white on the wings; and a blackiſh tail, edged with rufous. Native of Italy.

70. Fringilla Bononienſis, the ſpeckled ſparrow of Bologna: ſize of the preceding; bill yellow; irides white; head and neck the ſame, marked with yelloviſh ſpots; back and rump black, white, and yelloviſh, mixed; under parts yelloviſh-white; quills duſky; tail and legs yelloviſh. Native of Italy.

71. Fringilla leucura, the white-tailed ſparrow: this is yelloviſh above, ſpotted with cheſnut, and ſtreaked with white; head and under parts yelloviſh-white; tail cinereous-white. Found in the neighbourhood of Bologna.

72. Fringilla brachyura, the ſhort-tailed ſparrow: whole body yelloviſh; breaſt and belly paleſt; bill of a deeper yellow. Native alſo of Italy.

73. Fringilla Dalmatica, the Dalmatic ſparrow: this is bigger than the houſe ſparrow; bill whitiſh; the upper parts of the body reddiſh; the under whitiſh; tail forked; legs pale yellow. Inhabits Dalmatia.

74. Fringilla Bengalus, the Bengal finch: ſize of the ſmaller redpole; bill fleſh-colour; irides hazel; head, and upper parts of the body, grey; the lower part of the back and rump, and all the under parts, blue; on each ſide of the head is a curved purpliſh-red ſpot, placed beneath the eyes and rather behind them; the quills are brown, edged with grey; the tail pale blue, and wedge-ſhaped; legs whitiſh. The female is the ſame in colour, but wants the red ſpot beneath the eyes.

75. Fringilla Jamaica, the Jamaica finch: length five inches; bill black; the upper parts of the plumage dull blue; the feathers very ſoft; the under parts of a paler blue, inclining to yellow on the belly; wing-coverts greeniſh-blue; quills and tail the ſame; legs black. Inhabits Jamaica. The male and female are much alike.

76. Fringilla cana, the grey-headed finch: this is a large ſpecies; length eight inches; bill three quarters of an inch; the upper mandible bluiſh-brown; the under paler; head and throat grey; upper part of the neck and body yellow-brown; the under parts yellow; vent white; wings and tail dull brown, ſtreaked with white lines; legs bluiſh. Inhabits Jamaica.

77. Fringilla Savannarum, the Savanna finch: length only four inches; bill brown; over the eye a yellow ſtreak; crown, and upper parts of the body, dull brown, mixed with whitiſh and fillemot colour; beneath, as far as the breaſt, pale yelloviſh-brown; belly white; quills brown, tipped with white; tail brown; legs whitiſh. Inhabits Jamaica, where Sloane tells us, that "it ſits on the ground in the plains, and runs thereon after the manner of ſky-larks, as low as they can, to avoid being diſcovered; and, when raiſed, fly not far nor high, but alight again very near."

78. Fringilla coccinea, the ſcarlet finch: length four inches and a half; bill like that of a goldfinch; general colour of the plumage a brilliant deep orange, verging to ſcarlet; wings and tail duſky; the outer edges of the quills fringed with orange, and the ends of the prime ones black; tail even at the end; legs black. Inhabits the Sandwich iſlands.

79. Fringilla punicea, the red-breaſted finch: bill white; cheeks, throat, fore part of the neck, and breaſt, of a rich crimſon; crown, upper part of the neck, back, wings, and tail, black; wing-coverts croſſed with two lines of white; legs black. Found by our late voyagers at Sandy Hook.

80. Fringilla ferruginea, the ferruginous finch: ſize of the hedge-ſparrow; bill duſky; upper parts of the plumage, quills, and tail, dark brown, edged with reddiſh brown; the under parts, from the breaſt, light-coloured, marked with dark long ſpots on the breaſt; about the eyes white; legs browniſh fleſh-colour. Inhabits Pennſylvania, and other parts of North America.

81. Fringilla albicollis, the white-throated ſparrow: ſize of the mountain-ſparrow; bill duſky; irides hazel; from the corner of the mouth through the eye a duſky ſtreak, and above the eye one of an orange-colour; the upper parts of the plumage are reddiſh-brown; the throat white; cheeks, and the under parts, cinereous-white; edge of the upper part of the wing pale yellow; legs fleſh-colour. Inhabits Pennſylvania. They are ſeen in ſmall flocks round New York, in January, and are met with in ſummer at Newfoundland. Shewn in the Plate, at fig. 2.

82. Fringilla faſciata, the faſciated finch: crown, hind part of the neck, and back, ferruginous, ſpotted with black, the ſpots largeſt on the back; wings plain ferruginous; primaries duſky, edged with white; under parts of the body white, marked with ſtreaks of black, pointing downwards; tail brown, croſſed with numerous duſky bars. Inhabits the country about New York.

83. Fringilla graminea, the graſs finch: head, upper part of the neck, and back, cinereous and black; cheeks brown; leſſer wing-coverts bright bay; the others black, edged with white; primaries duſky, with white edges;

lower

lower part of the neck and ſides white, marked with ſmall ſtreaks; belly of a pure white; tail duſky. Inhabits New York, where it ſtays all the winter, and is known by the name of graſs-bird.

84. Fringilla cinerea, the cinereous finch: bill duſky; head, and upper parts of the body, deep cinereous brown, edged with obſcure ruſt-colour; at the corner of the upper mandible a light grey line; on the cheeks, beneath, a ſecond band, bounded by a duſky one; throat of a light grey; under ſide of the neck pale aſh-colour, varied with whitiſh marks; legs duſky. Inhabits Oonalaſhka, from whence it was brought by ſir Joſeph Banks.

85. Fringilla Nortonienſis, the Norton finch: head, upper part of the neck, and ſecondaries, black, edged with bright bay; the middle croſſed with a white line; primaries duſky; belly and ſides white; ſides of the neck, and fore part, ſpotted down the middle of each feather with ruſt-colour; tail duſky, edged with white; along the middle of the outer feather a pure white line, ending at the tip. Inhabits Norton Sound.

86. Fringilla hiemalis, the winter finch: head, neck, and breaſt, light brown, mottled with black; fore part of the neck, breaſt, and ſides, white, marked with ſmall brown ſpots; belly plain white; wing-coverts and primaries brown, edged with white. Found at New York in the winter.

87. Fringilla ſtriata, the ſtriated finch: length five inches and a half; bill lead-colour; between that and the eye, and the forehead, yellow; on the head three black ſtripes; behind the eye another; ſides of the head whitiſh; chin white; all the upper parts like the linnet in colour; middle of each feather very dark; wing-coverts and tail plain brown; quills duſky; the breaſt blue grey; belly very pale; legs brown. Found at New York, in May.

88. Fringilla purpurea, the purple finch: ſize of a chaffinch; colour of the plumage violet; the quills brown within; the belly white; the tail forked. The female is all over brown, except the breaſt, which is ſpotted with white like a thruſh. Theſe are found in Carolina, appearing firſt in November; aſſemble in ſmall flocks, and retire on the approach of winter; during their ſtay they live on the juniper-berries; and alſo deſtroy the buds of fruit-trees.

89. Fringilla roſea, the roſeate finch: ſize of the mountain finch; the plumage is moſtly of a fine roſeate colour; front ſilvery white; back with browniſh grey ſtripes; wings and tail blackiſh; tail-feathers roſy on the outer edge. Inhabits Siberia.

There are two varieties of this bird: 1. Reddiſh aſh, beneath white; feathers of the head, rump, and throat, tipt with fine red; quill and tail-feathers brown, edged with pale yellow. Female above yellowiſh-aſh; chin white. Inhabits the woods of Siberia: hardly five inches long. 2. Blackiſh, feathers edged with red; head and breaſt ſcarlet, the firſt with brown ſpots; belly fleſh-colour. Appears in April round New York.

90. Fringilla iliaca, the iliac finch: ſize of a thruſh; the feathers of the upper part of the body ſteel-blue at the baſe, olive in the middle and tipt with brown, beneath white, a few tipt with cheſnut; tail-feathers, and coverts, above rufous; bill yellow, with a brown ridge and tip; temples white; lower wing-coverts cinereous, edged and tipt with white, the upper rufous; quill-feathers blackiſh brown, the outer edge rufous; legs yellow. Inhabits North America.

91. Fringilla tricolor, the tri-coloured finch: forehead, temples, and throat, blue; region of the noſtrils, and back, greeniſh black; ſhoulders green; under parts yellowiſh white; quills greeniſh black; the prime ones deep green on the outer edge; tail black. Inhabits Surinam.

92. Fringilla cyanomela, the blue-headed finch: ſize of the greater redpole; bill brown; head and neck blue; acroſs the forehead a narrow black line; chin and throat black; acroſs the upper part of the back a ſemicircle of black; wing-coverts, lower part of the back, and rump, blue; breaſt, belly, and vent, blue; quills blackiſh brown, edged with blue, appearing green in ſome lights; tail dark brown; legs brown.

93. Fringilla picta, the azure-headed finch: length four inches; bill red; crown of the head pale blue; hind part of the neck, throat, breaſt, and under tail-coverts, red; belly pale aſh-colour; back, and leſſer wing-coverts, purpliſh; greater coverts green; lower part of the back, and rump, yellow; quills and tail blue; legs red. Inhabits China.

94. Fringilla cyanocephala, the blue-crowned finch: this is a large ſpecies; length ſeven inches; bill duſky; crown of the head blue, bounded behind with red; round the eye white; hind part of the neck, and back, pale reddiſh brown; lower part of the back, and rump, pale blue; under parts of the body yellow; thighs and vent white; middle and greater coverts margined with white; quills and tail black; legs pale brown. Inhabits Senegal.

95. Fringilla torquata, the lunar finch: length ſix inches and a half; bill ſlender, duſky black; head, neck, and back, reddiſh; the laſt inclining to brown; rump pale blue; acroſs the throat a narrow creſcent of black, bounded below with yellow; quills black, the ends of them blue, with a white ſpot at the tip of each: tail and legs black. Inhabits the Eaſt Indies.

96. Fringilla multicolor, the many-coloured finch: bill blueiſh; head, hind part of the neck, upper part of the back, and tail, black; cheeks, chin, and the reſt of the under parts, light yellow; vent yellow; wings black; on the coverts a white ſpot; the ſecondaries croſſed at the ends with white; lower part of the back, and thighs, green; legs grey. From Ceylon.

97. Fringilla maia, the Cuba finch: length only three inches three quarters; bill grey; head, neck, and under parts of the body, blackiſh; back, and upper parts, purpliſh cheſnut, brighteſt on the rump; acroſs the breaſt a cheſnut band; tail of the ſame colour; quills brown, edged with cheſnut; legs lead-colour. The female differs; in her the bill is whitiſh; head, neck, and upper parts, fulvous; throat purpliſh cheſnut; on each ſide of the breaſt a ſpot of the ſame colour; the reſt of the under parts dirty yellowiſh white; quills and tail fulvous; legs grey. Inhabits the iſland of Cuba, where the natives give it the name of *maia*. It is likewiſe found in the Eaſt Indies. It is a gregarious bird; flies in innumerable flocks, and is very hurtful to the rice fields, which it is a very great deſtroyer of, and, in all probability, may be found wherever that grain is cultivated. The fleſh is good and wholeſome food.

98. Fringilla domeſtica, the domeſtic or houſe ſparrow: this bird, every where well-known, is called in Greek στρουθος: moſt tranſlators and naturaliſts have made it to be στρουθος: the fact is, that this laſt name is generic, and applicable to all the ſparrows; in Italian, *paſſera*, or *paſſere caſaringo*; in Spaniſh, *pardal*; in German, *hauſs ſpar*, *haus-ſperling*; in Swediſh, *taelting*, *grawparf*. They occur in all the European climates, and in more diſtant regions, being found in Egypt, Senegal, and other parts of Africa and Aſia, &c. But in whatever country the ſparrow is ſettled, it never is found in deſert places, or at a diſtance from the reſidence of man. It likes neither woods nor vaſt plains; nor is it ſeen in the hamlets or farms that are buried in the depth of foreſts; it follows ſociety, to live at their expence; ſparrows are alſo extremely deſtructive; whence they are in many places proſcribed, and a price ſet on their heads. None of the feathered race are more crafty and artful; they eaſily diſtinguiſh the ſnares laid for them, and wear out the patience of thoſe who try to catch them; and even when the ſport ſucceeds, little impreſſion can be made on a ſpecies which breeds thrice a-year. Their neſt conſiſts of hay, lined with feathers. If you deſtroy it, they will in twenty-four hours build another; if you plunder the eggs,

which are five or ſix, they will in the courſe of a few days lay others; if you drive them from the trees or the houſes, they will reſort in great numbers to your granaries. Perſons who have kept them in cages aſſure us, that a ſingle pair of ſparrows conſume near twenty pounds of corn annually. We may judge from their numbers what prodigious deſtruction they muſt make in our fields; for though they feed their young with inſects, and eat many themſelves, they principally ſubſiſt on our beſt grain. They follow the labourer in ſeed-time, and the reaper in harveſt. They attend the threſhers at the barns, and the poulterer when he ſcatters grain to his fowls. They viſit the pigeon-houſes, and even pierce the craw of the young pigeons to extract the food. They eat bees, and are thus diſpoſed to deſtroy almoſt the only inſects uſeful to man; whence it ſeems the cordial wiſh of all men that ſome method could be deviſed for deſtroying them. There are two ſeaſons in the year when they aſſemble, not to fly in flocks, but to chirp together, in autumn on the willows by the river ſide, and in ſpring on the firs and other evergreens. They meet in the evening, and in mild weather. They ſpend the night on the trees, but in winter they are found either alone, or with their females in a hole of the wall, or beneath the roofs of houſes, &c. The males fight obſtinately for the poſſeſſion of their females, and in the violence of their ſtruggle they often fall to the ground. Few birds are ſo ardent, or ſo vigorous in their love. They will embrace twenty times in ſucceſſion with the ſame fire, and the ſame expreſſions of rapture. Some houſe-ſparrows, more indolent or bolder than the reſt, do not give themſelves the trouble of building, but drive off the martins, and poſſeſs their neſts. Sometimes they fight the pigeons, and eſtabliſh themſelves in their holes. This little tribe exhibit therefore habits and inſtincts more varied and perfect than moſt other birds; which reſults undoubtedly from their living in ſociety. They enjoy the benefits of the domeſtic ſtate without ſurrendering any portion of their independence. Their fleſh is by many perſons reckoned good food; and in ſome countries ſmall poſts are erected before the houſes, for theſe birds to build in, for the ſake of their young.

There are ſeveral varieties of this ſpecies, viz. 1. The *white houſe-ſparrow*, which has a yellow bill and irides, and the plumage wholly white. Specimens of theſe are to be ſeen both in the Britiſh and Leverian Muſeums, but the laſt contained many mixed varieties; one brown above; beneath dirty white. Another, marked as in common, but very pale, and ſome of the quills white. A third, the upper parts almoſt white; the under parts brown. Another, every where pure white, except a rudiment of black on the throat, ſhewing it to be a male. A fifth pure white, with a ſpot on the crown; the nape of the neck, and the back, brown. One like this is alſo in the Britiſh Muſeum. 2. The *yellow houſe-ſparrow*, with a tinge of cheſnut on the upper parts. There was one of theſe in the Leverian Muſeum, wholly of a yellow cream-colour. 3. The *black houſe-ſparrow*; the bill of a deep yellow. This variety is full as common as the white one. All theſe have been ſhot at large, and therefore could not be the effect of keeping in a cage, on improper food.

99. Fringilla montana, the mountain ſparrow: this beautiful bird is a ſize leſs than the houſe-ſparrow; bill black; irides greyiſh hazel; the head, and nape, cheſnut; the chin black; on each ſide of the head, behind the eye, a ſpot of the ſame; the upper parts of the body rufous brown, ſpotted with black, inclining to greeniſh towards the rump; ſides of the neck, the breaſt, and under parts, duſky white; wing-coverts rufous, edged with black, and croſſed with two bars of white; the greater coverts black, with ferruginous edges; quills blackiſh, with rufous edges; tail rufous brown; legs pale yellow. The female is duller in colour, and wants the black on the ears and throat.

This ſpecies is found in England, particularly in Lancaſhire, Lincolnſhire, and Yorkſhire, but not further to the north of England or Scotland. It is obſerved always to build on trees, and not in buildings like the houſe-ſparrow. It is much more common on many parts of the European continent than in England; as in Italy, France, Germany, Ruſſia, and the eaſtern part of Siberia, where it is more plentiful than the houſe-ſparrow. It is ſaid to viſit Hudſon's bay in April, and to depart in September; though Mr. Hutchins ſeems not certain but it may be the *mountain finch*. Dr. Forſter mentions a bird of this kind in Canada, ſix inches and a half in length, which has no black under the throat and eyes, and no white collar; the bill and legs black. This arrives at the ſettlements at Severn in May, and goes further north to breed, and returns in autumn. The mountain-ſparrow, though more reſtleſs than the houſe-ſparrow, is not ſo petulant, ſo familiar, or ſo voracious. It is more innocent, and not ſo deſtructive to the crops. It prefers fruits, wild ſeeds, particularly thoſe of the thiſtle, and alſo eats inſects. It avoids meeting the houſe-ſparrow, which is ſtronger and more miſchievous. It can be raiſed in a cage, and fed like a goldfinch; it lives five or ſix years; its ſong is very poor, but quite different from the harſh chirp of the houſe-ſparrow; but though more gentle, it is remarked not to be ſo docile. This is owing to its living more out of the ſociety of man.

100. Fringilla pinetorum, the pine finch: plumage above reddiſh teſtaceous, beneath yellow; breaſt with a tranſverſe ferruginous band. Inhabits the pine groves of Siberia.

101. Fringilla ſylvatica, the wood finch: head barred; body above varied with black and grey; breaſt and belly hoary. Inhabits alſo the pine foreſts of Siberia.

102. Fringilla Hudſonia, the Hudſon's-bay finch: the plumage above is black, beneath white; outmoſt tail-feathers white. Inhabits Hudſon's bay.

103. Fringilla flavicollis, the yellow-throated finch: bill and legs blueiſh grey; head and upper parts of the body cinereous; primaries duſky, edged with pale brown; chin white; on the throat a pale yellow ſpot; belly dull white. Inhabits New York.

104. Fringilla criſtata, the creſted ſparrow: nearly as large as the houſe-ſparrow; bill red; upper parts of the plumage, wings, and tail, reddiſh brown; the under parts, and rump, crimſon; the top of the head is creſted, and of the ſame colour; ſides of the head, under the creſt, black; legs brown. The female has the top of the head, round the eyes, and chin, black; neck, as far as the breaſt, crimſon; the upper parts brown; wings and tail pale brown; the quills black; on the breaſt a bar of black; the reſt of the under parts white, mixed with a little black at the thighs; legs brown. Inhabit Cayenne, and are alſo met with in Carolina.

105. Fringilla Carolinenſis, the Carolina black-faced finch: five inches and a half long; red-brown; belly white; face and pectoral band black; throat and rump ſcarlet; bill and legs browniſh; wings black; tail ſhort. Inhabits Carolina.

106. Fringilla bicolor, the two-coloured finch: length four inches; bill black; head, throat, and breaſt, the ſame; the reſt of the bird dull green. Found in the woods of Bahama, where it ſits perched on the tops of trees, and ſings not unlike the chaffinch. This bird varies in colour; one in the Britiſh Muſeum has an aſh-coloured belly, and the vent tinged with red; brought from Jamaica.

107. Fringilla Abyſſinica, the Abyſſinian finch: ſize and ſhape of the canary-bird; bill black; ſides of the head beneath the eyes, the throat, fore part of the neck, breaſt, and upper part of the belly, black; upper part of the head, the reſt of the body, and lower part of the belly, yellow; at the back of the neck a collar of black, which meets the black on the fore part; the wing-coverts, and quills black, with pale edges; tail black, edged with greeniſh yellow; legs pale brown. This inhabits Abyſſinia,

ſinia, where it is met with in flocks, and is known by the name of *worabée*. It feeds on the ſeed of a plant called *nuk*, which has a yellow flower, and the ſeed produces an oil, in much uſe with the monks.

108. Fringilla ultramarina, the ultramarine finch: ſize of a canary, but has a rounder head; bill white; plumage wholly of a fine deep ultramarine blue; legs red. The young birds and females are grey. The males get the blue plumage in the ſpring of the ſecond year; but the female ever remains of a ſimple grey colour. This alſo inhabits Abyſſinia, and is ſaid to have a fine ſong.

109. Fringilla Syriaca, the Syrian finch: a ſize larger than the linnet; bill thick, ſhort, and of a lead-colour; top of the head fine bright red; cheeks, throat, and fore-part of the neck, black, mixed with brown; the reſt of the neck, breaſt, upper parts of the body, and leſſer wing-coverts, brown, duſky, and yellow, mixed; the greater wing-coverts deep aſh-colour, edged with paler; quills and tail the ſame, but edged with bright orange; belly and vent dirty white, marked with obſcure yellow and duſky ſpots; legs lead-colour. This ſpecies is found about Tripoli, in Syria; it is a bird of paſſage, and ſings very finely. We are indebted for theſe three laſt ſpecies to the late celebrated Abyſſinian traveller, Mr. Bruce.

110. Fringilla criſpa, the frizzled ſparrow: ſize of a chaffinch; bill white; the head and neck black; the upper parts of the body, wings, and tail, deep olive; the under parts yellow; legs brown; the feathers of the body all frizzled, as is ſometimes ſeen in poultry. This ſpecies inhabits Angola and Braſil. The Portugeuſe call it *beco de prata*.

111. Fringilla Indica, the Indian finch: length five inches and three-quarters; bill and head black; round the bill and eyes, and the throat, white, paſſing round the neck as a collar; on the lower part of the neck before, a black bar; the reſt of the under parts are rufous white; the upper parts cinereous brown, paleſt on the rump; the wing-coverts are black, fringed with gloſſy rufous; greater quills black; tail and legs cinereous brown. Inhabits India.

112. Fringilla ochracea, the oker finch: ſize of a chaffinch; bill and legs yellow; general colour of the plumage white, except the head, fore part of the neck, breaſt, and wing-coverts, which are more or leſs of the colour of yellow oker. This was deſcribed from a living ſpecimen in an aviary, ſaid to have been caught in Auſtria.

113. Fringilla teſtacea, the teſtaceous finch: length five inches and a half; bill pale red; irides black; head, neck, and back, ferruginous, mottled with black; breaſt and belly the ſame, but paler; wings and tail brown; legs fleſh-colour. Native of Luſitania.

114. Fringilla imperialis, the imperial finch: ſize of the Amadavad finch; length three inches and a half; bill duſky red; crown, and all the under parts of the body, yellow; the upper parts pale ferruginous roſe-colour; quills and tail duſky; legs pale duſky red. Inhabits China.

115. Fringilla Auſtralis, the ruſty-collared finch: general colour of the plumage brown, with a ferruginous or ruſty grey collar. Inhabits Terra del Fuego.

FRI'O, a ſmall iſland on the coaſt of the Brazils, ſituated in 32° 2′ ſouth lat. and 41° 31′ 45″ weſt lon. The land of Frio is high, with a hollow in the middle, which gives it, at a diſtance, the reſemblance of two ſeparate iſlands. The paſſage between the iſland and the continent is about a mile broad, and ſeemed to ſir Eraſmus Gower to be clear from ſhoals.

FRI'O, a river of Spain, in the province of Grenada, which runs into the ſea, near Toros.

FRIP'PERER, *ſ.* [from *frippier*, Fr.] One who deals in old things vamped up.

FRIP'PERY, *ſ.* [*fripperie*, Fr. *fripperia*, Ital.] The place where old clothes are ſold.—Lurana is a *frippery* of bankrupts, who fly thither from Druina to play their after-game. *Howel.*—Old clothes; caſt dreſſes; tattered rags.—Ragfair is a place near the Tower of London, where old clothes and *frippery* are ſold. *Pope.*

The fighting-place now ſeamens rage ſupply,
And all the tackling is a *frippery*. *Donne.*

FRISCH (John Leonard), a writer in natural hiſtory and lexicography, born at Sulzbach, in the Upper Palatinate, in 1666, and ſtudied at Altdorff, Jena, and Salzburg. After travelling through France and Swiſſerland, he ſucceeded the evangelical preacher, Elias Breithorn, at Neuſol in Hungary, but was driven thence by perſecution, and became an interpreter during the Turkiſh war. From Hungary he went to Venice and other parts of Italy; and in 1693 was ſuperintendent of a nobleman's eſtate near Nuremberg. He next viſited Holland, after which he ſettled at Berlin, where he was appointed rector of the Grey Convent Gymnaſium in 1726. By the recommendation of Leibnitz, whom he inſtructed in the Ruſſian language, he was choſen a member of the royal academy of ſciences, and of the imperial academy of the ſearches into nature. He died at Berlin on the 21ſt of March, 1743. Friſch has perpetuated his name by being the founder of the ſilk manufactory in the marche of Brandenburg, about the beginning of the laſt century: he was the firſt perſon who cultivated mulberry-trees in the neighbourhood of Berlin, where he formed a plantation of them, his own property, which was attended with the beſt ſucceſs. He conceived an idea alſo that the church-yards in the city and adjacent villages might be planted with theſe trees to great advantage; and this plan was recommended, in 1718, by Frederic-William I. He rendered great ſervice to the German language by his dictionary. He wrote alſo in his native tongue a deſcription of all the inſects of Germany, of which thirteen parts were publiſhed, and which ſtill merits the approbation of naturaliſts. The principal works of this author are: 1. *Deutſch-lateiniſches Worterbuch, &c.* a German and Latin Dictionary, with the Etymology of the Words partly eſtabliſhed, and partly conjectural, and critical Annotations, Berlin, 1741, 2 vols. 4to. 2. *Dictionnaire nouveau des Paſſagers, François-Allemand, & Allemand-François*, Leipſic, 1712, 8vo. This uſeful book has gone through a great many editions. 3. *Beſchreibung von allerley Inſekten in Deutſchland, &c.* Deſcription of all the German Inſects, with Obſervations, and the neceſſary Figures, &c. thirteen parts, Berlin, 1720–1738, 4to. with 273 plates, making two quarto volumes. A new edition was publiſhed, at Berlin, 1766–1779, 4to. with plates. 4. *Vorſtellung der Vögel in Deutſchland, und beiläufig auch einger fremden, &c.* Repreſentation of the Birds of Germany, with a few of foreign Countries, coloured after Nature, &c. This work was publiſhed at Berlin by the author's ſon; and is eſteemed by connoiſſeurs, on account of the accuracy with which the plates are coloured. It contains twelve grand claſſes, which occupy 255 plates and 179 pages of deſcription. Friſch wrote the deſcriptions of the four firſt claſſes only.

FRISCH HAFF, a gulf, or arm of the ſea, on the coaſt of Pruſſian Pomerania, ſouth of the Baltic; about twenty-five miles in length from eaſt to weſt, and eight from north to ſouth. The Oder paſſes through it at the eaſtern extremity.

FRISCH HAFF, a bay, or arm of the ſea, between Konigſberg and Elbing, ſeparated from the Baltic by a tongue of land, called *Friſch Nerung*; about eighteen leagues in length, and hardly two in breadth. It communicates with the Baltic by a narrow paſſage, near Pillaw.

FRISCH NE'RUNG, a narrow ſlip of land, in Pruſſia, which lies between the Baltic and the Friſch Haff: twenty-ſix miles long, and hardly two wide.

FRISCH'BACH AL'LEN, a mountain of Stiria: ten miles eaſt of Pruck.

To FRISE, or FRIZZLE, *v. a.* [*friſer*, Fr.] To dreſs by criſping. This is confined to the hair of the head.

FRISEUR', *ſ.* [French.] Hair-dreſſer.—Let your man learn of the beſt *friſeur* to do your hair well, for that is a very material part of your dreſs. *Cheſterfield.*

FRISCH'LIN (Nicodemus), a learned German, born in 1547, at Balingen in the duchy of Wirtemberg. His father, who was a miniſter, educated him with great care; and ſuch was his early progreſs at the univerſity of Tubingen, that he became a verſifier in Greek and Latin at the age of thirteen. He taught the belles-lettres at that ſeminary, and employed a new method of inſtructing his ſcholars in grammar. Not content with this, he declared war againſt all former grammarians, in a work entitled *Strigil Grammatica*, which involved him in ſome angry controverſy with others of the profeſſion. In a commentary which he publiſhed on the Bucolics and Georgics of Virgil, he indulged ſuch an acrimony of ſtyle in declaiming upon the compariſon between the innocence of a country life, and the corrupt manners of the great, that he was compelled to quit his native country, and wander through the towns of Germany. He poſſeſſed a wonderful facility in poetical compoſition, and there are numbered among his works ſixteen books of elegies, ſeven comedies, two tragedies, odes, anagrams, and heroic verſes in abundance. That this facility was accompanied with mediocrity, may be ſafely concluded; his comedy of Rebecca, however, obtained for him the golden laurel and the title of *crowned poet* from the hands of the emperor Rodolph. He was leſs fortunate in pleaſing his ſovereign, the duke of Wirtemberg, though he wrote ſeven books of heroics on his marriage. For having, from his retreat at Mentz, made a fruitleſs application for a pecuniary remittance, he wrote back a remonſtrance ſo full of abuſe, that he was arreſted, and carried to the priſon of Aurach, in the duchy. Attempting to eſcape thence by cutting his ſheets into ſlips, and letting himſelf down from a window, his weight broke the ſupport, and he was killed in the fall. This melancholy cataſtrophe happened in November, 1590, when he was forty-three years of age. Beſides the works above-mentioned, he left Commentaries upon the Epiſtles of Horace and the Satires of Perſius, and tranſlations of Oppian, Ariſtophanes, Callimachus, and Heliodorus.

FRISCH'MUTH (John), a learned German, born at Wertheim, in Franconia, in 1619. He became rector, and afterwards profeſſor of languages in the univerſity of Jena, where he died in 1687. He was the author of Illuſtrations of many difficult paſſages in the ſacred writings, which are frequently ſucceſsful and valuable; and of more than ſeventy Diſſertations, philological and theological, on curious and intereſting ſubjects, which abound in erudition.

FRIS'II, or FRISO'NES, in ancient geography, a people of Germany, ſo called either from their ardent love of freedom, or from the freſh and unbroken lands they occupied, contradiſtinguiſhed from the old lands. Tacitus divides them, from their extent of power and territory, into the Majores, ſituated on the coaſt between the Rhine and the Ems; and into the Minores, occupying the parts about the lakes lying between the channels of the Rhine.

FRI'SIUS (John), a learned Swiſs divine in the ſixteenth century, born at Gryffenſee, in the canton of Zurich, in 1505. After he had gone through a proper courſe of ſtudy, he was admitted to the profeſſion of the miniſtry, and was invited to take that office upon him in the city of Zurich. In 1545 he went into Italy, where he embraced the opportunity of making himſelf maſter of the Hebrew language, under the inſtructions of the learned Jews who then reſided at Venice. On his return home he proved ſucceſsful, conjointly with his brother-in-law Pellicanus, in introducing a taſte for Oriental learning among the ſtudents at Zurich. For twenty-ſeven years he preſided over the college in that city, with eminent reputation and ſucceſs, and in requital for the ſervices which he rendered to his country, and to the intereſts of literature, he was made a burgher of the city. He tranſlated ſeveral books of the ſacred writings from Hebrew into German, and alſo publiſhed a Latin and German Dictionary. He died in 1665. He left two ſons: John-James, who was profeſſor of philoſophy and theology from 1576 till about 1610, and wrote many works in philoſophy, philology, and theology; and John, who was admitted to the degree of M. A. at Marpurg, and proved the learned and worthy ſucceſſor of his father in his profeſſional labours at Zurich. This John died of the plague in 1611.

FRI'SIUS (Henry), a deſcendant of the preceding, who ſpent ten years in foreign countries, to improve himſelf in ſcience and literature. Upon his return to his native country, the firſt appointment which he obtained was that of catechiſt, in 1676; after which he was created profeſſor of eloquence in 1681, and profeſſor of the languages in the lower college at Zurich in 1684. He died in 1718. He was the author of ſeveral ingenious and learned treatiſes; ſuch as 1. *De Sede Animæ rationalis.* 2. *De Communione Sanctorum.* 3. *De Unione Sanctorum.* 4. *Explicatio Articuli de ſacra Cœna.* 5. *Oratio de Quietiſmo, &c.*

FRI'SOIT, a town of Germany, in the circle of Weſtphalia, and biſhopric of Munſter: fourteen miles ſouth-weſt of Oldenburg, and ſeventy north of Munſter. Lat. 55. 1. N. lon. 25. 4. E. Ferro.

FRIT, or FRITT, *ſ.* in the glaſs manufacture, is the matter or ingredients whereof glaſs is made, when they have been calcined or baked in a furnace. A ſalt drawn from the aſhes of kali, fern, or other plants, mixed with ſand or flint, and baked together, makes an opaque maſs called by glaſs-men *frit*; probably from the Italian *frittare*, to fry; or becauſe the frit, when melted, runs into lumps, like fritters, called by the Italians *fritelli*. By the ancients, *frit* was called *ammonitrum*, of ἄμμος, ſand, and νίτρον, nitre; under which name it is deſcribed by Pliny thus: "Fine ſand from the Volturnian ſea, mixed with three times the quantity of nitre, and melted, makes a maſs called *ammonitrum*; which being rebaked makes pure glaſs." Neri obſerves, that frit is only the calx of the materials which make glaſs; which, though they might be melted, and glaſs be made, without thus calcining them, yet it would take up much more time. The calcining, or making of frit, ſerves to mix and incorporate the materials together, and to evaporate all the ſuperfluous humidity. The frit, once made, is readily fuſed, and turned into glaſs. There are three kinds of frits. The firſt, for cryſtal glaſs, is made with ſalt of pulverine and ſand. The ſecond, or ordinary frit, is made of the bare aſhes of pulverine or barilla, without extracting the ſalt from them: this makes the common crown glaſs. The third is frit for green glaſſes, made of common aſhes, without any preparation. The materials in each are to be finely powdered, waſhed, and ſearced; then equally mixed, and frequently ſtirred together in the melting pot. See the article GLASS.

FRITH (John), one of the earlieſt Engliſh martyrs to the principles of the reformation, the ſon of an innkeeper at Sevenoaks in Kent, born at that place towards the beginning of the ſixteenth century. After he had been qualified by a preparatory-ſchool education, he was ſent to King's college in the univerſity of Cambridge. In that ſeminary he diſtinguiſhed himſelf by his application and proficiency; and when he was admitted to the degree of bachelor of arts, had the reputation of being a firſt-rate linguiſt, and well-informed general ſcholar. On this account he was put down in the liſt of thoſe whom cardinal Wolſey brought from Cambridge, to his new inſtitution of Cardinal (now Chriſt-church) college, in the univerſity of Oxford, of which he was made one of the junior canons. In 1525 he was incorporated at Oxford in the ſame degree which he had taken at Cambridge. Before this, however, he had become acquainted with William Tyndale, a zealous Lutheran, with whom he held frequent conferences on religious ſubjects; the reſult of which was his conviction of the corruptions and errors

errors of popery, and his adoption of the principles of the reformers. After a wandering life ſpent for ſome years on the continent, and in England, he came to London, where, while he was endeavouring to make proſelytes, he was ſeized by the order of ſir Thomas More, then lord-chancellor, and committed priſoner to the Tower, in 1533. Beſides his different converſations for the purpoſe of propagating the principles of the reformers, Frith had drawn up ſeveral writings againſt the leading tenets of popery, copies of which were privately circulated among the converts to the reformed faith. While he was priſoner in the Tower, Frith held ſeveral diſputes with ſir Thomas More and others, who found themſelves incapable of producing any change in his opinions. At length he was brought before an epiſcopal commiſſion at St. Paul's cathedral, where he was interrogated on the ſubjects of tranſubſtantiation and purgatory, and many efforts were made to perſuade, or intimidate, him to renounce the notions which he entertained reſpecting thoſe doctrines, and to conform to the creed of the catholic church. When he was found to remain unmoved by their arguments or threatenings, and to perſiſt in a declaration that he could not be induced to believe that theſe were articles of Chriſtian faith; with much affected ſorrow and pity the biſhop of London pronounced ſentence of condemnation upon him, as an obſtinate heretic; and he was delivered over to the ſecular power. In purſuance of this ſentence a writ was iſſued out for his execution, and he was burnt at Smithfield not many days after his condemnation, maintaining his fortitude to the laſt, and charitably extending his forgiveneſs to a bigotted prieſt, who endeavoured to perſuade the people that they ought no more to pray for him than for a dog. He was the author of, 1. A Treatiſe on Purgatory. 2. An Anſwer to Raſtall's Dialogues on Purgatory. 3. An Anſwer to Sir Thomas More's Dialogues concerning Hereſies. 4. An Anſwer to John Fiſher, Biſhop of Rocheſter, on the Subject of the Corporal Preſence. 5. An Antitheſis between Chriſt and the Pope: and other controverſial and practical treatiſes, which were ſeparately printed at different periods, and collected together in a folio volume, publiſhed in 1573.

FRITH, *ſ.* [*fretum*, Lat.] A ſtrait of the ſea where the water being confined is rough:

What deſp'rate madman then would venture o'er
The *frith*, or haul his cables from the ſhore? *Dryden.*

A kind of net.—The Wear is a *frith*, reaching through the Ouſe, from the land to low-water mark, and having in it a bunt or cod with an eye hook; where the fiſh entering, upon their coming back with the ebb, are ſtopt from iſſuing out again. *Carew.*

FRITH, *ſ.* [Saxon.] A wood; a ſacred wood.

FRITH'BREACH, *ſ.* [from the Sax. ꝼꝛıꝺ, peace, and ꝼꝛıcc, a breach] A breach of the peace.

FRITH'BURG, *ſ.* A ſurety for the peace. *Phillips.*

FRITH'GAR, *ſ.* [Sax. ꝼꝛıꝺ, peace, and ȝeaꝛ, a year.] The year of jubilee.

FRITH'GILD, *ſ.* In old records, a fine for breach of the peace. *Scott.*

FRITH'SOKE, FRITH'SOKEN, *ſ.* Law terms: the right or liberty of frank pledge. *Obſolete.*

FRITH'WALD, [Saxon] A man's name.

FRITILLA'RIA, *ſ.* [from *fritillus*, a cheſs or draught board, like which the petals of the common fritillary are checquered. *Fritillus*, however, is not the board, but the dice-box.—*Movet arma fritillo.* Juv.] In botany, a genus of the claſs hexandria, order monogynia, natural order coronariæ, (lilia, *Juſſ.*). The generic characters are—Calyx: none. Corolla: ſix-petalled, bell-ſhaped, ſpreading at the baſe; petals oblong, parallel; nectary, an excavation or pit in the baſe of each petal. Stamina: filaments ſix, ſubulate, approximating to the ſtyle, the length of the corolla; antheræ quadrangular, oblong, erect. Piſtillum: germ oblong, three-cornered, obtuſe; ſtyle ſimple, longer than the ſtamens; ſtigma triple, ſpreading, blunt; (ſtyle triſid, with three ſtigmas.) Pericarpium: capſule oblong, obtuſe, three-lobed, three-celled, three-valved, (ſuperior, *Gærtner.*) Seeds: very many, flat, ſemiorbicular on the outſide, in a double row.—*Eſſential Character.* Corolla, ſix-petalled, bell-ſhaped, with a nectareous cavity above the claws; ſtamina, the length of the corolla.

Species. 1. Fritillaria imperialis, imperial fritillary, or crown imperial: flowers in a raceme, with a coma over them, but naked below; leaves quite entire. See Botany Plate VII. fig. 8. The crown imperial has a large round ſcaly root of a yellow colour, and a ſtrong odour of a fox; the ſtalk riſes to the height of four feet or upwards; it is ſtrong, ſucculent, and garniſhed two-thirds of the length on every ſide, with long narrow leaves ending in points, which are ſmooth and entire; the upper part of the ſtalk is naked, a foot in length; then the flowers come out all round the ſtalk upon ſhort foot-ſtalks, which turn downward, each ſuſtaining one large flower. Above theſe riſes a ſpreading tuft of green leaves, which are erect, and called the *coma*. This plant flowers the beginning of April, and the ſeeds are ripe in July. Being one of the earlieſt tall flowers of the ſpring, it makes a fine appearance in the middle of large borders, at a ſeaſon when ſuch flowers are much wanted to decorate the pleaſure-garden; but the rank fox-like odour which they emit is too ſtrong for moſt people, and renders the flowers leſs valuable than they would otherwiſe be. The beauty, however, of the plant, and the ſplendour of the magnificent pendulous flowers, will ever ſecure this a place in large gardens and plantations. The ſingular nectary cannot but engage the attention of the curious obſerver: it is a white glandular cavity at the baſe of each petal, and has a drop of limpid nectareous juice ſtanding in it when the flower is in vigour. Another of the wonders of nature may be obſerved in the peduncles, which bend down whilſt the plant is in flower, but become upright as the ſeed ripens. This circumſtance, however, is by no means peculiar to this plant, but common to it with many others.

Varieties. 1. Common crown imperial, of a dirty red colour. 2. Yellow crown imperial, of a bright yellow. 3. Bright red crown imperial, called *fuſai*. 4. The pale yellow crown imperial. 5. The yellow ſtriped crown imperial. 6. The large flowering crown imperial. 7. The broad-leaved late red crown imperial. 8. The double and triple crowned imperial crown. 9. The double red crown imperial. 10. The double yellow crown imperial. 11. The ſilver ſtriped leaved crown imperial. 12. The yellow ſtriped leaved crown imperial. There are ſome few other varieties which are mentioned in the catalogues of the Dutch floriſts, but their diſtinctions are ſo minute that they are not diſtinguiſhable. The variety with yellow flowers, that with large flowers, and thoſe with double flowers, are the moſt valuable; but that which has two or three whorls of flowers above each other, makes the fineſt appearance; though this ſeldom produces its flowers after this manner the firſt year after removing, but the ſecond and third year after planting, the ſtalks will be taller, and frequently have three tier of flowers, one above another, which is called the *triple crown*. The ſtalks of this ſort frequently run flat and broad, when they produce a greater number of flowers than uſual; but this is only a luxuriancy of nature, not conſtant, though many of the writers have mentioned it as a particular variety.

2. Fritillaria Perſica, the Perſian fritillary, or Perſian lily: raceme almoſt naked; leaves oblique. The Perſian lily has a large round root; ſtem three feet high, the lower part cloſely garniſhed on every ſide with leaves, which are three inches long, and half an inch broad, of a grey colour, and twiſted obliquely; flowers in a looſe ſpike at the top, forming a pyramid: they are ſhorter than the other ſorts, ſpread wider at the brim, and are

not bent down; they are of a dark purple colour, and appear in May, but ſeldom produce ſeeds in England; the loweſt leaves grow in pairs, three or four together, oppoſite, in whirls; root the ſize of an orange, of a taſte extremely bitter, but without any remarkable ſmell. Suppoſed to be a native of Perſia; and to have appeared in Europe in 1573. Gmelin found it in Ruſſia. Cultivated here in Gerarde's garden, in 1596. In his Herbal he ſays that it is a denizon in ſome few of our London gardens. Parkinſon, 1629, informs us that it was ſent unto us by the means of divers Turkey merchants from Conſtantinople; and eſpecially by the procurement of Mr. Nicholas Lete, a worthy merchant, and a lover of all fair flowers.

β. The ſmall Perſian lily, (which Mr. Miller makes a diſtinct ſpecies,) has a much ſhorter ſtem, and ſmaller leaves; the ſtem branches out at the top into ſeveral ſmall peduncles, each ſuſtaining one dark-coloured flower.

3. Fritillaria Pyrenaica, or black fritillary: loweſt leaves oppoſite; ſome of the flowers having a leaf interpoſed between them. The leaves of this are broader, and of a deeper green, than the common fritillary; the lower leaves are oppoſite, but thoſe above alternate; ſtem a foot and half high, terminated by two flowers of an obſcure yellow colour, and ſpreading more at the brim than thoſe of the common fritillary, but turned downwards in the ſame manner; it flowers three weeks after that. It is a native of France and Ruſſia.

4. Fritillaria meleagris, common fritillary, or checquered lily: all the leaves alternate; ſtem one-flowered. Root a ſolid bulb or tuber, about the ſize of a hazel-nut, white or yelloviſh-white, roundiſh, compreſſed, diviſible into ſeveral, incloſed by the withered wrinkled bulb of the preceding year, as in a caſe; ſtem from ſix to twelve, fifteen, and even eighteen, inches in height, advancing conſiderably in length after flowering; it comes out from the ſide of the root, is ſimple, upright, round, ſmooth, glaucous, and not unfrequently purpliſh; leaves three or four, ſometimes five or ſix, graſs-like, diſtantly alternate, half embracing, round on the under, and hollow on the upper, ſide, ſomewhat twiſted and glaucous. See the Botany Plate X. fig. 26. Flower uſually ſingle, ſometimes two, or even three, on the top of the ſtem, large, pendulous, at firſt ſomewhat pyramidal, but afterwards bell-ſhaped; petals checquered with purple and white, or purple and greeniſh yellow; in our wild ones the colour is a dull red checquered with a deeper, but without mixtures of either green or yellow. Native of the ſouthern countries of Europe. Found alſo in a wild ſtate near Upſala in Sweden, but eſcaped from a garden. In England it was firſt mentioned by Mr. Blackſtone to grow in Mawde fields near Riſlip common, Middleſex, and to have been obſerved there by Mr. Aſhby, of Breakſpears, above forty years. It has ſince been found between Mortlake and Kew; near Enfield; in a wood near Bromley in Kent; near Bury St. Edmunds, and between Laxfield and Stirrup-ſtreet, in Suffolk; Weſtthoe near Linton in Cambridgeſhire; near Leiceſter; and in a meadow near Blymhill in Staffordſhire. It flowers in April and May, and if the ſeaſon be mild, at the beginning of the former month, or even the end of March.

The common fritillary is named in German, *kiebitzey*; in Dutch, *kievitſbloem*; in Daniſh, *vibeæg*; in Swediſh, *vipaägg*; in French, *la fritillaire meleagre*, or *Panachee*, *le Damier*; in Italian, *fritillaria*, *giglio variegato*, *meleagride*, *fritillaria ſcaccheggiata*; in Spaniſh, *la fritillaria*, *el meleagro*. Gerarde calls it *turkey-hen* or *guinea-hen flower*, and *checquered daffodill*. The curious and painful herbaliſt of Paris, John Robin, ſent him many plants for his garden, where they proſpered (as he informs us), as in their own native country; and were then greatly eſteemed for the beautifying of our gardens, and the boſoms of the beautiful. Some call it, ſays Parkinſon, *Narciſſus Caparonius*, from the firſt finder, Noel Caparon, an apothecary then dwelling at Orleans, but ſhortly after murdered in the maſſacre of France. He leaves it to every one's will, to call it in Engliſh either *fritillaria*, as it is called of moſt, or *checquered daffodil* or *guinea-hen flower*; or, as he does, *checquered lilly*. Lobel makes it a kind of tulip. The country people about Riſlip call the flowers *ſnakes'-heads*.

Many varieties have been ſent from Spain, Portugal, Italy, &c. Many others have been raiſed from ſeed by the floriſts, which differ in the ſize and colour of their flowers: theſe amount to a conſiderable number in the catalogues of the Dutch floriſts; but as new varieties may be continually produced, and ſince theſe flowers are no longer in ſuch eſteem as they were formerly, it would be to little purpoſe to enumerate them.

5. Fritillaria Cantonienſis, or Cochinchina fritillaria: leaves three-nerved, the upper ones oppoſite; flowers in pairs, axillary. Stem annual, quite ſimple, hard, ſlender, round, upright, a foot and half high; leaves ſmooth, quite entire, rounded at the baſe, then conical, with a long point; flowers pendulous, the whole duſky purple, and without ſmell; corolla thick, ſix-cornered, almoſt cloſed; ſtyle trifid, with ſimple ſtigmas. Cultivated about Canton in China.

Propagation and Culture. The firſt ſpecies may be propagated by ſeeds, or offsets from the root; the former method is too tedious for moſt of the Engliſh floriſts, becauſe the plants ſo raiſed are ſix or ſeven years before they flower; but the Dutch and Flemiſh gardeners, who have more patience, frequently raiſe them from ſeeds, and ſo get ſome new varieties, which reward their labour. The method of propagating theſe flowers from ſeeds being nearly the ſame as for the tulip, *Tulipa*, the reader is deſired to turn to that article, where there are full directions for performing it. But the common method of propagating them here, is by offsets ſent out from the old roots, which will flower ſtrong the ſecond year after they are taken from the roots; in order to have plenty of theſe, the roots ſhould not be tranſplanted oftener than every third year, by which time each root will have put out ſeveral offsets, ſome of which will be large enough to flower the following year, ſo may be planted in the borders of the flower-garden, where they are to remain; and the ſmaller roots may be planted in a nurſery-bed, to grow a year or two, according to their ſize; therefore they ſhould be ſorted, and the ſmalleſt roots planted in a bed together, which ſhould remain there two years, and the larger by themſelves to ſtand one year, by which time they will have acquired ſtrength enough to flower, ſo may then be removed into the pleaſure-garden. The time for taking up theſe roots is in the beginning of July, when their ſtalks will be decayed; and they may be kept out of the ground two months, but they ſhould be laid ſingle in a dry ſhady room, but not in heaps, or in a moiſt place, which will cauſe them to grow mouldy, and rot. The offsets ſhould be firſt planted, for as theſe are ſmall, they will be apt to ſhrink if they are kept long out of the ground. As the roots are large, they muſt not be planted too near other flowers; and when they are planted in beds by themſelves, they ſhould not be nearer than a foot and a half in the rows, and two feet row from row; they ſhould be planted ſix inches deep at leaſt, eſpecially the ſtrong roots: they delight in a light ſoil, not too wet, nor very full of dung; therefore if any dung is laid upon the borders where they are planted, it ſhould be buried pretty deep, ſo as to be two or three inches below the roots.

2, 3, 4. Theſe plants are propagated either by ſeeds, or offsets from the old roots; by the firſt of which methods new varieties will be obtained, as alſo a larger ſtock of roots in three years, than can be obtained in twenty or thirty years in the latter method: we ſhall therefore firſt treat of their propagation by ſeeds. Having provided yourſelf with ſome good ſeeds, ſaved from the faireſt flowers, you muſt procure ſome ſhallow pans or boxes, which muſt have holes in their bottoms to let out the moiſture; theſe you ſhould fill with light

freſh

freſh earth, laying a few potſheards over the holes, to prevent the earth from ſtopping them; then, having laid the earth very level in the boxes, &c. you muſt ſow the ſeeds thereon pretty thick, covering it with fine ſifted earth a quarter of an inch thick. The time for ſowing the ſeed is about the beginning of Auguſt; for if it be kept much longer out of the ground, it will not grow; then place the boxes or pans where they may have the morning ſun until eleven o'clock, obſerving, if the ſeaſon proves dry, to water them gently, as alſo to pull up all weeds as ſoon as they appear; for if they are ſuffered to remain until they have taken deep root into the earth, they will draw the ſeeds out of the ground whenever they are pulled up. Toward the latter end of September, you ſhould remove the boxes, &c. into a warmer ſituation, placing them cloſe to a hedge or wall expoſed to the ſouth; if they are ſown in pots, theſe ſhould be plunged into the ground; but they are beſt in tubs; theſe ſhould be covered in ſevere froſt. In this ſituation they may remain until the middle of March, by which time the plants will be come up an inch high; you muſt therefore remove the boxes, as the weather becomes hot, into a more ſhady ſituation; for while the plants are young, they are liable to ſuffer by being too much expoſed to the ſun; and in this ſhady ſituation they may remain during the heat of the ſummer, obſerving to keep them clear from weeds, and to refreſh them now and then with a little moiſture; but be careful not to give them much water after their leaves are decayed, which would rot their roots. About the beginning of Auguſt, if the roots are very thick in the boxes, you ſhould prepare a bed of good light freſh earth, which muſt be levelled very even, upon which you ſhould ſpread the earth in the boxes in which the ſmall roots are contained, equally covering it about one-fourth of an inch thick with the ſame freſh earth: this bed ſhould be ſituated in a warm poſition, but not too cloſe to hedges, walls, or pales, which would cauſe their leaves to be long and ſlender, and make the roots weaker than if placed in a more open expoſure. In this bed they may remain until they flower, which is generally the third year from ſowing; at which time you ſhould put down a mark to the roots of all ſuch as produce fair flowers, that at the time of taking them out of the ground, which ought to be ſoon after their green leaves are decayed, they may be ſelected into a bed amongſt your old roots of this flower, which, for their beauty, are preſerved in the beſt gardens; but the other leſs valuable flowers may be planted in the borders of the parterre-garden for their variety, where, being intermixed with other flowers of different ſeaſons, they will make a good appearance.

The fine ſorts of this flower ſhould remain undiſturbed three years, by which time they will have produced many offſets; and ſhould be taken up when their leaves are decayed, and planted into a freſh bed, taking ſuch of their offſets as are large enough to produce flowers to plant in the flower garden; but the ſmaller roots may be planted into a nurſery-bed until they have obtained ſtrength enough to flower; but you muſt never ſuffer theſe roots to lay out of the ground when you remove them, but plant them again immediately, otherwiſe they will periſh, During theſe three years, the ſurface of the earth ſhould be ſtirred every autumn with a trowel, obſerving not to go ſo deep as to bruiſe the root, and at the ſame time lay a thin cover of very rotten dung or tanner's bark upon the ſurface of the beds; which, being waſhed into the ground, will cauſe the flowers to be larger, as alſo the roots to make a greater increaſe: you muſt alſo obſerve to keep them conſtantly clear from weeds; and thoſe roots which you would preſerve with care, ſhould not be ſuffered to ſeed. When a ſtock of good flowers are obtained, they may be preſerved and increaſed in the ſame manner as other bulbous rooted flowers, which is by offſets ſent out from their roots, which ſhould be taken off every other year from the fineſt ſorts; but the ordinary flowers may remain three years undiſturbed, in which time they will have multiplied ſo much, as that each root will have formed a cluſter; ſo that if they are left longer together, the roots will be ſmall, and the flowers very weak; therefore, if theſe are taken up every other year, the roots will be the ſtronger. Theſe roots may be treated in the ſame manner as tulips, and other bulbous-rooted flowers, with this difference only, that the roots will not bear to be kept out of the ground ſo long; therefore, if there ſhould be a neceſſity for keeping them out of the ground any time, it will be beſt to put the roots into ſand, to prevent their ſhrinking.

As theſe flowers come out early in the ſpring, they make a pretty appearance in the borders of the pleaſure garden, where they are planted in ſmall clumps; for, when they ſtand ſingle in the borders, they make but a poor figure. See STAPELIA.

FRITIL'LUS, *ſ.* [Latin.] A box out of which dice are caſt. *Cole.* *Not uſed.*

FRI'TINANCY, *ſ.* [from *fritinnio*, Lat.] The ſcream of an inſect, as the cricket or cicada.—The note or *fritinancy* thereof is far more ſhrill than that of the locuſt, and its life ſhort. *Brown.*

FRIT'TER, *ſ.* [*friture*, Fr.] A ſmall piece cut to be fried:

Maids, *fritters* and pancakes ynow ſee ye make;
Let Slut have one pancake for company ſake. *Tuſſer.*

A fragment: a ſmall piece:

The ancient errant knights
Won all their ladies hearts in fights;
And cut whole giants into *fritters*,
To put them into amorous twitters. *Hudibras.*

A cheeſecake; a wig. *Ainſworth.*

To FRIT'TER, *v. a.* To cut meat into ſmall pieces to be fried. To break into ſmall particles or fragments:

Joy to great chaos! let diviſion reign!
My racks and tortures ſoon ſhall drive them hence,
Break all their nerves, and *fritter* all their ſenſe. *Dunciad.*

How prologues into prefaces decay,
And theſe to notes are *fritter'd* quite away. *Pope.*

FRITZ'LAR, a town of Germany, in the circle of the Lower Rhine, and principality of Lower Heſſe, ſituated on the Eder. In 1232, Conrad landgrave of Thuringia ſacked it, ſlaughtered the inhabitants, ſet it on fire, and deſtroyed the walls. In 1631, it was taken by the landgrave of Heſſe, and retaken ſoon after by general Tilly. It contains two colleges and a convent: thirteen miles ſouth-ſouth-weſt of Caſſel. Lat. 50. N. lon. 26. 41. E. Ferro.

FRIU'LI, a province of Italy, which extends from the mouth of the Tagliamento to Pontieba, on the frontiers of Carinthia, and from the Livenza to the Liſonzo, namely, fifty-five miles in length and ſixty-five in breadth, and about 263 in circumference. The Friuli is bounded by the Tyrol and Carinthia on the north, by Carniola and Gradiſca on the eaſt, by the Adriatic ſea on the ſouth, and by the Marca Trevigiana on the weſt. The ſoil is partly flat, and partly mountainous; and its hilly part, ſituated towards Germany, is the moſt ſterile and uninhabited: for the mountains Montaſio and Chiarima, at the moſt northern end of the province, form a part of the Julian Alps which ſeparate Italy from Germany; but the mountain of Mariana, which parts it from Carinthia, is a part of the Noric Alps; and on the other ſide, this country is alſo covered by another ridge of mountains. The roads and paſſes which conduct through theſe terrific mountains to Germany, are, in part, ſo very narrow, that it is extremely dangerous to travel on them, either on foot or horſeback; and only the paſſes Chiuſa di Venzone, Tolmino, and Lubiana, can be paſſed by waggons and artillery. The flat part of the Friuli is very fertile; and the country produces, in general, a quantity of timber

ber and fire-wood, game, all kinds of grain, fruit, particularly good wine, among which is the famous piccoli. The breeding of cattle is very flouriſhing; and the culture of ſilk ſo very extenſive, that it produces yearly 1000 hundred-weight of ſilk, which is deemed ſome of the fineſt in Italy. The principal rivers are, the Tagliamento, which runs through the middle of the country, the Meduna, Cellina, Stella, Torre, and the Natiſone. The inhabitants, called *Furlani*, ſpeak a dialect much reſembling that of the ancient French language, widely differing from either the Italian or German idiom. The whole province, which is divided into the dioceſes of Udine and Concordia, contained in the year 1581 no more than 196,510 inhabitants; but in 1755 their number amounted to 342,158; and in 1795, to 365,512, who live in four cities, twenty ſmall towns and boroughs, and ſix hundred villages. This country was a duchy in the time of the Lombards; in the tenth century it devolved to the patriarch of Aquileia; and from 1420 to 1445 it came under the dominion of the Venetians, partly by force of arms, partly by compulſory treaties, and at laſt by voluntary ſubmiſſion: in the ſixteenth century, part of it was ſeized upon by the houſe of Auſtria; and the whole of it was confirmed to that houſe by the treaty of Campo Formio in 1797, as part of Maritime Auſtria; but by the treaty of Preſburgh in 1806, it becomes a part of the newly-erected kingdom of Italy. Udine is the capital.

FRIU'LI, or CITTA DI FRIULI, a town of Italy, in a country of the ſame name; the ſee of a biſhop, ſuffragan of Aquileia: 185 miles eaſt-north-eaſt of Milan, and thirty-two north-north-weſt of Trieſte. Lat. 46. 15. N. lon. 31. E. Ferro.

FRIVO'LITY, *ſ.* Inſignificancy.—The admiral was no ſtranger to the *frivolity*, as well as falſehood, of what he urged in his defence. *Robertſon.*

FRIV'OLOUS, *adj.* [*frivolus*, Lat. *frivole*, Fr.] Slight; trifling; of no moment.—I will not defend any miſtake, and do not think myſelf obliged to anſwer every *frivolous* objection. *Arbuthnot.*

She tam'd the brinded lioneſs,
And ſpotted mountain pard; but ſet at nought
The *frivolous* bolt of Cupid. *Milton.*

FRIV'OLOUSLY, *adv.* Triflingly; wanting weight.—Such a fellow is troubleſomely active, *frivolouſly* buſy, fooliſhly lively. *Cheſterfield.*

FRIV'OLOUSNESS, *ſ.* Want of importance; trifling neſs.—Nothing can prove more fully the innocence of Suffolk, than the *frivolouſneſs* of the articles, which his enemies thought proper to object againſt him. *Hume.*

To FRIZ'LE, *v. a.* [*friſer*, Fr.] To curl in ſhort curls like nap of frieze.—They *frizled* and curled their hair with hot irons. *Hakewill.*

I doff'd my ſhoe, and ſwear
Therein I ſpy'd this yellow *frizled* hair. *Gay.*

The operation of the workman in raiſing or friezing the nap of cloth.

FRI'ZON (Peter), a French eccleſiaſtic of the ſeventeenth century, born in the dioceſe of Rheims. For ſome time he was a member of the ſociety of Jeſuits, and was employed to inſtruct their pupils in claſſical learning. Afterwards he officiated as penitentiary in the church of Rheims, and was promoted to a canonry in that cathedral. In 1632 he was choſen coadjutor to the grand-maſter of the college of Navarre, at Paris; and ſoon ſucceeded to the ſtation of grand-maſter himſelf, which he retained until the year 1635. Being then deſirous of a more tranquil life, he reſigned his poſt, and ſpent the remainder of his days in literary labours. He was admitted to the degree of doctor by the faculty of the Sorbonne. He died in 1651. In 1621 he publiſhed an edition, in folio, of The Holy Bible, in French, tranſlated by the divines of the univerſity of Louvain. In 1629 he publiſhed a hiſtory of the French cardinals, under the title of *Gallia purpurata*; of which he gave a ſecond edition in 1638, folio, augmented by a Hiſtory of the Grand Almoners of France. This work was held in high eſtimation, until its credit was leſſened by M. Baluze's expoſure of its errors, in his *Anti-Frizonius*, publiſhed in 1652, and afterwards in his Hiſtory of the Popes of Avignon. M. de Launoi informs us, that he carried on Henry de Sponde's Continuation of the Annals of Baronius, from 1622 to 1630. He was alſo the author of The Life of Henry de Sponde, prefixed to his Continuation of the Eccleſiaſtical Annals, publiſhed at Paris in 1659.

FRO, *adv.* [ꝼꝛa, Sax.] Backward; regreſſively. It is only uſed in oppoſition to the word *to*; *to* and *fro*, backward and forward, *to* and *from*:

As when a heap of gather'd thorns is caſt,
Now to, now *fro*, before th' autumnal blaſt,
Together clung, it rolls around the field. *Pope.*

It is a contraction of *from*. *Not now uſed.*

They turn round like grindleſtones,
Which they dig out *fro'* the delves,
For their bairns' bread, wives, and ſelves. *Ben Jonſon.*

FRO'BEN (John), an eminent printer, born at Hammelburg in Franconia. He was liberally educated, and acquired much reputation at the univerſity of Baſil. As the buſineſs of a printer was at that time connected with the profeſſion of letters, Froben was induced to learn it, and to ſet up a preſs in the city of Baſil. He became not only eminent in the practice of his art, but he ſupported its dignity and utility by a ſcrupulous choice in the authors he printed. Such was his reputation, that the advantage of having his works printed by Froben, was the chief inducement to Eraſmus for taking up his reſidence at Baſil. Among the numerous productions of the Frobenian preſs, were the works of Eraſmus, in nine volumes folio, and alſo thoſe of St. Jerom and St. Auguſtine, on which he beſtowed his reviſion. Theſe are reckoned the moſt correct of Froben's editions. He had an intention of printing the Greek fathers, but was prevented by his death, which happened in 1527. Eraſmus, who ſincerely lamented him, honoured his memory with a Greek and a Latin epitaph. He himſelf died in the houſe of Jerom Froben, ſon of the former, and his ſucceſſor in the printing-office jointly with his ſon-in-law Nicholas Epiſcopius. They carried into effect the deſign of printing the Greek fathers. A catalogue of the works printed at this office was publiſhed in 1564.

FRO'BISHER (ſir Martin), an eminent navigator, born near Doncaſter in Yorkſhire. He was brought up to the ſea, and acquired great ſkill in the art of navigation. The diſcovery of a north-weſt paſſage to the Indies was an object which excited his zeal, and during many years he made fruitleſs endeavours among the merchants to procure the means for that attempt. At length, by application to the miniſters of queen Elizabeth, he was enabled to fit out a private adventure for this purpoſe: but his equipment amounted to no more than two barks of twenty-five tons burthen each, and a pinnace of ten tons. With this ſlender force he ſailed from Deptford on June 8, 1576, and on July 28 made the coaſt of New Greenland, about lat. 62. After ſome time ſpent in exploring, Frobiſher entered the ſtrait which has ever ſince borne his name, lat. 62. 50. and ſailed up it the length of ſixty leagues. This is an inlet on the eaſtern ſide of the continent of New Greenland, which terminates further to the ſouth at Cape Farewell. He had ſome communication with the natives of this diſmal region, and took formal poſſeſſion of it in the name of his ſovereign. He then returned, bringing with him a piece of black ſtone, by way of ſample of the country. This mineral, which was probably a kind of pyrite, was ſuppoſed to give tokens of containing gold; and it is aſſerted that, upon being aſſayed, it was found to be rich in that metal. No mineralogiſt will now doubt that the ſuppoſition

ſition muſt have originated in fraud or ignorance; however, ſuch were its effects, that the nation thought of nothing but a new Peru or Mexico, and a ſecond voyage was determined upon the next ſpring. For this purpoſe, the queen lent Frobiſher a ſhip of the royal navy of two hundred tons, to which he added two ſmall barks. Numbers of volunteers ſolicited to accompany him, ſeveral of them gentlemen of family; and by his reſtriction to the number of one hundred and forty, many were diſappointed. His commiſſion for this voyage directed him "*only to ſearch for ore, and to remit diſcovery to another time;*" whence the character of that ſpirit of adventure which diſtinguiſhed this period may be eſtimated. He ſailed in May, 1577, and proceeding to his former ſtrait, explored its coaſts and bays, and landed on ſeveral iſlands, where the crews furniſhed themſelves with a quantity of the ſuppoſed golden ore. He returned to England in September with his ſhips and cargo, which laſt, upon the examination of commiſſioners, was judged to promiſe great riches. And ſo completely was the deluſion kept up, that another expedition was reſolved upon for the next year, accompanied by miners, refiners, and ſoldiers to guard the treaſure. The adventurers offered to paſs a winter in that rigorous climate, and materials were taken out for the conſtruction of a wooden fort, and other neceſſary buildings. Frobiſher ſailed upon his third voyage in May, 1578; and ſo much was the public expectation raiſed, that beſides three ſhips particularly devoted to diſcovery, twelve more were fitted out for the purpoſe of being laden with the riches of the country. In this voyage they traced more of the coaſts and iſlands of Greenland, and diſcovered a new ſtrait; but meeting with ſtorms, which retarded them and deſtroyed part of their fort, they agreed to return without leaving any perſons to winter. They brought back ſome more ladings of the precious mineral, but it is probable that its true nature was now detected, ſince we hear of no renewal of theſe ſingular expeditions. The original map of Frobiſher's voyages, according to Pennant, is a remarkable ſketch of erroneous ſuppoſition. He makes his ſtraits reach to the icy ſea, oppoſite to what he calls Cathaya, juſt to the north of what is made to reſemble the new-diſcovered ſtraits of Bering. Indeed, theſe voyages ſeem to be among thoſe that were the leaſt conducive to the improvement of geography; but no attempts of this kind are entirely uſeleſs, ſince they at leaſt render future ones leſs erroneous.

Frobiſher, after this time, appears only as a gallant naval commander. In 1585 he accompanied ſir Francis Drake to the Weſt Indies as captain of the Aid. He had a ſhare of the glorious defence of the country againſt the Spaniſh armada in 1588, commanding the Triumph, one of the three largeſt ſhips in the Engliſh fleet. For his ſervices on this important occaſion he received the honour of knighthood. He commanded ſquadrons againſt the Spaniards in 1590 and 1592, and took two rich prizes. In 1594 he was ſent with four ſhips of war to the aſſiſtance of Henry IV. of France againſt the Spaniards and Leaguers, when, in an attack upon a fort near Breſt, he received a ſhot, of which he died after he had brought his ſquadron home. Sir Martin Frobiſher is ſaid to have partaken of the native roughneſs which long characteriſed his profeſſion; but is allowed to have been a brave and able commander.

FRO'BISHER's STRAITS, or FORBISHER's STRAITS, a narrow ſea on the weſt of Davis's Strait, to the ſouth of Cape Walſingham of Frobiſher. Lat. 61. 50. to 63. 20. N. lon. 65. to 70. W. Greenwich.

FROCK, *ſ.* [*froc*, Fr.] A dreſs: a coat:

That monſter, cuſtom, is angel yet in this,
That to the uſe of actions fair and good,
He likewiſe gives a *frock* or livery,
That aptly is put on. *Shakeſpeare.*

A kind of cloſe coat for men.—I ſtrip my body of my ſhepherd's *frock*. *Dryden.*—A kind of gown for children.

FROD'LINGHAM, a ſmall town in the county of York, in the Eaſt Riding, ſituated on a branch of the Hull, with a weekly market on Thurſdays. It is twelve miles north of Beverly, and 194 north from London.

FROD'MORTEL, *ſ.* An old law term: an immunity or free pardon for murder or manſlaughter.

FROD'SHAM, a genteel and pleaſant town in Cheſhire, diſtant from London 182 miles, Cheſter ten, and Warrington ten. It is ſuppoſed to derive its name from a ford over the river Weaver, at the eaſt end of the town, before the erection of the bridge, which conſiſts of four arches, handſomely built of hewn ſtone. By means of the late inland navigation, it has communication with the rivers Dee, Ribble, Ouſe, Trent, Darwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extends above five hundred miles. The town is a mile in length from eaſt to weſt; the ſtreet is ſpacious and well-paved; another ſtreet, interſecting at right angles about the middle of the town, leads to the pariſh-church, which is ſituated on a lofty hill called Frodſham-hill, the higheſt in the county. The church is a large handſome building, dedicated to St. Lawrence; it is a vicarage, in the gift of Chriſtchurch college, Oxford. The pariſh is in circumference about thirty-one miles, bordering upon the great foreſt of Delamere, conſiſting of ten ſmall villages, beſides Frodſham. The manor belongs to the right hon. George James earl of Cholmondeley. At the weſt end of the town ſtood a caſtle called Maurice Caſtle, anciently the ſeat of the Savages earls Rivers, but was burnt down in 1652. Here is a free grammar-ſchool, with a good ſchool-houſe, endowed with lands, &c. to the value of ſixty pounds per annum. The principal trade of the place is a ſalt-refinery, erected in 1772, where is manufactured from ſix to ſeven thouſand tons of ſalt annually. A graving dock and yard have lately been made for building and repairing veſſels. A cotton manufactory has alſo been newly eſtabliſhed.

Above the town is Beacon-hill, on which was formerly placed a beacon, as a ſignal in caſe of an invaſion. This hill is cut out in walks gradually and gently aſcending to the ſummit, and carried round the face of it, from whence there is a delicious *coup d'œil* of a fine large extended plain, with the junction of two large rivers; the Merſey, navigable to Manchester, and the Weaver, in Winsford, near Middlewich: both theſe rivers empty themſelves into the Iriſh ſea below Liverpool. This hill commands an extenſive proſpect of the counties of Stafford, Salop, Derby, Lancaſter, York, Denbigh, Flint, Carnarvon, and Merioneth. It is a great thoroughfare from the counties north to Wales and Ireland. At the weſt end of the town is an excellent cold bath, which diſcharges 1700 gallons of water in a minute. The town is well ſupplied with many excellent ſprings of good water; one in particular, called Pearl of Wiggan, which diſtils from the face of a rock in drops from every vein, reſembling the pureſt gems. The town and pariſh contain about four thouſand inhabitants. It has a good market on Thurſdays; and two fairs for cattle, &c. on the 15th of May, and 21ſt of Auguſt.

FRŒ'LICH (Eraſmus), a learned Jeſuit, born at Gratz in Styria, in 1700. He entered the ſociety in 1716, and became profeſſor of mathematics and the belles-lettres at Vienna. He there alſo purſued the medallic ſcience, to which he was much attached. He died in 1758. His works are, 1. *Quatuor Tentamina in Re Nummaria*, 4to. 1737 & 1750. 2. *Annales Rerum et Regum Syriæ*, folio, 1751. 3. *De Figura Telluris*, 4to. 1757: and various diſſertations on particular medals.

FRŒLICH'IA, *ſ.* in botany, a genus of the claſs triandria, order monogynia. The generic characters are—Calyx ſuperior, four-toothed; corolla tubular; berry one-ſeeded, juiceleſs; ſeed arillate.

Frœlichia paniculata, a ſingle ſpecies. It is a ſhrub with ſquare branches. Leaves oppoſite, elliptic-lanceolate, pointed, glabous, entire; panicle terminal. Inhabits Trinidad.

FROG, *ſ.* [ꝼnogga, Sax.] A well-known amphibious animal; for the various ſpecies and natural hiſtory of which, ſee the article RANA.—The hollow part of a horſe's foot.

FROG, *artificial*, for horſes feet. See the article FARRIERY, vol. vii. p. 262.

FROG-BIT, *ſ.* in botany. See HYDROCHARIS.

FROG-FISH, *ſ.* See RANA PARADOXA.

FROG-LAKE, a lake of North America. Lat. 53. 15. N. lon. 91. 50. W. Greenwich.

FROG-POINT, a neck of land, in Weſt Cheſter county, New York, on the coaſt of Long-Iſland Sound, nine miles from Harlem Heights, in North America.

FRO'GES, a town of France, in the department of the Iſere, and chief place of a canton, in the diſtrict of Grenoble: three leagues north-north-weſt of Grenoble.

FROGO'ZA, a town of Portugal, in the province of Entre Duero e Minho: one league and a half north of Barcelos.

FROH'BURG, a town of Germany, in the circle of Upper Saxony, and circle of Leipſic, ſituated on the Wichra. The inhabitants have a manufacture of ſtuff and earthen-ware: five miles ſouth-ſouth-eaſt of Borna.

FRO'HENS-LE-GRAND, a town of France, in the department of the Somme, and chief place of a canton, in the diſtrict of Doulens: two leagues north-weſt of Doulens.

FROHNS'DORF, a town of Germany, in the circle of Upper Saxony, and circle of Thuringia: ſeven miles ſouth-eaſt of Weiſſenſee.

FROHNS'PURG, a town of Germany, in the archduchy of Auſtria: one mile ſouth of Hardegg.

FRO'JAN, a town of Spain, in the province of Galicia: twenty-two miles north-north-eaſt of Orenſe.

FROID'MONT (Libert), an eccleſiaſtic of the biſhopric of Liege, born near Maeſtricht, in 1587. He taught philoſophy in the univerſity of Louvain, and in 1633 was preferred to the deanery of St. Peter's, in that city. Afterwards he was admitted to the degree of doctor of divinity, and, upon the nomination of the celebrated Janſenius to the biſhopric of Ypres, was appointed his ſucceſſor in the chair of interpreter of the Sacred Scriptures in the univerſity. He was well verſed in the learned languages, particularly the Greek and Hebrew, and had alſo made conſiderable progreſs in mathematical learning. He died in 1653, at ſixty-ſix years of age. He was the author of, 1. *Diſſertatio de Cometa Anni* 1618. 2. *Meteorologicorum Libri V.* 3. *Brevis Anatomia Hominis.* 4. *Querimonia Jacobi Regis.* 5. *Chryſippus, ſive de libero Arbitrio*, 1644. 6. *In Actus Apoſtolorum Commentarii.* 7. A Latin Commentary on the Epiſtles of St. Paul, in two volumes, folio, 1670; &c. The work laſt-mentioned is in a conſiderable degree an abridgment of the Commentary of Eſtius, and is held in high eſtimation.

FRO'JERED, a town of Sweden, in the province of Weſt Gothland: ſeventy miles eaſt of Uddevalla.

FROISE, *ſ.* [from the French *froiſſer.*] A kind of food made by frying bacon incloſed in a pancake.

FROIS'SART (John), a French hiſtorian and poet, born at Valenciennes in 1337. He is aſſerted to have commenced a writer of hiſtory at the age of twenty; and it cannot be doubted that his poetical talent diſplayed itſelf at leaſt as early. To divert his chagrin from an amorous diſappointment, he paid a viſit to England, where he was kindly received by his country-woman Philippa of Hainault, queen of Edward III. He became ſecretary to queen Philippa in 1361, and continued five years in her ſervice. During that period he viſited Scotland, and was entertained for ſome time by William earl of Douglas. He was in Gaſcony in 1366 with Edward the Black Prince; and afterwards viſited ſeveral of the Italian courts. In 1369 he loſt his patroneſs Philippa; and retiring to his own country, obtained the benefice of Leſtines in the dioceſe of Cambray. Froiſſart, however, not being of a diſpoſition to devote himſelf to the cloiſter, entered into the ſervice of the duke of Brabant, who was alſo a poet. From the compoſitions of his maſter, joined with ſome of his own, he formed a kind of romance, entitled Meliador, relating to love and chivalry. After the duke's death, in 1384, he acquired the patronage of Guy earl of Blois. He then travelled to the brilliant court of Gaſton earl of Foix, who received him with great cordiality, and liſtened with intereſt to the recital of his poems. Here he met with much uſeful information from ſome knights of Arragon and England in the retinue of the duke of Lancaſter. After his travels in France and the Low-countries, he returned home, and finiſhed the third book of his hiſtory. He paid another viſit to England in 1395, and was introduced to the young king Richard II. to whom he preſented a ſplendid copy of his Meliador, which was graciouſly received. Here he obtained freſh materials for his hiſtory, beſides other favours. He returned to his own country, and fixed his reſidence at Chimay, where he poſſeſſed the benefice of canon and treaſurer of the collegiate church. The year of his death is uncertain; but he muſt have lived beyond 1400, as his Chronicle extends to that date.

Though Froiſſart was the author of thirty thouſand verſes, his poetical character is ſunk into oblivion, and he is only known in the republic of letters as an hiſtorian. In this capacity, as writing of his own times, and with all the artleſſneſs and minuteneſs of narration belonging to his age, he is highly valued by thoſe who ſtudy ancient manners from original draughts. His Chronicle, divided into four books, comprehends the period from 1326 to 1400. It relates the events which took place not only in France, but in Flanders, England, Scotland, and Ireland, with many details reſpecting the papal courts of Rome and Avignon, and collateral particulars of the tranſactions in the reſt of Europe, and even in Turkey and Africa. The beſt edition of his Chronicle is that of Lyons, four volumes, folio, 1559. A tranſlation of the Chronicles of Froiſſart into Engliſh, has been recently made by Thomas Johnes, eſq.

FROIS'SY, a town of France, in the department of the Oiſe, and chief place of a canton, in the diſtrict of Breteuil: five miles ſouth-ſouth-weſt of Breteuil.

FRO'LIC, *adj.* [*vrolijck*, Dut.] Gay; full of levity; full of pranks.—The gay, the *frolic*, and the loud. *Waller.*

Whether, as ſome ſages ſing,
The *frolic* wind that breathes the ſpring,
Zephyr with Aurora playing,
As he met her once a Maying;
There on beds of violets blue,
And freſh-blown roſes waſh'd in dew,
Fill'd her with thee a daughter fair,
So buxom, blithe, and debonnair. *Milton.*

FRO'LIC, *ſ.* A wild prank; a flight of whim and levity:

He would be at his *frolic* once again,
And his pretenſions to divinity. *Roſcommon.*

While rain depends, the penſive cat gives o'er
Her *frolics*, and purſues her tail no more. *Swift.*

To FRO'LIC, *v. n.* To play wild pranks; to play tricks of levity and gaiety.—Manly ſpirit and genius plays not tricks with words, nor *frolics* with the caprices of a frothy imagination. *Glanville.*

Then to her new love let her go,
And deck her in golden array;
Be fineſt at every fine ſhow,
And *frolic* it all the long day. *Rowe.*

FRO'LICLY, *adv.* Gaily; wildly.

FRO'LICSOME, *adj.* Full of wild gaiety.

FRO'LICSOMELY, *adv.* With wild gaiety.

FRO'LICSOMENESS, *ſ.* Wildneſs of gaiety; pranks.

FRO'LOIS, a town of France, in the department of the Cote-d'Or, and chief place of a canton, in the diſtrict of Semur: ſeven leagues north-weſt of Dijon.

FROM,

FROM, *prep.* [ꝼꝛam, Saxon and Scottiſh.] Away; noting privation:

Your flighting Zulema, this very hour
Will take ten thouſand ſubjects *from* your power. *Dryd.*

Noting reception.—What time would ſpare *from* ſteel receives its date. *Pope.*—Noting proceſſion, deſcent, or birth.—The ſong began *from* Jove. *Dryden.*

Thus the hard and ſtubborn race of man
From animated rock and flint began. *Blackmore.*

Noting tranſmiſſion.—The meſſengers *from* our ſiſter and the king. *Shakeſpeare.*—Noting abſtraction or vacation:

I ſhall find time
From this enormous ſtate, and ſeek to give
Loſſes their remedies. *Shakeſpeare.*

With *to* following; noting ſucceſſion.—He bid her *from* time *to* time be comforted. *Addiſon.*—Theſe motions we muſt examine *from* firſt *to* laſt, to find out what was the form of the earth. *Burnet.*—Out of; noting emiſſion:

When the moſt high
Eternal Father, *from* his ſecret cloud
Amidſt, in thunder utter'd thus his voice. *Milton.*

Noting progreſs from premiſſes to inferences.—This is evident *from* that high and refined morality, which ſhined forth in ſome of the ancient heathens. *South.*—Noting the place or perſon from whom a meſſage is brought.—The king is coming, and I muſt ſpeak with him *from* the bridge.—How now, Fluellan, cam'ſt thou *from* the bridge? *Shakeſpeare.*—Out of: noting extraction:

From high Meonia's rocky ſhores I came,
Of poor deſcent; Acætes is my name. *Addiſon.*

Becauſe of. Noting the reaſon or motive of an act or effect.—David celebrates the glory of God *from* the conſideration of the greatneſs of his works. *Tillotſon.*

You are good, but from a nobler cauſe;
From your own knowledge, not *from* nature's laws. *Dryd.*

Out of. Noting the ground or cauſe of any thing.—They who believe that the praiſes which ariſe *from* valour are ſuperior to thoſe which proceed *from* any other virtues, have not conſidered. *Dryden.*

By the ſacred radiance of the ſun,
The myſteries of Hecate, and the night;
By all the operations of the orbs,
From whom we do exiſt, and ceaſe to be,
Here I diſclaim all my paternal care. *Shakeſpeare.*

Not near to; noting diſtance:

His regiment lies half a mile at leaſt
South *from* the mighty power of the king. *Shakeſpeare.*

Noting ſeparation or receſſion:

Haſt thou beheld when *from* the goal they ſtart,
The youthful charioteers with heaving heart,
Ruſh to the race, and, panting, ſcarcely bear
Th' extremes of fev'riſh hope and chilling fear. *Dryden.*

Noting exemption or deliverance:

From jealouſy's tormenting ſtrife,
For ever be thy boſom free'd. *Prior.*

Noting abſence:

Our father he hath writ, ſo hath our ſiſter,
Of diff'rences which I beſt thought it fit
To anſwer *from* our home. *Shakeſpeare.*

Noting derivation:

I lay the deep foundations of a wall,
And Enos, nam'd *from* me, the city call. *Dryden.*

Since. Noting diſtance from the paſt.—The other had been trained up *from* his youth in the war of Flanders. *Clarendon.*

The milk of tygers was his infant food,
Taught *from* his tender years the taſte of blood. *Dryden.*

Contrary to. *Not in uſe.*—Any thing ſo overdone is *from* the purpoſe of playing; whoſe end, both at the firſt and now, was and is to hold, as 'twere, the mirror up to nature. *Shakeſpeare.*

Did you draw bonds to forfeit? Sign, to break?
Or muſt we read you quite *from* what we ſpeak,
And find the truth out the wrong way? *Donne.*

Noting removal.—Thrice *from* the ground ſhe leap'd. *Dryden.*

FROM is very frequently joined by an ellipſis with adverbs: as, *from above*, *from* the parts *above*; *from below*, *from* the places *below*; of which the following are examples:

FROM *above.*—He which gave them *from above* ſuch power, for miraculous confirmation of that which they taught, endued them alſo with wiſdom *from above*, to teach that which they ſo did confirm. *Hooker.*

No ſooner were his eyes in ſlumber bound,
When, *from above*, a more than mortal ſound
Invades his ears. *Dryden.*

FROM *afar.*—Light demi-lances *from afar* they throw. *Dryden.*

FROM *beneath:*

An arm ariſes out of Stygian flood,
Which, breaking *from beneath* with bellowing ſound,
Whirls the black waves and rattling ſtones around. *Dryd.*

FROM *behind:*

See, to their baſe reſtor'd, earth, ſeas, and air,
And joyful ages *from behind*, in crowding ranks appear.
Dryden.

FROM *far:*

Their train proceeding on their way,
From far the town and lofty tow'rs ſurvey. *Dryden.*

FROM *high.*—Then heav'ns imperious queen ſhot down *from high. Dryden.*

FROM *thence.* Here *from* is ſuperfluous.—In the neceſſary differences which ariſe *from thence*, they rather break into ſeveral diviſions than join in any one public intereſt; and *from hence* have always riſen the moſt dangerous factions, which have ruined the peace of nations. *Clarendon.*

FROM *whence. From* is here ſuperfluous:

While future realms his wand'ring thoughts delight,
His daily viſion and his dream by night,
Forbidden Thebes appears before his eye,
From whence he ſees his abſent brother fly. *Pope.*

FROM *where:*

From where high Ithaca o'erlooks the floods,
Brown with o'erarching ſhades and pendent woods,
Us to theſe ſhores our filial duty draws. *Pope.*

FROM *without.*—When the plantation grows to ſtrength, then it is time to plant it with women as well as with men, that it may ſpread into generations, and not be pierced *from without. Bacon.*

If native power prevail not, ſhall I doubt
To ſeek for needful ſuccour *from without.* *Dryden.*

From is ſometimes followed by another prepoſition, with its proper caſe.

FROM *amidſt:*

Thou too ſhalt fall by time or barb'rous foes,
Whoſe circling walls the ſev'n fam'd hills encloſe;
And thou, whoſe rival tow'rs invade the ſkies,
And *from amidſt* the waves with equal glory riſe. *Addiſon.*

FROM *among:*

Here had new begun
My wand'ring, had not he, who was my guide,
Up hither *from among* the trees appear'd,
Preſence divine! *Milton.*

FROM

FROM *beneath*:

My worthy wife our arms miſlaid,
And *from beneath* my head my ſword convey'd. *Dryden.*

FROM *beyond*.—There followed him great multitudes of people from Galilee, and *from beyond* Jordan. *Mat.* iv. 25.

FROM *forth*:

Young Aretus, *from forth* his bridal pow'r,
Brought the full laver o'er their hands to pour. *Pope.*

FROM *off*.—The ſea being conſtrained to withdraw *from off* certain tracts of lands, which lay till then at the bottom of it. *Woodward.*

Knights, unhors'd, may riſe *from off* the plain,
And fight on foot, their honour to regain. *Dryden.*

FROM *out*:

Strong god of iron, whoſe iron ſceptre ſways
The freezing north and hyperborean ſeas,
Terror is thine, and wild amazement, flung
From out thy chariot, withers ev'n the ſtrong. *Dryden.*

FROM *out of*.—Whatſoever ſuch principle there is, it was at the firſt found out by diſcourſe, and drawn *from out of* the very bowels of heaven and earth. *Hooker.*

FROM *under*:

He, though blind of ſight,
Deſpis'd and thought extinguiſh'd quite,
With inward eyes illuminated,
His fiery virtue rous'd
From under aſhes into ſudden flame. *Milton's Agoniſtes.*

FROM *within*:

From within
The broken bowels and the bloated ſkin,
A buzzing noiſe of bees his ears alarms. *Dryden.*

FROMA'GE (Peter), a French Jeſuit, born at Laon, in 1678. He commenced his noviciate at Nancy in 1693; and on account of his proficiency was ſelected by his ſuperiors to preſide over the claſſical ſtudies of their younger pupils. When he had completed his courſe of theology, he offered his ſervices as a miſſionary to the Levant; and being approved of, was firſt ſent into Egypt, where he ſpent ſome years in acquiring a knowledge of the Arabic tongue, and in different employments to which he was appointed. Afterwards he was ſent into Syria, where he ſpent the remainder of his life. He there formed the plan, which, by his perſeverance, was carried into execution, of eſtabliſhing a printing-preſs for the Arabic language, in the monaſtery of St. John the Baptiſt near Antura, a village in the chain of mountains diſtinguiſhed by the name of Antilibanus. Having procured the proper types from Rome, and the neceſſary workmen, he printed in Arabic a great number of theological and devotional pieces, which were diſperſed, with conſiderable benefit, among the inhabitants of the country. Fromage was preſent at a ſynod of the Maronites held in 1736, and pronounced a diſcourſe at its opening, which is publiſhed, together with his account of the proceedings of the ſynod, in the eighth volume of the New Memoirs of the Miſſions of the Society of Jeſus in the Levant, 12mo. 1745. He died in 1740, in his ſixty-third year.

FROMAGEAU' (Germain), a French eccleſiaſtic, born at Paris, and admitted into the houſe and ſociety of the Sorbonne in 1661. He has the character of a learned and able divine, and particularly famous for his knowledge of caſuiſtical divinity. On this account he was looked up to as the proper ſucceſſor of M. Delamet, for reſolving difficult caſes of conſcience; and to his determination the clergy frequently had recourſe on nice points relative to eccleſiaſtical diſcipline. He was repeatedly offered dignities in the church; but he conſtantly refuſed them, as he had inherited from his father a fortune equal to his utmoſt wiſhes. His benevolence and humanity not only ſhone forth in numerous acts of charity, but in ſubmitting, for ſome years, to the painful office of viſiting, and preparing for their laſt moments, perſons who were convicted of capital crimes. He died at the Sorbonne in 1705. He left behind him reſolutions of numerous caſes of conſcience, ſome of which were publiſhed in the ſame volume with thoſe of M. Delamet, which appeared in 1714, and the reſt in the ſucceeding volumes of the ſame collection.

FROME, a river of England, in the county of Somerſet, which joins the Avon about five miles ſouth-eaſt of Bath.

FROME, a river of England, which runs into the Lug, near Hereford.

FROME, a river of England, in the county of Dorſet, which paſſes by Dorcheſter, &c. and runs into the ſea in Poole harbour, a little below Wareham.

FROME, a river of England, in the county of Glouceſter, which joins the Avon at Briſtol.

FROME, a river of England, which runs into the Severn, near Berkeley, in Glouceſterſhire.

FROME, or FROME-SELWOOD, a large, rich, and populous, market-town, ſituated in the ancient foreſt of Selwood, in Somerſetſhire; diſtant 106 miles from London, fifteen from Wells, and thirteen from Bath. The ſituation of Frome is extremely pleaſant; the ſurrounding country being agreeably diverſified with hills, valleys, large incloſures, and fine woods; and having the ſeats of many of the nobility and gentry. The ſtreets are narrow and irregular; the houſes are built of ſtone, and covered with ſtone tile, dug on the ſpot. Here is a large handſome church, 150 feet long, and fifty-four broad; compriſing a nave, chancel, north and ſouth aiſles, four chapels, and a veſtry-room; it has a very handſome altar-piece; alſo a ſquare embattled tower, and octagonal ſpire 120 feet high. The river Frome paſſes through the lower part of the town, under a ſtone bridge of five arches; near which ſtands a free-ſchool for clothing and educating twenty boys, and an almſhouſe for widows, a large handſome building erected by ſubſcription about the year 1720. A large market is held here on Wedneſdays for cattle, pigs, corn, &c. Fairs, St. Matthias's and St. Catharine's days, for cattle, cheeſe, toys, &c.

Frome is a place of conſiderable antiquity.—Aldhelm, a monk of Malmſbury, and biſhop of Sherborne, built here a monaſtery in honour of St. John the Baptiſt, about the beginning of the eighth century. Here were alſo a priory, a nunnery, a cell, and an hermitage. It was formerly a royal demeſne, but never obtained a charter of incorporation. The civil police of the town is maintained by the neighbouring magiſtrates, and by conſtables annually choſen at the courts leet of the marquis of Bath and the earl of Cork and Orrery, lords of the ſeveral manors here. It was governed formerly by a bailiff. The inhabitants, after having ſhewn their zeal for the revolution, endeavoured in the reign of king William to obtain a charter of incorporation, but in vain.

Frome has for many years been famous for working Spaniſh and Engliſh wool into broad-cloths and kerſeymeres; in 1789, 348,000 pounds weight of wool were wrought here into 160,000 yards of broad-cloth and kerſeymere, of which quantity the former article compoſed about four-fifths; a buſineſs that employed 233 ſcribblers, and 223 ſhearmen. The quantity of wool manufactured here is ſince conſiderably increaſed, but the number of people employed is diminiſhed, the introduction of machines having leſſened, in a prodigious proportion, the call for manual labour. At preſent there are in the town of Frome twenty-ſeven manufacturers of cloth, who make of broad, narrow, and kerſeymere, about two hundred pieces weekly, of twenty-eight yards each; or, calculating by a different meaſure, about 160 miles of cloth, in length, every year. The following ſketch will ſhew the proceſs purſued in this branch of Britiſh manufactories, and, at the ſame time, give an idea of the number of people to whom we are obliged for every

every coat we wear:—The Engliſh fleece is ſorted, and the ſhort and fine mixed with the Spaniſh. It is then carried to the dye-houſe, and when cleanſed from its impurities, (by ſcouring it in a furnace of hot water,) dyed, and returned to the manufacturer; afterwards ſcribbled, carded, and ſpun into yarn by machinery; twiſted, woven in the loom; burled, by nipping off its knots and burs; milled by the fuller, dubbed with cards of teazle, ſtretched on the tenter hooks, dreſſed, ſheared, preſſed between heated planks and preſs paper, and then packed for the markets.

From a late ſurvey, this town, including hamlets, was found to contain in all, 1684 families, and 8105 inhabitants. The woodlands around the church are now the only part of the ancient foreſt of Selwood, which bears any reſemblance to its former ſtate; and have been within the memory of man the notorious aſylum of a deſperate clan of banditti, whoſe depredations were a terror to the ſurrounding pariſhes. One of their practices, and which perhaps was far from being the worſt, was that of coining money; but the cutting down large tracts of woods, eſtabliſhing ſmall farms, and *building the church*, were the means of deſtroying their haunts, and obliging the poſſeſſors to ſeek ſubſiſtence in honeſt and uſeful labour. The church here mentioned is ſaid to have been erected by lord Weymouth, in 1712.

FROM'ERIES, a town of France, in the department of the Somme: ſeven miles ſouth-weſt of Poix.

FROMIGUE'RE, a town of France, in the department of the Eaſt Pyrenees, and chief place of a canton, in the diſtrict of Prades: ſeven miles north of Montlouis.

FROMIS'TA, a town of Spain, in the province of Leon: eighteen miles north of Palencia.

FROM'WARD, *prep.* [ꝼnam and peapꝺ, Sax.] Away from; the contrary to the word *towards*. *Not now in uſe.*—The horizontal needle is continually varying towards eaſt and weſt; and ſo the dipping or inclining needle is varying up and down, towards or *fromwards* the zenith. *Cheyne.*

FROND, *ſ.* [*frons*, Lat. from *βεvω*, *pullulo*, to germinate or bud.] In botany, a term applied by Linnæus to the peculiar leafing of palms and ferns. He defines it to be a kind of trunk or ſtem, which has the branch united with the leaf, and frequently with the fructification. See BOTANY, vol. iii.

FRONDA'TION, *ſ.* [from the Lat. *frons*, the leaf of a tree.] The act of ſtripping off the leaves. *Scott. Not much uſed.*

FROND'ATED, *adj.* Having leaves; bearing leaves.

FRON'DENBERG, a town of Germany, in the circle of Weſtphalia, and county of Marck: two miles weſt of Unna.

FRON'DENT, *adj.* [*frondeo*, Lat. to bear leaves.] Bearing leaves.

FRONDESCEN'TIA, *ſ.* In botany, the leafing ſeaſon, or time of the year when plants firſt unfold their leaves.

FRONDI'FEROUS, *adj.* [*frondifer*, Lat.] Bearing frond-leaves.

FROND'OSE, *adj.* [*frons*, Lat. a leaf.] In botany; full of leaves; bearing leaves.

FRONDO'SENESS, *ſ.* Plenty of leaves; full of leaves. *Scott. Not much uſed.*

FRONDOS'ITY, *ſ.* The quality of having leaves; the leafy part of a plant. *Scott. Not much uſed.*

FRONS, *ſ.* [from *fero*, Lat. to bear, becauſe the indications of the mind are borne upon it; or from *φρονὶς*, Gr. thought, it being the ſeat of thought.] In anatomy, the fore part of the head; the frontal, or forehead. Linnæus, in his botanical ſyſtem, applies this term to the leaves of all the genera of plants in the order cryptogamia, becauſe, from the frond alone, all the other parts of the plant, with its fructification, are ſucceſſively evolved and put forth. See BOTANY, vol. iii. p. 279, under *Cryptogamia*.

FRON'SAC, a town of France, in the department of the Gironde, and chief place of a canton, in the diſtrict of Libourne, on the Ille: two miles north-weſt of Libourne.

FRONT, *ſ.* [*frons*, Lat. *front*, Fr.] The face.—His *front* yet threatens, and his frowns command. *Prior.*

The patriot virtues that diſtend thy thought,
Spread on thy *front*, and in thy boſom glow. *Thomſon.*

The face, in a ſenſe of cenſure or diſlike: as, a hardened *front*; a fierce *front*. This is the uſual ſenſe:

That dar'ſt, though grim and terrible, advance
Thy mis-created *front* athwart my way. *Milton.*

The face as oppoſed to an enemy:

His forward hand, inur'd to wounds, makes way
Upon the ſharpeſt *fronts* of the moſt fierce. *Daniel.*

The part or place oppoſed to the face.—The acceſs of the town was only by a neck of land: our men had ſhot that thundered upon them from the rampier in *front*, and from the gallies that lay at ſea in flank. *Bacon.*—The van of an army:

'Twixt hoſt and hoſt but narrow ſpace was left,
A dreadful interval! and *front* to *front*
Preſented, ſtood in terrible array. *Milton.*

The forepart of any thing, as of a building.—Palladius adviſeth the *front* of his edifice ſhould ſo reſpect the ſouth, that in its firſt angle it receive the riſing rays of the winter ſun, and decline a little from the winter ſetting thereof. *Brown.*

The prince approach'd the door,
Poſſeſs'd the porch, and on the *front* above
He fix'd the fatal bough. *Dryden.*

The moſt conſpicuous part or particular:

The very head and *front* of my offending
Hath this extent, no more. *Shakeſpeare.*

To FRONT, *v. a.* To oppoſe directly, or face to face; to encounter.—You four ſhall *front* them in the narrow lane; we will walk lower: if they 'ſcape from your encounter, then they light on us. *Shakeſpeare.*

I ſhall *front* thee, like ſome ſtaring ghoſt,
With all my wrongs about me. *Dryden.*

To ſtand oppoſed or overagainſt any place or thing.—The ſquare will be one of the moſt beautiful in Italy when this ſtatue is erected, and a town houſe built at one end to *front* the church that ſtands at the other. *Addiſon.*

To FRONT, *v. n.* To ſtand foremoſt:

I *front* but in that file,
Where others tell ſteps with me. *Shakeſpeare.*

FRONT'AL, *ſ.* [*frontale*, Lat. *frontal*, Fr.] Any external form of medicine to be applied to the forehead, generally compoſed amongſt the ancients of coolers and hypnotics.—The torpedo, alive, ſtupifies at a diſtance; but after death produceth no ſuch effect; which had they retained, they might have ſupplied opium, and ſerved as *frontales* in phrenſies. *Brown.*—The face part of a bridle. In architecture, a *fronton*, a pediment.

FRONT'AL, *adj.* Belonging to the bone of the forehead.

FRONT'ALE, *ſ.* With phyſicians, an external medicine applied to the forehead; one of the muſcles of the forehead.

FRONTA'NA, a town of Spain, in the province of Catalonia: twenty-five miles ſouth-eaſt of Urgel.

FRON'TATED, *adj.* [from *frons*, Lat.] In botany, the *frontated* leaf of a flower grows broader and broader, and at laſt perhaps terminates in a right line: uſed in oppoſition to cuſpated, which is, when the leaves of a flower end in a point. *Quincy.*

FRONT'BOX, *ſ.* The box in the playhouſe from which there is a direct view to the ſtage:

How vain are all theſe glories, all our pains,
Unleſs good ſenſe preſerve what beauty gains!

That men may ſay, when we the *frontbox* grace,
Behold the firſt in virtue, as in face. *Pope.*

FRON'TE, a town of Piedmont, in the marquiſate of Ivrea, on the Marlon: five miles north-eaſt of Lanzo, and eleven north of Turin.

FRONTEAU' (John), canon regular of St. Genevieve, and chancellor of the univerſity of Paris, born at Angers in 1614. He was educated in the college of the fathers of the oratory at Angers, whence he was removed to the college of La Flêche, where he went through an extenſive courſe of philoſophy. After he had finiſhed his theological ſtudies, he was called by the ſuperior-general of the congregation to Paris, where he was appointed to teach philoſophy at St. Genevieve. In 1639 he was appointed profeſſor of divinity, which he taught for twelve years with diſtinguiſhed reputation. He adhered to the principles of Aquinas both in his theology and in his philoſophy. In 1648, he was appointed chancellor of the univerſity of Paris; and in 1654 he ſucceeded to the priory of Benay, in the dioceſe of Angers. In 1662 he was nominated to the priory of St. Magdalen of Montargis, where he died not many days after he had taken poſſeſſion of his benefice, in the forty-eighth year of his age. Beſides Latin and Greek, he was maſter of the Hebrew, Chaldee, Syriac, Arabic, Italian, and Spaniſh, languages. In his works he knew how to adorn his ſubject with intereſting paſſages out of Greek and Latin authors, and with curious hiſtorical notices. Among other works which he publiſhed was 1. an edition of The Philoſophy of Alamandus, with a Supplement. 2. *Quæſtionum de Prædeſtinatione et Gratia Concordia*; intended to reconcile the Janſeniſts and Jeſuits. 3. *Antitheſes Auguſtini et Calvini*; comparing the paſſages of St. Auguſtine and Calvin on the ſubject of grace. 4. *De Diebus Feſtivis*, folio, 1652, being an ancient calendar of the Roman church, illuſtrated with a learned preface and notes, and accompanied with diſſertations. After the author's death a collection of his ſelect letters was publiſhed at Liege, in 1677, 12mo. in which, beſides particular points of doctrine and diſcipline, ſome very curious queſtions in eccleſiaſtical antiquities are diſcuſſed.

FRON'TED, *adj.* [*frons*, Lat.] Formed with a front.—Part *fronted* brigades form. *Milton.*

FRONTEI'RA, a town of Portugal, in the province of Alentejo; remarkable for a victory which the Portugueſe, under the command of the duke of Schomberg, obtained over the Spaniards, in 1663: ten miles north of Eſtremos.

FRONTEIT'TEN, a town of Germany, in the duchy of Stiria: fourteen miles north-north-weſt of Graz.

FRON'TENHAUSEN, a town of Germany, in the circle of Lower Bavaria: five miles ſouth of Dingelfingen, and fourteen eaſt of Landſhut.

FRON'TIER, *ſ.* [*frontiere*, Fr.] The marches; the limit; the utmoſt verge of any territory; the border; properly that which terminates not at the ſea, but fronts another country.—Draw all the inhabitants of thoſe borders away, or plant garriſons upon all thoſe *frontiers* about him. *Spenſer.*

I upon my *frontiers* here keep reſidence,
That little which is left ſo to defend. *Milton.*

FRON'TIER, *adj.* Bordering; conterminous:

A place there lies on Gallia's utmoſt bounds,
Where riſing ſeas inſult the *frontier* grounds. *Addiſon.*

FRON'TIERED, *adj.* Guarded on the frontier.—Now that is no more a border, nor *frontiered* with enemies. *Spenſ.*

FRONTIGNAC'. See FRONTIGNAN.

FRON'TIGNAC-FO'RT, a fortreſs in Canada, ſituated at the head of a fine bay or harbour, on the north-weſt ſide of the outlet of Lake Ontario, where all ſorts of veſſels may ride in ſafety. It is a league from the mouth of the lake, and only a ſhort diſtance ſouth of Kingſton, and about 300 miles from Quebec. The winter at this place is much ſhorter than at Quebec; and the ſoil is ſo well cultivated as to produce all ſorts of European and Indian corn, and fruits. Here is one of the moſt charming proſpects in the world, during ſpring and ſummer. The river St. Lawrence and the mouth of Lake Ontario, contain a number of beautiful and fertile iſlands of different magnitudes, well wooded; and the bay often preſents to the view veſſels at anchor, and others paſſing to and from the lake. But the misfortune is, that the advantageous communication between this lake, Montreal, and Quebec, is ſomewhat difficult and dangerous, on account of the river being full of rocks and water-falls. This, together with the ambuſcades of the Iroquois Indians, induced the French to abandon and deſtroy the ſtrong works they had formerly erected here. This happened in 1689. At length the Britiſh, under colonel Bradſtreet, took it in 1759, to whom it was confirmed at the peace in 1763. A river has lately been opened here by the deputy ſurveyor general of Canada, from its entrance into the lake at Kenty, near Cadaraqui, to its ſource in lake St. Clie; from which there is an eaſy and ſhort portage acroſs north-weſt to the north-eaſt angle of Lake Huron, and another that is neither long nor difficult, to the ſouthward, to the old ſettlement of Toronto. This is a ſhort route from Fort Frontenac to Michillimackinack. See KINGSTON.

FRONTIGNAN', a town of France, in the department of the Herault, and chief place of a canton, in the diſtrict of Montpellier; celebrated for its excellent wine, generally called *Frontigniac*: four leagues ſouth-ſouth-weſt of Montpellier, and one and a half north-eaſt of Cette.

FRONTIN'IAC, *adj.* [a town of France.] Denoting a kind of grape.—Miſtreſs and woman differ no otherwiſe, than *Frontiniac* and ordinary grapes. *Suckling.*

FRONTI'NUS (Sextus-Julius), an eminent Roman, and the city-prætor under Veſpaſian, A. D. 70. He was afterwards conſul, but probably only *ſuffectus*, or ſupplementary, ſince his name does not appear in the conſular ſeries. He ſucceeded Cerialis as commander in Britain, where he diſtinguiſhed his military talents, and reduced the nation of the Silures. Under Nerva he was appointed to the ſuperintendance of the waters, and he brought the water of the Anio to Rome by means of a ſplendid aqueduct. He wrote two books on the conſtruction of theſe works by that emperor's order. Frontinus is mentioned with honour by ſeveral writers, particularly by the younger Pliny, who ſucceeded him in the dignity of augur. When he died, he forbade the erection of a monument to his memory, ſaying that it was a ſuperfluous expence, for that his name would ſurvive, if by his actions he had merited it. Beſides the work upon aqueducts above-mentioned, he wrote Military Stratagems, ſtill extant. A treatiſe upon agriculture, under the name of Frontinus, was moſt probably compoſed by a later writer. The works of Frontinus *De Aquæductibus*, and *Stratagemata*, were edited with the notes of Steweckius, *L. Bat.* 1607, 4to. The *Stratagemata* are printed with the *Autores de Re Militari*, *Rom.* 1487, and have alſo been edited ſeparately. The beſt edition is the *Variorum*, *L. Bat.* 1731, and 1779, 8vo.

FRON'TISPIECE, *ſ.* [*frontiſpicium*, *id quod in fronte conſpicitur*; *frontiſpice*, Fr.] That part of any building or other body that directly meets the eye.—The *frontiſpiece* of the town houſe has pillars of a beautiful black marble, ſtreaked with white. *Addiſon.*

With *frontiſpiece* of diamond and gold
Embelliſh'd, thick with ſparkling orient gems
The portal ſhone. *Milton.*

The print or engraving which often fronts the title of a book.

FRONTISTE'RIUM, *ſ.* [Latin, from φροντιστηριον, Gr.] Learned ſeminary:

'Twill be the great gymnaſium of the realm,
The *frontiſterium* of Great Brittany. *Randolph.*

FRONT'LESS,

FRONT'LESS, *f.* Not bluſhing; wanting ſhame; void of diffidence.—Strike a bluſh through *frontleſs* flattery. *Pope.*

For vice, though *frontleſs*, and of harden'd face,
Is daunted at the ſight of awful grace. *Dryden.*

FRONT'LET, *f.* [from *frons*, Lat; *fronteau*, Fr.] A bandage worn upon the fore forehead.—They ſhall be as *frontlets* between thine eyes. *Deut.* vi. 8.—To the forehead *frontlets* were applied, to reſtrain and intercept the influx. *Wiſeman.*

FRON'TO (Marcus-Cornelius), an eminent Roman orator, who attained the higheſt rank in his profeſſion in the age wherein he lived. He was maſter of rhetoric to Marcus Aurelius and Lucius Verus, and was rewarded for his ſervices with the honours of the conſulate and a ſtatue. A. Gellius ſpeaks of him as a perſon replete with erudition, and particularly ſkilled in the delicacies of the Latin language. His reputation for eloquence was ſo high, that he is mentioned as one of the heads of a ſect among orators; and Macrobius calls the kind in which he excelled the *dry (ſiccum)*, which others more favourably characteriſe as the *grave* and *weighty*. No relics of his compoſitions remain. He muſt be diſtinguiſhed from Fronto, the conſul under Nerva.

FRON'TON, *f.* In architecture; a pediment, a little ornament over a door or window.

FRON'TON, a town of France, in the department of the Upper Garonne: five leagues north of Toulouſe, and ſix ſouth-eaſt of Caſtle Saraſin.

FRONT'ROOM, *f.* An apartment in the forepart of the houſe.—If your ſhop ſtands in an eminent ſtreet, the *frontrooms* are commonly more airy than the backrooms; and it will be inconvenient to make the *frontroom* ſhallow. *Moxon.*

FRONT'STALL, *f.* The fore part of a bridle. *Bailey.*

FROO'GARDE, a town of Norway, in the dioceſe of Drontheim: ſixty miles ſouth-ſouth-eaſt of Drontheim.

FROOME. See FROME.

FRORE, *adj.* [*bevrozen*, Dut. frozen.] Frozen. This word is not uſed ſince the time of *Milton.*

The parching air
Burns *frore*, and cold performs th' effect of fire. *Milton.*

FRORNE, *adj.* [*bevrozen*, frozen, Dut.] Frozen; congealed with cold. *Obſolete.*

O, my heart-blood is well nigh *frorne* I feele,
And my galage grown faſt to my heele. *Spenſer.*

FRO'RY, *adj.* Frozen:

Her up betwixt his rugged hands he rear'd,
And with his *frory* lips full ſoftly kiſt. *Spenſer.*

Covered with a froth reſembling hoar froſt:

She us'd with tender hand
The foaming ſteed with *frory* bit to ſteer. *Fairfax.*

FROSE, a town of Germany, in the circle of Upper Saxony, and duchy of Magdeburg: ten miles ſouth of Magdeburg.

FROSSAS'CO, a town of Italy, in the principality of Piedmont: thirteen miles ſouth-weſt of Turin, and three north of Pignerola.

FROSSAY', a town of France, in the department of the Lower Loire, and chief place of a canton, in the diſtrict of Painbœuf: one league and a half ſouth-eaſt of Painbœuf.

FROST, *f.* [ꝼꝛoꝛꝺ, Sax.] The laſt effect of cold; the power or act of congelation.—When the *froſt* ſeiſes upon wine, only the more wateriſh parts are congealed: there is a mighty ſpirit which can retreat into itſelf, and within its own compaſs lie ſecure from the freezing impreſſion. *South.*

This is the ſtate of man: to day he puts forth
The tender leaves of hopes, to-morrow bloſſoms,
And bears his bluſhing honours thick upon him;
The third day comes a *froſt*, a killing *froſt*,
And when he thinks, good eaſy man, full ſurely
His greatneſs is a ripening, nips his root,
And then he falls. *Shakeſpeare.*

The appearance of plants and trees ſparkling with congelation of dew:

Behold the groves that ſhine with ſilver *froſt*,
Their beauty wither'd, and their verdure loſt. *Pope.*

The nature and effects of froſt in different countries, are full of intereſt and curious enquiry. In the more northern parts of the world, even ſolid bodies are affected by froſt, though this is only or chiefly in conſequence of the moiſture they contain, which being frozen into ice, and ſo expanding as water is known to do when frozen, it burſts and rends any thing in which it is contained, as plants, trees, ſtones, and large rocks. Some fluids expand by froſt, as water, which expands about $\frac{1}{10}$th part, for which reaſon ice floats in water; but others again contract, as quickſilver, and hence frozen quickſilver ſinks in the fluid metal. See the article FREEZING, p. 29. of this volume.

Froſt, being derived from the atmoſphere, naturally proceeds from the upper parts of bodies downwards, as the water and the earth: ſo, the longer a froſt is continued, the thicker the ice becomes upon the water in ponds, and the deeper into the earth the ground is frozen. In about ſixteen or ſeventeen days froſt, Mr. Boyle found it had penetrated fourteen inches into the ground. At Moſcow, in a hard ſeaſon, the froſt will penetrate two feet deep in the ground; and captain James found it penetrated ten feet deep in Charlton iſland, and the water in the ſame iſland was frozen to the depth of ſix feet. Scheffer aſſures us, that in Sweden, the froſt pierces two cubits or Swediſh ells into the earth, and turns what moiſture is found there into a whitiſh ſubſtance like ice; and ſtanding waters to three ells, or more. The ſame author alſo mentions ſudden cracks or rifts in the ice of the lakes of Sweden, nine or ten feet deep, and many leagues long; the rupture being made with a noiſe not leſs loud than if many guns were diſcharged together. By ſuch means however the fiſhes are furniſhed with air; ſo that they are rarely found dead.

The natural hiſtories of froſts furniſh very extraordinary effects of them upon all kinds of ſubſtances. The trees are often ſcorched, and burnt up, as with the moſt exceſſive heat; and ſplit or ſhattered. In the great froſt in 1683, the trunks of oak, aſh, walnut, &c. were ſplit and cleft, ſo that they might be ſeen through, and the cracks were often attended with dreadful noiſes like the exploſion of fire arms. Philoſ. Tranſ. No. 165. The cloſe of the year 1708, and the beginning of 1709, were remarkable, throughout the greateſt part of Europe, for a ſevere froſt. Dr. Derham ſays, it was the greateſt in degree, if not the moſt univerſal, in the memory of man; extending through moſt parts of Europe, though ſcarcely felt in Scotland or Ireland.

In very cold countries, meat may be preſerved by the froſt ſix or ſeven months, and prove tender and good; as was experienced by captain Middleton in Hudſon's bay. In that climate the froſt ſeems never out of the ground, it having been found hard frozen in the two ſummer months. Brandy and ſpirit of wine, ſet out in the open air, freeze to ſolid ice in three or four hours. Lakes and ſtanding waters, not above ten or twelve feet deep, are frozen to the ground in winter, and all their fiſh periſh. But in rivers, where the current of the tide is ſtrong, the ice does not reach ſo deep, and the fiſh are preſerved.

In Ruſſia, the natives avail themſelves of hard and ſevere froſts in order to *cure* their proviſions by *freezing*. As ſoon as the winter is fairly ſet in, the farmers kill all but their breeding ſtock of cattle, pigs and poultry, and place it in the air to freeze. Fiſh and game they alſo freeze in great abundance. This circumſtance is particularly favourable to Ruſſia, as by it they ſave all the expence of winter feeding, and have cheaper and better carriage for bringing

bringing it to market. It is brought from the remoteſt provinces, and large ſupplies arrive at St. Peterſburg, even from the frozen ocean in the north, and from the borders of the Caſpian ſea, in the ſouth. The great market at St. Peterſburg begins juſt before the Chriſtmas holydays; the frozen proviſions are upon an average about thirty per cent. cheaper than if freſh killed; and it would be difficult even for a nice epicure to perceive the difference. Pork, fiſh, and game, appear to ſuffer leaſt by freezing. In keeping, great care is requiſite not to expoſe it to any warmth; and juſt before cooking, they thaw it in cold water. The market for frozen proviſions covers ſeveral acres of ground; and from the piles of animals, birds, and fiſh, with their ſeveral ſkins, feathers, and ſcales, on, preſents a moſt curious and ſingular appearance. A market of this kind can only exiſt in countries in which the winters are remarkably cold: but it is ſurpriſing that, when we are ſo well acquainted with the effects of congelation in retarding animal putrefaction, more ice-houſes (which are cheap edifices) are not erected; for what utility in the midſt of ſummer might not be derived from a ſtock of ice in preſerving meat freſh, and in preventing the produce of the dairy from becoming rancid; what benefit would it be to the farmer to be able to cool the atmoſphere of his dairy, by throwing in quantities of ice; and how eaſily would he convey it in a perfect ſtate to the greateſt diſtance, by packing it up in frozen water! a circumſtance which, in this age of improvement and luxury, cannot, we imagine, be long overlooked.

The great power of froſt on vegetables is a thing ſufficiently known; but the differences between the froſts of a ſevere winter, and thoſe which happen in the ſpring mornings, in their effects on plants and trees, were never perfectly explained, till by Meſſ. Du Hamel and Buffon, in the Memoirs of the Paris academy. The froſts of ſevere winters are therein ſhewn to be much more terrible than thoſe of the ſpring, as they bring on a privation of all the products of the tenderer part of the vegetable world; but then they are not frequent, ſuch winters happening perhaps but once in an age; while the froſts of the ſpring are in reality greater injuries to us than theſe, becauſe they are every year repeated. In regard to trees, the great difference is this, that the froſts of ſevere winters affect even their wood, their trunks and large branches; whereas thoſe of the ſpring have only power to deſtroy the buds. The winter froſts happening at a time when moſt of the trees in our gardens have neither leaves, flowers, nor fruits, upon them, and have their buds ſo hard as to be proof againſt ſlight injuries of weather, eſpecially if the preceding ſummer has not been too wet; in this ſtate, if there are no unlucky circumſtances attending, the generality of trees bear moderate winters very well; but hard froſts, which happen late in the winter, cauſe very great injuries even to thoſe trees which they do not utterly deſtroy.

Froſt, as is well known in Scotland, is particularly deſtructive to the bloſſom of fruit-trees; and the following method of ſecuring ſuch trees from being damaged by early froſts may be acceptable to many of our readers. A rope is to be interwoven among the branches of the tree, and one end of it brought down ſo as to be immerſed in a bucket of water. The rope, it is ſaid, will act as a conductor, and convey the effects of the froſt from the tree to the water. This idea is not new; for the following paſſage may be found in Colerus: "If you dig a trench around the root of a tree, and fill it with water, or keep the roots moiſt till it has bloomed, it will not be injured by the froſt. Or, in ſpring, ſuſpend a veſſel filled with water from the tree. If you wiſh to preſerve the bloom from being hurt by the froſt, place a veſſel of water below it, and the froſt will fall into it." *Phil. Mag.* No. 11.

Remarkable inſtances of ſevere froſts in Europe, and chiefly in England, are as follow: In the

Year 220, Froſt in Britain that laſted five months.
259, The Thames frozen nine weeks.
291, Moſt rivers in Britain frozen ſix weeks.
359, Severe froſt in Scotland for fourteen weeks.
401, The Euxine Sea frozen over for twenty days.
508, The rivers in Britain frozen for two months.
558, The Danube quite frozen over.
695, Thames frozen ſix weeks; booths built on it.
759, Froſt from Oct. 1 till Feb. 26, 760.
763, Froſt at Conſtantinople, where the two ſeas were frozen over for upwards of a hundred miles.
827, Froſt in England for nine weeks.
859, Carriages uſed on the Adriatic ſea, which was completely frozen over.
908, Moſt rivers in England frozen for two months.
923, The Thames frozen thirteen weeks.
987, Froſt laſted 120 days: began Dec. 22.
998, The Thames frozen five weeks.
1035, Severe froſt on June 24: the corn and fruits nearly all deſtroyed.
1063, The Thames frozen fourteen weeks.
1076, Froſt in England from November till April.
1114, Several wooden bridges carried away by ice.
1205, Froſt from January 14 till March 22.
1407, Froſt that laſted fifteen weeks, accompanied with a deep ſnow, and killed almoſt all the ſmall birds.
1434, From November 24 till February 10. The Thames was frozen down to Graveſend, and ſeveral miles below; during which all merchandiſe was obliged to be brought to London through Kent and Eſſex, by land-carriage.
1683, Froſt for thirteen weeks, Thames froze over.
1709, Severe froſt for many weeks, with deep ſnow.
1715, The ſame for many weeks.
1739, Froze for nine weeks, began December 24. This is generally called the hard froſt of 1740, when all ſorts of carriages went upon the Thames, and all manner of perſons were carried on upon the ice.
1742, Severe froſt for many weeks.
1747, Severe froſt in Ruſſia, and the north of Europe.
1754, Severe one in England.
1760, The ſame in Germany.
1776, The ſame in England.
1788, Thames frozen below bridge; with booths and a fair on it.

FROST'BITTEN, *adj.* Nipped or withered by the froſt.—The leaves are apt to be too much *froſtbitten*. *Mortimer.*

In the human ſubject, particularly in cold countries, ſometimes the whole limb, but more commonly the extremities, become froſt-bitten, and apparently dead. Perſons thus affected are compared to cataleptic patients, but ſtill there is much difference between a catalepſy and a *froſt-bitten* caſe. Cold braces up the body when applied to it in a certain degree; upon this conſtriction being increaſed, the humours are carried in a larger quantity to the internal parts, and are principally accumulated in the head; they ſtagnate in the veſſels of the brain, and diſtend them; hence they produce a ſtricture in, or a compreſſion on, the nerves that ariſe from the brain, which is the origin of a catalepſis, attended with an abolition of the ſenſes. The cold continuing, with its effects juſt mentioned, at length there is an extravaſation of the blood or ſerum in the head, by which the cerebellum is compreſſed, whence death enſues, which is uſhered in by a lethargy, ending in apoplexy.

When a man is pierced with cold, ſo as to be benumbed, if he attempts to warm himſelf by the fire, pains are preſently produced in the part expoſed to the heat, and a mortification is too often the conſequence; juſt as is ſeen in frozen fruit, which if put into cold water that is near freezing, it recovers, but if put into warm water, or in a warm place, it ſoon rots; and if men, when too ſeverely

affected

affected with cold, would firſt put the frozen part into cold water, or cover it with ſnow, until a ſenſe of warmth is perceived, or ſome degree of motion returns, at which time a little warm wine, mixed with camomile tea, might be drunk, or either of theſe alone, and then proceed gradually to allow of warmth, a mortification would be avoided.

When travellers begin to be drowſy in the cold, they ſhould redouble their ſpeed to extricate themſelves from danger: for though their ſleepineſs is eaſy, it is often fatal. The heat of our bodies, when in health, exceeds that of the ambient air, even in the hotteſt weather; whence a conſiderable degree of cold is required to freeze the ſoft parts of our bodies: it is becauſe our extremities are the coldeſt parts, that froſt always affects them ſooneſt. And when a mortification from cold approaches, Van Swieten obſerves, that the part affected by it is firſt pale, then red; this redneſs is attended with a troubleſome pain, and a violent itching: after this the colour becomes almoſt purple, and at laſt black.

That ſudden heat, applied after extreme cold, ſhould produce the ſame ſymptoms and conſequences, will be readily underſtood by what follows. As water cools, it condenſes, until it comes to the freezing point; but in the act of congelation it expands with a violence that nothing can reſiſt. When a perſon goes into the cold air, his fluids are gradually condenſed, the veſſels collapſe, and the ſkin is pale, the circulation again puſhes the blood into the arteries, whoſe contracted extremities allow it only to paſs ſlowly, and make the ſkin look red; alſo produces an itching, becauſe of the obſtruction that it meets with; the blood being puſhed from behind, whilſt the obſtruction is increaſed before, a livid colour is produced, and a tingling pain; at laſt the circulation being ſtopped, a gangrenous black finiſhes the ſcene, with a loſs of all ſenſation, the veſſels being ſtretched far beyond their natural dimenſions by the congealed fluids. In this caſe, applying of cold water diſſolves the frozen juices, and condenſes them; thus the veſſels have room to contract, and are aſſiſted in ſo doing by the coldneſs of the water: after this, if warm diluting liquor is drunk, a diaphoreſis is produced, and all danger is overcome; if warmth be applied at the firſt, the outer parts are quickly thawed, but the inner veſſels, ſtill obſtructed, ſoon burſt by the rarefaction of their contents, and deſtruction to the part is inſtantly produced. Van Swieten's Com. Med. Muſ. vol. i. p. 71.

Mr. Eaton, in his "Preſent State of Surgery in Turkey," gives the following intereſting account of an eaſy and infallible method of reſtoring froſt-bidden patients in that country, as practiſed not by the ſurgeons, but by the common people: "After Ochakof was taken, I received into my ſubterranean lodging as many priſoners as it would contain, all of whom were either wounded or had a limb frozen. Among them were two children, one about ſix and the other about fourteen years of age; the latter had one of her feet frozen to the ancle, the other all the toes and the ſole of one of her feet. The ſecond day the parts appeared black. The French ſurgeon, whom prince Potemkin had ſent for purpoſely from Paris, and who was a man of note, ordered them to be conſtantly bathed with warm camphorated ſpirits: the elder was removed to the hoſpital, when a mortification began; the younger I kept, and as we removed into winter quarters, I carried the child along with me. The mortified parts ſeparated, the bones of the toes came off, and, after a conſiderable time, the ſores healed. I ſhould have ſaid, the ſurgeon was for immediately amputating both the limbs.

"In a ſubterranean room, not far from mine, were ſeveral women whoſe feet had been in a like manner frozen; but as no ſurgeon attended them, the Ruſſian ſoldiers and waggoners undertook the cure. It was alſo the ſecond day when they applied their remedy, and the parts were perfectly black. This remedy was gooſe-greaſe, with which the parts were ſmeared warm, and the operation often repeated; their directions were, never to let the parts be dry, but always covered with greaſe. The conſequence was, that by degrees the circulation extended lower down, and the blackneſs decreaſed, till, laſt of all, the toes were only diſcoloured, and at length circulation was reſtored to them.

"I can account for this no otherwiſe, than that the fat kept the pores ſhut, and prevented the air from promoting putrefaction; in the mean time the veſſels were continually abſorbing part of the ſtagnated blood, till by degrees the whole circulation was reſtored. It is known that extravaſated and ſtagnated blood will remain a long time in the body without putrifying, if it be not expoſed to the air. I conclude alſo, that in theſe caſes of froſt, the mortification firſt begins on the ſurface, which is in contact with the air. I only mean, however, to relate facts, and leave it to others to account for them. This is a general practice of the peaſants throughout all Ruſſia; but if a part is diſcovered to be frozen, *before the perſon comes into a warm room*, they extract the froſt by plunging the part into cold water, or rubbing it with ſnow till the circulation returns."

FROST'ED, *adj.* Laid on in inequalities like thoſe of the hoar froſt upon plants:

The rich brocaded ſilk unfold,
Where riſing flow'rs grow ſtiff with *froſted* gold. *Gay.*

FROST'ILY, *adv.* With froſt; with exceſſive cold. Without warmth of affection:

Courtling, I rather thou ſhould'ſt utterly
Diſpraiſe my work, than praiſe it *froſtily*. *Ben Johnſon.*

FROSTI'NESS, *ſ.* Cold; freezing cold.

FROST'NAIL, *ſ.* A nail with a prominent head driven into the horſe's ſhoes, that it may pierce the ice. —The claws are ſtraight only to take hold, for better progreſſion; as a horſe that is ſhod with *froſt-nails*. *Crew.*

FROST'WORK, *ſ.* Work in which the ſubſtance is laid on with inequalities, like the dew congealed upon ſhrubs:

By nature ſhap'd to various figures, thoſe
The fruitful rain, and theſe the hail compoſe;
The ſnowy fleece and curious *froſtwork* theſe
Produce the dew, and thoſe the gentle breeze. *Blackmore.*

FROS'TY, *adj.* Having the power of congelation; exceſſive cold.—The air, if very cold, irritateth the flame, and maketh it burn more fiercely; as fire ſcorcheth in *froſty* weather. *Bacon.*

For all my blood in Rome's great quarrel ſhed,
For all the *froſty* nights that I have watch'd,
Be pitiful to my condemned ſons. *Shakeſpeare.*

Chill in affection; without warmth of kindneſs or courage.—What a *froſty*-ſpirited rogue is this! *Shakeſpeare.*

Hoary; grey-haired; reſembling froſt:

Where is loyalty?
If it be baniſh'd from the *froſty* head,
Where ſhall it find a harbour in the earth? *Shakeſpeare.*

FROTH, *ſ.* [*froe*, Daniſh and Scottiſh.] Spume; foam; the bubbles cauſed in liquors by agitation.—When wind expireth from under the ſea, as it cauſeth ſome reſounding of the water, ſo it cauſeth ſome light motions of bubbles, and white circles of *froth*. *Bacon.*—The uſeleſs *froth* ſwims on the ſurface, but the pearl lies covered deep with a maſs of waters. *Glanville.*

Surging waves againſt a ſolid rock,
Though all to ſhivers daſh'd, th' aſſault renew;
Vain batt'ry, and in *froth* or bubbles end. *Milton.*

They were the *froth* my raging folly mov'd
When it boil'd up; I knew not then I lov'd,
Yet then lov'd moſt. *Dryden.*

Any empty or senseless show of wit or eloquence. Any thing not hard, solid, or substantial:

Who eateth his veal, pig, and lamb, being *froth*,
Shall twice in a week go to bed without broth. *Tusser.*

To FROTH, *v. n.* To foam; to throw out spume; to generate spume.—Excess muddies the best wit, and only makes it flutter and *froth* high. *Grew.*

He frets within, *froths* treason at his mouth,
And churns it through his teeth. *Dryden.*

FROTHI'LY, *adv.* With foam; with spume. In an empty trifling manner.

FROTH'INESS, *s.* The state of being frothy, lightness, want of solidity.

FROTH'SPIT, *s.* The froth which is frequently found on plants in the spring with a little insect in it. *Ash.*

FROTH'Y, *adj.* Full of foam, froth, or spume.—The sap of trees is of differing natures; some watery and clear, as vines, beeches, pears: some thick, as apples; some gummy, as cherries; and some *frothy*, as elms. *Bacon.*

Behold a *frothy* substance rise;
Be cautious, or your bottle flies. *Swift.*

Soft; not solid; wasting.—Their bodies are so solid and hard as you need not fear that bathing should make them *frothy*. *Bacon.*—Vain; empty; trifling.—What's a voluptuous dinner, and the *frothy* vanity of discourse that commonly attends these pompous entertainments? What is it but a mortification to a man of sense and virtue? *L'Estrange.*

FROU'ARD, a town of France, in the department of the Meurte, and chief place of a canton, in the district of Nancy, situated on the Moselle: one league and three quarters north-north-west of Nancy, and three and a half north-east of Toul.

FROU'LAY-TESSE', a town of France, in the department of the Orne: seven miles south-east of Domfront.

FROUNCE, *s.* A word used by falconers for a distemper, in which white spittle gathers about the hawk's bill. *Skinner.*

To FROUNCE, *v. a.* To frizzle or curl the hair about the face. This word was at first probably used in contempt.—Some warlike sign must be used; either a slovenly buskin, or an overstaring *frounced* head. *Ascham.*

Some *frounce* their curled hair in courtly guise,
Some prank their ruffs, and others timely dight
Their gay attire. *Fairy Queen.*

FROUQUI'E, a small island in the English channel: about one mile from the west coast of the island of Jersey.

FROU'ZY, *adj.* Fœtid; musty. *A cant word.*—Petticoats in *frouzy* heaps. *Swift.*—Dim; cloudy:

When first Diana leaves her bed,
Vapours and steams her looks disgrace;
A *frouzy* dirty-coloured red
Sits on her cloudy wrinkled face. *Swift.*

FROW, *s.* [from the German *fraw.*] A Dutch or German woman. *A low word.*

FRO'WARD, *adj.* [ƿiampeapd, Sax.] Peevish; ungovernable; angry; perverse; the contrary to *toward.*—Whose ways are crooked, and they *froward* in their paths. *Prov.* ii. 15.—'Tis with *froward* men, and *froward* factions too, as 'tis with *froward* children; they'll be sooner quieted by fear than by any sense of duty. *L'Estrange.*

She's not *froward*, but modest as the dove:
She is not hot, but temperate as the morn. *Shakespeare.*

FRO'WARDLY, *adj.* Peevishly; perversely.—I hid me and was wroth, and he went *frowardly* in the way of his heart. *Isaiah*, lvii. 17.

FRO'WARDNESS, *s.* Peevishness; perverseness.—How many *frowardnesses* of ours does he smother? how many indignities does he pass by? how many affronts does he put up at our hands! *South.*

We'll mutually forget
The warmth of youth, and *frowardness* of age. *Addison.*

FROWDE (Philip), a minor English poet, whose father was post-master in the reign of queen Anne. He was sent to the university of Oxford, where he had the honour of being distinguished by Addison, who took him under his protection. While he remained there, he became the author of several pieces of poetry, some of which in Latin were elegant enough to intitle them to a place in the *Musæ Anglicanæ*. He likewise wrote two tragedies: The Fall of Saguntum, dedicated to sir Robert Walpole; and Philotas, addressed to the earl of Chesterfield. He died in Cecil-street in the Strand, in 1738. His biographer concludes with the following eulogium: "Though the elegance of Mr. Frowde's writings has recommended him to general esteem, the politeness of his genius is the least amiable part of his character; he considered the talents of wit and learning only as they were conducive to the excitement and practice of honour and humanity. With a soul cheerful, benevolent, and virtuous, he was in conversation delightful, in friendship sincere, in death religiously resigned."

FROW'ER, *s.* [among woodmen.] A cleaving tool:

A *frower* of iron for cleaving of lath,
With roll for a sawpit, good husbandry hath. *Tusser.*

FROW'EY, *adj.* With carpenters, having the grain even, void of knots.

To FROWN, *v. a.* [*frogner*, old French, to wrinkle. *Skinner.*] To express displeasure by contracting the face to wrinkles; to look stern.—Heroes in animated marble *frown*. *Pope.*

Say, that she *frowns*; I'll say, she looks as clear
As morning roses newly wash'd with dew. *Shakespeare.*

The wood,
Whose shady horrors on a rising brow
Wav'd high, and *frown'd* upon the stream below. *Pope.*

FROWN, *s.* A wrinkled look; a look of displeasure.—Patiently endure that *frown* of fortune, and by some notable exploit win again her favour. *Knolles.*

In his half-clos'd eyes
Stern vengeance yet and hostile terror stand;
His front yet threatens, and his *frowns* command. *Prior.*

FROW'SACK, the channel or gut of Canso, a strait between Nova-Scotia and Cape Breton, five French leagues long, and one broad.

FROWN'INGLY, *adv.* Sternly; with a look of displeasure:

What, look'd he *frowningly*?
A countenance more in sorrow than in anger. *Shakespeare.*

FROW'Y, *adj.* Musty; mossy. This word is now not used; but instead of it *frouzy*:

But if they with thy gotes should yede,
They soon might be corrupted;
Or like not of the *frowy* fede,
Or with the weeds be glutted. *Spenser.*

FRO'YEN, an island in the North Sea, near the coast of Norway, about thirty-five miles in circumference. Lat. 63. 45. N. lon. 9. E. Greenwich.

FRO'ZEN, [*part. pass.* of *freeze.*] Congealed with cold:

What was the waste of war, what fierce alarms
Shook Asia's crown with European arms?
Ev'n such have heard, if any such there be,
Whose earth is bounded by the *frozen* sea. *Dryden.*

Chill in affection:

Be not ever *frozen*, coy,
One beam of love will soon destroy
And melt that ice to floods of joy. *Carew.*

Void

Void of heat or appetite:
Even here, where *frozen* chaſtity retires,
Love finds an altar for forbidden fires. *Pope.*

FROZEN O'CEAN, the ſeas of ice which are ſuppoſed to ſurround the two poles of the world; called the Arctic Sea, or North Frozen Ocean; and the Antarctic Sea, or South Frozen Ocean. The former is more generally known among ſeamen by the name of the "Greenland Seas."

F.R.S. *Fellow* of the *Royal Society*:

Who *virtû* profeſs
Shine in the dignity of *F. R. S.* *Pope.*

FRO'ZES, a town of France, in the department of the Vienne: five miles weſt of Poitiers.

FRUCTESCEN'TIA, *ſ.* in botany, the fruiting ſeaſon; or the time when vegetables begin to ſcatter their ripe ſeeds.

FRUCTIF'EROUS, *adj.* [*fructifer*, Lat.] Bearing fruit. *Ainſworth.*

FRUCTIFICA'TION, *ſ.* The act of cauſing or of bearing fruit; fecundation; fertility.—That the ſap doth powerfully riſe in the ſpring, to put the plant in a capacity of *fructification*, he that hath beheld how many gallons of water may be drawn from a birch-tree, hath ſlender reaſon to doubt. *Brown.*

In botany, *fructification*, or fruiting, denotes a temporary part of vegetables, which is appropriated to generation, by terminating the old, and beginning the new, vegetable. The eſſence of it conſiſts in the flower and fruit; and there can be no fructification without *anther*, *ſtigma*, and *ſeed*. When perfect, it conſiſts of ſeven parts: 1. Calyx. 2. Corolla. 3. Stamen. 4. Piſtillum. 5. Pericarp. 6. Seed. 7. Receptacle. Of theſe, the four firſt belong to the flower; the two next to the fruit; and the laſt is common to both. For a diſplay of theſe parts, ſee the article BOTANY, vol. iii. p. 263–289; and plates 10 to 15.

To FRUC'TIFY, *v. a.* [*fructifier*, Fr.] To make fruitful; to fertiliſe.—The legal levies the ſovereign raiſes are as vapours which the ſun exhales, which fall down in ſweet ſhowers to *fructify* the earth. *Howell.*

Wheree'er ſhe looks, behold ſome ſudden birth,
Adorns the trees, and *fructifies* the earth. *Granville.*

To FRUC'TIFY, *v. n.* To bear fruit.—It watereth the heart, to the end it may *fructify*; maketh the virtuous in trouble, full of magnanimity and courage; and ſerveth as a moſt approved remedy againſt all doleful and heavy accidents which befal men in this preſent life. *Hooker.*

FRUCT'IST, *ſ.* [from the Lat. *fructus*, fruit.] A botaniſt who endeavours to diſtinguiſh the ſeveral kinds of plants by the fruit or ſeeds which they produce.

FRUC'TUOUS, *adj.* [*fructueux*, Fr. from *fructify*.] Fruitful; fertile; impregnating with fertility:

Apples of price, and plenteous ſheaves of corn
Oft interlac'd occur; and both imbibe
Fitting congenial juice, ſo rich the ſoil,
So much does *fructuous* moiſture o'er abound. *Philips.*

FRU'GAL, *adj.* [*frugalis*, Lat. *frugal*, Fr.] Thrifty; ſparing; parſimonious: not prodigal; not profuſe; not laviſh:

And wing'd purveyors his ſharp hunger fed
With *frugal* ſcraps of fleſh and maſlin bread. *Harte.*

If through miſts he ſhoots his ſullen beams,
Frugal of light, in looſe and ſtraggling ſtreams,
Suſpect a driſling day. *Dryden.*

FRU'GALLY, *adv.* Parſimoniouſly; ſparingly; thriftily:

Mean time young Parſimond his marriage preſs'd,
And *frugally* reſolv'd, the charge to ſhun,
To join his brother's bridal with his own. *Dryden.*

FRUGAL'ITY, *ſ.* [*frugalité*, Fr. *frugalitas*, Lat.] Thrift; parſimony; good huſbandry.—As for the general ſort of men, *frugality* may be the cauſe of drinking water; for that is no ſmall ſaving, to pay nothing for one's drink. *Bacon.*

Frugality and bounty too,
Thoſe diff'ring virtues meet in you. *Waller.*

FRU'GES, a town of France, in the department of the Straits of Calais, and chief place of a canton, in the diſtrict of Montreuil: three leagues north of Heſdin, and four ſouth-weſt of Arras.

FRUGO'NI (Carlo-Innocenzo), a celebrated Italian poet, born of a noble family at Genoa in 1692. He was one of thoſe ſacrifices ſo frequent among the younger children of the Italian nobility, and at the age of ſixteen was perſuaded, much againſt his inclination, to take the monaſtic vows in the congregation of Sommaſchi. "I was, (ſays he,) ready to die with chagrin and indignation, in a condition not made for me;" a ſituation, doubtleſs, too common among theſe "captives of the cloiſter," as he terms them. He taught claſſical literature with ſucceſs for ſome years in ſeveral of the cities of Italy; and at length, at the age of thirty-five, through the intereſt of cardinal Bentivoglio, he was liberated from his vows by pope Clement XII. retaining only the ſecular prieſthood. At this time he had obtained the patronage of the houſe of Farneſe, who gave him an honourable aſylum in Parma. When the duke eſtabliſhed in that capital an academy for the fine arts, Frugoni was employed to draw up its ſtatutes, and was made its perpetual ſecretary. To this office were joined thoſe of court-poet and inſpector of theatrical exhibitions; and penſions and honours were liberally beſtowed upon him. His poetical compoſitions ſpread his fame throughout Italy; and he preſerved the fire and vivacity of his genius to an advanced age, dying at Parma in December, 1768. His works conſiſt of ſonnets, odes, canzoni, elegies, ſatires, eclogues, and epiſtles. As well in ſerious as in ſportive writings he had a ſtyle peculiar to himſelf, diſtinguiſhed by warmth, energy, and facility. He is judged to have diſplayed moſt merit and originality in lyric poetry, in which he attained a ſublimity ſcarcely ſurpaſſed by any of his countrymen. He poſſeſſed the imagination of a true poet; and one of his panegyriſts terms him "*il principe dello ſtile fantaſtico*," at the head of the fanciful or figurative ſtyle. He attempted the drama, but did not ſucceed in it, though he had tranſlated ſuperiorly the Rhadamiſtus and Zenobia of Crebillon. His collected works were publiſhed at Parma, in 9 volumes 8vo. 1779.

FRUHITAN', an iſland in the Atlantic, near the weſtern coaſt of Ireland: three miles weſt of Maſa Point.

FRUGIF'ERENT, *adj.* [from the Lat. *frux*, fruit, and *fero*, to bear.] Bearing fruit. *Scott.*

FRUGIF'EROUS, *adj.* [*frugifer*, Lat.] Bearing fruit. *Ainſworth.*

FRUGIF'EROUSNESS, *ſ.* Fruitfulneſs, fertility. *Scott.*

FRUGIV'OROUS, *adj.* [from the Lat. *frux*, fruit, and *voro*, to devour.] Devouring fruits.

FRUGIV'OROUSNESS, *ſ.* The quality of devouring fruits. *Scott.*

FRUIT, *ſ.* [*fructus*, Lat. *frwyth*, Welſh; *fruit*, Fr.] The product of a tree or plant in which the ſeeds are contained:

The ſtrawberry grows underneath the nettle,
And wholeſome berries thrive and ripen beſt,
Neighbour'd by *fruit* of baſer quality. *Shakeſpeare.*

That part of a plant which is taken for food:

By taſting of that *fruit* forbid,
Where they ſought knowledge, they did error find.
Davies.

See how the riſing *fruits* the gardens crown,
Imbibe the ſun, and make his light their own. *Blackmore.*

Production.—The *fruit* of the ſpirit is in all goodneſs, and righte-

righteousness, and truth. *Ephes.* v. 9.—The offspring of the womb; the young of any animal:

Can'st thou their reck'nings keep? the time compute,
When their swol'n bellies shall enlarge the *fruit*. *Sandys.*

Advantage gained by any enterprise or conduct.—What is become of all the king of Sweden's victories? Where are the *fruits* of them at this day? Or of what benefit will they be to posterity? *Swift.*—The effect or consequence of any action.—They shall eat of the *fruit* of their own way. *Prov.*

By 4 Geo. II. c. 32. to steal fruit growing against walls, or to rob orchards or gardens of fruit growing therein, may be punished by fine, whipping, &c. and by 1 Geo. I. c. 48. fine and imprisonment may be inflicted on persons destroying fruit-trees. See LARCENY.

FRUIT-TIME, *s.* The autumn; the time for gathering fruit.

FRUIT-TREE, *s.* A tree of that kind whose principal value arises from the fruit produced by it. For the various kinds, management, and cultivation, see the article HORTICULTURE.

Lady, by yonder blessed moon I vow,
That tips with silver all these *fruit-tree* tops. *Shakespeare.*

All with a border of rich *fruit-trees* crown'd,
Whose loaded branches hide the lofty mound. *Waller.*

FRUIT'AGE, *s.* [*fruitage*, Fr.] Fruit collectively; various fruits.—What is more ordinary with them than the taking in flowers and *fruitage* for the garnishing of their work? *More.*

In heav'n the trees
Of life ambrosial *fruitage* bear, and vines
Yield nectar. *Milton.*

FRUIT'BEARER, *s.* That which produces fruit.—Trees, especially *fruitbearers*, are often infected with the measles. *Mortimer.*

FRUIT'BEARING, *adj.* Having the quality of producing fruit.—By this way graft trees of different kinds one on another, as *fruitbearing* trees on those that bear not. *Mortimer.*

FRUIT'ERER, *s.* [*fruitier*, Fr.] One who trades in fruit:

Walnuts the *fruit'rer's* hand in autumn stain;
Blue plumbs and juicy pears augment his gain. *Gay.*

FRUIT'ERY, *s.* [*fruiterie*, Fr.] Fruit collectively taken:

Oft, notwithstanding all thy care
To help thy plants, on the small *fruitery*
Exempt from ills, an oriental blast
Disastrous flies. *Philips.*

A fruit-loft; a repository for fruit.

FRUIT'FUL, *adj.* Fertile; abundantly productive; liberal of vegetable product.—If he continued cruel, he could no more sustain his life than the earth remain *fruitful* in the sun's continual absence. *Sidney.*—Actually bearing fruit:

Adonis' gardens,
That one day bloom'd, and *fruitful* were the next. *Shakes.*

Prolific; childbearing; not barren.—I have copied nature, making the youths amorous and the damsels *fruitful*. *Gay.*

Male he created thee, but thy consort
Female for race; then bless'd mankind, and said,
Be *fruitful*, multiply, and fill the earth;
Subdue it, and throughout dominion hold. *Milton.*

Plenteous; abounding in any thing:

While you, my lord, the rural shades admire,
And from Britannia's public posts retire,
Me into foreign realms my fate conveys,
Through nations *fruitful* of immortal lays. *Addison.*

FRUIT'FULLY, *adv.* In such a manner as to be prolific:

How sacred seeds of sea, and air, and earth,
And purer fire through universal night,
And empty space did *fruitfully* unite. *Roscommon.*

Plenteously; abundantly.—You have many opportunities to cut him off: if your will want not, time and place will be *fruitfully* offered. *Shakespeare.*

FRUIT'FULNESS, *s.* Fertility; fecundity; plentiful production.—Neither can we ascribe the fame *fruitfulness* to any part of the earth, nor the fame virtue to any plant thereon growing, that they had before the flood. *Raleigh.*—The quality of being prolific, or bearing many children:

The goddess, present at the match she made,
So bless'd the bed, such *fruitfulness* convey'd,
That ere ten moons had sharpen'd either horn,
To crown their bliss, a lovely boy was born. *Dryden.*

Exuberant abundance.—The remedy of *fruitfulness* is easy, but no labour will help the contrary. *Ben Johnson.*

FRUIT'GROVES, *s.* Shades, or close plantations of fruit trees:

The faithful slave,
Whom to my nuptial train Icarius gave,
To tend the *fruitgroves*. *Pope.*

FRUI'TION, *s.* [*fruor*, Lat.] Enjoyment; possession; pleasure given by possession or use.—Man doth not seem to rest satisfied either with *fruition* of that wherewith his life is preserved, or with performance of such actions as advance him most deservedly in estimation. *Hooker.*

God riches and renown to men imparts,
Ev'n all they wish; and yet their narrow hearts
Cannot so great a fluency receive,
But their *fruition* to a stranger leave. *Sandys.*

FRUIT'IVE, *adj.* Enjoying; possessing; having the power of enjoyment. A word not legitimate.—To whet our longings for *fruitive* or experimental knowledge, it is reserved among the prerogatives of being in heaven, to know how happy we shall be, when there. *Boyle.*

FRUIT'LESS, *adj.* Barren of fruit; not bearing of fruit.—The Spaniards of Mexico, for the first forty years, could not make our kind of wheat bear seed; but it grew up as high as the trees, and was *fruitless*. *Raleigh.*—Vain; productive of no advantage; idle; unprofitable.—The other is for entirely waving all searches into antiquity, in relation to this controversy, as being either needless or *fruitless*. *Waterland.*

O! let me not, quoth he, return again
Back to the world, whose joys so *fruitless* are:
But let me here for ay in peace remain,
Or straightway on that last long voyage fare. *Spenser.*

Having no offspring:

Upon my head they plac'd a *fruitless* crown,
And put a barren sceptre in my gripe;
No son of mine succeeding. *Shakespeare.*

FRUIT'LESSLY, *adv.* Vainly; idly; unprofitably.—After this fruit curiosity *fruitlessly* enquireth, and confidence blindly determineth. *Brown.*

Walking they talk'd, and *fruitlessly* divin'd
What friend the priestess by those words design'd. *Dryd.*

FRUMENTA'CIOUS, *adj.* [*frumentum*, Lat.] Made of grain.

FRUMENTA'RII, *s.* a kind of soldiers or archers under the western empire. They first occur in the reign of Adrian, who made use of them to inform himself of whatever passed. They were not a particular corps, but a certain number of them was incorporated in each Roman legion. It is supposed, that they were at first a number of young persons, disposed by Augustus throughout the provinces, to acquaint the emperor with every thing that

happened. Afterwards they were incorporated into the troops, where they ſtill retained their ancient name. As their principal office was the giving intelligence, they were often joined with the curioſi, with whom they agreed in this part of their office. Their name of *frumentarii* is derived from their being alſo a ſort of purveyors to the armies, cities, &c. collecting all the corn from the ſeveral provinces to furniſh the common-wealth.

FRUMENTA'RIOUS, *adj.* Belonging to corn.

FRUMENTA'TION, *ſ.* in Roman antiquity, a largeſs of corn beſtowed on the people. The practice of giving corn to the people was very ancient among the Romans, and frequently uſed to ſoothe the turbulent humour of the populace. At firſt the number of thoſe to whom this largeſs was given was indeterminate, till Auguſtus fixed it at 200,000.

FRUMEN'TIUS, a ſaint in the Romiſh calendar, and native of Tyre, who flouriſhed in the fourth century. He was educated under Meropius, a chriſtian philoſopher, who ſet out on a voyage to India towards the beginning of the fourth century, accompanied by Frumentius, and another of his ſcholars named Ædeſius. In the courſe of their voyage they had the misfortune to touch on the coaſt of Ethiopia, where Meropius was cruelly murdered by the natives; but his two ſcholars had their lives ſpared; and being found to be youths of a beautiful appearance, were ſent to the emperor of the country. That prince was ſo pleaſed with them, that he placed Frumentius in his ſecretary's office, and Ædeſius in that of his butler. As long as he lived he ſhewed them marks of his favour, and a little before his death granted them their liberty. When, after that event, they were about to avail themſelves of their freedom, and to return home, they were importunately requeſted by the queen-regent to remain ſome time longer in the country, and to undertake the tutelage of her ſon till he ſhould be of age. Having conſented to her requeſt, they appear to have obtained liberty for the Roman merchants reſiding in the ports of Ethiopia, who were Chriſtians, to aſſemble together for the worſhip of God; and they alſo ſucceeded in making many converts to the chriſtian faith among the courtiers. When their pupil had taken the adminiſtration of the government upon himſelf, they both deſired leave to return home, and obtained it, but not without much difficulty. Ædeſius went to Tyre, where he was afterwards ordained a preſbyter, and related the foregoing particulars to Ruffinus, who recorded them in the ninth chapter of the firſt book of his Eccleſiaſtical Hiſtory; but Frumentius repaired to Alexandria, and acquainted Athanaſius, who was then biſhop of that city, with the progreſs he had made in introducing Chriſtianity into Ethiopia, and the fair proſpect there was of farther ſucceſs. Athanaſius, after conſulting with his clergy, perſuaded Frumentius to be conſecrated a biſhop, and to return to Ethiopia in that character, for the accompliſhment of the work which he had ſo happily begun. He was accordingly conſecrated in 331, and, returning to Ethiopia, entered on his miſſion at Axuma, the capital of the country. His labours are ſaid to have been ſo ſucceſsful, that in a ſhort time the emperor, and the great body of the people, were converted to the chriſtian faith, and numerous churches were eſtabliſhed throughout the empire. Frumentius lived to the year 356.

FRUMENTO'SE, *adj.* Full of corn. *Scott.*

FRU'MENTY, *ſ.* [*frumentum*, Lat. corn.] Food made of wheat boiled in milk.

FRUM'GYLD, *ſ.* [Saxon.] In the ancient law, the firſt payment made to the kindred of a perſon ſlain, towards the recompence of his murder.

To FRUMP, *v. a.* To mock; to browbeat. *Ainſworth.*

FRUMP, *ſ.* A woman, in deriſion; generally an old woman.

To FRUSH, *v. a.* [*froiſſer*, Fr.] To break, bruiſe, or cruſh. *Hanmer.*

I like thy armour well;
I'll *fruſh* it, and unlock the rivets all,
But I'll be maſter of it. *Shakeſpeare.*

FRUSH, *ſ.* A ſort of tender horn in a horſe's foot, that grows in the middle of the ſole, and at ſome diſtance from the toe: it divides into two branches, running towards the heel, in the form of a fork.

FRUSI'NO, in ancient geography, a town of the Volſci on one of the branches of the Liris. *Juvenal.*

FRUSTRANE'A, *ſ.* [*fruſtra*, Lat. vain, or barren.] In botany, the name of the third order in the claſs *Syngeneſia* of Linneus's Artificial Syſtem; comprehending ſuch compound flowers as have perfect florets in the diſk, producing ſeed; but imperfect florets in the ray, which for want of a ſtigma are barren.

FRUSTRA'NEOUS. *adj.* [*fruſtra*, Lat.] Vain; uſeleſs; unprofitable; without advantage.—He timely withdraws his *fruſtraneous* baffled kindneſſes, and ſees the folly of endeavouring to ſtroke a tiger into a lamb, or to court an Ethiopian out of his colour. *South.*

To FRUS'TRATE, *v. a.* [*fruſtror*, Lat. *fruſtrer*, Fr.] To defeat; to diſappoint; to baulk.—It is an axiom of nature, that natural deſire cannot utterly be *fruſtrate.* *Hooker.*

I ſurvive,
To mock the expectations of the world,
To *fruſtrate* prophecies, and to raze out
Rotten opinion. *Shakeſpeare.*

To make null; to nullify.—The act of parliament which gave all his lands to the queen, did cut off and *fruſtrate* all ſuch conveyances. *Spenſer.*

Now thou haſt aveng'd
Supplanted Adam; and by vanquiſhing
Temptation, haſt regain'd loſt paradiſe,
And *fruſtrated* the conqueſt fraudulent. *Milton.*

FRUS'TRATE, *participial adj.* Vain; ineffectual; uſeleſs; unprofitable:

He is drown'd
Whom thus we ſtray to find, and the ſea mocks
Our *fruſtrate* ſearch on land. *Shakeſpeare.*

Null; void. Few things are ſo reſtrained to any one end or purpoſe, that, the ſame being extinct, they ſhould forthwith utterly become *fruſtrate.* *Hooker.*

FRUSTRA'TION, *ſ.* [*fruſtratio*, Lat.] Diſappointment; defeat.—In ſtates notoriouſly irreligious, a ſecret and irreſiſtible power countermands their deepeſt projects, ſplits their counſels, and ſmites their moſt refined policies with *fruſtration* and a curſe. *South.*

FRUS'TRATIVE, *adj.* Fallacious; diſappointing. *Ainſworth.*

FRUS'TRATORY, *adj.* That which makes any procedure void; that which vacates any former proceſs.—Bartolus reſtrains this to a *fruſtratory* appeal. *Ayliffe.*

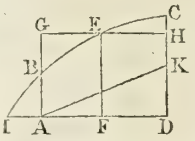
FRUS'TUM, *ſ.* [Latin.] In geometry, is the part of a ſolid next the baſe, left by cutting off the top, or ſegment, by a plane parallel to the baſe: as the fruſtum of a pyramid, of a cone, of a conoid, of a ſpheroid, or of a ſphere, which is any part compriſed between two parallel circular ſections; and the middle fruſtum of a ſphere, is that whoſe ends are equal circles, having the centre of the ſphere in the middle of it, and equally diſtant from both ends.

For the ſolid content of the fruſtum of a cone, or of any pyramid, whatever figure the baſe may have. Add into one ſum, the areas of the two ends and the mean proportional between them; then $\frac{1}{3}$ of that ſum will be a mean area, or the area of an equal priſm, of the ſame altitude with the fruſtum; and conſequently that mean area being multiplied by the height of the fruſtum, the product will be the ſolid content of it.

That is, if A denote the area of the greater end,
a that of the leſs, and h the height;
then $\overline{A + a + \sqrt{Aa}} + \frac{1}{3}h$ is the ſolidity.

The curve ſurface of the zone or fruſtum of a ſphere, is obtained by multiplying the circumference of the ſphere by the height of the fruſtum. *And the ſolidity of the ſame fruſtum is found*, by adding together the ſquares of the radii of the two ends, and $\frac{1}{3}$ of the ſquare of the height of the fruſtum, then multiplying the ſum by the ſaid height and by the number 1·5708. That is, $\overline{R^2 + r^2 + \frac{1}{3}h^2} + \frac{1}{2}ph$ is the ſolid content of the ſpheric fruſtum, whoſe height is h, and the radii of its ends R and r, p being $=$ 3·1416.

Concerning the fruſtum of a ſphere, cone, ſpheroid, or conoid, terminated by parallel planes, when compared with a cylinder of the ſame altitude, on a baſe equal to the middle ſection of the fruſtum made by a parallel plane, Dr. Hutton remarks as follows: The difference between the fruſtum and the cylinder is always the ſame quantity, in different parts of the ſame, or of ſimilar ſolids, or whatever the magnitude of the two parallel ends may be; the inclination of thoſe ends to the axis, and the altitude of the fruſtum being given; and the ſaid conſtant difference is $\frac{1}{4}$ part of a cone of the ſame altitude with the fruſtum, and the radius of its baſe is to that altitude, as the fixed axis is to the revolving axis of the fruſtum. Thus, if BEC be any conic ſection, or a right line, or a circle, whoſe axis, or a part of it, is AD; AB and CD the extreme ordinates, FE the middle ordinate, AF being $=$ FD; then taking, as AD to DK, ſo is the whole fixed axis, of which AD is a part, to its conjugate axis; and completing the parallelogram AGHD: then if the whole figure revolve about the axis AD, the line BEC will generate the fruſtum of the cone or conoid, according as it is a right line or a conic ſection, or it will generate the whole ſolid when AB vaniſhes, or A and B meet in the ſame point; likewiſe AGHD will generate a cylinder, and ADK a cone: then is the 4th part of this cone always equal to the difference between the ſaid cylinder generated by AGHD and the ſolid or fruſtum generated by ABECD; having all the ſame altitude or axis AD.



In the parabolic conoid, this difference and the cone vaniſh, and the fruſtum, or whole conoid ABECD, is always equal to the cylinder AGHD, of the ſame altitude. In the ſphere, or ſpheroid, the fruſtum ABECD is *leſs* than the cylinder AGHD, by $\frac{1}{4}$ of the cone AKD. And, in the cone or hyperboloid, that fruſtum is *greater* than the cylinder, by $\frac{1}{4}$ of the ſaid cone AKD, which is ſimilar to the other cone IBCD. The ſame relations are true, whether the ends of the fruſtum are perpendicular or oblique to the axis. And the ſame will hold for the fruſtum of any pyramid, whether right or oblique; and ſuch a fruſtum of a pyramid will exceed the priſm, of the ſame altitude, and upon the middle ſection of the fruſtum, by $\frac{1}{4}$ of the ſame cone.

It has been obſerved, that the difference, or $\frac{1}{4}$ of the cone AKD, is the ſame, or conſtant, when the altitude and inclination of the ends of the fruſtum remain the ſame. But when the inclination of the ends varies, the altitude being conſtant; then the ſaid difference varies ſo as to be always reciprocally as the cube of the conjugate to the diameter AD. And when both the altitude and inclination of the ends vary, the differential cone is as the cube of the altitude directly, and the cube of the ſaid conjugate diameter reciprocally: but if they vary ſo, as that the altitude is always reciprocally as that diameter, then the difference is a conſtant quantity.

Another general theorem for fruſtums, is this. In the fruſtum of any ſolid, generated by the revolution of any conic ſection about its axis, if to the ſum of the two ends be added four times the middle ſection, $\frac{1}{6}$ of the laſt ſum will be a mean area, and being drawn into the altitude of the ſolid, will produce the content. That is, $\overline{AE + DC + 4FE} \times \frac{1}{6}$ AD is the content of ABCD. This theorem is general for all fruſtums, as well as the complete ſolids, whether right or oblique to the axis, and not only of the ſolids generated from the circle or conic ſections, but alſo of all pyramids, cones, and in ſhort of any ſolid whoſe parallel ſections are ſimilar figures. The ſame theorem alſo holds good for any parabolic *area* ABECD, and is very *nearly true* for the area of any other curve whatever, or for the content of any other ſolid than thoſe above-mentioned.

FRUTES'CENT, *adj.* [*frutex*, Lat.] In botany, ſhrubby, full of ſmall ſhoots.

FRU'TEX, *ſ.* In botany, a ſhrub.

FRUTIC'OSE, *adj.* In botany, hard, woody, fit to bear fruit. *Scott.*

FRUTIFICA'TION, *ſ.* In botany, the young ſhoots of a tree or plant. *Scott. Not much uſed.*

FRY, *ſ.* [*froe*, *foam*, Dan. *Skinner.*] The ſwarm of little fiſhes juſt evolved from the ſpawn.—The angler had the hap to draw up a very little fiſh from among the *fry*. *L'Eſtrange.*

They come to us, but as love draws;
He ſwallows us and never chaws;
By him, as by chain'd ſhot, whole ranks to die;
He is the tyrant pike, and we the *fry*. *Donne.*

So cloſe behind ſome promontory lie
The huge leviathans, t' attend their prey;
And give no chace, but ſwallow in the *fry*,
Which through their gaping jaws miſtake the way.
Dryden.

Any ſwarm of animals; or young people in contempt.—Out of the *fry* of theſe horſeboys, growing up in knavery and villainy, are their kern continually ſupplied and maintained. *Spenſer.*

Draw me no conſtellations there,
Nor dog nor goat, nor bull, nor bear;
Nor any of that monſtrous *fry*
Of animals that ſtock the ſky. *Oldham.*

FRY, *ſ.* A kind of ſieve.—He dreſſed the duſt from malt by running it through a fan or *fry*. *Mortimer.*

To FRY, *v. a.* [*frigo*, Lat. *ffrio*, Welſh; *frijch*, Erſe.] To dreſs food in a pan on the fire.

To FRY, *v. n.* To be cooked in a pan on the fire. To ſuffer the action of fire:

So when with crackling flames a cauldron *fries*,
The bubbling waters from the bottom riſe;
Above the brims they force their fiery way,
Black vapours climb aloft, and cloud the day. *Dryden.*

To melt with heat:

Spices and gums about them melting *fry*,
And phenix like, in that rich neſt they die. *Waller.*

To be agitated like liquor in the pan on the fire.—Oil of ſweet almonds, newly drawn with ſugar, and a little ſpice, ſpread upon bread toaſted, is an excellent nouriſher; and then, to keep the oil from *frying* in the ſtomach, drink mild beer after it. *Bacon.*

Where no ford he finds, no water *fries*,
Nor billows with unequal murmurs roar,
But ſmoothly ſlide along, and ſwell the ſhore,
That courſe he ſteer'd. *Dryden.*

FRY, *ſ.* A diſh of things fried.

FRY'S BAY, a bay on the ſouth-weſt coaſt of the iſland of Antigua: one mile and a half ſouth of Reed Point.

FRY'BERG, a town of Bohemia, in the circle of Prachatiz: nine miles weſt of Roſenberg.

FRYDUF'FRIN, a townſhip of the American States, in Cheſter county, Pennſylvania.

FRY'INGPAN, *ſ.* The veſſel in which meat is cooked on the fire.—We underſtand by out of the *fryingpan* into the fire, that things go from bad to worſe. *L'Eſtrange.*

—A free-

—A freeman of London has the privilege of diſturbing a whole ſtreet with the twanking of a braſs kettle, or a *fryingpan*. *Addiſon*.

"Out of the FRYINGPAN into the fire."—The French ſay, *Tomber de fievre en chaud mal*; To fall from a common into a burning fever. Or, *Tomber de la poële dans la braiſe*. This proverb is applied to perſons, who, impatient under trivial inconveniencies, and raſhly endeavouring to extricate themſelves, for want of prudence and caution, often intangle themſelves in difficulties and perplexities greater than they were in before: *Incidit in Scyllam cupiens evitare Charybdim*, ſay the Latins; and Εις το πυρ εκ καπνε, the Greeks. The Italians ſay as the French, *Cader della padella nelle bragie*. The Germans, *Born regin in a bach kommen*; To come out of the rain into the brook. The Spaniards, *Del lódo, en el arrbyo*.

FRY'INGPAN, a dangerous ſhoal in America, ſo called from its form. It lies at the entrance of Cape Fear river in North Carolina; the ſouth part of it is in north lat. 83. 32. ſix miles from Cape Fear pitch, and twenty-four ſouth-eaſt by ſouth, from the light-houſe on Bald Head.

FRYS'BURGH, or FRYBURG, a townſhip of the American States, pleaſantly ſituated in York county, in the diſtrict of Maine, in a bow formed by the north branch of Great Oſſipee river. It was incorporated in 1777, has a flouriſhing academy, and in 1796 contained 447 inhabitants. This is the ancient Indian village Peckwalket, through which the upper part of Saco meanders; ſixty miles from the ſea, and 120 north by eaſt of Boſton. Lat. 44. 2. N. lon. 70. 47. 30. W.

FRYTH, *ſ.* A plain between woods. *Termes de la Ley* and *Camden's Remains*.

FU'AGE, an ancient tax of 12d. levied for every fire. Edward the black prince, having Acquitain granted him, laid an impoſition of ſuage upon the ſubjects of that dukedom. And it is probable, that the hearth money impoſed anno 16 Car. II. took its original from hence. See FUMAGE.

To FUB, *v. a.* To put off; to delay by falſe pretences; to cheat. It is generally written *fob*. See FOB.—A hundred mark is a long loan for a poor lone woman to bear! and I have borne, and borne, and borne, and have been *fubb'd* off and *fubb'd* off from this day to that day, that it is a ſhame to be thought on. *Shakeſpeare*.

FUB, *ſ.* A plump chubby boy. *Ainſworth*.

FU'CA, *Straits of Juan de*, on the north-weſt coaſt of North America. The entrance lies between Cape Flattery on the ſouth ſide, in north lat. 48. 25. weſt lon. 124. 52. to the oppoſite coaſt of the Quadras iſles, in north lat. 48. 53. 30. It communicates with Pintard's ſound, and thus forms Quadras iſles; in the ſouth-eaſtern coaſt of which lies Nootka ſound. The Spaniards jealous of their right to the American coaſt, eſtabliſhed a ſettlement at this place.

To FU'CATE, *v. a.* [from the Lat. *fuco*, to colour.] To paint the face, to put on falſe colouring. *Bailey*.

FU'CATED, *adj.* [*fucatus*, Lat.] Painted; diſguiſed with paint. Diſguiſed by falſe ſhow.

FUCA'TION, *ſ.* The act of painting the face, the act of diſguiſing by a falſe ſhew; a falſe colouring.

FUCA'TOR, *ſ.* One that paints the face, one that diſguiſes with paint.

FUCEC'CHIO, a town of Italy, in the duchy of Tuſcany: eighteen miles ſouth-ſouth-weſt of Piſtoia.

FUCHS (Leonard), an eminent German phyſician, born in 1501, at Wembding in Bavaria. He early diſtinguiſhed himſelf by his literary attainments; and having, in 1519, viſited the univerſity of Ingolſtadt, he became a convert to the opinions of Luther. He devoted his ſtudies to phyſic, in which he graduated at Ingolſtadt in 1521. For the practice of his art he removed to Munich, where he married; but he left that city to undertake the medical profeſſorſhip at Ingolſtadt. Thence, on account of religion, he removed to Onoltzbach, and was appointed firſt phyſician to the margrave of Brandenburg. In 1535 he was invited to Tubingen, at which place he occupied the chairs of phyſic and anatomy as long as he lived. He was ennobled by the emperor Charles V. and Coſmo, grand-duke of Florence, was deſirous of engaging him by a large ſalary to ſettle at Piſa, but he declined the offer. He was the firſt German phyſician whoſe name became celebrated in foreign countries. He died in 1565. Among his works are tranſlations of various books of Hippocrates and Galen, with commentaries. His *Medendi Methodus*, and *Inſtitutiones Medicæ*, are almoſt entirely founded upon the fathers of medicine above-mentioned. His *Paradoxorum Medicinæ*, Lib. III. contain much invective againſt the Arabians, and correction of their errors, both theoretical and practical. In his work *De Corporis humani Fabrica*, he copies his anatomical deſcriptions from Galen and Veſalius. He ranks among the earlier botaniſts, on account of his *Hiſtoria Plantarum*, folio, Baſil, 1542, which has been frequently reprinted, and tranſlated into ſeveral modern languages.

FUCH'SIA, *ſ.* [ſo named in honour of *Leonard Fuchs*, mentioned above.] In botany, a genus of the claſs octandria, order monogynia, natural order onagræ, *Juſſ.* The generic characters are—Calyx: perianthium one-leafed, funnel-form, coloured, ſuperior, deciduous; tube ovate at the baſe, contracted above it, then gradually widening, patulous, angular; border ſhort, four-parted; parts ovate, acuminate, ſpreading. Corolla: petals four, ovate, acuminate, ſeſſile, ſpreading, the ſame length with the parts of the calyx. Stamina: filaments four, (or eight) filiform, erect, inſerted into the tube of the calyx below the middle, and a little longer than the tube; antheræ twin. Piſtillum: germ inferior, ovate, below the inſertion of the calyx conſtricted; ſtyle ſimple, the length of the ſtamens; ſtigma obtuſe, (club-ſhaped?) Pericarpium: berry ovate, four-grooved, four-celled. Seeds: many, ovate, fixed in a double row to a columnar receptacle in the middle of the berry.—*Eſſential Character*. Calyx, one-leafed, coloured, bearing the corolla, very large; petals, four, ſmall; berry, inferior, four celled, with many ſeeds.

Species. 1. Fuchſia triphylla, or three-leaved fuchſia: peduncles one-flowered; leaves by threes. Root woody, branched, reddiſh; ſtem herbaceous, upright, quite ſimple, reddiſh green, leafy, two feet high at moſt; leaves lanceolate, entire, pale green, a little firm or coriaceous, ſeſſile, diſpoſed in threes; peduncles one-flowered, ſcattered, and forming a ſtraight terminating raceme; flowers large, very fine, of a very bright ſcarlet, having eight ſtamens, not projecting beyond the flower; and the berry is a little larger than an olive, fleſhy, ſoft, reddiſh-black, ſomewhat pubeſcent, of a very pleaſant taſte; the ſeeds are ſmall and brown. Plumier obſerved this plant in St. Domingo; and it was afterwards found by Dr. Houſtoun at Carthagena in New Spain, whence he ſent the ſeeds into England: it muſt have been cultivated here, therefore, by Mr. Miller before 1733, in which year Dr. Houſtoun died.

2. Fuchſia coccinea, or ſcarlet-flowered fuchſia: leaves oppoſite, ovate, toothletted; petals obovate, obtuſe. This is a ſhrub, growing to the height of ſix or ſeven feet; the leaves are commonly oppoſite, on ſhort petioles, of a fine green, having the veins tinged with red, with a fine down on them; peduncles axillary, one-flowered, longer than the leaves; flowers pendulous, bright ſcarlet, with a four-parted calyx, four petals, and eight ſtamens. It is a plant of peculiar beauty, producing its rich pendant bloſſoms through moſt part of the ſummer: the petals in the centre of the flower are particularly deſerving of notice; they ſomewhat reſemble a ſmall roll of the richeſt purple-coloured ribband. Native of Chili, and flowers from May to July. Mr. Lee, of Hammerſmith, is ſaid to have had this plant firſt for ſale.

3. Fuchſia multiflora: peduncles many-flowered. This was found in South America, by Mutis.

4. Fuchſia

4. Fuchſia excortica: peduncles axillary, one-flowered; leaves ovate, alternate. This is a very ſmooth tree; leaves on long petioles, hoary underneath, very finely ſerrate; flowers pendulous, very large; corolla funnel-ſhaped; but, according to Forſter, there is no corolla, except four nectaries, which are ovate-lanceolate, erect, interpoſed between the ſegments of the calyx, and only one-third of their ſize. Others call theſe the petals. Native of New Zealand. Forſter gave it the name of *Skinnera* from Mr. Skinner of Oxford—*acutiſſimo oculatiſſimoque botanico Oxonienſi*, as he expreſſes it.

5. Fuchſia involucrata: flowers involucred. Native of Jamaica.

Propagation and Culture. This is propagated by ſeeds, which muſt be ſown in pots filled with rich light earth, and plunged into a hot-bed of tanners' bark, and treated in the ſame way as other ſeeds from warm countries. In about a month or ſix weeks after the ſeeds are ſown, the plants will begin to appear, when they ſhould be carefully cleared from weeds, and frequently refreſhed with water to promote their growth; and when they are about two inches high, they ſhould be taken out of the pot, and ſeparated carefully; then plant each into a ſmall pot filled with light rich earth, and plunge them again into a hot-bed of tanners' bark, being careful to ſcreen them from the ſun until they have taken new root: after which time they muſt have freſh air admitted to them every day in proportion to the warmth of the ſeaſon, and ſhould be frequently watered. As the ſeaſon advances and becomes warm, the glaſſes of the hot-bed ſhould be raiſed higher, to admit a greater ſhare of air to the plants, to prevent their drawing up weak; and when the plants are grown ſo tall as to reach the glaſſes, they ſhould be removed into the bark-ſtove, and plunged into the tan-bed. In winter theſe plants require to be kept very warm, and at that ſeaſon they muſt not have much water, but in ſummer it muſt be often repeated. Theſe plants are too tender to thrive in the open air in this country, even in the hotteſt part of the year; therefore they ſhould conſtantly remain in the ſtove, obſerving to let in a large ſhare of freſh air in ſummer, but in winter they muſt be kept warm; with this management the plants will produce their flowers, and make a beautiful appearance in the ſtove, amongſt other tender exotic plants.

FUCHSWINKL, a town of Sileſia, in the principality of Nieſſe: two miles and a half ſouth of Patſchkau.

FUCI'NUS, in ancient geography, a lake of Italy in the country of the Marſi; now *Lago di Celano*, from a cognominal citadel, lying in the ſouth of the Abruzzo Ultra, in the kingdom of Naples, near the Apennine. This lake was under the protection of a god of the ſame denomination, whoſe temple ſtood on its banks. According to the teſtimony of ancient authors, it was ſubject to extraordinary riſings and decreaſings. The actual circumference is forty-ſeven miles: the breadth in the wideſt part is ten, in the narroweſt four; its depth twelve feet upon an average. But all theſe have varied prodigiouſly. Two miles up the plain, behind Avezzano, the fragments of boats, ſhells, and other marks of its ancient extent, have been caſually diſcovered; and, on the contrary, there are people who remember when it did not flow nearer than within two miles of Avezzano. An immenſe tract of excellent land is loſt at every increaſe of its level. All round this noble piece of water riſes a circle of grand mountains, ſome of them the higheſt in Italy, if we except the Alps, and many of them covered with ſnow; and at the foot of them are numerous villages, with rich and well-cultivated farms. The environs of the lake, and the ſides of the hills, are covered with fine woods; its waters abound with fiſh of various kinds, and thither repair at ſtated ſeaſons innumerable flights of wild-fowl. As the ſwelling of the lake was attended with incredible damage, the Marſi had often petitioned the ſenate to drain it: Julius Cæſar would have attempted it, had he lived longer. His ſucceſſors were averſe to the project; till Claudius, who delighted in expenſive enterprizes, undertook it. During the ſpace of eleven years he employed 30,000 men in digging a paſſage through the mountain; and when every thing was ready for letting off the water, he exhibited a ſuperb naval ſpectacle on the lake. A great number of condemned criminals were obliged to act the parts of Rhodians and Sicilians in ſeparate fleets, to engage in earneſt, and to deſtroy one another for the entertainment of the court and the multitude of ſpectators that covered the hills. A line of well-armed veſſels and rafts loaded with ſoldiers ſurrounded the ſcene of action, in order to prevent any of the condemned wretches from eſcaping; but it was with great difficulty and many threats that they could be brought to an engagement. When this ſavage diverſion was ended, the operations for opening the outlet commenced, and the emperor was very near being ſwept away and drowned, by the ſudden ruſhing of the waters towards its vent. However, either through the ignorance or negligence of the engineers, the attempt did not anſwer; and Claudius did not live to ſee this great work completed. Nero abandoned the ſcheme through envy. Adrian is ſaid to have let off the waters of the Fucinus; but none now eſcape except through hidden channels formed by nature, which are probably ſubject to be obſtructed, and thus occaſion a ſuperabundance of water in the lake, till ſome unknown or accidental cauſe removes the obſtruction, and again gives a free paſſage.

Sir William Hamilton, who viſited the Fucinus in 1785, ſays, "it is the moſt beautiful lake he ever ſaw, and would be complete if the neighbouring mountains were better wooded." It furniſhes abundance of fiſh, though not of the beſt quality. Claudius's channel he deſcribes as ſtill entire, though filled up with earth and rubbiſh in many parts. He went into it with torches as far as he could. It is a covered underground canal three miles long, part of it cut through a hard rock, and other parts are ſupported by maſon work, with wells to give light. Sir William Hamilton is of opinion, that if the canal were cleared and repaired, it would anſwer the purpoſe, and thereby reſtore a great deal of rich land for cultivation.

FU'CUS, *ſ.* [φυκος, Gr. from פד, *fuka*, Heb. becauſe it was uſed in painting the cheeks.] The ancients gave the name of *fucus* to a purple dye of a moſt beautiful colour, obtained from a ſea-plant; and the women of thoſe times alſo uſed a *fucus* to ſtain their cheeks red; from whence many have ſuppoſed that the ſame ſubſtance was uſed on both occaſions. But, on a ſtrict enquiry, this proves not to be the caſe. The Greeks called every thing *fucus*, that would ſtain or paint the fleſh. This peculiar ſubſtance uſed by the women to paint their cheeks, was diſtinguiſhed from the others by the name of *rizion*, and was a root brought from Syria into Greece. The Latins, in imitation of the Greek name, called this root *radicula*, and Pliny very erroneouſly confounds the plant with the *radix lunaria*, or *ſtruthion* of the Greeks.

The word *fucus* was in thoſe times become ſuch an univerſal name for paint, that the Greeks and Romans had a *fucus metallicus*, which was the ceruſe uſed for painting the neck and arms white; after which they uſed the *purpuriſſem*, or red fucus of the *rizium*, to give the colour to the cheeks. In after-times they alſo uſed a peculiar *fucus* or paint for the purpoſe, prepared of the *Creta argentaria*, or ſilver-chalk, and ſome of the rich purple dyes that were in uſe at that time: and this ſeems to have been very little different from our roſe-pink; a colour now commonly ſold at the milliner's, and uſed on like occaſions.—Thoſe who paint for debauchery ſhould have the *fucus* pulled off, and the coarſeneſs underneath diſcovered. *Collier.*

Women chat
Of *fucus* this and *fucus* that. *Ben Jonſon.*

FU'CUS, *ſ.* [from *fucare*, Lat. to dye or paint; ſome of

1. The Serrated Fucus. 2. Bladder Fucus. 3. Gigartine Fucus. 4. Necklace Fucus. 5. Kaliform Fucus.

London Published as the Act directs May 24th 1806 by J. Wilkes

of the *fuci* or ſea-weeds being uſed for this purpoſe.] In botany, a genus of the claſs cryptogamia, order algæ; comprehending moſt of thoſe plants known by the name of SEA-WEEDS. The generic characters are—Seeds produced in cluſtered tubercles, which burſt at their ſummits.—Of this genus, fifty-eight ſpecies are enumerated in the fourteenth edition of *Syſtema Vegetabilium*. Sixty-eight Britiſh ſpecies, beſides many varieties, are enumerated in Dr. Withering's Botanical Arrangements; and ſeventy-two have been more recently deſcribed by Dr. Goodenough and Mr. Woodward, in the Linnæan Tranſactions, vol. iii. Turton, collecting from the reſearches of all botaniſts, gives a catalogue of one hundred and forty-nine ſpecies. A great deal of uncertainty and doubt is ſtill attached to this genus of plants, concerning the fructification, and peculiar mode of propagation. See the article BOTANY, vol. iii. p. 283–288, wherein this ſubject has been already diſcuſſed. We ſhall however add, in this place, the ingenious obſervations of Dr. Goodenough and Mr. Woodward:

"In many *fuci*, two ſorts of fructification are to be ſeen—one warty tubercles, and the other numerous ſingle grains. The obſervation of theſe has led young botaniſts to imagine that they are the differences of ſex. Undoubtedly both theſe appearances are of the female flower, i. e. ſeminal. We have obſerved them occaſionally in F. alatus, vermicularis, and hypogloſſon, ſcattered along the rib or nerve, or on the membrane on each ſide of it. Some few of theſe grains we have obſerved ſwelling apparently into a tubercle, and the others diſappearing. Whether this be the mode of perfecting the fructification, and that ſuch of theſe grains as are impregnated ſwell into ſeminiferous tubercles, whilſt the reſt are abortive and decay; or, whether theſe grains may not be real ſeeds eſcaped from a tubercle, the coats of which are burſt, and adhering to the frond, it were to be wiſhed that naturaliſts reſident on the ſea-ſide would examine and endeavour to determine. The tubercles of the greater part of the fuci open at the point, are imbedded in the ſubſtance and become ſwollen, as in F. ſerratus, ſpiralis, &c. or aſſume a broad warty form, as in laceratus and ſome others; are imbedded, ſmooth, and veſiculiform, as in criſpus, &c. project very much from the frons, as in confervoides; or are ſituated in a pedunculated capſular proceſs, as in filiquoſus, pedunculatus, &c.

"It has been the general opinion of naturaliſts, that the root of fuci is an organ of adheſion only, and not of nutrition. It ſeems ſo admirably calculated for the former of theſe purpoſes, that probably this idea has precluded all conſideration of the latter. How the vegetation is carried on, cannot be preciſely aſcertained; and although it does not ſeem likely, that the root ſhould draw nouriſhment from the rock, ſtone, or other body to which it is affixed, in the ſame manner as the roots of terreſtrial plants from the earth in which they grow; yet it would be difficult to aſſert and bring proofs, that while it fixes, it does not alſo aſſiſt to nouriſh.—They are principles by no means incompatible. It is very poſſible, that the element in which theſe plants grow, may be imbibed at numberleſs minute pores on the ſurface of the frons, imperceptible to our ſight, and that theſe pores may be common to the root with the reſt of the plant; and thus the divine will may be accompliſhed.

"All fuci appear to proceed from a thin, round, entire or fiſſile, glutinous, coriaceous ſubſtance: this will appear to any one who will watch the growth of F. loreus. In ſome few this ſubſtance is fiſſile, and imitates the fibres of land plants: but each fibre attaches itſelf by its extremity, which immediately becomes a flat diſk, to ſome rock, and, if the rock be ſmooth, longitudinally alſo. Gmelin's idea of the root does not accord with this fact. He ſays, that thoſe ſpecies which are thin and papyraceous, have never ſhewn any appearance of root. Never was there a more palpable miſtake. The root in all of them is a flat dilated diſk, more or leſs in proportion to the ſize and ſubſtance of the plant. One of the thinneſt and moſt tender productions, F. laceratus *var.* laciniatus, has not only this kind of root, but ſometimes for the ſpace of two or three lines, has a roundiſh ſtalk before it is diſſolved into its thin laminæ or branches. The root is either purely fibrous, as in ſaccharinus, or between ſolid and fibrous, as in ſerratus, where a tendency to fibrous diviſion is obſervable; but the fibres, which are ſomewhat prominent upon the ſurface, are webbed as it were, or connected by a thick membrane or the intervening part of the diſk; or laſtly, which is by far the moſt numerous, an entire ſolid diſk. There are different modifications of this laſt ſort of root. Sometimes, as in filiquoſus, it becomes in its more advanced age a ſolid woody cone; ſometimes a plant having ſprung from its diſk, conſtantly throws out from its very baſe cluſters of little ſurculi, which accidentally touching the rock form a callus, by which as by a new diſk it adheres, and thence becomes the parent of a new plant. Its original, from a ſmall diſk, is thus ſo covered over and obſcured, that it is not to be diſcerned. This takes place particularly in F. purpuraſcens, which hence is generally deſcribed with a fibrous root, as ſhewn in the Engraving. From this ſurloſity at the baſe, and the ſurculi occaſionally forming new diſks and new plants, ſome fuci appear to have creeping roots.

"The F. natans is deſcribed by Linnæus, *libere natans nec radicatus*. Theſe words muſt be underſtood to mean *floating at large, and not faſtened by any root*. He never could mean, *having no root*; for his own ſpecimen in the herbarium has one, which is a *diſcus explanatus*, and appears to have a very ſlight power of adheſion. It may be preſumed that it is an inhabitant of the deep waters, beyond the reach of human ſight. Storms and tempeſts, diſlodging it from its native bed, bear it in their uncontrollable violence to all the ſhores of the known world. F. bulboſus is a plant *ſui generis*; the diſk immediately aſſumes an inflated bulbous form, the bulb becomes covered with numerous excreſcences, which require very minute inveſtigation. The aſcertainment of its œconomy in this particular, as alſo of its fructification, would be a ſubject of very curious enquiry. All plants produced from thoſe rudiments of new branches obſervable on the ſurface of *mammilloſus*, *rubens*, &c. muſt neceſſarily have a plain diſcoid root, that being the cauſe of their firſt adheſion.

"Great variations in the ſame ſpecies of fucus, will often ariſe from two cauſes, from the mutilations which they ſuffer from the violence of the waves, or other injuries, and their growing nearer, or more remote from, the deflux of freſh water. A very frequent effect of external injury is the proliferous or reproductive tendency which is thereby occaſioned, and which often ſo alters the natural appearance of the plant, as to entirely diſguiſe it to the eye of an unpractiſed obſerver. This is extremely frequent in F. ſinuoſus, when the membranous parts are deſtroyed, and only the nerves or fibres remain, from which young leaves are frequently ſeen to ſhoot in great abundance, giving it an appearance ſo entirely different from that which it at firſt had, that it might eaſily be ſuppoſed a different ſpecies, did not the frequency of this plant afford us an opportunity of ſeeing it in all its varying forms. The F. rubens perhaps owes ſome of its appearances to this cauſe; for the young plants are at firſt entire, and thoſe of a more advanced growth ſhew ſometimes much leſs appearance of this proliferous tendency than others: but we cannot, in this ſpecies, attribute the whole of the particular habit to theſe accidental cauſes. Injuries done to the hardier ſpecies may be more readily traced in their effects; F. inflatus is one inſtance of this, which is probably nothing more than *veſiculoſus*, with a branch inflated or ſwollen by the injury of ſome inſect or outward violence. The *veſiculoſus* var. *foliaceous*, affords one of the moſt remarkable inſtances of reproduction occaſioned by external violence. This was firſt noticed by Major Vel-

ley in Withering's Bot. Arr. vol. iii. p. 241: 'If the F. veſiculoſus receives an injury or fracture in any part of the leaf, provided it be in a healthy vegetating ſtate, it conſtantly throws out abundance of young leaves from the injured part. If even a ſmall aperture be made in the middle of it, a new leaf on either ſide will be found to ſhoot out.' Without this explanation it would appear extraordinary, that, where a branch is broken off, not only a cluſter of new leaves ſhould ſhoot from the fractured end, but that alſo numerous ſimilar ones ſhould be produced from the ſides of the broken branch; which we have obſerved to take place. This will alſo account for the frequent appearance of theſe new leaves on the ſurface of the root itſelf, even whilſt the plant is apparently in a perfectly uninjured ſtate.

"The ſoil, or their growing near freſh water, or altogether diſtant from it, makes a great difference in the ſize and texture of theſe plants. On the more inland banks of the Severn, and in the extenſive æſtuary in the north of Lancaſhire, formed by the influx of the Ken, Leven, and other ſtreams, F. canaliculatus is ſometimes found remarkably luxuriant. At Ilfracombe, where there is a very trifling influx of freſh water, F. faſtigiatus grows ſo ſlender and compact, that no inexperienced perſon would think it the ſame as the large *interceptus*. We ſuppoſe theſe things principally occaſioned by the vicinity or abſence of freſh ſtreams. At Ilfracombe, F. fibroſus grows ſcarcely more than a foot high; but we have ſeen it thrown up on the ſhore at Weymouth after a violent ſtorm, literally appearing to us at firſt ſight to be the root of ſome great tree. The different appearances of *multifidus* are occaſioned by differences of ſoil, ſituation, or growth; as are thoſe of *nodoſus* alſo.

"Some attention ought to be paid to the colour and opacity of Fuci. If plants have lain long in the water, and been left by the reflux of the tide on the ſhore, where they are neceſſarily expoſed to the power of the wind and ſun, the natural colour is oftentimes all diſcharged; they become white or black, &c. according to circumſtances. In drying Fuci, green and red colours retain their proper appearance, but the olivaceous colours uſually appear black. Where the change has been effected by drying only, the original colour may generally be detected by holding up the plant to a ſtronglight of a candle or lamp. Fuci are alſo more or leſs opake from a variety of cauſes. Our variety of *faſtigiatus* called *interceptus* is in general opake: but the new branches produced beyond the rings at the extremity of the frons, that is after injury received, are green and ſomewhat pellucid; for in almoſt all plants the parts repaired are of a ſubſtance and texture weaker and ſofter than the ſound parts. The F. palmatus is a remarkable inſtance of the difference of opacity; ſome ſpecimens being thin as paper and pellucid, and others of a perfectly horny or leathery ſubſtance when dried. All Fuci are more or leſs pellucid and thin in their firſt beginnings.

"The ſtructure of the Fuci is ſo very ſingular, that were they not affixed by their baſe to the rocks, as terreſtrial plants are by their roots to the ground, we ſhould be at a loſs how to trace any kind of analogy between them; and yet it has been a favourite employment with all writers; and it countenanced Reaumur in his hypotheſis of Fuci being provided with *male* and *female* flowers. They are formed of one continued ſubſtance, of various texture, from the moſt tender and membranaceous to the moſt firm and thick; numerous beyond deſcription, capable of being turned to the uſe of man in many ways, both as to food and other conveniences, and affording protection and ſupport to myriads of the ſubmarine inhabitants. All this marks the goodneſs of the ever-bleſſed Godhead, 'by whom they are and were created.' That part in creation is not to be found, where ſome principle does not invariably act beneficial to man."

1. Fucus ſerratus, the ſerrated fucus or ſea wrack. The ſerratures on the margin render this ſpecies very diſtinct. The nerve in the centre of the frond, frequently acquires the ſtem-like form. The ſummits in their ripened ſtate are tough, ſolid, and not inflated, neither do they contain any woolly ſubſtance. The tubercles or pericarps are nearly of an ovate form, and at firſt ſeem ſcarcely attached to the ſides of the ſummit; although in maturity ſeveral of them are found cloſely united to minute perforations in the exterior ſurface of the fucus. Theſe veſſels conſiſt of a callous ſubſtance, not much darker than that in which they are imbedded. The middle nerve appears to terminate preciſely at the part where the fructifications commence. The colour of the plant varies through ſeveral ſhades of olive and yelloviſh-brown. In the Fucus Plate I. at fig. 1. is ſhewn a branch of the ſerrated fucus; *a*, tranſverſe ſection of a piece of the branch, magnified, to exhibit the ſeeds; *b*, the external covering.

2. Fucus nodoſus, or bladder fucus. This ſpecies is ſo well known, that any long deſcription of it would be unneceſſary: the large elliptical veſſels or air-bladders, which form its moſt conſpicuous character, and from which its trivial name is taken, ſufficiently diſtinguiſh it from all other Britiſh ſpecies. Theſe veſicles are ſolitary, diſtant from each other, wider than the ſtalk, and decreaſe regularly in ſize from the loweſt to the uppermoſt on each frond or branch. The lower part of the frond is uſually deſtitute of veſicles as well as leaves; but there is always a ſmall veſicle above the uppermoſt leaves, from which the branch continues again naked to the ſummit, which is obtuſe. The diſtichous leaves in an advanced ſtate are ſwelled, replete with mucus, and contain numerous tubercles, each having a correſponding opening on the ſurface of the leaf. It is common on every part of the Britiſh coaſt, on the rocks, and alſo on the piles and other wood-work of the harbours, and is often adorned with large tufts of *Conferva polymorpha*, which appears particularly to attach itſelf to this plant, as ſhewn at *a a*, fig. 2. Plate I. The veſicles vary in ſize from the bigneſs of a pea to that of a crow's egg, and ſome are even larger.

3. Fucus gigartinus. This is readily diſtinguiſhed by the ſharp thorny appearance of the plant, and by its ſeſſile globoſe ſmooth tubercles. Murray, who firſt gave a deſcription of this plant, mentions the tubercle as ſuſtained by a ſhort footſtalk, which ſubtends and is longer than the tubercle. No dependance however can be placed upon this remark. The fructification is always ſeſſile at the baſe or axilla of a little branch. In its perfect form this little branch projects beyond the tubercle; but it is rarely found with any regularity in this ſtate; for, in conſequence of the agitation of the ſea, the branch is often broken off; whence the tubercle appears in its true ſituation, always ſeſſile, ſometimes ſingle on a main branch, ſometimes double or treble on a little one, and not unfrequently terminal. The frond appears ſometimes to have roundiſh branches; but they are generally compreſſed, the upper ones always ſo in a greater or leſs degree, as exhibited in the engraving at fig. 3; *c*, a ſmall branch magnified, to ſhow the globules.

4. Fucus concatenatus, or necklace fucus. The frond extends to half a foot or more in length, riſing from a tough clubbed baſe, which frequently produces three or four obtuſe excreſcences, from the ſides of which the branches originate in the form of linear ſhoots; and theſe throw out in various directions ſhort round ſubulate leaves. The latter, as the plant advances towards maturity, extend in proportion, forming ſecondary branches, which frequently produce others. Theſe branches ſoon loſe their former habit by becoming ſwollen and contracted nearly at equal diſtances, ſo as to form a concatenation of oblong veſicles, having the appearance of pods or ſeed-veſſels. They contain nothing more than a clear gelatinous ſubſtance. A great number of ſeeds crowded together in ſuch a manner as to reſemble minute warts, appear in every direction beneath the ſurface of the branches; when magnified, they ſeem to be fixed in an annular form; leaving a ſmall portion in the centre ſomewhat tranſparent. In maturity they become rather prominent, while

London Published as the Act directs. June 14. 1806. by J. Wilkes.

the central ſpace is reduced to a kind of puncture; which probably may be deſigned for the ſeed to eſcape. The branches, when young, are very ſlender and filiform: in their mature and diſtended ſtate they are furniſhed with very ſhort and tender ſpinules; and when diſſected are found to be in part hollow. This fucus and its deſcription ſeem to agree with the F. concatenatus of Lightfoot. Whether it may be the fucus which Linnæus has deſcribed under that name, remains a more doubtful circumſtance. The colour of this fucus varies from a darkiſh olive to a blackiſh chocolate, inclining to a very deep red when recent. See a ſprig of this ſpecies in its early ſtate, at fig. 4.

5. Fucus kaliformis, the kaliform fucus. This elegant ſpecies approaches very near to the *verticillatus* of Lightfoot, but appears to differ in ſubſtance, in colour, and in the form and diſpoſition of the branches. The ſubſtance of it is tender, and approaching to gelatinous. The branches which divide directly from the root are filiform, and tubular. They vary extremely in ſize; plants found on the coaſt of Cornwall exceeding the thickneſs of a crow's quill, whilſt ſuch as have been found on the beach at Yarmouth ſcarcely equal that of the ſparrow. The ſecondary branches vary extremely in their manner of proceeding from the primary: ſome are oppoſite, others alternate, but much the larger part appear to grow without any order. The extreme ramuli, which are ſhort, ſubulate, and terminate rather obtuſely, are very often verticillate, generally three or four in a whorl, and, when not regularly ſo, have always a viſible tendency to that diſpoſition. The fructification conſiſts of globular tubercles ſeſſile on the ſides of the ſmaller branches, ſo minute as ſcarcely to be diſtinguiſhed by the naked eye, bright red, and when filled with ſeeds, nearly black. The colour of the plant is a pale delicate red; ſomewhat mixed with green; a change which is obſervable in moſt of the gelatinous ſpecies. This is delineated in Plate I. fig. 5.

6. Fucus purpuraſcens, the purple fucus. This ſpecies differs from all its affinities by its fructification, which conſiſts of roundiſh, or ſometimes oval, ſwellings, placed at ſome diſtance from each other on the ſmalleſt branches, and which, when the plant is mature, are filled with blackiſh purple ſeeds. The fructification is truly an innate tubercle, which occupies the central part of the branch, and, as it ſwells, cauſes that to dilate, and to form a gouty knot which is then externally obſervable. The ſubſtance of the branch is no ways altered by this proceſs, but retains a conſiderable degree of tranſparency. The ſubſtance of the plant, though cartilaginous, is tender, and in ſome ſpecimens very much approaching to gelatinous. The principal ſtem is continued throughout, and is generally naked for a ſmall ſpace at the baſe, after which it is thickly clothed with branches, of which thoſe below the middle are longeſt, and the upper very ſhort, giving a taſty lanceolate outline to the whole frond. The main ſtem terminates obtuſely at the baſe, from whence it throws out ſeveral inverted radicles, as if for claſping more firmly the object to which it is attached. The primary branches are ſometimes oppoſite and ſometimes alternate, but much more frequently grow without order; theſe are again once or twice branched, and the terminal ones are not unfrequently crowded. The colour is wholly purple, yet frequently mixed with green: and the more the plant approaches to being gelatinous, the leſs purple is to be obſerved in it. It is found adhering to the ſub-marine rocks and ſtones on almoſt every part of the Britiſh coaſt. See a figure of this beautiful ſpecies in the Fucus Plate II. fig. 1.

7. Fucus membranifolius, the membrane-leafed fucus. Of this there are four varieties, growing on the coaſt of Norfolk, on the iſle of Portland, and generally on the rocky ſhores of England. The *cilia* on the edges of the variety exhibited in the Fucus Plate II. fig. 2, appear to be the rudiments of leaves or membranes, and to have no concern in the production of any thing relating to the fructification. In all the varieties the fructification is produced on the branches, and is ſupported by a very ſhort pedunclé. The colour varies; ſometimes it is of a light red; ſometimes it appears herbaceous and green; at other times it is found of a parchment colour, and even white, owing to its having been expoſed to the ſun when caſt upon the ſhore. In the figure given in the engraving, the baſe of the leaves and terminal membrane keeps its colour of blood or raw fleſh in all expoſures.

8. Fucus ciliatus, the ciliated fucus. This ſpecies, as it puts on different appearances, has formed three of Gmelin: his *ciliatus*, *ligulatus*, and *holoſetaceus*. The frond is at firſt membranaceous, divided almoſt immediately from the root, the branches one half or three fourths of an inch broad, the margins fringed with numerous *cilia*. This is Gmelin's *ciliatus*. In ſome ſpecimens many *ligulæ* are interſperſed among the *cilia*, which are nothing more than young branches. This is the *ligulatus* of Gmelin. When the plant is arrived at maturity it acquires a thicker ſubſtance, and becomes almoſt cartilaginous; and in this ſtate each ſurface of the frond is frequently rough, with numerous round ſpines from half a line to a line in length, of which ſome are bifid. Some of theſe bear globular tubercles filled with ſeeds, and are certainly no other than the peduncles of theſe tubercles, though many of them are abortive. This is Gmelin's *holoſetaceus*. The marginal *cilia* are always ſimple; ſuch as appear otherwiſe being in fact *ligulæ*, about to form young branches; theſe ſometimes, but rarely, bear tubercles. It adheres firmly to the rocks by its fibrous baſe, and when taken out of the water is generally of a pale fleſh colour, but, on being expoſed to the air, ſoon acquires a full red; but ſometimes it is found of a bright red colour whilſt in a growing ſtate. Found frequently on the Britiſh coaſt. A figure of it is given in Plate II. fig. 3.

9. Fucus veſiculoſus, the veſiculated fucus, or ſea oak. Of this fucus, the various authors who have written on the ſubject, have divided the ſix varieties included in the denomination *veſiculoſus*, into ſix diſtinct ſpecies; but nature has ſhewn the true limit: the appearance of veſicles or bladders in the frond is its unerring characteriſtic. In the firſt variety the veſicles are ranged on each ſide of the rib throughout the frond, and alſo at the axillæ. The frond itſelf varies in having its branches from a quarter of an inch to a full inch in breadth, with edges either plane or undulated, as in *ſpiralis*. The ends of the branches when in fructification are ſwollen and ſomewhat acute. A figure of this variety is given under BOTANY, Plate XV. with the parts of fructification delineated and explained, in vol. iii. p. 287. The ſecond variety, or *divaricatus*, is remarkable for having the bladders in ſome of the axillæ (for it is by no means conſtant in all) extremely dilated, as if two veſicles had been confluent into one; in conſequence the branches fork off wider than uſual, and become divaricated. This variety is found in Southampton river, often ſomewhat twiſted. The third variety, *inflatus*, ſeems to be occaſioned by a diſeaſe. By ſome means or other a body of air is introduced between the two coats of the frond, and thus gives it a bladder-like appearance. That it is accidental is evident, from its not happening uſually in more than one or two branches in any given plant. The fourth variety, *acutus*, is ſo called from the lanceolate terminations of its branches. The ſame plant, however, occaſionally furniſhes lanceolate terminations, and others bluntiſh. The fifth variety, *foliaceus*, is merely a plant which, in the vigour of its growth having been broken off by ſome accident, endeavours to repair itſelf in an irregular manner, producing cluſters of new branches reſembling obovate leaves. Theſe are principally from the broken extremities; but they are alſo found on the ſides, and even upon the expanded root. This is ſhewn in the Fucus Plate II. fig. 4. growing on a ſhell; and at *a*, is exhibited a ſmall part of the frond magnified, to ſhew the fine hairs which Reaumur miſtook for male flowers.

ers. The fixth variety, is the *volubilis* of Mr. Hudſon. It cannot however be called a diſtinct ſpecies; for its form is the ſame nearly as the firſt, only it is extremely twiſted.

10. Fucus canaliculatus, the channeled or furrowed fucus. The diſtinguiſhing character of this fucus, is a channel or furrow, paſſing through every branch on one ſide, in a longitudinal direction. The frond is from two to ſix inches in extent, and has a compact coriaceous baſe, from whence ſeveral branches ſuddenly originate; each one producing ſtems, in a dichotomous ſeries, which in their turn alſo are ſubdivided, and frequently terminate with bifid ſummits. The plant has in general a faſtigiate appearance. The fructification is fixed in the interior part of the ſwollen ſummit, conſiſting of tough elaſtic globular tubercles. In ſome of theſe, when perfectly mature, an appearance like a puncture, cloſely fitted to the perforation in the ſurface of the frond, may ſometimes be obſerved, which ſeems deſigned to facilitate the diſperſion of the ſeeds. Each tubercle contains ſeveral grains, either more or leſs in number. Theſe latter, notwithſtanding their minuteneſs, vary as to their form, which is ſometimes more or leſs ovate. The colour of the grains is a bright cheſnut; and on ſome ſhores, a light olive-green. The fucus, when freſh from the ſea, has a yelloviſh hue, which afterwards turns to a black. A branch of this ſpecies is given in the Fulica Plate, at fig. 3.

11. Fucus obtuſus, the obtuſe fucus. The frond of this fucus is doubly-pinnate, and from three to five inches in length. The ſtems proceed from a compact glutinous baſe, and are ſubdivided into lateral branches, which produce a third ſeries, conſiſting of the obtuſe ſegments. The latter, as well as the branchlets on which they grow, become gradually contracted in length, as they approach the ſummit of the frond: and they both ſeem to obſerve rather an alternate or dichotomous mode of growth. This fucus frequently grows in a more ſimple ſtate upon the edge of the Fucus filum, or on other plants. The frond only conſiſts of a ſmall ſingle ſtem, an inch and half in length, with a few dichotomous lateral ſhoots. In the more luxuriant plants, the ſtems are as large as common packthread, and reſemble iſinglaſs in colour: but the cuticle, which ſurrounds the ſecondary branches and the ſegments, has a beautiful pink colour. The interior ſubſtance of the plant is tender: and, when the fucus is freſh, it has a kind of elaſticity. It may always be diſtinguiſhed by the obtuſe terminations of the ſegments, and frequently by a powerful perfume which it imparts, not unlike that of violets. The fructification conſiſts of oblong-ovate grains or ſeeds, fixed in the interior part of the ſegments. In a ſtate of maturity, they appear like minute opaque warts upon the ſurface. See a figure of this plant in the Fulica Plate, fig. 4.

12. Fucus bracteatus, the thin-leaf fucus. See a figure of this in the Fulica Plate, fig. 5.

13 Fucus ſinuoſus. Stem round: leaves oblong, undulate, ſinuate-pinnatifid, ciliate on the margin; fringe linear-lanceolate, compreſſed, ſeminiferous.

14. Fucus polypodioides. Stem roundiſh, flexuous, branched: leaves membranous, nerveleſs, alternately pinnate, obtuſe entire.

15. Fucus Koelreuteri. Membrano-cartilaginous: ſtem very ſhort, round, branched: fronds entire, linear; younger ones warty.

16. Fucus ſanguineus. Stem round, branched: leaves petioled, ſimple, elliptic, undulate, entire: tubercles peduncled, globular, mucronate.

17. Fucus volubilis. Frond flat, ſpiral, perfoliate, repand toothed.

18. Fucus venoſus. Frond flat, oblong, painted with warty veins.

19. Fucus contortus. Fronds flat, nerveleſs, proliferous towards the top, a little twiſted at the axils, denticulate on the margin, ſomewhat undulate both ſides.

20. Fucus ruſcifolius. Stem branched, winged; leaves oblong-oval, obtuſe, flat, entire, proliferous with pellucid concatenate veins: tubercles globular, ſeſſile.

21. Fucus hyplogoſſum. Branched, winged: leaves linear-lanceolate, flat, entire, proliferous, with reticulate veins: tubercles globular, ſeſſile.

22. Fucus palmetta. Stem round ſimple; the tips expanded into nerveleſs many-cleft leaves: fertile tubercles on the extreme ſegments.

23. Fucas ovalis. Frond filiform, a little compreſſed with uniform vague branches: leaves oval-oblong, fleſhy, entire; upper ones crowded.

24. Fucus lendigerus. Stem filiform, branched: leaves lanceolate, ſerrate: veſicles racemed, ſiliculous, tubercled.

25. Fucus tenuiſſimus. Frond filiform, much branched; branches alternate, capillary, acute: leaves tapering to both ends, bearing ovate-oblong tubercles.

26. Fucus daſyphyllus. Frond round, filiform, branched; branches nearly ſimple: leaves cylindrical, tapering to the baſe, ſcattered, proliferous.

27. Fucus natans. Filiform, compreſſed, pinnate: leaves oblong-lanceolate, ſerrate: veſicles globular, peduncled, ſcattered, on flat dilated peduncles.

28. Fucus acinarius. Filiform, branched: leaves linear, very entire: veſicles globular, peduncled.

29. Fucus ſalicifolius. Stem ſimple, flattiſh: leaves lance-linear, very entire: veſicles globular, axillary, ſeſſile.

30. Fucus turbinatus. Filiform, ſlightly branched: veſicles racemed, one of them turbinate, peltate, with a heart-ſhaped crenate leaf.

31. Fucus bacciferus. Round, filiform, rigid, much branched: leaves linear-lanceolate, ſerrate: veſicles globular, very numerous, on round peduncles.

32. Fucus ſiliquoſus. Compreſſed, branched: leaves two-rowed, alternate, entire: veſicles peduncled, oblong, hollow; pods lanceolate, ſolid.

33. Fucus filiculoſus. Filiform-compreſſed: leaves alternate, ſlightly ſerrate: veſicles nearly globular, peduncled, mucronate.

34. Fucus ſubrepandus. Compreſſed; branches alternate: leaves linear-lanceolate, ſomewhat repand-toothed: veſicles peduncled.

35. Fucus roſa marina. Round, fleſhy, branched: leaves perfoliate, about three in a whorl, marked with a ring in the middle.

36. Fucus ſpermophorus. Membranous, compreſſed, forked, capillary: leaves linear, many-cleft: globules peduncled, lateral.

37. Fucus abrotanifolius. Filiform, compreſſed, doubly pinnate; extreme branchlets veſicular: veſicles innate, elliptic, ending in many-parted tubercled leaflets.

38. Fucus diſcors. Round, branched: leaves linear-lanceolate, ſerrate, alternately pinnatifid; upper ones capillary, many-cleft ovate and tubercled at their tips.

39. Fucus marginalis. Somewhat cartilaginous: frond filiform, round, compreſſed, much branched, beſet on the lateral margin above with umbilicate tubercles.

40. Fucus muſciformis. Membranous, filiform, much branched; branches ſetaceous; margins of the ſtem and branches ciliate.

41. Fucus mucronatus. Round, much branched; branches filiform, ſpinous, the extreme ones veſicular: veſicles innate, lanceolate, filiform, ending in a ſimple tubercled point.

42. Fucus barbatus. Round, much branched, unarmed; branches filiform, tubercled at top: tubercles cluſtered into an ovate cuſpidate pod.

43. Fucus ſelagnoides. Round, much branched; branches panicled, with alternate ſubulate ſomewhat tetraſtichous ſpines tubercled at the baſe; upper ones cloſely imbricate.

44. Fucus tamariſcifolius. Round, much branched; branches filiform, ſpinous, the extreme ones veſicular: veſicles

FUCUS, FULICA, AND FURIA.

1. The purple Gallinule or Sultana Hen. 2. The crested Coot. 3. Fucus canaliculatus.
4. Fucus obtusus. 5. Fucus bracteatus. 6. The Furia infurnalis.

London Published as the Act directs. Jan.ʸ 18 1806. by J. Wilkes.

veſicles roundiſh, innate, ending in ſubulate ſpines tubercled at the baſe.

45. Fucus fibroſus. Round, unarmed, much branched: veſicles roundiſh, moniliform, innate: leaves entire, lower ones linear-lanceolate, uper ones ſetaceous.

46. Fucus ligulatus. Somewhat cartilaginous, flat, veinleſs, bipinnate-ligulate; ligules oppoſite, two-rowed, the extreme ones linear-lanceolate and ſpinous-toothed.

47. Fucus eſculentus. Simple, undivided, enſiform, on a pinnate ſtalk; diviſions two-rowed, oblong, veinleſs.

48. Fucus ceranoides. Somewhat forked, linear, entire, ſcatteredly pinnate; diviſions many-cleft, ſomewhat radiate, tubercled linear-lanceolate rather tumid and pointed at their tips.

49. Fucus membranaceus. Linear, forked, membranous, dotted, diaphanous, very tender, with an undulate nerve ſcatteredly proliferous.

50. Fucus alatus. Membranous, very tender, ſomewhat forked, with alternate decurrent ſegments: tubercles globular, ſeſſile.

51. Fucus dentatus. Membranous, branched, almoſt nerveleſs, alternately pinnatifid; branchlets linear, cut at top, with acute ſegments: fruit racemed.

52. Fucus laceratus. Membranous, very tender, ſlightly veined, with linear obtuſe branches, undulate and curled-laciniate on their margins: tubercles immerſed.

53. Fucus laciniatus. Membranous, branched, veinleſs; branches dilated, palmate, obtuſe with flat margins: tubercles in the marginal fringe.

54. Fucus bifidus. Membranous, dilated, cloven, with divaricate obtuſe ſegments: tubercles marginal, ſcattered.

55. Fucus polyphyllus. Cartilaginous; ſtem roundiſh, flat and toothed towards the top: leaves gradually dilated, entire.

56. Fucus flagellum. Stem ſimple, leafleſs, ſubcoriaceous.

57. Fucus aceroſus. Leafleſs: ſtems round, branched; branches two-rowed, crowded, every where beſet with filiform ſpreading briſtles.

58. Fucus fragilis. Stems filiform, forked, brittle, flat-topped, leafleſs.

59. Fucus debilis. Stems round, branched, ſomewhat flat-topped, tubular weak, leafleſs.

60. Fucus cuneiformis. Leafleſs; branches alternate, three-ſided, jointed; joints wedge-form; angles ſubulate, toothed.

61. Fucus viſcidus. Stems round, forked, flat-topped, branched, two-horned at top.

62. Fucus prolifer. Frondeſcent, green, with ovate flat proliferous joints.

63. Fucus hypnoides. Stem and branches vaguely ſcattered, filiform, round-compreſſed, cartilaginous, pinnate, with ſubulate ſegments.

64. Fucus flavus. Spongy: branches erect, ſomewhat five-angled, laciniate-toothed, areolate, poliſhed.

65. Fucus ciliatus. Membranous, tough, pinnate, clothed and fringed with ſcattered ſubulate moſtly ſimple proceſſes bearing the ſeeds in a globular tubercle.

66. Fucus palmatus. Membranous, glabrous both ſides, palmate; ſegments oblong, nearly ſimple.

67. Fucus edulis. Fleſhy, wedge form, nearly ſimple, glabrous both ſides, rounded at top, entire at the margin.

68. Fucus angulatus. Stem flattiſh: branches divaricate, forked, cloven at top: tubercles lateral and axillaſcattered, minute, opake.

69. Fucus faſcia. Somewhat leathery, ſimple, linear, tapering to both ends, undulate, entire, without ſtem.

70. Fucus phyllitis. Membranous, thin, ſimple, linear-lanceolate, entire, on a ſhort compreſſed ſtem.

71. Fucus ſaccharinus. Leathery, ſimple, ſword-ſhaped, on a round rigid ſtem.

72. Fucus digitatus. Cartilaginous, palmate, with ſword-ſhaped ſegments, on a round ſtalk: root fibrous.

73. Fucus bicornis. Membranous, powdery, dilated, cloven at top.

74. Fucus ſerrulatus. Stems round, branched: leaves linear, ſimple, ſerrulate.

75. Fucus linearis. Flat, linear, forked, taper, acute.

76. Fucus plumaris. Stem round, creeping, branched upwards; branches feather-like, leafy.

77. Fucus folifer. Fronds flat, gradually dilated, forked; the extreme ones warty, with a linear lanceolate entire leaf at the margin and top.

78. Fucus truncatus. Membranous, three and four-forked, with truncate ſegments crenate-curled at top.

79. Fucus glacialis. Flat, linear, forked, many-cleft, much branched, with a very fine fringe.

80. Fucus filicinus. Leathery, nearly cylindrical, much branched; branches ſpread into an orb, with frondoſe ſegments near the tip.

81. Fucus fruticuloſus. Leathery, round, filiform, decompoundly branched above; branches nearly ſetaceous, with alternate lax branchlets, and ſmall pinnate denticulate ſubdiviſions.

82. Fucus bulboſus. Palmate, with enſiform ſegments: ſtem flat, undulate on the margins below; root bulbous, rough.

83. Fucus rubens. Somewhat membranous, forked, proliferous in a chain-like manner; branches elliptic; branchlets dilated and cloven at top.

84. Fucus Norvegicus. Cartilaginous, forked: branches linear, entire, rounded at top: tubercles hemiſphærical, ſeated on the diſk.

85. Fucus criſpus. Cartilaginous, forked, curled-undulate: branches dilated, entire: tubercles ſolitary, ſcattered, immerſed, concave on one ſide.

86. Fucus mamilloſus. Cartilaginous, forked, channelled on one ſide: branches dilated, entire, clothed on both ſides with mamillary tubercles.

87. Fucus geniculatus. Stem and branches jointed: frond forked, pellucid, equal: veſicles terminal.

88. Fucus lortus. Forked, linear, acute, tubercled on all ſides, with a cup-like baſe.

89. Fucus triqueter. Frond, two-edged, branched: leaves petioled, denticulate: veſicles immerſed, oblong, three-ſided.

90. Fucus racemoſus. Stem round, creeping-branched, leafleſs: veſicles obovate, in crowded racemes.

91. Fucus trinodis. Stem round, branched; branches with three inflected veſicles, ſubulate at top.

92. Fucus ſeticuloſus. Round, branched, ſcatteredly warty; branches dilated at the baſe into a papillous veſicle.

93. Fucus pyriferus. Filiform, forked: leaves enſiform, ſolitary, ſerrate; terminal-ones inflated, petioled.

94. Fucus pygmæus. Cartilaginous, forked, dilated and palmate at top: tubercles globular, terminal perforated at top.

95. Fucus burſa-paſtoris. Branched above; branches pinnate-branched: branchlets denticulate, with kidney-form winged ſeſſile mucronate ſcales at the top of the extreme ones.

96. Fucus triangularis. Stem and branches linear, three-ſided, ſerrate, imbricate three-ways with ſpreading two-pointed denticles: globules ſerrate, ſeſſile.

97. Fucus capitatus. Stem round-depreſſed; branches round, ſubulate, alternate, much crowded; veſicles racemed.

98. Fucus corymbiferus. Linear, flat, forked, long, black: leaves alternate, diſtant, ending in denticles: globules terminal, crowded.

99. Fucus dentatus. Membranous, nerveleſs, red, ſomewhat pinnate, with denticulate thickly dotted ſegments.

100. Fucus pilularia. Flat, with alternate branches: frond pinnatifid, with lanceolate ſerrate mucronate ſegments: globules ſolitary and in pairs, ſeſſile and pedunced.

101. Fucus hirſutus. Filiform, round, forked every where clothed with thick hair.

102. Fucus ericoides. Filiform, much branched, hairy.

103. Fucus aculeatus. Cartilaginous, filiform, much branched: branches linear, with marginal ſubulate erect ſpines.

104. Fucus pinnatifidus. Cartilaginous, branched; branches nearly alternate, doubly pinnatifid; ſegments obtuſe, callous, with ovate ſeſſile tubercles.

105. Fucus corneus. Somewhat horny, much branched; branches tapering to both ends, nearly doubly pinnatifid; ſegments oppoſite, ſpread, obtuſe, tubercled at top.

106. Fucus cartilagineus. Cartilaginous, repeatedly pinnate, naked below; ſubdiviſions alternate, compreſſed, nearly linear; ultimate ones ſhort, obtuſe, tubercled at top.

107. Fucus coronopifolius. Cartilaginous, much branched; branches much divided, obſcurely veined, dilated when barren: tubercles globular, on ſhort two-rowed forked or pointed ſtalks.

108. Fucus coccineus. Somewhat cartilaginous, much branched; ultimate branches ſubulate, alternately pectinate on one ſide; tubercles globular, ſeſſile. See Botany Plate X. fig. 26.

109. Fucus crinitus. Cartilaginous, flat, much branched; branchlets with ſimple and forked teeth: tubercles ſcattered.

110. Fucus ſpinuloſus. Cartilaginous, much branched, depreſſed below; branches flattened, ſpread; branchlets nearly oppoſite, pinnately ſetiferous each ſide: briſtles ſubulate, thickened at top.

111. Fucus vermicularis. Soft, pellucid: ſtems round, branched: fronds round, alternately pinnate, petioled, very ſhort, tumid at top.

112. Fucus ſpinoſus. Cartilaginous, leafleſs, branched, with whorled denticles three together.

113. Fucus ſpermophorus. Membranous, forked, compreſſed, capillary: tubercles peduncled, lateral: leaves linear, many-cleft.

114. Fucus cæſpitoſus. Round, branched, with crowded warts tapering to both ends ſimple and branched.

115. Fucus papilloſus. Round, branched, every where clothed with ſpiral rows of warts many-lobed at top.

116. Fucus uvifer. Round, with ſcattered branches, and crowned ovate tubercles.

117. Fucus plumoſus. Rather cartilaginous, repeatedly branched; branches doubly pinnate; ultimate ſegments oppoſite ſubulate, ending in tubercles which are four-cleft when ripe.

118. Fucus tomentoſus. Roundiſh, equal, downy, forked, obtuſe.

119. Fucus tuberculatus. Filiform, forked, unequal in length; angles of the forks rather obtuſe; tips oblong, obtuſe, fruiting.

120. Fucus rotundus. Filiform, forked, flat topped; angles of the forks roundiſh; tips forked, acute, with lateral deformed warts.

121. Fucus faſtigiatus. Filiform, forked, much branched, obtuſe.

122. Fucus lanoſus. Capillary, forked, much branched, rough.

123. Fucus lumbricalis. Filiform, forked, flat-topped; angles of the forks acute; tips fruiting, linear-lanceolate, round.

124. Fucus plicatus. Somewhat horny, filiform, equal, much branched; branchlets rather leaning to one ſide, entangled: tubercles lateral and terminal.

125. Fucus confervoides. Filiform, much branched; branches and branchlets rather leaning one ſide, tapering to both ends: tubercles hemiſphærical, lateral, ſeſſile.

126. Fucus flagelliformis. Filiform, ſlippery, branched; branches, two-rowed, moſtly alternate, long, ſimple or divided, obtuſe.

127. Fucus Filum. Slippery, ſomewhat cartilaginous, filiform, tapering to both ends, tubular, ſomewhat jointed within.

128. Fucus Lycopodioides. Filiform, branched, every where clothed with prominent briſtles: branches moſtly ſimple.

129. Fucus pinaſtroides. Filiform, branched, every where clothed with ſubulate ſimple briſtles rather leaning to one ſide; branches involute at top.

130. Fucus ſubfuſcus. Filiform, much branched; branchlets moſtly alternate, ſubulate, ſhort: fruit axillary, in ſmall oblong pointed cluſtered pods.

131. Fucus coralloides. Stems ſomewhat three-ſided: branches alternately ſpread; branchlets denticulate each ſide, forked at top.

132. Fucus plicatus. Capillary, uniform, much branched, entangled, nearly tranſparent.

133. Fucus rudis. Roundiſh, much branched; branchlets alternate, faſcicled, very ſhort, tubercled, rough.

134. Fucus aphyllanthos. Cartilaginous, round, entangled: ultimate branches ſubulate, thickened at top, or divaricate two ways, with tranſparent tubercles at the divarications.

135. Fucus Serra. Cartilaginous, ſimple, proſtrate, beſet with ſubulate briſtles oppoſite by pairs.

136. Fucus ſertularioides. Cartilaginous, erect, depreſſed, very thin, branched; fronds briſtle-like, imbricate, pinnate; diviſions numerous, incurved, entire.

137. Fucus Wigghii. Filiform, tender, much branched; branchlets ſetaceous, nearly ſimple, ſcattered, with lanceolate pointed tubercles at their tips.

138. Fucus aſparagoides. Filiform, tender, much branched; branchlets ſetaceous, oppoſite, alternately tipt with globular tubercles.

139. Fucus pedunculatus. Filiform, pinnately branched; branches capillary, clothed with obovate ſlightly-peduncled tubercles, filamentous at top.

140. Fucus Bailloviana. Stem flattiſh above, branched; filaments pencil-form, very minute, crowded, lax, floating.

141. Fucus Baſtera. Stem round, branched at top: tubercles one-ſeeded, ovate, alternate.

142. Fucus capillaris. Filiform, alternately much branched; branchlets ſomewhat two-rowed, ſubulate, ſhort.

143. Fucus Thrix. Filiform, tubular, unbranched, capillary, many threads from the ſame baſe. Probably a Conferva.

144. Fucus clavelloſus. Filiform, tender, tubular, much branched; branches and branchlets ſomewhat alternate and two rowed: tubercles lateral cup-ſhaped.

145. Fucus articulatus. Tubular, concatenately jointed, with ovate-cylindrical joints: branches uniform, forked and whorled.

146. Fucus Opuntia. Somewhat compreſſed, ſolid, jointed, much branched; joints obſoletely lanceolate: branches horizontal, pointed.

147. Fucus amphibius. Capillary, much branched: branches and branchlets alternate, involute at their tips.

148. Fucus fruticuloſus. Filiform, branched; branches alternately repeatedly pinnate; ultimate branchlets many-cleft, ſetaceous; tubercles ſeſſile, ovate.

149. Fucus viridis. Repeatedly pinnate, with all the diviſions oppoſite and capillary.

Several of the ſpecies which appear in Gmelin have been removed to other genera. See ULVA, TREMELA, LEPRARIA, CONFERVA, LICHEN, RUPPIA, TREMELLA, ULVA, ZOSTERA, and RHIZOPHORA.

To FUD'DLE, *v.a.* [Of unknown etymology.] To make drunk:

The table floating round,
And pavement faithleſs to the *fuddled* feet. *Thomſon.*

To FUD'DLE, *v.n.* To drink to exceſs.—Men will be *fuddling* ſtill. *L'Eſtrange.*

FU'DIA, a ſmall mountainous iſland of Scotland: two miles north of Barra.

FUE'GO,

FUE'GO, or TERRA DEL FUEGO, a large iſland, ſeparated from the ſouthern extremity of America by a narrow ſea, called the *Straits of Magellan*; and ſo named from the volcanoes obſerved on it. The aſpect of the country is repreſented as dreary and uncomfortable, conſiſting of a chain of ſtupendous rocks, and continually covered with ſnow. Along the coaſts are a great number of inlets, or harbours, for the largeſt ſhips, with rocks near the ſhore, which, however, may be diſcovered by ſounding. The inhabitants are ſaid to be naturally as fair as Europeans, but that they go naked, and paint their bodies with the moſt gorgeous colours. Thoſe on the ſouth ſide are ſaid to be uncivilized, treacherous, and barbarous; while thoſe on the oppoſite ſide are ſimple, affable, and perfectly harmleſs. The ſkins of wild animals are ſometimes uſed to cover their bodies, upon occaſions of extraordinary pomp; and their tents are made of poles, diſpoſed in a conical form, covered with ſkins, or the bark or leaves of trees. Sir Joſeph Banks, Dr. Solander, and ſome others, landed here in the month of January, 1768, which is the time of ſummer in that part of the globe, notwithſtanding which two of the company died of the cold only by ſleeping one night, and Dr. Solander himſelf hardly eſcaped. Lat. 52. 30. to 55. 35. S. lon. 51. 20. to 58. W. Ferro.

FUE'GO, or FOGO, or St. PHILIP, one of the Cape Verd iſlands. The former name it received from a volcano, and the laſt from being diſcovered on St. Philip's day. The volcano iſſues from a lofty mountain, and throws out flames, which may be ſeen at a great diſtance in the night, clouds of aſhes, which ſuffocate cattle, pumice-ſtones, which float on the ſea, and torrents of ſulphur. The iſland is without rivers, almoſt without freſh water; nevertheleſs, it is fertile in maize, gourds, water melons, wild figs, oranges, and apples. There is a great number of goats, which run wild upon the mountains; but the profit on their ſkins is a revenue of the crown. They export alſo the ſkins of cattle, horſes, aſſes, and hogs. The iſland is about five leagues in length. Lat. 15. 10. N. lon. 24. 20. W. Greenwich.

FU'EL, *ſ.* [from *feu*, fire, Fr.] The matter or aliment of fire.—This ſhall be with burning and *fuel* of fire. *Iſa.* ix. 5.

Mov'd by my charms, with them your love may ceaſe;
And as the *fuel* ſinks the flame decreaſe. *Prior.*

To FU'EL, *v. a.* To feed fire with combuſtible matter.—The *fuel'd* chimney blazes wide. *Thomſon.*

And yet ſhe cannot waſte by this,
Nor long endure this torturing wrong;
For more corruption needleſs is,
To *fuel* ſuch a fever long. *Donne.*

To ſtore with firing.—Some are plainly œconomical, as that the ſeat be well watered, and well *fuelled*. *Wotton.*—If any perſon ſhall ſell billet-wood or faggots for *fuel* under the aſſize, &c. on preſentment thereof upon oath by ſix perſons ſworn by a juſtice of peace, the party may be ſet on the pillory in the next market town, with a faggot, &c. bound to ſome part of his body. None are to buy *fuel* but ſuch as will burn it, or retail it to thoſe who do, on pain to forfeit the treble value; alſo no perſon may alter any mark or *aſſiſe of fuel*, on the like forfeiture. 7 *Edw.* VI. c. 7: 43 *Eliz.* c. 14. See the article BILLET-WOOD, vol. iii. p. 39.

FU'ELOE, one of the Faroe Iſlands, in the North Sea.

FUEILLEMO'RTE, *ſ.* [French.] Corruptly pronounced and written *philomot*.—*Fueillemorte* colour ſignifies the colour of withered leaves in autumn.

FU'EN, a river of China, which runs into the Hoang, in the province of Chan-ſi. Lat. 35. 29. N. lon. 128. E. Ferro.

FU'EN-HO'A, a city of China, in the province of Petcheli, celebrated for its extent and the number of its inhabitants, as well as for the beauty of its ſtreets and triumphal arches. It is ſituated near the great wall, amidſt mountains; and has under its juriſdiction, beſides two cities of the ſecond and eight of the third claſs, a great number of fortreſſes, which bar the entrance of China againſt the Tartars.

FUENCALIEN'TE, a town of Spain, in Old Caſtile, near the ſource of the Xalon: three leagues north of Siguenca.

FUENSA'LIDA, a town of Spain, in New Caſtile: eighteen miles north-north-weſt of Toledo.

FUEN-TCHEOU', a city of China, of the firſt rank, in the province of Chan-ſi, ſituated on the river Fuen; celebrated for its hot baths: 280 miles ſouth-weſt of Peking. Lat. 37. 20. N. lon. 129. 6. E. Ferro.

FU'EN-SI', a town of China, of the third rank, in the province of Chan-ſi: twelve miles weſt-north-weſt of Tcho.

FUEN'TE (La), a town of Spain, in the province of Auſtria: twenty miles ſouth-weſt of Santillana.

FUEN'TE-DUEN'NA, a town of Spain, in New Caſtile, ſituated on the Tagus: twenty-four miles ſouth-eaſt of Madrid.

FUEN'TE GINAL'DO, a town of Spain, in the province of Eſtremadura, uſed in the war of ſucceſſion by the Spaniards as a depot of corn and cattle. In 1734, it was taken and plundered by the Portugueſe, under the conduct of the marquis das Minas: ſixteen miles north-weſt of Coria.

FUEN'TE EL OL'MO, a town of Spain, in Old Caſtile, between Segovia and Aranda de Duero.

FUEN'TE-OVEJU'NA, a town of Spain, in the province of Cordova: thirty-two miles north-weſt of Cordova.

FUEN'TE DE LA PIE'DRA, a village of Spain, in the province of Grenada, in which is a medicinal ſpring, whoſe virtues were known to the ancients, and celebrated for curing ſeveral diſorders, particularly the gravel: two leagues from Antequera.

FUEN'TE DEL SABU'CO, or FUENTE de SABURRO, a town of Spain, in the kingdom of Leon: ſixteen miles from Salamanca.

FUENTEL'SO, a town of Spain, in Old Caſtile: thirty-two miles north of Avila.

FUEN'TES, a town of Spain, with a Carthuſian monaſtery, in the kingdom of Aragon, on the Ebro: twenty miles ſouth-ſouth-eaſt of Saragoſſa.

FUEN'TES, a town of Spain, in the province of Leon: thirteen miles north-weſt of Palencia.

FUEN'TES-DE-ONO'RO, a town of Spain, in the province of Leon: thirteen miles weſt of Civdad Rodrigo.

FUR'SBRUNN, a town of Germany, in the archduchy of Auſtria: two miles north-eaſt of Haderſtorf.

FUES'SEN, or FUSSEN, a town of Germany, in the circle of Swabia, and biſhopric of Augſburg, ſituated on the Lech: and a frontier town to Bavaria and the Tyrolese, with a Benedictine abbey and convent of Franciſcans. In 1745, a peace between Auſtria and Bavaria was ſettled in this town: forty-ſeven miles ſouth of Augſburg, and ſixty-five eaſt of Conſtance. Lat. 47. 34. N. lon. 28. 25. E. Ferro.

FU'ESSLY (John-Gaſpard), an ingenious artiſt and writer, born at Zurich in 1706. Having ſtudied the principles of the graphic art under his father, he left his native country in his eighteenth year, and proceeded to Vienna, unfriended and without ſupport. In this city he ſoon attracted the notice of the principal nobility, and it is probable he would have ſpent his whole life there, had not the prince of Schwarzenberg prevailed on him to accept an invitation to go to Raſtadt. At this place he was a favourite with the court; and received every mark of reſpect. From hence he removed to Nuremberg, where he formed an intimate friendſhip with the celebrated Rupezki, under whom he ſtudied with a view to improve himſelf in his profeſſion. At the end of eighteen months he reſolved to pay a viſit to Augſburg and Munich, and then to return to Swiſſerland, where he arrived in the thirty-

thirty-fourth year of his age, and ſoon after married. In conſequence of his talents, he was highly reſpected by moſt of the eminent artiſts. Mengs made him a preſent of a manuſcript treatiſe On the Beautiful, which Fueſsly publiſhed, with a preface; and Winkelman lived with him in habits of the cloſeſt intimacy. He had as much taſte for the beauties of poetry as for thoſe of painting, and maintained an epiſtolary correſpondence with Kleiſt, Klopſtock, Wieland, Bodmer, and Breitinger. Perſons of the higheſt rank, among whom were cardinal Koth and count Firmian of Milan, thought him worthy of their friendſhip. In 1740, and 1742, he loſt two of his beſt friends, Rupezki and Rugendas, both men of the firſt eminence in the art, and whom he highly loved and eſteemed. Being deſirous that their talents and virtues might not remain unknown to poſterity, he wrote a biographical account of them, and as this firſt eſſay in the department of literature met with a favourable reception, he conceived a ſtrong deſire of reſcuing from oblivion ſome of his meritorious countrymen, by publiſhing as complete a hiſtory as poſſible of the artiſts of Swiſſerland. In this work, which he completed with great labour and patience, he ſhewed himſelf a good writer and a ſound critic in the arts. He died at Zurich on the 6th of May, 1782.

FU'ESSLY (John Gaſpar), ſon of the former, a bookſeller at Zurich, who died in the month of April, 1786, has made himſelf known by his works on entomology. Theſe are: 1. *Magazin für die Liebhaber der Entomologie*, Magazine for the Lovers of Entomology, 2 vols. Zurich and Winterthour, 1778, 1779, with coloured plates, 8vo. 2. *Neur Magazin für die Liebhaber der Entomologie*, New Magazine for the Lovers of Entomology, 3 vols. 1786. 3. *Archiv der Inſekten Geſchichte*, Archives of the Natural Hiſtory of Inſects, Zurich and Winterthour, 1781, 1786, in eight numbers, 4to, with many coloured and uncoloured plates. A French tranſlation of this work was publiſhed at Winterthour in 1794.

FUGA'CIOUS, *adj.* [*fugax, fugacis*, Lat.] Volatile.—Its beauties are not of the *fugacious* kind. *Warton on Pope.*

FUGA'CIOUSNESS, *ſ.* [*fugax*, Lat.] Volatility; the quality of flying away.

FUGA'CITY, *ſ.* [*fugax*, Lat.] Volatility; quality of flying away.—Spirits and ſalts, which, by their *fugacity*, colour, ſmell, taſte, and divers experiments that I purpoſely made to examine them, were like the ſalt and ſpirit of urine and ſoot. *Boyle.*—Uncertainty; inſtability.

FUGA'LIA, in Roman antiquity, a feaſt ſuppoſed to be the ſame with the *refugium*, held on the 24th of February, in memory of the expulſion of the kings and the aboliſhing of monarchical government. Others diſtinguiſh the fugalia from the regifuge. And others again think, that the fugalia was the ſame with the *poplifugia*, or the feaſt of Fugia, the goddeſs of joy, occaſioned by the rout of an enemy, which was the reaſon the people abandoned themſelves to riot and debauchery.

FU'GAM FE'CIT, in law, is where it is found by inquiſition, that a perſon *fled* for felony, &c. And if *flight* and felony be found on an indictment for felony, or before the coroner, where a murder is committed, the offender ſhall forfeit all his goods, and the iſſues of his lands, till he is acquitted or pardoned: and it is held, that when one indicted of any capital crime, before juſtices of *Oyer, &c.* is acquitted at his trial, but found to have fled, he ſhall, notwithſtanding his acquittal, forfeit his goods: but not the iſſues of his lands, becauſe by acquittal the land is diſcharged, and conſequently the iſſues. 3 *Inſt.* 218. The party may in all caſes, except that of the coroner's inqueſt, traverſe the finding of a *fugam fecit*; and the particulars of the goods found to be forfeited, may be always traverſed; alſo whenever the indictment againſt a man is inſufficient, the finding of a *fugam fecit* will not hurt him. 2 *Hawk. P. C.* c. 49. Making default in appearance or indictment, &c. whereby *outlawry* is awarded, is a *flight in law*. See the article OUTLAWRY.

FU'GAS, a river of Africa, which runs into the Indian Sea, near Jubo, on the coaſt of Zanguebar.

FUGA'TION, *ſ.* [*fugo*, Lat. to fly.] The act of putting to flight; the act of eſcaping by flight. *Scott. Not much uſed.*

FUGH, *interj.* [perhaps from φεῦ.] An expreſſion of abhorrence. Commonly *foh*.—A very filthy fellow: how odiouſly he ſmells of his country garlic! *fugh*, how he ſtinks of Spain! *Dryden.*

FU'GITIVE, *adj.* [*fugitif*, Fr. *fugitivus*, Lat.] Not tenable; not to be held or detained.—Our idea of infinity is a growing and *fugitive* idea, ſtill in a boundleſs progreſſion, that can ſtop no where. *Locke.*

Happineſs, object of that waking dream,
Which we call life, miſtaking; *fugitive* theme
Of my purſuing verſe, ideal ſhade,
Notional good, by fancy only made. *Prior.*

Unſteady; unſtable; not durable. Volatile; apt to fly away.—The more tender and *fugitive* parts, the leaves, of many of the more ſturdy vegetables, fall off for want of the ſupply from beneath: thoſe only which are more tenacious, making a ſhift to ſubſiſt without ſuch recruit. *Woodward.*—Flying; running from danger:

Whilſt yet with Parthian blood thy ſword is warm,
The *fugitive* Parthians follow. *Shakeſpeare.*

Flying from duty; falling off.—Can a *fugitive* daughter enjoy herſelf, while her parents are in tears? *Clariſſa.*—Wandering; runnagate; vagabond.—The moſt malicious ſurmiſe was countenanced by a libellous pamphlet of a *fugitive* phyſician. *Wotton.*

FU'GITIVE, *ſ.* One who runs from his ſtation or duty.—Unmarried men are beſt friends, beſt maſters, beſt ſervants, but not always beſt ſubjects; for they are light to run away, and almoſt all *fugitives* are of that condition. *Bacon.*

Back to thy puniſhment,
Falſe *fugitive!* and to thy ſpeed add wings,
Leſt with a whip of ſcorpions I purſue
Thy ling'ring. *Milton.*

One who takes ſhelter under under another power from puniſhment.—Your royal highneſs is too great and too juſt, either to want or to receive the homage of rebellious *fugitives*. *Dryden.*—One hard to be caught or detained:

What muſe but his can nature's beauties hit,
Or catch that airy *fugitive*, call'd wit. *Harte.*

FU'GITIVES *over Sea.* By two ancient ſtatutes, 6 Edw. III. c. 10: 5 Rich. II. ſt. 2. c. 2: to depart this realm over the ſea, without the king's licence, except it were great men and merchants, and the king's ſoldiers, incurred forfeiture of goods: and maſters of ſhips, &c. carrying ſuch perſons beyond ſea, forfeited their veſſels; alſo if any ſearcher of any port, negligently ſuffered any perſons to paſs, he ſhould be impriſoned.

FU'GITIVENESS, *ſ.* Volatility; fugacity.—That divers ſalts, emerging upon the analyſis of many concretes, are very volatile, is plain from the *fugitiveneſs* of ſalt and of hartſhorn attending in diſtillation. *Boyle.*—Inſtability; uncertainty.

FU'GUE, *ſ.* [French; from *fuga*, Lat. to chaſe.] In muſic, is when, according to the rules of harmony, the different parts of a muſical compoſition follow each other, each repeating in order what the firſt had performed. See the article MUSIC.—The ſkilful organiſt plies his grave and fancied deſcant in lofty *fugues*. *Milton.*

Long has a race of heroes fill'd the ſtage,
That rant by note, and through the gamut rage;
In ſongs and airs expreſs their martial fire,
Combat in trills, and in a *fugue* expire. *Addiſon.*

FUH-SA'NAH, a town of Africa, in the country of Tunis: 110 miles weſt-ſouth-weſt of Tunis.

FUH-SE', a river of Germany, in the circle of Lower Saxony, which runs into the Allier, near Zell.

FUH'ME, a river of Germany, which runs into the Mulda,

Mulda, two miles ſouth of Ragune, in the electorate of Saxony.

FUI'CHT, or WALDFUCHT, a town of Germany, in the circle of Weſtphalia: three miles eaſt of Sufteren.

FUILLE'E (La), a town of France, in the department of the Lower Seine, and chief place of a canton, in the diſtrict of Gournay: three leagues weſt of Gournay.

FUIRE'NA, *ſ.* [So named by Rotböll in memory of *George Fuiren*, a learned Dane.] In botany, a genus of the claſs triandria, order monogynia, natural order calamariæ, (cyperoideæ, *Juſſ.*) The generic characters are—Calyx: ament oblong, cylindric, imbricate; ſcales channelled, wedge-ſhaped, three-keeled, awned at the tip; awn cylindric, ſtraight, ſhorter than the glume; flowers between the ſcales, ſolitary, very ſmall, ſitting on a tubercle; glume, beſides the amentaceous ſcales, none. Corolla: glume three-valved; valves petal-ſhaped, obcordate, ſomewhat membranaceous, flat, quite entire, ending in an awn that is bent in. Stamina: filaments three, linear, inſerted into the receptacle between the corolline valves; antheræ linear, erect. Piſtillum: germ large, three-cornered; ſtyle filiform; ſtigmas two, revolute. Pericarpium: none, except the withered corolla, incloſing the ſeed. Seed: three-cornered, naked, without any villoſe hairs.—*Eſſential Character.* Ament imbricate, with awned ſcales; calyx none. Corolla, with three petal-ſhaped obcordate glumes, ending in a tendril.

Fuirena paniculata, a ſingle ſpecies. It is a lofty graſs. Leaves on the ſtem, with looſe, pitcher-ſhaped, hairy ſheaths; panicles terminating and axillary, compoſed of cylindric ſcabrous ſpikelets: theſe are oblong, about three lines in length, conglomerate, blackiſh, imbricate with obovate, concave, rigid ſcales, having three keels uniting at top into an awn. It has the appearance of a Scirpus. Native of Surinam, where it was obſerved by Rolander; and of Jamaica.

FU'LA, a ſmall iſland of Scotland, in the North Sea: twenty miles weſt from the larger Shetland iſland. Lat. 60. 8. N. lon. 0. 40. E. Edinburgh.

FUL'BERT, a learned prelate, by birth an Italian, who flouriſhed at the beginning of the eleventh century. He was a diſciple of the learned Gerbert, who aſcended the pontifical throne in 999, under the name of Sylveſter II. From Rome he journeyed to France, and delivered public lectures in the ſchools of the church of Chartres. His great reputation drew numerous ſcholars to him from all parts, who diffuſed the learning and information acquired under his inſtructions over France and Germany, and the other northern ſtates of Europe; ſo that he is entitled to be conſidered as one of the principal reſtorers of learning and of the ſciences in his time. In 1007, a vacancy taking place in the ſee of Chartres, Fulbert was appointed to that dignity, and governed his church with great vigilance and prudence for more than one-and-twenty years. He was alſo made treaſurer of St. Hilary, at Poitiers, which benefice he retained in conjunction with his biſhopric, and expended its profits in rebuilding the cathedral church. He died in 1028; leaving many Sermons, Hymns, and other pieces, in proſe and verſe. The moſt valuable of his works is a collection of Letters by himſelf and correſpondents, one hundred and thirty-four in number, which ſhew in what eſtimation his character was held by the greateſt men of his time, among whom were Robert king of France, Canute king of England, Richard II. duke of Normandy, William duke of Aquitaine, and other eminent princes and prelates. His works were collected together, and publiſhed in a ſeparate form at Paris, 1608, in 8vo. by Dr. Charles de Villiers; and they are alſo inſerted in the ſeventeenth volume of the *Bibliotheca Patrum*. A Letter of his concerning eccleſiaſtical revenues, not inſerted in his works, is to be met with in the ſecond volume of Dachery's *Specilegium*; and another, written againſt the practice of ſome of his brother prelates who aſſumed the character of warriors, in the firſt volume of D. Merſenne's *Theſaurus Anecdotum*.

To biſhop Fulbert alſo has been aſcribed, The Life of St. Aubert, biſhop of Cambray, of which a mutilated edition was publiſhed by Surius.

FUL'CIBLE, *adj.* [from the Lat. *fulcio*, to prop.] Capable of being propped. *Bailey. Not much uſed.*

FUL'CIMENT, *ſ.* [*fulcimen*, *fulcimentum*, Lat.] That on which a body reſts, which acts or is acted upon at each end, as a balance or a lever.—The power that equiponderates with any weight, muſt have the ſame proportion unto it, as there is betwixt their ſeveral diſtances from the centre or *fulciment*. *Wilkins.*

FU'LCRUM, *ſ.* [from פלך *falk*, a ſtaff, Heb.] A prop. In mechanics, it is the fixed point about which a lever turns and moves.

FUL'CRUM, *ſ.* [from *fultum*, of *fulcio*, Lat. a prop, or ſupport.] In botany, it means ſeveral minute parts, with which vegetables are armed or ſupported. They are of ſeven kinds.—1. Stipula, or ſtipule. 2. Bractea, or bracte. 3. Spina, or thorn. 4. Aculeus, or prickle. 5. Cirrus, claſper, or tendril. 6. Glandula, a gland. 7. Pilus, hairs, or pubeſcence. In Delin. Pl. theſe are otherwiſe enumerated. 1. Petiolus, the petiole, leaf-ſtalk or foot-ſtalk. 2. Stipula. 3. Cirrus. 4. Pubes. 5. Arma, arms or inſtruments of defence; comprehending prickles, thorns, and ſtings. 6. Bractea. 7. Pedunculus, the peduncle, flower-ſtalk, and fruit-ſtalk. Theſe terms are all explained in the article Botany, vol. iii. where figures are given.

FUL'DA, a biſhopric and principality of Germany, in the circle of the Upper Rhine; bounded on the north by Heſſe Caſſel, on the eaſt by the county of Henneberg, on the ſouth by the biſhopric of Wurzburg, and on the weſt by the principality of Iſenberg and Heſſe; about forty miles in length, and from ſeven to twenty-five in breadth. The country is mountainous and woody, with ſome rich arable lands, and ſome ſalt and medicinal ſprings. The aſſeſſment in the matricula of the empire is 250 florins monthly, and the tax for each chamber term 243 rix-dollars four kruitzers. The biſhopric owes its riſe to a cloiſter of benedictine monks, erected in 744, which was raiſed to a biſhopric, in the year 1752, by pope Benedict XIV.

FUL'DA, a town of Germany, and capital of the biſhopric of the ſame name, ſituated on the river Fulda, in the circle of the Upper Rhine. It was only a village before the year 1162, when it was made a town. The biſhop reſides here in a handſome palace. Beſides the cathedral, it has a collegiate church, an univerſity, founded in 1734, a college, an academy, and a convent of benedictines. It is ſituated nearly in the centre of the dioceſe. The chapter is compoſed of thirteen canons. The library contains a number of ancient and rare manuſcripts. Fulda was taken by the hereditary prince of Brunſwick, and prince Charles of Bevern, in 1759, with little loſs on their ſide: the duke of Wurtemberg was preparing a grand entertainment and ball on the very day, but decamped precipitately. The loſs of the enemy was very conſiderable, four battalions being killed, or much wounded, and near 1000 made priſoners: ſixty-three miles eaſt-north-eaſt of Mentz, and forty-three eaſt of Wetzlar. Lat. 50. 22. N. lon. 27. 21. E. Ferro.

FUL'DA, a river of Germany, in the circle of the Upper Rhine, which paſſes by the town of Fulda, and joining the Werra at Minden, they together form the Weſer.

FUL'DA (Charles-Frederic), an ingenious German writer on language and philology, born in 1724, at Wimpfen in Swabia. He received the principles of his education in the Gymnaſium of Stutgard, and at Tubingen; and in 1748 was appointed chaplain to a regiment in Holland. His regiment being afterwards diſbanded, he made a tour through various parts of Germany, and in 1749 completed his ſtudies at Gottingen. In 1751 he was chaplain to the garriſon of Aſperg; and in 1757 and 1758 he obtained ſettlements at Einzengen, and Mühlhauſen. His firſt production was a prize diſſertation on the two princi-

pal dialects of the German language, which was crowned by the royal ſociety of Gottingen. The principal facts and moſt ingenious ideas contained in this eſſay he introduced, ſome years after, in his Dictionary of the German Roots. If the German language was much indebted to Fulda for this work, in which he made the firſt attempt to illuſtrate the philoſophy of its elements, its antiquity, and richneſs, it was not a little improved by the *Sprachforſcher*, or Enquiry into Language, which he publiſhed in conjunction with Naſt, ſenior, of Stutgard. His ſervice to the German language was ſtill farther increaſed by his *Idiotikon*. His philoſophical acuteneſs, extenſive knowledge of language and the hiſtory of it, and his indefatigable diligence in ſearching all the documents that could tend to illuſtrate the object of his purſuit, appear not only in his larger works, but in his ſmaller eſſays and papers, which were publiſhed at different times. He did not, however, confine his reſearches to language alone, but extended them to hiſtory and antiquities in general. Of this he gave various proofs in ſingle diſſertations, which appeared in various collections: ſuch as, On the Origin of the Goths; On the Veroneſe and Vicentine Cimbri; On the Deities of the Germans, &c. But the principal monument of his extenſive and well arranged treaſure of hiſtorical knowledge, ingenuity, and inventive genius, is contained in his Chart of Hiſtory, publiſhed at Augſburg in 1783. In his younger years he was accuſtomed, according to the method of his preceptor Goritz of Stutgard, to render different objects of knowledge eaſier to be retained in the memory by graphic repreſentations. At a period of greater maturity, he exhibited in a ſort of genealogical tree, the connection of all the ſciences, profeſſions, arts, and handicrafts. In a ſimilar manner he repreſented, in 1787, all the organs of ſpeech, with the origin of human language and ideas. His Chart of Hiſtory, a ſketch of which was ready in 1756, aroſe from a ſimilar origin. He died at Einzigen on the 11th of December, 1788. Though the philoſophy of language ſeemed to be the principal field which he cultivated, and which he rendered fruitful with ſo much ſucceſs, his extenſive genius embraced every thing that belongs to the department of the ſciences. He exerciſed his ingenuity alſo in things which one could hardly expect from an abſtract thinker. All the window and bed curtains in the houſe were of his own making; and he not only invented implements for weaving the fringes, but worked them himſelf. The tables, chairs, and ſofas, were alſo of his own conſtruction.

To FULFIL', *v. a.* To fill till there is no room for more. This ſenſe is now not uſed:

Six gates i' th' city, with maſſy ſtaples,
And correſponſive and *fulfilling* bolts,
Sparre up the ſons of Troy. *Shakeſpeare.*

To anſwer any prophecy or promiſe by performance.—They knew him not, nor yet the voices of the prophets which are read every ſabbath-day, they have *fulfilled* them in condemning him. *Acts*, xiii. 27.

The fury bath'd them in each other's blood;
Then having fix'd the fight, exulting flies,
And bears *fulfill'd* her promiſe to the ſkies. *Dryden.*

To anſwer any purpoſe or deſign.—Here nature ſeems *fulfill'd* in all her ends. *Milton.*—To anſwer any deſire by compliance or gratification:

If on my wounded breaſt thou drop'ſt a tear,
Think for whoſe ſake my breaſt that wound did bear;
And faithfully my laſt deſires *fulfil*,
As I perform my cruel father's will. *Dryden.*

To anſwer any law by obedience.—Love worketh no ill to his neighbour, therefore love is the *fulfilling* of the law. *Rom.* xiii. 10.

This I my glory account,
My exaltation, and my whole delight,
That thou in me well-pleas'd declar'ſt thy will
Fulfill'd, which to *fulfill* is all my bliſs. *Milton.*

FUL'FRAUGHT, *adj.* Fully ſtored:

Thy fall hath left a kind of blot
To mark the *fulfraught* man, the beſt endu'd,
With ſome ſuſpicion. *Shakeſpeare.*

FUL'GENCY, *ſ.* [*fulgens*, Lat.] Splendour; glitter.

FUL'GENT, *adj.* [*fulgens*, Lat.] Shining; dazzling; exquiſitely bright.—The illumination is not ſo bright and *fulgent* as to obſcure or extinguiſh all perceptibility of reaſon. *More.*

As from a cloud his *fulgent* head,
And ſhape ſtar-bright, appear'd. *Milton.*

FULGEN'TIUS, a Romiſh ſaint, and African prelate in the ſixth century, born at Lepte in Byzacena, about the year 468. Having loſt his father when very young, he was placed by his mother under able tutors in the Latin and Greek languages, and made extraordinary proficiency in both. He alſo poſſeſſed ſo ſtrong a memory, that when he was a boy he could repeat the whole of Homer; and he could converſe in the Greek language with purity and fluency. Reſolving to embrace a religious life, he early took the vows, and placed himſelf under the diſcipline of Fauſtus, a catholic biſhop, who had eſtabliſhed a monaſtery in the vicinity of Lepte. In 490, the perſecutions of the Arians againſt Fauſtus diſperſed his community, and Fulgentius entered into another monaſtery in the ſame neighbourhood, where the high opinion entertained of his ſanctity and merits, occaſioned his being appointed co-abbot with Felix, the ſuperior of that inſtitution. Before a long time had intervened, the incurſions of the Moors having ſcattered the religious of this monaſtery, Fulgentius embarked for Egypt, with the deſign of aſſociating with the monks in that country; but having put into Syracuſe on his voyage, he was diſſuaded from proceeding by Eulalius, biſhop of that city, becauſe the Egyptian monks had ſeparated from the communion of the church of Rome. After ſpending ſome time in Syracuſe he went to Rome in the year 500, and, having offered his devotion at the ſepulchres of the apoſtles, returned to Africa, where he eſtabliſhed a new monaſtery in the province of Byzacena. At this time Africa was under the dominion of Thraſimond king of the Vandals, who was an Arian, and a bitter enemy to the Catholics. He had iſſued a decree, by which it was forbidden to ordain new catholic biſhops to ſupply the places of thoſe who ſhould die; but the African prelates had come to a determination to pay no reſpect to his tyrannical mandate. Upon a vacancy taking place in the ſee of Ruſpa, he was, though very unwillingly, ordained biſhop of that place, in 504, according to Baronius, but according to other hiſtorians in 508. It was not long after his ordination, that, by a decree of Thraſimond, he was baniſhed, in common with the other catholic biſhops of Africa, to the iſland of Sardinia. In this place of exile, though he was of junior rank among his brother prelates, yet his learning and talents cauſed him to be reſpected by them as their ableſt adviſer and advocate, and they made uſe of his pen in the writings which were circulated in their common name, to vindicate themſelves and their principles. By the treatiſes which he wrote, he acquired ſo high a reputation, that Thraſimond had the curioſity to ſee and hear him; and having ſent for him to Carthage, propoſed to him many difficulties, which, according to the catholic writers, he anſwered to the king's ſatisfaction. The opportunity, however, which he embraced during his reſidence at Carthage, of confirming the Catholics in their opinions, and of converting ſome Arians, having awakened the jealouſy of the arian biſhop, Thraſimond was perſuaded to ſend Fulgentius back to his place of exile in Sardinia. Upon the death of Thraſimond, about the year 522, his ſon Hilderic recalled the catholic biſhops; and Fulgentius, as well as his fellow-ſufferers, met with a joyful reception from the orthodox in Africa. He appears to have ſpent the remainder of his life in peace and tranquillity, diſcharging the duties of his epiſ-

copate

copate with diligence and prudence, and rendering himſelf a ſubject of veneration and eſteem by his piety, humility, and exemplary manners. He was frequently appointed to preſide at the ſynods which were held by his party. He died in 533, in the ſixty-fifth year of his age. He left behind him numerous treatiſes in theological controverſy, homilies, epiſtles, &c. many of which have been long ſince loſt. They have been frequently printed at Baſil, Cologne, Antwerp, Lyons, Paris, and other places; but the beſt edition of them is that publiſhed at Paris by Deſprez, in 1684, in one volume 4to. They are alſo inſerted in the ninth volume of the *Bibliotheca Patrum*. Fulgentius is highly praiſed by Iſiodorus, for the correctneſs and clearneſs of his ſtyle, and by ſome writers he is called the Auguſtine of his age; for he not only conformed to the doctrine of that father, but alſo imitated his diſcipline and auſterity.

FULGEN'TIUS-PLANCIADES (Fabius), ſometimes confounded with the preceding, as he flouriſhed about the year 520, and, according to ſome writers, was biſhop of Carthage. He was the author of three books On Mythology, addreſſed to a prieſt, named Catus. They were publiſhed in 1599, by Jerome Comelin, together with the mythological treatiſes of Hygynus, Julius Firmicus Maternus, and Alberic; and at Amſterdam in 1681, by Munker, in two volumes 8vo. with other treatiſes of a ſimilar nature, under the title of *Mythographi Latini*. This Fulgentius was alſo the author of a curious treatiſe *De primis vocabulis Latinis*, publiſhed at Paris in 1586, 4to. and to him has been attributed a diſſertation On the Allegories of Virgil, addreſſed to Charicles, a grammarian.

FUL'GID, *adj.* [*fulgidus*, Lat.] Shining; glittering; dazzling.

FULGID'ITY, *ſ.* [from *fulgid.*] Splendour; dazzling glitter.

FULGINA'TES, (ſing. *Fulginas*;) anciently a people of Umbria, whoſe chief town was Fulginum, now *Foligno*. *Pliny*.

FUL'GORA, *ſ.* [from *fulgeo*, Lat. to ſhine, lighten, or glitter.] In entomology, the LANTHORN FLY; a genus belonging to the order of hemiptera; the characters of which are: Head hollow, inflated, extended forward: antennæ ſhort, ſeated beneath the eyes, conſiſting of two joints, the outer one larger and globular; ſnout elongated, inflected, four-jointed; legs formed for walking. Twenty-five ſpecies have been aſcertained, viz.

1. Fulgora lanternaria: front or ſnout elongated, and ſtraight; wing-caſes richly variegated with a profuſion of colours; on each wing a large lucid ocellate ſpot. It inhabits Surinam, and all the warm parts of South America; and it emits ſo ſtrong a phoſphoric light from the hollow part of the head, that travellers are ſaid to be directed in their journey at night, by fixing one or two of them to the end of a ſtick. Of this magnificent inſect, madam Merian gives the following account, during her reſidence at Surinam. "On a pomegranate branch I obſerved the larva or beetle, repreſented at fig. 1, in the annexed engraving. It was naturally very ſluggiſh, and conſequently eaſily taken: under the forepart of their head they have a remarkable oblong proboſcis, which they ſtick into flowers when they ſuck their juices. On the 20th day after I had taken it, it became motionleſs, and the ſkin on its back breaking off, it produced a greeniſh fly, which made a ſound ſomewhat like a lute, for which reaſon the Dutch inhabitants called it the *harper*. It had the proboſcis the ſame as in the larva ſtate. The Indians informed me that theſe inſects came to be the flies which the Dutch call *lantaren dragers*, i. e. lanthorn bearer; which gives ſo great a light in the dark, that one may ſee to read and write by it. Having therefore collected a number of theſe flies, I obſerved their firſt metamorphoſis, in which the harper retained its form in every part, except the large tranſparent hood which grew out of the head; the Indians call the fly in this ſtate, the *mother of the lanthorn bearer*, as the beetle is called the *parent of the fly*. Fig. 2, in the engraving, ſhews how the harper is by degrees thus changed into the lanthern bearer. When the Indians had brought me a great many of theſe flies in their firſt or harper ſtate, I put them up in a box, not knowing yet that they ſhone in the dark; but one night an unuſual buzzing ſuddenly awaked and terrified me; I jumpt out of bed, and cauſed a light to be ſtruck, wondering what ſtrange humming was in the houſe, when we perceived that the noiſe proceeded from the box. We therefore pulled off the lid in great terror, and flung it on the ground; when we ſaw, as it were, a flame of fire come out, which again appeared at the flight of every inſect; but having for ſome time viewed them attentively, and they returning to us, we collected them, greatly admiring their ſplendour." The lanthorn fly, in its perfect or mature ſtate, is ſhewn in the engraving, at fig. 3.

2. Fulgora diadema: the head of this ſpecies, though not ſo reſplendent and luminous as the preceding, is nevertheleſs extremely curious. The hood is extended almoſt half an inch above the eyes, in the ſhape of a crown; whence its ſpecific name. It is decorated with many tubercles, like ſtudded horns, on the ſides, and trifid at the tip. The elytra, or wing-caſes, next the body, are of a greeniſh hue, with ſome duſky red patches irregularly placed; and towards the extremity is a large patch of a dark yellow colour. The internal wings are black, but next the body are red, with ſome red ſpots ſcattered over the centre of them. This is a native of India; is very common at Cayenne; and a correct repreſentation of it is given in the engraving at fig. 4.

3. Fulgora candelaria: the front or hood of this ſpecies is remarkably extended in the ſhape of a candle, whence proceeds a ſtrong phoſphoric light. The body and lower wings are of a rich orange colour, except the tips of the wings, which have a border of black. The upper wings or elytra are green, variegated and ſpotted with yellow. The head and front are of a deeper orange, inclining to red. It is a native of China; and is repreſented in the annexed engraving at fig. 5.

4. Fulgora ſerrata: front extended, aſcending, ſerrate four ways. Front with four rows of ſtrong ſharp teeth; wing-caſes brown; wings ocellate at the tip. Inhabits Surinam.

5. Fulgora phoſphorea: front ſubulate, extended, aſcending; body grey, glaucous. Inhabits Surinam.

6. Fulgora noctivida: front extended, aſcending, pointed; body green; wings hyaline. Inhabits Surinam.

7. Fulgora lucernea: front extended, body above greeniſh, beneath, yellow. Inhabits Surinam.

8. Fulgora flammea: front extended, aſcending, round, truncate. Inhabits South America.

9. Fulgora tenebroſa: front extended, ſtraight, truncate; wing-caſes rough, grey; head brown; front ſtraight, round, rufous and truncate; thorax and wing-caſes rough with raiſed brown dots: wings duſky. Inhabits Guinea.

10. Fulgora obſcurata: front extended, ſtraight, truncate; wing-caſes cinereous ſpotted with black; ſnout as long as the body, black with a white baſe, and marked with white dots and two white bands; front obliquely truncate; thorax brown; wings white; legs varied with white and black. Inhabits New Holland.

11. Fulgora adſcendens: front extended, ſubulate, aſcending; wing-caſes ruſty-brown, dotted with white. A ſmall ſpecies; the ſnout above, black, beneath, yellow; head beneath, yellow, with two oblique black ſtreaks, a black dorſal line above; wings hyaline; body, yellow; border of the abdomen black on the back. Inhabits Cayenne.

12. Fulgora faſciata: front extended, aſcending; wing-caſes, ruſty-brown, with two green bands and a green dot behind; head conic grooved, yellow with a brown back; thorax, brown; body, yellow; abdomen rufous above. Inhabits Cayenne.

13. Fulgora truncata: front ſomewhat obtuſe; wings, green truncate. Inhabits India.

14. Fulgora

14. Fulgora plana: front extended, flat, yellowiſh; thorax and wing-caſes ferruginous; head with a groove beneath; fore edge of the thorax, yellow; wing-caſes hyaline at the tip; body, yellow; abdomen ferruginous above. Inhabits Cayenne.

15. Fulgora pallipes: front extended, flat; wing-caſes green, hyaline at the tip; head, black, with a whitiſh edge all round; thorax greeniſh, with a black blotch on the fore-part; wing-caſes a little yellowiſh at the baſe, with a ſtreak of black ſpots before the tip; abdomen above fulvous, black at the tip, beneath, yellow; wings hyaline; legs pale. Inhabits Cayenne.

16. Fulgora folium: front extended, ſhort, ſtraight; body, yellow-green; wings very large, vertical, compreſſed. Inhabits America.

17. Fulgora hyalinata: front, conic, unequal; wing-caſes hyaline, with a black ſtreak. Front ſhort, conic, unequal above, grooved beneath, pale with black ſtreaks and ſpecks; eyes large, white globular; thorax pale, ſpeckled with black; wings hyaline with a black ſpot at the tip; larger than F. obſcurata. Inhabits Bengal

18. Fulgora feſtiva: front conic; wing-caſes, brown, the outer margin greeniſh, with black and fulvous dots; wings red at the baſe; head above, flat, brown, beneath yellowiſh, edged with black; thorax, brown; wings ſangineous tipt with brown. Inhabits Coromandel.

19. Fulgora Europæa: front, conic; body green; wings hyaline, reticulate. Inhabits Europe.

20. Fulgora minuta: front, conic; head and thorax, yellow, with a whitiſh dorſal line; wing-caſes whitiſh; ſmall; antennæ, thicker upwards. Inhabits Saxony.

21. Fulgora limbata: brown; wing-caſes hyaline, with two brown ſpots on the diſk and many on the border, the nerves punctured. Antennæ ſhort, thick, ſetaceous at the tip; wing-caſes longer than the body; wings hyaline immaculate; ſize of the laſt. Inhabits Saxony.

22. Fulgora pellucida: brown; wing-caſes white hyaline, immaculate; ſize of F. Europæa; legs teſtaceous. Inhabits Saxony.

23. Fulgora flaveſcens: yellowiſh; wing-caſes white hyaline, immaculate; ſmall. Antennæ thick, ſetaceous. Inhabits Saxony.

24. Fulgora ſtriata: head black, ſtriate; wing-caſes yellowiſh hyaline, immaculate. Head ſtriate with black and yellow; abdomen beneath, black at the baſe; ſize of the laſt. Inhabits Saxony.

25. Fulgora marginata: black; head, with yellowiſh ſtreaks; fore-edge of the thorax and legs yellowiſh; wing-caſes yellow hyaline. Antennæ duſky, thick; head, black with three-yellowiſh ſtreaks. Theſe five laſt ſmall ſpecies are probably not of this genus, as they differ in their habit and the ſhape of the antennæ. Inhabits Saxony.

FULGO'SIO (Raphael), a celebrated juriſt, a native of Placentia, though the Genoeſe writers claim him for their countryman. He appears to have been a profeſſor at Pavia in 1389, and at Placentia in 1399. He afterwards occupied the chair of law at Padua, where his appointments were finally raiſed to 1000 ducats. He was ſent as juriſconſult to the council of Conſtance, and was of great uſe to that aſſembly by his dexterity and profound knowledge. He was likewiſe frequently delegated on public buſineſs to Venice. He died in 1427, and a ſplendid monument was erected to his memory in the church of St. Antony at Padua. Fulgoſio was the author of ſeveral eſteemed works in his profeſſion, as Commentaries upon the Code and Digeſt, Counſels, &c. He introduced ſeveral new opinions into the ſchools of Italy; of which, that concerning males deſcending through females, which bore his name, was the occaſion of much controverſy even down to late times.

FUL'GOUR, *ſ.* [*fulgor*, Lat.] Splendour; dazzling brightneſs like that of lightning.—When I ſet my eyes on this ſide of things, there ſhines from them ſuch an intellectual *fulgour*, that methinks the very glory of the Deity becomes viſible through them. *More.*

FULGURA'TION, *ſ.* [*fulguratio*, Lat.] The act of lightning.

FUL'HAM, a conſiderable village of Middleſex, four miles weſt from London. The Danes, in 869, wintered at this place till they retired to the continent. It was in the conqueror's time held of the king by the canons of St. Paul. The biſhop of London has a palace here; and the demeſne has belonged to that dioceſe ever ſince the year 1067. From this place to Putney there is a bridge over the Thames, where not only horſes and carriages, but foot-paſſengers alſo, pay toll. The church is both a rectory and a vicarage.

FUL'HAM, *ſ.* A cant word for falſe dice. *Hanmer.*

Let vultures gripe thy guts, for gourd and *Fulham's* hold,
And high and low beguile the rich and poor. *Shakeſpeare.*

FU'LICA, *ſ.* [from *fuligo*, Lat. ſoot; ſo named by Linnæus, on account of its ſooty colour.] In ornithology, the Coot, Gallinule, &c. a genus belonging to the order of Grallæ; the characters of which are: Bill convex; the upper mandible vaulted at its margin over the under, which ſwells behind its tip; noſtrils oblong; front bald; feet four-toed, ſomewhat pinnated. This genus contains twenty-ſeven ſpecies now known, ranged in two ſub-diviſions; thoſe with cloven feet, correſponding to the gallinules or water-hens, amounting to twenty ſpecies; and thoſe with pinnated feet, correſponding to the coots, amounting to ſeven ſpecies. Theſe birds inhabit the water, and live upon worms, inſects, and ſmall fiſh. In the compreſſed form of their body, they reſemble the rails; their bill is thick, their tail and wings ſhort.

I. *Feet cloven.* 1. Fulica fuſca, the brown gallinule: ſpecific character, fron tyellowiſh, bracelets of the ſame colour, its body duſkiſh. Length one foot; bill one inch, olive green; irides red; eyelids white; the plumage above is olive brown; throat, and fore part of the neck, deep aſh-colour, with a tinge of olive; breaſt, belly, and thighs, aſh-colour, the feathers margined with white at the tips; under tail coverts black; bend of the wing white; quills duſky brown; the outer one edged with white; the tail is olive brown; the outer feather white, and a little rounded in ſhape; legs olive brown; garter round the knee yellow. This ſpecies inhabits France, and is a ſolitary bird, frequenting the ſame places with the common gallinules, but not mixing with that ſpecies; it feeds on the ſame food as that bird, and the fleſh is much like it in the taſte. In all probability this is the ſame with Aldrovandus's Italian rail, which is taken in the neighbourhood of Venice with great ceremony; ſeveral perſons wading among the marſhy places, and driving them from the buſhes and places where they lurk, while others being ready with hawks, let them off as ſoon as they take wing. They are ſaid to have been much eſteemed at the time of the above-mentioned author.

There is a variety larger than the preceding; length eighteen inches; bill two inches long; the baſe, and moſt part of the under mandible, yellow; the reſt of the length black; bare part on the fore-head yellow; the head and neck are blackiſh; the upper parts of the body and wings cheſnut; breaſt, belly, and ſides, dull aſh-colour, edged with white; lower belly and vent white; the thighs aſh-colour, croſſed with indiſtinct lines of white; tail rounded in ſhape; the colour cheſnut, except the two outer feathers, which are white; legs green. The female differs only in being paler in colour.

2. Fulica chloropus, the common gallinule, water-hen, or moor-hen: front tawny, bracelets red, body black; is compreſſed at the ſides, bill of a ſimilar form to that of the rail, but ſhorter; in this reſpect it is liker the gallinaceous tribe; its head too is bare, and covered with a thick membrane; a character of which veſtiges may be found in certain ſpecies of rails. It flies likewiſe with

FUCHSIA AND FULGORA.

1. The Lanthorn Fly in its pupa state. 2. The same about half evolved. 3. Its mature state. 4. The Fulgora diadema. 5. The Fulgora Candelaria. 6. The Fuchia coccinea Plant.

London, Published as the Act directs, Nov.r 2.d 1805, by J. Wilkes.

with its feet hanging down; its toes are extended in the ſame manner as thoſe of the rails, but are furniſhed their whole length with a membranous edging; and this is the intermediate ſhade between the birds with cloven feet and thoſe with webbed feet. The habits of the water-hen correſpond to its conformation: it is oftener in the water than the rail, though it does not ſwim much, but only croſſes from one ſide to another. It lurks the greateſt part of the day among the reeds, or under the roots of alders, willows, and oſiers, and leaves not its retreat until evening: it frequents leſs the marſhes and bogs than the rivers and pools. Its neſt is placed cloſe to the brink of the water, and conſtructed with a large heap of broken reeds and ruſhes interwoven. The mother quits her neſt every evening, having previouſly covered the eggs with herbs and ruſhes. The young run as ſoon as they are hatched, like thoſe of the rail, and in the ſame way are led by their dam to the water; and, no doubt, it is for this reaſon that the parents, conſulting future convenience, always build their neſt ſo near the ſurface. So well is the little family conducted and concealed, that it is difficult to rob it during the very ſhort term of its education; for the young ones are ſoon able to ſhift for themſelves, and leave their prolific mother ſufficient time to rear a ſecond brood. It is even averred that they ſometimes have three hatches in a year. Though the water-hen is not migratory, and is every where rather ſcarce, it has been planted by nature in moſt of the known regions of the world, even the remoteſt. Captain Cook found it in the iſle of Norfolk and in New Zealand; Adanſon, in an inlet at Senegal; Gmelin, in the plain of Mangaſea in Siberia, near the Jeniſea, where the ſpecies is very numerous. Nor are theſe birds leſs common in the Antilles, at Guadaloupe, at Jamaica, and in the iſle of Aves, though it contains no freſh water: many are found alſo in Canada, and other parts of North America. This is the moor-hen ſpecies, ſo common in England, frequenting every where the borders of rivers and ponds where weeds grow. The neſt, where and how made, is mentioned above. It lays ſeven eggs, almoſt two inches in length, of a yellowiſh white, marked with irregular reddiſh brown ſpots, which are not numerous, with a few minute ones interſperſed, and breeds, with us, twice in the ſeaſon. It flies awkwardly, and not far at a time, though it runs faſt; and, notwithſtanding it is not web-footed, it ſwims well, and dives to a conſiderable diſtance. Thoſe found in Europe are diſtinguiſhed by their ſize, being about the bulk of a pullet ſix months old; the length from the bill to the tail is a foot, and from the bill to the nails fourteen or fifteen inches; the bill is yellow at the point, and red at the baſe; the membranous ſpace on the front is alſo red, and ſo is the lower part of the thigh above the knee; the feet are greeniſh; all the plumage is of a dull iron grey, clouded with white under the body, and greeniſh brown grey above; a white line borders the wing; the tail, when raiſed, ſhews white on the lateral feathers of the inferior coverts; the plumage is thick, compact, and clothed with down. In the female, which is ſmaller, the colours are lighter; the white waves on the belly are more diſtinct, and the throat is white: the ſpace on the forehead is, in young ſubjects, covered with a down more like hair than feathers.

3. Fulica viridis, the green gallinule: length eleven inches and a half; bill of a greeniſh yellow, as is the bare part of the forehead; the upper parts of the body are of a dull green; the under white; legs of a greyiſh yellow; claws grey. This ſpecies ſeems peculiar to the Eaſt Indies.

4. Fulica melanocephala, the black-headed gallinule: this is wholly blue, except the head and neck, which are black; and there is a broad bare ſpace on the top of the head. The female is ſaid to have a deep fulvous crown; the upper parts of the body the ſame, ſtreaked with white on the ſcapulars; the wings greeniſh, with a fulvous tinge; quills greeniſh blue. It inhabits America.

5. Fulica alba, the white gallinule: this is a large ſpecies, not leſs than two feet in length. The plumage is entirely white; and the forehead, bill, and legs, red. It was found in Norfolk Iſland, by governor Phillip, in his voyage to the ſettlement of Botany-bay.

6. Fulica purpurea, the crowing gallinule: the bill of this is pale; irides fulvous; the plumage of a dark purple colour, with ſome white feathers intermixed; the legs greeniſh yellow. This inhabits Mexico; is a marſh bird, feeding on fiſh, and thought to be not ill-taſted meat. It is called by ſome *yacacintli*, and is ſaid to imitate the crowing of a cock.

7. Fulica flaviroſtris, the favourite gallinule: length twelve inches; bill yellow; upper parts of the plumage deep blue; ſides of the head and neck paler; fore part of the neck blueiſh white; belly, thighs, and rump, white; quills and tail brown, the laſt darkeſt; legs long, yellow; hind toe very long. Inhabits Cayenne.

8. Fulica porphyrio, the purple gallinule, or ſultana hen: front red, bracelets many; body green above, violet below; ſize of a common fowl; length one foot five inches; bill very ſtout at the baſe, compreſſed on the ſides, above an inch and a half in length, and of a deep red; irides fulvous; the forehead bare and red; the head and hind part of the neck, are gloſſy violet; cheeks, throat, and fore part of the neck, violet blue; back, rump, and ſcapulars, dull green, but gloſſy; quills the ſame, but brown within; the tail nearly the ſame, and rounded in ſhape; legs very ſtout, and the colour of the bill. The female is ſmaller than the male. This bird is more or leſs common in all the warmer parts of the globe. On the coaſts of Barbary they abound, as well as in ſome of the iſlands of the Mediterranean. In Sicily they are bred in plenty, and kept for their beauty. It is frequently met with in various parts of the ſouth of Ruſſia, and weſtern parts of Siberia, among reedy places; and in the neighbourhood of the Caſpian ſea not uncommon; but in the cultivated rice-grounds of Ghilar in Perſia, in great plenty and in high plumage. The female makes her neſt among the reeds in the middle of March; lays three or four eggs, and ſits from three to four weeks. That it is common in China the paper-hangings from thence will every where teſtify. It is alſo met with in the Eaſt Indies, the iſlands of Java, Madagaſcar, and many others. Our late navigators ſaw them at Tongataboo in vaſt numbers, as well as in the iſland of Tanna, and other parts. It is alſo common in the ſouthern parts of America. Both the Greeks and Romans, notwithſtanding their voracious luxury, abſtained from eating the porphyrio. They brought it from Lybia, from Comagene, and from the Balearic iſlands, to be placed in their palaces and temples, where it was left at liberty as a gueſt, whoſe noble aſpect, gentle diſpoſition, and elegant plumage, merited, as they thought, ſuch honours. In reſpect to its manners, it is a very docile bird, being eaſily tamed, and made to feed with the poultry, ſcratching the ground with the foot as the cock and hen. It will feed on many things, ſuch as fruit, roots of plants, and grain; but will eat fiſh with avidity, dipping them into the water before it ſwallows them: it will frequently ſtand on one leg, and lift the food to its mouth with the other, like a parrot. A pair of theſe, kept in an aviary, made a neſt of ſmall ſticks, mixed with a quantity of ſtraw, and laid ſix white eggs, perfectly round; but the hen was careleſs of them, and they came to nothing. The fleſh is ſaid to be exquiſite in taſte. See a correct figure of this bird in the annexed engraving.

9. Fulica violacea, the violet gallinule: body dark violet, blue beneath the neck, front and legs red; vent white. Inhabits as the laſt.

10. Fulica Carthagena, the Carthagena gallinule: this ſpecies is diſtinguiſhed by a bare or naked place on its forehead, which is of a fine blue colour. The body is wholly of a rufous brown; and it is about the ſize of the common coot. It inhabits the banks of the rivers and waters about Carthagena.

11. Fulica Cayenenſis, the Cayenne gallinule: this bird approaches the heron by the length of its neck, and removes from the water-hen by the length of its bill. It is the largeſt of the genus, being eighteen inches long; the neck and the head, the tail, the lower belly, and the thighs, are brown grey; the upper ſurface is dull olive; the ſtomach and the quills of the wings are rufous inclined to reddiſh. It is very common in the ſwamps of Guiana, and is ſeen even in the ditches of the town of Cayenne; it lives on ſmall fiſh and aquatic inſects; when young its plumage is entirely grey, which becomes reddiſh after moulting.

12. Fulica ruficollis, the black-bellied gallinule: length ſeventeen inches; bill two inches and a half; baſe red; end yellow; crown brown; hind part of the neck cinereous brown; back greeniſh brown; quills the ſame, with rufous margins: chin white; fore part of the neck and breaſt bright rufous; belly, thighs, vent, and rump, black; ſides and under wing-coverts tranſverſely barred with rufous and black; legs red, and pretty long. This is ſuppoſed to inhabit Cayenne, as it was brought among others from that place.

13. Fulica Maderaſpatana, the Madras gallinule: ſize of a duck; the bill and legs pretty long; forehead bare and white; the plumage on the upper parts of a fine aſh-colour; ſides of the head, and under parts, white; acroſs the lower part of the neck black ſpots in the ſhape of creſcents; quills aſh-colour, edged with black; the tail is ſhort. Found in the neighbourhood of Madras, where it is called *boollu-cory*; alſo at Malabar, and known there by the name of *caunangoly*.

14. Fulica Martinicenſis, the Martinico gallinule: leſs than the common gallinule, and the body more ſlender; length about twelve inches; bill thirteen lines long, yellow, with a red baſe; forehead bald and blue; irides red; the plumage is in general of a fine gloſſy green; but the head, neck, and under parts, are of a changeable blue; the vent white; quills and tail duſky, edged with green; legs yellow; toes very long, and ſlender. That deſcribed by Briſſon differs from the above in having the bare part of the forehead and legs red; and is ſaid to inhabit the Eaſt Indies, as well as America. Many of theſe birds have been brought both from Cayenne and the Weſt-India iſlands, all of which anſwered to the above deſcription, except one, which had the upper parts of the plumage blue-green, tinged with brown; the crown of the head brown; beneath white; a little mottled with black in the middle of the belly, and greatly ſo acroſs the lower part of the neck, juſt above the breaſt; chin quite white; legs brown. Theſe have been brought alive to England; but not ſo tame as to be at large. They lived on rice, bread, lettuce, and other ſuch food, and ſeemed to bear confinement tolerably well.

15. Fulica Novæboracenſis, the yellow-breaſted gallinule: this ſpecies is ſmaller than a quail; crown and hind part of the neck dark olivaceous brown, ſpotted with white; back plain brown; ſcapulars edged with yellowiſh white; breaſt dirty yellow; legs brown. Inhabits the province of New York.

16. Fulica nævia, the grinetta gallinule: length nine inches and three quarters; bill ten lines long; colour of it and the irides yellowiſh green; forehead bare and yellow; the feathers of the head and upper parts black, with rufous margins; thoſe of the back have the margins likewiſe fringed with white; over the eye a white ſtreak; the throat blueiſh aſh-colour; fore part of the neck and breaſt the ſame, with an olive tinge, and ſpotted with black; belly and thighs pale rufous; ſides tranſverſely barred black and white; wing coverts rufous, marked with tranſverſe, waved, or zigzag, lines; quills duſky brown, edged outwardly with white; tail the ſame, but the two middle feathers white on both margins, and rounded in ſhape; legs dirty green; toes very long. This ſpecies inhabits Italy, about Bologna, and known there by the name of *grinetta*, and at Milan called *gillerdine*.

17. Fulica maculata, the ſpeckled gallinule: length eleven inches; bill of a dull yellow; forehead bare, and of the ſame colour; the upper parts of the plumage rufous brown, marked with black and white ſpots on the wings; ſides of the head, throat, and fore part of the neck, white; from thence to the vent brown; the two middle tail feathers are black, tipped with white; the others brown; legs grey. This frequents the marſhes of Germany; and is called *matkneltzel*, and *matkern*.

18. Fulica flavipes, the yellow-legged gallinule: this is about the ſize of the common gallinule; bill yellow, with the end black; edges of the eyelids ſaffron-colour; forehead bare, and of a pale yellow; the reſt of the head, and upper parts of the bird, rufous, ſpotted with black; ſides of the head, and under parts, white; leſſer wing-coverts ſpotted with duſky, and a little brown; the edges reddiſh near the tips; the outer greater ones the ſame, but thoſe near the body white; quills black; tail rufous, ſpotted with black; legs of a pale yellow. Inhabits Germany, where it is called *ſchmirring*.

19. Fulica fiſtulans, the piping gallinule: the bill in this ſpecies is black; the forehead bare, and of a yellowiſh green; the plumage on the upper parts brown; ſides of the head, and under parts, white; and there is a little mixture of the ſame on the wing-coverts; quills and tail brown; legs yellowiſh grey; claws grey. Inhabits Germany, and frequents the banks of rivers and ponds, like moſt of the genus. It is known about Straſburg by the name of *glutt*, and has a ſhrill kind of note not unlike that of a ſmall flute or fife.

20. Fulica cinerea, the creſted gallinule: ſize of the coot; length eighteen inches; bill as in that bird; forehead and crown bare, and of a reddiſh colour, riſing at the back into a knob, not unlike that on the head of the Guinea pintado; the head and neck aſh-colour; chin mottled with white; body and wings greeniſh aſh-colour; outer edge of the laſt pale; under parts of the body pale aſh; middle of the belly white; legs very ſtout and brown. This is ſuppoſed to inhabit China.

II. *Feet pinnated.* 21. Fulica atra, the common coot: ſpecific character, front freſh-coloured, bracelets greeniſh yellow; body blackiſh. The coot, though its feet are not completely webbed, lives habitually on the water, and ſeems even more attached to that element than any fowl, except the diver. It is ſeldom ſeen on land, and is there ſo bewildered and defenceleſs, that it frequently ſuffers itſelf to be caught with the hand. It ſpends the whole day on the pools, which it prefers to the rivers; and, except in walking from one pool to another, it never ſets foot on ſhore; and if the interval be conſiderable, it has recourſe to its wings, and riſes very high; but commonly it flies only in the night. The coots, like many other water-fowl, ſee beſt in the duſk, and the older ones never ſeek their food but in the night. They lurk among the ruſhes the greater part of the day; and, when diſturbed in their retreat, they will bury themſelves in the mud rather than ſpring. They ſeem to make an effort in commencing the motion ſo natural to other birds; and, whether on water or on land, they riſe with difficulty. The young coots, leſs ſolitary or circumſpect, are ſeen at all hours of the day, bouncing with ſmall leaps out of the water, one fronting another. They ſuffer the fowler to approach, yet eye him ſteadily; and they plunge ſo nimbly, the inſtant they perceive the flaſh, that often they elude the ſhot. But in autumn, when theſe birds leave the ſmall pools, and aſſemble on the lakes in France, vaſt quantities are caught. For this purpoſe, as Buffon informs us, a number of ſkiffs are arranged in a line extending the breadth of the lake; this little fleet is rowed forward, and drives the coots into ſome inlet; the birds, then, urged by fear and neceſſity, riſe at once into the air, and, endeavouring to regain the open water, they

paſs

paſs over the heads of the fowlers, and receive a general and deſtructive fire. The ſame plan of operation is then conducted at the other end of the lake, where thoſe which eſcaped have alighted; and what is ſingular, neither the clamours of the ſportſmen, the report of the muſkets, the ſpectacle of the range of boats, nor the death of their companions, can urge theſe birds to diſtant flight. The coot and moor-hen, not being deemed *fleſh* by the canons of the church of Rome, were wont to be bought up with great avidity by the French people, who ate them as a luxury on days of abſtinence, however rank and fiſhy an Engliſh palate might deem them.

Theſe indolent birds have many foes: the moor-buzzard ſucks their eggs, and plunders their young; and to this deſtruction muſt be imputed the fewneſs of their number, conſidering that they are very prolific. The coot lays eighteen or twenty eggs, which are of a dirty white, and almoſt as large as a hen's; and if the firſt hatch be deſtroyed, the mother has often a ſecond, of ten or twelve eggs. She builds in deluged ſpots covered with dry reeds: ſhe ſelects a tuft, on which ſhe raiſes a ſtructure above the level of the water, and lines the cavity with little dry herbs and tops of reeds, forming a large ſhapeleſs neſt, diſtinguiſhable at a diſtance. She ſits twenty-two or twenty-three days, and as ſoon as the young are hatched they jump out of the neſt, and never return again. The mother cheriſhes them under her wings, and they ſleep round her beneath the reeds: ſhe leads them to the water, in which they ſwim and dive well, from the moment of their birth. They are covered at firſt with a ſmoky black down, and look very ugly; only the trace is to be ſeen of the white plate deſtined to ornament their front. It is then that the bird of prey aſſails them ſo cruelly, and often devours the dam and her brood. The old coots, which have repeatedly loſt their callow offſpring, grow cautious from misfortune, and conceal their neſts among the flags on the margin of the pools; and keep together their young among theſe thick coverts. Theſe alone perpetuate the ſpecies; for ſo great is the depopulation of the reſt, that a good obſerver, who has particularly ſtudied the œconomy of the coots, reckons that not above one-tenth eſcape the talons of the birds of prey, particularly thoſe of the moor-buzzard.

The coots breed early in the ſpring, and eggs are found in their body as ſoon as the end of winter. They reſide on the pools the greateſt part of the year, and in ſome places they are permanent ſettlers. Yet in autumn they generally leave the ſmall pools, and reſort to the large ones, where they aſſemble in a great flock: there they often remain till December; and when the ſnows, and eſpecially the froſts, drive them from the high and chill tracts, they deſcend into the plains, which enjoy a milder temperature; and the want of water, rather than the cold, conſtrains them to ſhift their haunts. M. Hebert ſaw them in a very ſevere winter on the lake of Nantau, which is late in freezing: he ſaw them alſo in the plains of Brie, though in ſmall numbers, in the depth of winter. But, moſt probably, the bulk of the ſpecies remove by degrees to the adjacent countries, which are warmer; for, as their flight is laborious and tardy, they cannot journey to any great diſtance; and indeed they appear again as early as February. The coots are ſpread through the whole of Europe, from Italy to Sweden: they are found, too, in Aſia. They occur in Greenland, if Egede rightly tranſlates two words in the language of the natives, by the great and little coot. In fact, the ſpecies conſiſts of two families, which live in the ſame lake without ever cohabiting, and are diſtinguiſhed from each other ſolely by their bulk, and not by the colour of the frontal plate, as ſome pretend; for in both, that is uſually white, and becomes red only in the ſeaſon of love.

This thick naked membrane, which covers the fore ſide of the head like an eſcutcheon, and which made the ancients give the coot the epithet of *bald*, ſeems to be a production of the upper layer of the ſubſtance of the bill, which is ſoft, and almoſt fleſhy near the root. The bill is faſhioned into a flat cone at the ſides, and is bluiſh white; when in the ſeaſon of incubation, the frontal plate aſſumes its vermilion tint. All the plumage is furniſhed with a thick down, covered with very cloſe feathers; it is of a leaden-black, full and deep on the head and neck, with a white ſtreak on the fold of the wing: no difference indicates the ſex. The coot is almoſt as large as a domeſtic hen, and its head and body are nearly of the ſame form; its toes are half-webbed, fringed fully on both ſides with a membrane, ſcalloped into feſtoons, whoſe knots correſpond to the joints of the phalanges: theſe membranes are, like the feet, of a leaden colour: above the knee a ſmall portion of the naked leg is circled with a garter of reddiſh yellow; the thighs are thick and fleſhy. Theſe birds live chiefly, as well as the water-hens, on aquatic inſects, ſmall fiſh, and leeches; yet they alſo gather ſeeds, and ſwallow pebbles; their fleſh is black, moſtly lean, and has a marſhy taſte. Dr. Turton has four varieties: 1. With the body black, and wings white. 2. Entirely black; breaſt and belly waved with ferruginous. 3. Brown; chin, belly, and primary quill-feathers, white; head ſpotted with white; upper mandible red. 4. White; head and wings with a few ſpots.

22. Fulica aterrima, the greater coot: front white; bracelets red; body blackiſh. This is of a larger ſize than the preceding, but differs not in the colour of the plumage, except that it is blacker. Briſſon diſtinguiſhes the two by the colour of the bare part of the forehead, which in this is white; and the garters, which are of a deep red. This bird is ſaid to be found in Lancaſhire and Scotland. It ſhould ſeem to be a mere variety of the former, did not authors join in advancing the contrary. They are more plentiful on the continent, being found in Ruſſia and the weſtern part of Siberia very common; and are alſo in plenty at Sologne and the neighbouring parts, where they call it *judelle*. The people eat them, like the former, on maigre days, and the fleſh is much eſteemed.

23. Fulica leucoryx, the Swediſh coot: this has the eyelids pale, and the whole of the wing white, but the ſhafts of the prime quills black; in other things it is like the common ſpecies. It was found dead in the park at Stockholm.

24. Fulica Æthiops, the ferruginous coot: ſize of the common one, and differs only in having the feathers of the breaſt and belly ferruginous, undulated with brown. It was diſcovered by Sparrman; but the place is not mentioned.

25. Fulica Americana, the cinereous coot: this is ſmaller than the common coot; bill pale green; bare place over the forehead ſmaller than in that ſpecies, and white; plumage above duſky aſh-colour; beneath the ſame, but paler; chin duſky white; down the middle of the belly the ſame; legs blue-black; the membranes on each ſide of the toes much narrower than in any other of the ſpecies. It is ſaid to inhabit North America.

26. Fulica Mexicana, the Mexican coot: ſize of the greater coot; bill red, with a yellow tip; forehead bare and red; head, neck, breaſt, belly, thighs, under wing and tail coverts, purple; back, rump, and wing coverts, pale green, varied with blue and fulvous; quills pale green. It inhabits Mexico.

27. Fulica criſtata, the creſted coot. (See the Engraving.) This is ſtill larger than F. aterrima; bill red at the baſe, and whitiſh the reſt of its length; the whole crown bare, of a deep red, and riſing into a bifid detached membrane like a creſt, as in ſome of the jacana ſpecies; the whole plumage blue black; legs duſky, and ſhaped like thoſe of the common ſpecies. It inhabits Madagaſcar, and probably China alſo; as it is ſeen in ſome Chineſe drawings. The garter above the knee is of three colours, red, green and yellow; and the Chineſe name of the bird is *tzing kye*.

FULIGINOUS, *ſ.* [*fuligineux, ſe*, Fr. *fuliginoſus*, Lat.] Sooty; ſmoky.—Burrage hath an excellent ſpirit to re-

preſs the *fuliginous* vapours of duſky melancholy, and to cure madneſs. *Bacon.*

Fuliginous vapours are ſuch as are replete with ſoot or other craſs matter, and have the property of fixing themſelves to ſurrounding bodies in the form of black powder. In the firſt fuſion of lead, there exhales a great deal of fuliginous vapour, which being retained and collected, makes what is called litharge. And lamp-black is what is gathered from the fuliginous vapours of pines, and other reſinous wood, when burnt.

FULI'GINOUSLY, *adv.* By being ſooty:

Or whence the joy 'mid columns, towers,
'Midſt all the city's artful trim,
To rear ſome breathleſs vapid flowers,
Or ſhrubs *fuliginouſly* grim. *Shenſtone.*

FULI'GO, *ſ.* in botany, a genus of the claſs cryptogamea, order fungi. The generic characters are, a cellular-fibrous bark; the fibres penetrating in a reticulate manner through the ſeminal maſs.

Species. 1. Fuligo ſeptica: yellow, lacinate. 2. Fuligo capitata: yellow, capitate. 3. Fuligo panicea: white, ſeſſile, grain-like.

FU'LIMART, *ſ.* [This word, of which *Skinner* obſerves that he found it only in this paſſage, ſeems to mean the ſame with *ſtoat*.] A kind of ſtinking ferret.—The fichat, the *fulimart*, and the ferret, live upon the face, and within the bowels of the earth. *Walton.* See MUSTELA.

FULKE (William), a learned Engliſh divine in the ſixteenth century, born in London, where he received the early part of his education; and in 1655 he was entered of St. John's college, Cambridge. He was choſen fellow of St. John's in 1664, and diſtinguiſhed himſelf by his proficiency in the different branches of academic learning, particularly mathematics and theology. In 1665, when he was M. A. of three years ſtanding, he was incorporated in the ſame degree in the univerſity of Oxford. Having formed an acquaintance with the learned Thomas Cartwright, lady Margaret's profeſſor of divinity, who was attached to puritan ſentiments, Mr. Fulke embraced the ſame opinions; and by his ſentiments he rendered himſelf ſo obnoxious, that he was expelled from his college, and reduced to maintain himſelf by delivering lectures in his private apartments. Afterwards he was patroniſed by the earl of Leiceſter, who in 1571 preſented him to the living of Warley in Eſſex, and in 1573 to that of Didington in Suſſex. Soon afterwards he went to France in the capacity of chaplain to the Engliſh embaſſy. After his return to his native country, he was made maſter of Pembroke-hall in the univerſity of Cambridge, and was alſo appointed lady Margaret's profeſſor. He died in 1589. He is ſpoken of as a man of great merit, who, when young, ſuſtained the character of a good philoſopher, and when more advanced in life, that of a pious and ſolid divine. The moſt important of his works is his Comment upon the Rheims Teſtament, 1580, folio, which in 1617 was reprinted with the title, The Text of the New Teſtament of Jeſus Chriſt, tranſlated out of the vulgar Latin by the Papiſts of the traitorous Seminary at Rhemes; with Arguments of Books, Chapters, and Annotations, pretending to diſcover the Corruption of divers Tranſlations, &c. Whereunto is added the Tranſlation out of the original Greek, commonly uſed in the Church of England, with a Confutation of all ſuch Arguments, Gloſſes, &c. This work underwent ſeveral impreſſions, and was attacked with much fury by the catholic writers; to whoſe animadverſions the author replied in A Defence of the ſincere and true Tranſlation of the Holy Scriptures into the Engliſh Tongue, againſt the manifeſt Cavils, &c. of Gregorio Martin, &c. 1617, folio.

FULL, *adj.* [fulle, Sax. *vol*, Dut.] Replete; without vacuity; having no ſpace void.—Better is an handful with quietneſs, than both the hands *full* with travel and vexation of ſpirit. *Eccl.* iv. 6.—Gay religion's *full* of pomp and gold. *Milton.*—He is *full* of wants which he cannot ſupply, and compaſſed about with infirmities which he cannot remove. *Tillotſon.*

From yon bright heaven our author fetch'd his ire,
And paints the paſſions that your eyes inſpire;
Full of that flame, his tender ſcenes he warms,
And frames his goddeſs by your matchleſs charms.
Granville.

Stored with any thing; ſupplied with any thing:

Full of days was he;
Two ages paſt, he liv'd the third to ſee. *Tickel.*

Plump; ſaginated; fat.—A gentleman of a *full* body having broken his ſkin by a fall, the wound inflamed. *Wiſeman.*—Saturated; fated.—I am *full* of the burnt offerings of rams. *Iſa.* i. 11.—The alteration of ſcenes feeds and relieves the eye, before it be *full* of the ſame object. *Bacon.*—Crowded with regard to the imagination or memory.—Every one is *full* of the miracles done by cold baths on decayed and weak conſtitutions. *Locke.*—That which fills or makes full; large; great in effect.—Water digeſteth a *full* meal ſooner than any liquor. *Arbuthnot.*—Complete; ſuch as that nothing further is deſired or wanted.—The reſurrection of Jeſus from the dead hath given the world *full* aſſurance of another life. *Tillotſon.*

What remains, ye gods,
But up and enter now into *full* bliſs? *Milton.*

Complete without abatement; at the utmoſt degree.—At the end of two *full* years Pharaoh dreamed. *Geneſis.*—Containing the whole matter; expreſſing much.—Where my expreſſions are not ſo *full* as his, either our language or my art were defective; but where mine are *fuller* than his, they are but the impreſſions which the often reading of him have left upon my thoughts. *Denham.*—Strong; not faint; not attenuated.—I did never know ſo *full* a voice iſſue from ſo empty a heart; but the empty veſſel makes the greateſt ſound. *Shakeſpeare.*

Dryden taught to join
The varying verſe, the *full* reſounding line. *Pope.*

Mature; perfect.—In the ſultanry of the mamalukes, ſlaves reigned over families of free men; and much like were the caſe, if you ſuppoſe a nation, where the cuſtom were that after *full* age the ſons ſhould expulſe their fathers out of their poſſeſſions. *Bacon.*

So law appears imperfect, and but given
With purpoſe to reſign them in *full* time
Up to a better covenant. *Milton.*

[Applied to the moon.] Complete in its orb.—Towards the *full* moon, as he was coming home one morning, he felt his legs faulter. *Wiſeman.*—Not continuous, or a full ſtop.—Therewith he ended, making a *full* point of a hearty ſign. *Sidney.*—Spread to view in all dimenſions.—'Till about the end of the third century, I do not remember to have ſeen the head of a Roman emperor drawn with a *full* face: they always appear in profile. *Addiſon.*

FULL, *ſ.* Complete meaſure; freedom from deficiency.—We'll ſee thoſe things affected to the *full*. *Shakeſp.*

If where the rules not far enough extend,
Some lucky licence anſwer to the *full*
Th' intent propos'd, that licence is a rule. *Pope.*

The higheſt ſtate or degree:

The ſwan's down feather,
That ſtands upon the ſwell at *full* of tide,
Neither way inclines. *Shakeſpeare.*

The whole; the total:

The king hath won, and hath ſent out
A ſpeedy pow'r to encounter you, my lord:
This is the news at *full*. *Shakeſpeare.*

The ſtate of being ſatiated.—When I had fed them to the *full*. *Jer.* v. 7.—[Applied to the moon.] The time in which the moon makes a perfect orb.—Brains in rabbits,

woodcocks, and calves, are fulleſt in the *full* of the moon. *Bacon.*

FULL, *adv.* Without abatement or diminution.—The moſt judicious writer is ſometimes miſtaken after all his care; but the haſty critic, who judges on a view, is *full* as liable to be deceived. *Dryden.*

A modeſt bluſh ſhe wears, not form'd by art;
Free from deceit his face, and *full* as free his heart.
Dryden.

With the whole effect.—'Tis the pencil, thrown luckily *full* upon the horſe's mouth to expreſs the foam, which the painter, with all his ſkill, could not perform without it. *Dryden.*—Exactly:

Full in the centre of the ſacred wood,
An arm ariſeth of the Stygian flood. *Addiſon.*

Directly.—He met her *full*, but full of wareſulneſs. *Sidney.*

He then confronts the bull,
And on his ample forehead aiming *full*,
The deadly ſtroke deſcending pierc'd the ſkull. *Dryden.*

It is placed before adverbs and adjectives, to intend or ſtrength their ſignification:

Adam was all in tears, and to his guide
Lamenting turn'd *full* ſad. *Milton.*

Full well the god his ſiſter's envy knew,
And what her aims and what her arts purſue. *Dryden.*

FULL-A'CORNED, *adj.* Fed full with acorns.—Like a *full-acorn'd* boar. *Shakeſpeare.*

FULL-BLOWN, *adj.* Spread to the utmoſt extent, as a perfect bloſſom:

My glories are paſt danger; they're *full-blown*:
Things, that are blaſted, are but in the bud. *Denham.*

My *full-blown* youth already fades apace;
Of our ſhort being 'tis the ſhorteſt ſpace!

Stretched by the wind to the utmoſt extent:

He who with bold Cratinus is inſpir'd,
With zeal and equal indignation fir'd;
Who at enormous villainy turns pale,
And ſteers againſt it with a *full blown* ſail. *Dryden.*

FULL-BOT'TOM, *ſ.* A full-bottomed wig:

Adieu, ye bobs! ye bags, give place,
Full-bottoms come inſtead. *Shenſtone.*

FULL-BOT'TOMED, *adj.* Having a large bottom.—I was obliged to ſit at home in my morning-gown, having pawned a new ſuit of clothes and a *full-bottomed* wig for a ſum of money. *Guardian.*

FULL-EA'RED, *adj.* Having the heads full of grain:

As flames roll'd by the winds conſpiring force,
O'er *full-ear'd* corn, or torrents raging courſe. *Denham.*

FULL-EY'ED, *adj.* Having large prominent eyes.

FULL-FED, *adj.* Sated; fat; ſaginated:

All as a partridge plump, *full-fed* and fair,
She form'd this image of well-bodied air. *Pope.*

FULL-HEART'ED, *adj.* Full of courage.—The enemy *full-hearted*. *Shakeſpeare.*

FULL-LA'DEN, *adj.* Laden 'till there can be no more added.—It were unfit that ſo excellent a reward as the goſpel promiſes ſhould ſtoop down, like fruit upon a *full-laden* bough, to be plucked by every idle and wanton hand. *Tillotſon.*

FULL'-ORBED, *adj.* Like a full moon:

Twelve thouſand creſcents all ſhall ſwell
To *full-orb'd* pride, and fading die. *Maſon.*

FULL-SPRE'AD, *adj.* Spread to the utmoſt extent:

How eaſy 'tis, when deſtiny proves kind,
With *full-ſpread* ſails to run before the wind;
But thoſe that 'gainſt ſtiff gales laveering go,
Muſt be at once reſolv'd and ſkilful too. *Dryden.*

FULL-SUM'MED, *adj.* Complete in all its parts.—The cedar ſtretched forth his branches, and the king of birds neſted within his leaves, thick feathered, and with *full-ſummed* wings faſtening his talons eaſt and weſt; but now the eagle is become half naked. *Howel.*

FULL'-WINGED, *adj.* Having full wings:

And often to our comfort ſhall we find
The ſharded beetle in a ſafer hold,
Than is the *full-wing'd* eagle. *Shakeſpeare.*

To FULL, *v. a.* [*fullo*, Lat.] To cleanſe cloth from its oil and greaſe.

FULL'AGE, *ſ.* The money paid for fulling or cleanſing cloth.

FULL'ER, *ſ.* [*fullo*, Lat.] One whoſe trade is to cleanſe cloth.—His raiment became ſhining, exceeding white as ſnow; ſo as no *fuller* on earth can whiten them. *Mar.* ix. 3.

The clothiers have put off
The ſpinſters, carders, *fullers*, weavers. *Shakeſpeare.*

FUL'LER (Nicholas), a learned Engliſh divine in the latter end of the ſixteenth and beginning of the ſeventeenth century, born at Southampton, in 1557. He was educated in claſſical learning at the free-ſchool in that town, from whence he was taken into the family of Dr. Horne, biſhop of Wincheſter, and was made ſecretary to that prelate. The ſame poſt was filled by him under Dr. Watſon, the ſucceſſor of Dr. Horne; but upon his death within about three months after his advancement, Fuller determined to retire from that ſituation, and became tutor to the ſons of a knight in Hampſhire, two of whom he accompanied to Oxford in 1584, and was matriculated at the ſame time with them, as a member of St. John's college. Having taken both his degrees in arts, he left the univerſity, and retired to his native town; and ſoon afterwards he was admitted to orders, and preſented with the ſmall rectory of Allington, near Ambreſbury, in Wiltſhire. He was alſo made a prebendary of Saliſbury; and was afterwards preferred by the biſhop of Wincheſter to the valuable rectory of Biſhop's-Waltham, in Hampſhire, where he died in 1622–3, aged ſixty-five years. He was the author of *Miſcellanea Theologica*, lib. iii. firſt printed at Heidelberg, in 1612, in 8vo. and afterwards at Oxford, with the addition of a fourth book, in 1616, and at London in 1617. Theſe *Miſcellanea* having fallen into the hands of the celebrated Druſius, he accuſed the author of plagiariſm, in taking many of the beſt remarks in them out of his works, without making any acknowledgment of his obligations. Againſt this charge Fuller ſatisfactorily vindicated himſelf in his *Miſcellanea Sacra, cum Apologia contra V. Cl. Johan. Druſium*, publiſhed at Leyden in 1622, 4to. and conſiſting, beſides the author's defence of himſelf, of two additional books to his former work. Theſe *Miſcellanea* are inſerted in the ninth volume of the *Critici Sacri*, and diſperſed throughout the whole of Pool's *Synopſis Criticorum*. Fuller was alſo the author of an Expoſition of Rabbi Mordecai Nathan's Hebrew Roots, with Notes; and a Lexicon; both which remain in MS. in the Bodleian library at Oxford, and are honourable memorials of the author's erudition and induſtry.

FUL'LER (Nicholas), a contemporary of the preceding, who was educated at Emanuel college, Cambridge, to which he was a benefactor. He became a counſellor of ſome eminence, and a bencher of Gray's-inn, in London. He had the boldneſs to reſiſt, in his profeſſional character, the illegal and oppreſſive proceedings of archbiſhop Bancroft, and his brethren of the high-commiſſion court, againſt a miniſter of Yarmouth, and a merchant of that town, who were impriſoned for being preſent at a pretend-

ed conventicle. His pleading was however ineffectual for the releaſe of his clients; and by thus honeſtly diſcharging his duty, he drew down the vengeance of the commiſſioners upon himſelf. By a ſcandalous ſtretch of power he was ſhut up in cloſe confinement, whence neither the interceſſion of his friends nor his own petitions could obtain his releaſe to the day of his death. His Argument, in the caſe above-mentioned he gave to the public in 1607, in 4to. and it was afterwards reprinted in 1641.

FULLER (Thomas), an eminent Engliſh divine and hiſtorian in the ſeventeenth century, born at Aldwincle in Northamptonſhire, in 1608. He was inſtructed in grammar learning by his father, and made ſuch a rapid progreſs, that at twelve years of age he was ſent to Queen's college, Cambridge, of which his mother's brother, Dr. Davenant, afterwards biſhop of Saliſbury, was then maſter. To his academic exerciſes he applied with extraordinary diligence and ſucceſs, and took his degree of B. A. in 1624; and that of M. A. in 1628, with univerſal applauſe. Being prevented from obtaining a fellowſhip in his college, by a prohibition in the ſtatutes againſt the admiſſion of two fellows from the county of Northampton, he removed to Sidney college, and was choſen miniſter of St. Bennet's pariſh in Cambridge, and attracted numerous audiences by his admirable pulpit talents. In 1631, he obtained a fellowſhip in Sidney college, and was alſo collated to a prebend in the cathedral church of Saliſbury. In the ſame year he ſent his firſt publication into the world, which was of the poetical kind, entitled David's heinous Sin, heartie Repentance, and heavie Puniſhment, 8vo. He was afterwards preſented to the rectory of Broad-Windſor, in Dorſetſhire, where he exerciſed his miniſterial duties with great diligence and acceptability for ſeveral years. In 1635 he took his degree of bachelor of divinity; and about three years afterwards married a young gentlewoman, by whom he had one ſon, but loſt his wife about the year 1641. Before her death he publiſhed, in folio, his Hiſtory of the Holy War, which met with a favourable reception, and has gone through ſeveral editions. He was now induced by the ferment in the nation, which indicated an approaching civil war, to remove to London, where he expected to enjoy greater ſecurity than in his country reſidence, at the ſame time that he ſhould have more ready acceſs to the works and converſation of the learned. In the metropolis he ſoon acquired high fame as a preacher, and was choſen lecturer of the Savoy, in the Strand. When the parliament met in 1640, a convocation was alſo aſſembled in king Henry VIIth's chapel, of which Fuller was a member. When after the diſſolution of that parliament the convocation was commiſſioned to continue its ſitting, in order to draw up new canons for the better government of the church, he was one of the ſelect committee; but diſapproved of ſome of the ſteps taken by the convocation, which in the next parliament were voted to be contrary to the king's prerogative, to the eſtabliſhed laws and ſtatutes of the realm, to the rights of parliament, to the property and liberty of the ſubject, tending to ſedition, and of dangerous conſequence. His diſapprobation of them, however, did not ariſe from a want of zeal in his attachment to the king's cauſe. Of this he gave abundant evidence by his exertions, in public as well as private, to ſerve the royal intereſts. With this view, after the king had left London with a determination to commence hoſtilities againſt the parliament, Mr. Fuller, on the anniverſary of his majeſty's inauguration in 1642, preached at Weſtminſter-abbey from 2 Sam. xix. 30. "Yea, let them take all, ſo that my lord the king return in peace." His ſermon on this occaſion, which was printed, gave great offence to the parliament party, and brought the preacher into ſome danger. About this time he publiſhed his Holy State, in folio. In 1643, after finding that to prevent being ſilenced and ejected as other royaliſts had been, he muſt take an oath againſt which his conſcience proteſted, he withdrew to the king at Oxford. He obtained a letter of recommendation to ſir Ralph Hopton, and was received by him in the capacity of chaplain. The duties of that appointment he conſtantly exerciſed, as the army moved from place to place, omitting no opportunity, when favourable intervals offered, of purſuing his ſtudies, of making hiſtorical collections, and, particularly, of gathering materials for his Worthies of England. The aſſiduity with which he carried on his reſearches in this wandering kind of life, was aſtoniſhing; and he at the ſame time maintained a very extenſive correſpondence on the ſubjects of his enquiries. After the battle on Cheriton-down, in 1644, lord Hopton drew the remains of his army to Baſing-houſe, where he left his chaplain; who animated the garriſon to ſo vigorous a defence of that place, when it was ſoon afterwards beſieged by ſir William Waller, that the latter was obliged to abandon his enterpriſe, after his army had ſuſtained conſiderable loſs. When afterwards the king's army under lord Hopton was driven into Cornwall, Mr. Fuller had the leave of that nobleman to retire to Exeter, where he reſumed his ſtudies, and preached conſtantly with great ſatisfaction to the citizens. During his reſidence at Exeter he was appointed chaplain to the infant princeſs Henrietta Maria, who was born in that city in 1643; and ſoon afterwards received from the king a patent for his preſentation to the living of Dorcheſter, in Dorſetſhire. The offer of the living he declined, as inconſiſtent with his intention of ſettling in London when the war ſhould be terminated; but he continued his attendance upon the princeſs until Exeter was obliged to ſurrender to the parliament forces in 1646, when he was permitted by the general, ſir Thomas Fairfax, to remove to London. Upon his arrival, he met with but a cold reception from his former pariſhioners at the Savoy, probably on account of the part which he had taken in politics; and he found his lecture-ſhip filled by another perſon. It was not long, however, before he was choſen lecturer at St. Clement's-lane, in Lombard-ſtreet; whence he ſoon removed to St. Bride's church, in Fleet-ſtreet. Afterwards he appears to have been ſubjected to a temporary ſuſpenſion from the office of public preaching by the parliament party; but in 1648 that ſuſpenſion ſeems to have been withdrawn, and he was preſented to the rectory of Waltham-abbey, in Eſſex, by the earl of Carliſle. In that and the following year he employed ſome engravers to embelliſh with maps and other copper-plates his view of the Holy Land, entitled, A Piſgah Sight of Paleſtine, and the Confines thereof; with the Hiſtory of the Old and New Teſtament acted thereon, in folio, publiſhed in 1650. In the following year he publiſhed a collection of lives, ſome written by himſelf, and ſome by others, of religious reformers, martyrs, confeſſors, biſhops and other learned divines, foreign and domeſtic, under the title of Abel Redivivus, in 4to. After Mr. Fuller had lived above twelve years a widower, about the year 1654 he married one of the ſiſters of lord viſcount Baltinglaſs; by whom he had a ſon, who ſurvived him, together with his ſon by his former wife. In 1656 he publiſhed his Church Hiſtory of Britain, from the Birth of Chriſt to the year 1648; to which work are ſubjoined The Hiſtory of the Univerſity of Cambridge ſince the Conqueſt, and The Hiſtory of Waltham-abbey, in Eſſex, founded by King Harold; the whole forming a large folio volume. This Church Hiſtory was attacked with much aſperity by Dr. Peter Heylin, in his *Examen Hiſtoricum*, publiſhed in 1659; to whoſe ſtrictures Mr. Fuller replied with much mildneſs, ingenuity, and candour, in his Appeal of injured Innocence to the learned and impartial Reader, in Anſwer to ſome Animadverſions of Dr. Heylin's on his Church Hiſtory, publiſhed in the ſame year, in folio. A ſubſequent exchange of letters between theſe gentlemen, and ſome perſonal conferences, led to the termination of their controverſy. About this time Mr. Fuller was invited to another living in Eſſex, where he exerciſed his miniſterial labours till he was made chaplain to lord Berkeley, who

preſented him to the living of Cranford, in Middleſex. That patron he accompanied to the Hague, when he went to congratulate king Charles II. on his reſtoration. A ſhort time before that event Mr. Fuller had been re-admitted to his lecture in the Savoy, and after it had taken place was re-inſtated in his prebend of Saliſbury. Soon afterwards he was appointed chaplain to his majeſty; created doctor of divinity at Cambridge, and, had he lived a twelvemonth longer, would probably have been raiſed to a biſhopric. The laſt literary work on which his attention was employed, was his Hiſtory of the Worthies of England, part of which was printed during his life, and the reſt from his papers after his death. It was publiſhed in 1662, in folio. In 1661 Dr. Fuller took a journey to Saliſbury, on the buſineſs of his prebend; but on his return home was attacked by a fever, to which he fell a ſacrifice, in the fifty-fourth year of his age. Out of reſpect to his character, at leaſt two hundred of the clergy accompanied his remains to the place of interment. Though biſhop Nicholſon and Mr. Granger threw ſome reflections on his writings, yet his works deſerve to be commended as repoſitories of much valuable and uſeful information, which may be advantageouſly conſulted by the eccleſiaſtical hiſtorian, and by the biographer. Beſides the treatiſes already mentioned, he was the author of many ſermons, tracts, and other ſmall pieces.

FULLER's EARTH, *ſ.* [called *ſmectis*, in Latin, from σμηκω, Gr. to abſterge.] A ſpecies of argillaceous earth or clay, of a greyiſh or light greeniſh colour; found in many parts of England, but particularly in Hampſhire, and in the vicinity of Woburn in Bedfordſhire, which is ſaid to be the beſt in the world. It acquired the name of *fuller's earth*, from being of ſuch extenſive uſe to fullers in milling and cleanſing broad and narrow cloths. The ſuperiority of this mineral in England, is offered as one great reaſon why the Engliſh ſurpaſs all other nations in the woollen manufacture; and hence it is prohibited by law from exportation, under the penalty of one ſhilling for every pound weight. See the article MINERALOGY.

FUL'LER's THIS'TLE, or TEASEL, *ſ.* ſo called, becauſe it is uſed by fullers or clothiers for raiſing the nap on cloth. For its propagation and culture, ſee the article DIPSACUS, vol. v. p. 852. For a correct figure of this thiſtle, ſee Plate IX. fig. 2, in the article BOTANY, vol. iii. p. 252.

FUL'LERTON POINT, a cape on the weſt coaſt of the iſland of Antigua. Lat. 17. 13. N. lon. 61. 35. W. Greenwich.

FUL'LERY, *ſ.* The place where the trade or buſineſs of a fuller is carried on.

FUL'LING, *ſ.* the art of cleanſing, ſcouring, and felting, cloths, ſtuffs, &c. in order to render them ſtronger, cloſer, and firmer: called alſo *milling*. Pliny aſſerts that Nicias, the ſon of Hermias, was the firſt inventor of the art of fulling: and it appears by an inſcription, quoted by ſir G. Wheeler, in his Travels through Greece, that Nicias was a governor in Greece in the time of the Romans.

The fulling of cloths and ſtuffs is performed by a kind of water-mill, called a *fulling* or *ſcouring mill*; which, except as to the mill-ſtones and hopper, is nearly the ſame with corn-mills: and there are ſome of them which ſerve indifferently for either uſe; corn being ground, and cloths fulled, by the motion of the ſame wheel. Whence, in ſome parts of France, the fullers are called *millers*; as grinding corn and milling cloths at the ſame time.

It appears, from the reſearches of profeſſor Beckman, that before the invention of the fulling-mill, cloths were fulled by being *walked upon*, or ſtamped with the feet; ſomewhat ſimilar to the method of waſhing linen by barting and rinſing in the brook. He ſays that, "anciently the fullers received the cloth as it came from the loom, in order that it might be ſcoured, *walked*, and ſmoothed. It was walked by being ſtamped upon with the feet. The rough wool raiſed by this operation was cleaned off by the ſkin of a hedge-hog, leaving on the cloth only a ſoft nap. Sheering ſeems not then to have been known; and the caſe is the ſame with reſpect to the preſſes, which were not invented till the ſixteenth century. When the fulling-mill was firſt invented is not known; but we find it mentioned at the beginning of the thirteenth century. The ancients uſed the Cimolian, Chian, Lemnian, Umbrian, and Samian, earths, as ſimilar to our fuller's earth; and in greater quantities; for the modern fuller often ſubſtitutes oatmeal, barley-meal, and ſoap, for finiſhing the finer and more delicate cloths."

The fulling-mill gives motion to a tree or ſpindle, whoſe teeth communicate with a ſet of wooden hammers or mallets, called *ſtampers*, which fall alternately into a large wooden trough. In theſe troughs are laid the cloths, ſtuffs, &c. intended to be fulled: then, letting the current of water put the wheel in motion, the hammers are ſucceſſively let fall, and by their weight and velocity ſtamp and preſs the ſtuffs very ſtrongly, which by this means become thickened and condenſed.

The neceſſity and utility of fulling, will appear obvious from the following conſiderations: The aſperities with which the ſurface of wool is every where ſurrounded, and the diſpoſition which it has to aſſume a progreſſive motion towards the root, render the ſpinning of wool, and making it into cloth, difficult operations. In order to ſpin wool, and afterwards to weave it, we are obliged to cover its fibres with a coating of oil, which, filling the cavities, renders the aſperities leſs ſenſible; in the ſame way as oil, when rubbed over the ſurface of a very fine file, renders it ſtill leſs rough. When the piece of cloth is finiſhed, it muſt be cleanſed from this oil; which, beſides giving it a diſagreeable ſmell, would cauſe it to foil whatever it came in contact with, and would prevent its taking the colour which is intended to be given to it by the dyer. To deprive it of the oil, it is carried to the fulling-mill, where it is beat with the hammers in the trough full of water, in which ſome fuller's-earth, or ſoap, has been mixed; the fuller's-earth combines with the oil which it ſeparates from the cloth, and both together are waſhed away by the freſh water which is continually brought into it by the machine; and thus, after a certain time, the oil is entirely waſhed out of the cloth.

But the ſcouring of the cloth is not the only object in fulling it; the alternate preſſure given by the mallets to the piece of cloth occaſions, eſpecially when the ſcouring is pretty far advanced, an effect analogous to that which is produced upon hats by the hands of the felter; the fibres of wool which compoſe one of the threads, whether of the warp or the woof, aſſume a progreſſive movement, introduce themſelves among thoſe of the threads neareſt to them, then into thoſe which follow; and thus by degrees all the threads, both of the warp and the woof, become felted together. The cloth, after having, by the above means, become ſhortened in all its dimenſions, partakes both of the nature of cloth, and of that of felt; it may be cut without being ſubject to ravel, and, on that account, we are not obliged to hem the edges of the pieces of which clothes are made. Laſtly, as the threads of the warp and thoſe of the woof are no longer ſo diſtinct and ſeparated from each other, the cloth, which has acquired a greater degree of thickneſs, forms a warmer clothing. Knit worſted alſo is, by fulling, rendered leſs apt to run, in caſe a ſtitch ſhould drop in it.

FULL'ING-MILL, *ſ.* See FULLING.

FUL'LO (Peter), who derived his ſurname from the employment which he exerciſed in his monaſtic ſtate, was biſhop of Antioch in the fifth century, and a noted leader of the ſect of Monophyſites, or advocates for the doctrine of one nature in Chriſt. He entered into a monaſtery at Conſtantinople, from which he was expelled on account of his having become a convert to the eutychian doctrine. Afterwards he found means to recommend himſelf to the good graces of Zeno, the ſon-in-law of the emperor Leo; and when his patron was appointed count of the Eaſt, he accompanied him to Antioch, the capital of his government.

ment. In that city he entered into intrigues for the purpoſe of depriving Martyrius, the biſhop, of his dignity; and having procured accuſations to be brought againſt him as a Neſtorian, which obliged him to repair to Conſtantinople to anſwer to the charge, he uſurped his ſee in his abſence. He was afterwards depoſed from the epiſcopate, and condemned for the oppoſition which he made to the decrees of the council of Chalcedon. In 482, however, by the interpoſition of Zeno, and the favour of Acacius biſhop of Conſtantinople, he was re-inſtated in the poſſeſſion of his former dignity. No ſooner was he firmly fixed in his ſeat, than he introduced an alteration into a part of the devotional ſervice of the church, which proved a ſubject of bitter diſcord. To the famous hymn, which the Greeks call *Triſagium*, he ordered the following phraſe to be added in the eaſtern churches, "who has ſuffered for us upon the croſs." His deſign was, to fix more deeply in the minds of the people the doctrine of one nature in Chriſt. By his adverſaries, however, it was repreſented as intended to convey the notion that all the three perſons of the trinity were crucified: hence they gave the name of Theopaſchites to thoſe who approved of that addition. The conſequence was a violent controverſy between the Weſtern and Eaſtern Chriſtians; the former rejecting the addition inſerted by Fullo, as implying a blaſphemous hereſy; and the latter conſtantly uſing it after this period, becauſe they conſidered it as applying to Chriſt alone. To put an end to this controverſy, the emperor Zeno publiſhed, in 482, his *Henoticon*, or Decree of Union, which was intended to reconcile the contending parties. But inſtead of producing that effect it gave riſe to new conteſts and diviſions, which terminated in a formal ſchiſm between the Latin and the Oriental Chriſtians. Fullo retained the ſee of Antioch until his death, which took place in 486.

FUL'LY, *adv.* Without vacuity. Completely; without lack; without more to be deſired.—He *fully* poſſeſſed the entire revelation he had received from God, and had thoroughly digeſted it. *Locke.*

The goddeſs cry'd
It is enough, I'm *fully* ſatisfy'd. *Addiſon.*

FUL'MINANT, *adj.* [*fulminant*, Fr. *fulminans*, Lat.] Thundering; making a noiſe like thunder.

To FUL'MINATE, *v. n.* [*fulmino*, Lat. *fulminer*, Fr.] To thunder:

I cannot *fulminate* nor tonitruate words
To puzzle intellects; my ninth lap affords
No Lycophronian buſkins. *Randolph.*

To make a loud noiſe or crack.—In damps one is called the ſuffocating, and the other the *fulminating* damp. *Woodward.*—To iſſue out eccleſiaſtical cenſures.—All things in this his *fulminating* bull are not of ſo innoxious a tendency. *Burke.*

To FUL'MINATE, *v. a.* To throw out as an object of terror.—As excommunication is not greatly regarded here in England, as now *fulminated*; ſo this conſtitution is out of uſe among us in a great meaſure. *Ayliffe.*

FULMINA'TION, *ſ.* [*fulminatio*, Lat. *fulmination*, Fr.] The act of thundering. Denunciations of cenſure.—The *fulminations* from the vatican were turned into ridicule. *Ayliffe.*—In chemiſtry, *fulmination* is more commonly expreſſed by the word DETONATION, which ſee. This effect is produced by the chemical admixture and combination of various ingredients; the principal of which are *fulminating powder*, for which ſee CHEMISTRY, vol. iv. p. 237.—*Fulminating gold*, p. 242, 316; and *fulminating ſilver*, p. 311, of the ſame article.

FUL'MINATORY, *adj.* [*fulmineus*, Lat.] Thundering; ſtriking horror.

FULMIN'EOUS, *adj.* [from the Lat. *fulmen*, thunder.] Belonging to thunder. *Scott. Not much uſed.*

FUL'NEK, a town of Moravia, in the circle of Prerau: ten miles north-weſt of Freyburg.

FUL'NESS, *ſ.* The ſtate of being filled ſo as to have no part vacant.—Your heave-offering ſhall be reckoned the *fulneſs* of the wine-preſs. *Numb.* xviii. 27.—Let the ſea roar and the *fulneſs* thereof. *Deut.*—To the houſes I wiſhed nothing more than ſafety, *fulneſs*, and freedom. *King Charles.*—The ſtate of abounding in any quality good or bad. Completeneſs; ſuch as leaves nothing to be deſired.—Your enjoyments are ſo complete, I turn wiſhes into gratulations, and congratulating their *fulneſs* only wiſh their continuance. *South.*—Completeneſs from the coalition of many parts.—The king ſet forwards to London, receiving the acclamations and applauſes of the people as he went; which indeed were true and unfeigned, as might well appear in the very demonſtration and *fulneſs* of the cry. *Bacon.*—Completeneſs; freedom from deficiency.—In thy preſence is *fulneſs* of joy. *Pſalms.*

He is the half part of a bleſſed man,
Left to be finiſhed by ſuch as ſhe;
And ſhe a fair divided excellence,
Whoſe *fulneſs* of perfection lies in him. *Shakeſpeare.*

Repletion; ſatiety.—I need not inſtance in the habitual intemperance of rich tables, nor the evil accidents and effects of *fulneſs*, pride and luſt, wantonneſs and ſoftneſs. *Taylor.*—Plenty; wealth:

To lapſe in *fulneſs*
Is ſorer than to lie for need; and falſhood
Is worſe in kings than beggars. *Shakeſpeare.*

Struggling perturbation; ſwelling in the mind.—A principal fruit of friendſhip is the eaſe and diſcharge of the *fulneſs* of the heart, which paſſions of all kinds do cauſe and induce. *Bacon.*—Largeneſs; extent.—There wanted the *fulneſs* of a plot, and variety of characters to form it as it ought; and perhaps ſomething might have been added to the beauty of the ſtyle. *Dryden.*—Force of ſound, ſuch as fills the ear; vigour.—This ſort of paſtoral derives almoſt its whole beauty from a natural eaſe of thought and ſmoothneſs of verſe; whereas that of moſt other kinds conſiſts in the ſtrength and *fulneſs* of both. *Pope.*

FUL'SOME, *adj.* [from pulle, Sax. foul.] Naſeous; offenſive:

Now half the youth of Europe are in arms,
How *fulſome* muſt it be to ſtay behind,
And die of rank diſeaſes here at home! *Otway.*

Rank; groſs; to the ſmell.—White ſatyrion is of a dainty ſmell, if the plant puts forth white flowers only, and thoſe not thin or dry, they are commonly of rank and *fulſome* ſmell. *Bacon.*—Luſtful.—He ſtuck them up before the *fulſome* ewes. *Shakeſpeare.*—Tending to obſcenity.—A certain epigram, which is aſcribed to the emperor, is more *fulſome* than any paſſage I have met with in our poet. *Dryd.*

FUL'SOMELY, *adv.* Naſeouſly; rankly; obſcenely.

FUL'SOMENESS, *ſ.* Naſeouſneſs. Rank ſmell. Obſcenity.—No decency is conſidered, no *fulſomeneſs* is omitted, no venom is wanting, as far as dulneſs can ſupply it. *Dryden.*

FUL'VIA, a bold and ambitious woman, who married the tribune Clodius, and afterwards Curio, and at laſt M. Antony. She took a part in all the intrigues of her huſband's triumvirate, and ſhewed herſelf cruel as well as revengeful. When Cicero's head had been cut off by order of Antony, Fulvia ordered it to be brought to her, and with all the inſolence of barbarity, ſhe bored the orator's tongue with her golden bodkin. Antony divorced her to marry Cleopatra, upon which ſhe attempted to avenge her

her wrongs, by perſuading Auguſtus to take up arms againſt her huſband. When this ſcheme did not ſucceed, ſhe raiſed a faction againſt Auguſtus, in which ſhe engaged L. Antonius her brother-in-law; and when all her attempts proved fruitleſs, ſhe retired into the eaſt, where her huſband received her with great coldneſs and indifference. This unkindneſs totally broke her heart, and ſhe ſoon after died, about forty years before the chriſtian era. *Plutarch.*—A woman who diſcovered to Cicero the deſigns of Catiline upon his life.

FUL'VID, *adj.* [*fulvidus*, Lat.] Of a deep yellow colour.

FUL'VIUS, a Roman ſenator, intimate with Auguſtus. He diſcloſed the emperor's ſecrets to his wife, who made it public to all the Roman matrons, for which he received ſo ſevere a reprimand from Auguſtus, that he and his wife hanged themſelves in deſpair.—A friend of C. Gracchus who was killed in a ſedition with his ſon. His body was thrown into the river, and his widow was forbidden to put on mourning for his death. *Plutarch.*—Flaccus Cenſor, a Roman who plundered a marble temple of Juno, to finiſh the building of one which he had erected to Fortune. He was an example of miſery and unhappineſs after this ſacrilege. *Livy.*—Ser. Nobilior, a Roman conſul who went to Africa after the defeat of Regulus. After he had acquired much glory againſt the Carthaginians, he was ſhipwrecked at his return with 200 Roman ſhips. His grandſon Marcus was ſent to Spain, where he greatly ſignalized himſelf. He was afterwards rewarded with the conſulſhip.

FUL'VOUS, *adj.* [*fulvus*, Lat.] Ruddy, of a deep yellow.

FUMA'DO, *ſ.* [*fumus*, Lat.] Smoked or dried fiſh. Pilchards are ſo called in Spain and Italy, whither great quantities are exported from England.—Fiſh that ſerve for the hotter countries, they uſed at firſt to fume, by hanging them upon long ſticks one by one, drying them with the ſmoke of a ſoft and continual fire, from which they got the name of *fumadoes*. *Carew.*

FU'MAGE, [*fumagium*, Lat.] Dung for ſoil, or manuring of land. Chart. *Rich.* II. Pat. 5 *Edw.* IV. And this word has been uſed for *ſmoke-money*, or *hearth-money*, a cuſtomary payment for every houſe that had a chimney.

FUMA'NA, *ſ.* in botany. See GISTUS.

FUMA'NI (Adam), a writer in the ſixteenth century, and a native of Verona. He acquired an accurate knowledge of the Greek and Latin languages, and was intimate with the moſt eminent ſcholars of his time. He accompanied cardinal Pole in his legation to Flanders; and Navagero to the council of Trent, who procured for him the ſecretaryſhip to that aſſembly. He had a canonry at Verona, which he held till his death, in 1587. Fumani tranſlated from Greek into Latin the moral and aſcetic works of St. Baſil. He alſo compoſed poems, of which the moſt remarkable was, A Syſtem of Logic, in Latin heroics, in five books. This unpromiſing ſubject he treated with an elegance and eaſe which are altogether ſurpriſing, and prove at leaſt his facility in the management of verſe and language. It was printed for the firſt time in the ſecond Cominian edition of the works of Fracaſtorius, 1739, along with other poems, Greek, Latin, and Italian, of the ſame author.

FUMA'RIA, *ſ.* [Becauſe it affects the eyes, like ſmoke.] FUMITORY; in botany, a genus of the claſs diadelphia, order hexandria, natural order of corydales, (papaveraceæ, *Juſſ.*) The generic characters are—Calyx: perianth two-leafed; leaflets oppoſite, equal, lateral, erect, acute, ſmall, deciduous. Corolla: oblong, tubular, ringent; palate prominent, cloſing the throat; upper lip flat, obtuſe, emarginate, reflex; nectary the baſe of the upper lip prominent backward, obtuſe; lower lip entirely ſimilar to the upper, keeled towards the baſe; nectary the keeled baſe, but in this leſs prominent; throat four-cornered, obtuſe, perpendicularly bifid. Stamina: filaments two, equal, broad, one within each lip, incloſed, acuminate; antheræ three at the end of each filament. Piſtillum: germ oblong, compreſſed, acuminate; ſtyle ſhort; ſtigma orbiculate, erect, compreſſed. Pericarpium: filicle one-celled. Seeds: roundiſh.—*Eſſential Character.* Calyx: two-leaved corolla ringent; filaments two, membranaceous, with three antheræ on each.

Species. I. Corollas with two ſpurs. 1. Fumaria cucullaria, or naked-ſtalked fumitory: ſcape naked. Root ſcaly, the ſize of a large hazel nut; flower-ſtalk eight or nine inches high. Native of Virginia and Canada. Perennial. It flowers in June and July; and was cultivated by Mr. Miller in 1759.

2. Fumaria ſpectabilis: flowers two-lobed behind; ſtem leafy. This is a fine plant, with very large, handſome flowers. It has the air of F. bulboſa, but is bigger in all its parts. The branches proceed from the axils of the leaves, and are but few; ſtem erect. Native of Siberia.

3. Fumaria fungoſa, or ſpongy-flowered fumitory: flowers bigibbous at the baſe; ſiliques linear, ancipital, covered by an inflated fungous corolla; leaves climbing. Annual. Native of North America; flowers from June to September.

II. Corollas with one ſpur. 4. Fumaria nobilis, or great-flowered fumitory: ſtems ſimple; bractes ſhorter than the flower, undivided. Perennial; very like the next ſpecies, but much larger. Native of Siberia; and flowers in May.

5. Fumaria bulboſa, or bulbous fumitory: ſtem ſimple, bractes the length of the flowers. Theſe plants are united ſpecifically by a fleſhy, ſimple root. There are three varieties, which Linnæus informs us are all natives of Sweden, but in different provinces; the firſt in Scania, both with a red and a white flower; the ſecond in moſt of the woods of Upland; and the third on the coaſts of Roſlag and Finland. They may be thus diſtinguiſhed; α has a hollow root, and entire bractes; β a ſolid root, and entire bractes; γ a ſolid root, and gaſhed bractes. The hollow and ſolid rooted fumitory never are ſeen together, for they affect different ſoils; the former flowers fourteen days later, and the latter has entire bractes the firſt year. According to Curtis, the ſolid-rooted fumitory rarely exceeds three or four inches in height, and produces its ſpike of purple flowers in April; it does not vary much in colour. The hollow-rooted fumitory has a much larger root, hollow like a ſhell; the plant grows to twice the ſize of the other, and bears a foliage and flowers proportionably larger; the bractes, which in that aſſume a kind of fingered appearance, in this are entire, or but ſlightly indented; and it flowers about three weeks earlier. There are three principal varieties of it in point of colour; white, bluſh-coloured and purple. As this ſpecies is found in moſt parts of Europe from Sweden to Italy, Linnæus remarks, as a ſingularity, that it does not grow wild in England. In our gardens they appear early in April.

6. Fumaria ſempervirens, or glaucous fumitory: ſiliques linear, panicled; ſtem erect. Annual; ſtem upright, a foot and half high, round, and very ſmooth, ſending out ſeveral branches at top; leaves ſmooth, branching, pale, divided like the common ſort, but the leaflets larger and more obtuſe; flowers in looſe panicles from the ſides of the ſtem, and at the extremities of the branches, of a pale purple colour, with yellow chaps or lips; pods taper, narrow, an inch and half long, containing many ſmall black ſhining ſeeds. It flowers during ſummer. Native of North America.

7. Fumaria lutea, or yellow fumitory: ſiliques cylindric; ſtems diffuſed, angles obtuſe. This is very like the ninth ſpecies, but it is perennial. Miller adds, that the ſtalks of this have blunt angles, whereas thoſe of the ninth are acute; that they are of a purpliſh colour; and that the flowers grow in a looſer panicle, on longer pedicles; the root ſtrikes deep into the ground; ſtems many, ſucculent, diffuſed, about ſix inches high; leaves on

long branching petioles, compoſed of many irregular leaflets, trifid at the top; ſee Botany Plate VI. fig. 23. They continue green all the year, and the flowers in ſucceſſion from April to October; ſo that this ſpecies deſerves a place in every garden. It is peculiarly proper for rock-work, old walls and buildings, in which the ſeeds often lodge of themſelves, being thrown to a conſiderable diſtance by the elaſticity of the pods. It is a native of Barbary.

8. Fumaria Sibirica, or Siberian fumitory: ſiliques oval; ſtems patulous, leaflets oblong. Annual. Native of Siberia.

9. Fumaria capnoides, or white-flowered fumitory: ſiliques linear, four-cornered; ſtems diffuſed, acute-angled. Annual. It has a ſucceſſion of the flowers from May to October; and this, as well as the ſeventh, is proper for walls, old buildings and rock-work. Native of the ſouth of Europe.

10. Fumaria enneaphylla; leaves triternate, leaflets cordate. This has weak trailing ſtems, which are much divided, and leaflets divided into three parts, each of which has three heart-ſhaped lobes; the flowers are produced in ſmall looſe panicles from the ſide of the ſtalks; they are of a greeniſh white, and appear moſt of the ſummer months. Native of Spain and Italy, upon old walls and in rocky places.

11. Fumaria officinalis, or common fumitory: pericarps one-ſeeded, racemed; ſtem diffuſe. This is a common weed in corn fields, gardens, and on ditch banks; flowering from April to Auguſt, and even later. Kine and ſheep eat it; to the latter it is accounted ſalubrious; the leaves are ſucculent, ſaline, and bitter. The expreſſed juice in doſes of two or three ounces, with whey, is uſeful in hypochondriacal, ſcorbutic, and cachectic habits. It corrects acidity, and ſtrengthens the tone of the ſtomach. Hoffman prefers it to all other medicines as a ſweetener of the blood. There is no doubt of its utility in obſtructions of the viſcera, and the diſeaſes ariſing from them. The celebrated Boerhaave frequently preſcribed it in the black jaundice and bilious cholics. An infuſion of the leaves is uſed as a coſmetic to remove freckles, and clear the ſkin; and Dr. Cullen experienced its good effects in many cutaneous diſorders.

12. Fumaria capreolata, or ramping fumitory: pericarps one-ſeeded, racemed; leaves climbing, ſubcirrhoſe. This ſeems to be nothing more than a variety of the foregoing. Hudſon could perceive no difference except in the colour of the flowers, which in this is white with a purple tip; it climbs, not by tendrils, but by the bending or twiſting of the petioles; but Louis Gerard attributes this wholly to its ſituation in hedges or among buſhes. Dr. Stokes, however, has obſerved the ſtem ſometimes trailing, and interweaving its branches among the graſs, very much branched, ſometimes three feet long, the bloſſoms pale red; the ſtems are longer and weaker; the leaves more diſtant, and not ſo finely divided, the extreme diviſions broader and blunter than the foregoing; the ſpikes of flowers are on longer peduncles, but with fewer flowers on a ſpike. All theſe differences may alſo be owing to ſituation. Native of Provence, Sileſia, and Britain. Linnæus remarks, as a ſingularity, that this does not occur in Sweden, where the foregoing is very common, not only in corn fields, but among buſhes.

13. Fumaria ſpicata, or narrow-leaved fumitory: pericarps one-ſeeded, ſpiked; ſtem erect, leaflets filiform. Annual. The ſtalks more erect than in the common ſort; the leaves are very finely divided, and the flowers grow in a looſe ſpike; they are of a deep red colour, and appear about the ſame time; the flowers grow very cloſe together in the ſpike; and the leaves are glaucous, and ſmaller than in the other ſpecies, like camomile; thoſe that proceed from the root are on longer petioles, but the ſegments are ſhorter; thoſe on the ſtem have ſhorter petioles, but longer ſegments; both ſtems and leaves are covered with a glaucous bloom; there is little or no bitterneſs in the leaves. Linnæus ſuſpects that this may be a hybridous plant; and is of opinion, that whoever ſhall determine this and the following to be varieties of the 11th or common fumitory can hardly err; the fruit indicating that they are one and the ſame. Native of Spain, Portugal, Italy, and the ſouth of France. It flowers with us in July and Auguſt. Ray ſays it flowers in ſummer, whereas Linnæus aſſerts that the flowers are vernal.

14. Fumaria claviculata, or climbing fumitory: ſiliques linear; leaves tendril-bearing. Native of Denmark and Britain, in woods and moiſt hedges, boggy and rocky places in a ſandy ſoil, on the banks of lakes and rivers, and on the thatch of cottages; as on Blackheath and about Charlton and Greenwich; at Snareſbrook near Woodford, Eſſex; on the banks of the Trent near Ouſeley in Staffordſhire; in the hedges between Bala in Merionethſhire and Pimble-mere; above Great Malvern tower; about Birmingham; rocks of Stonehall near Rawdon, ſeven miles from Leeds; Thorpe near Norwich; in the quarries at Inner-Keith, in Scotland; near Whitwick in Leiceſterſhire; Kendal in Weſtmoreland: flowering from the end of May to the end of July.

15. Fumaria veſicaria, or bladdered fumitory: ſiliques globular, acute, inflated; leaves cirrhoſe. This is an annual plant, with trailing ſtalks, which are two or three feet long, dividing into many ſmaller ones, with ſmall branching leaves, like thoſe of common fumitory, but ending in tendrils; flowers in looſe panicles, from the ſide of the ſtalks, of a whitiſh yellow colour; the terminating leaflets are protracted into tendrils; peduncles oppoſite to the leaves, bearing one to four flowers. Native of the Cape of Good Hope. Cultivated in the Chelſea garden in 1696; it flowers in July.

Propagation and Culture. The firſt ſpecies is propagated by offsets from the root; it loves a ſhady ſituation and a light ſoil; the beſt time to tranſplant the roots is in autumn, when the leaves are decayed, for it ſhoots pretty early in the ſpring, therefore it would not be ſafe to remove them at that ſeaſon. The fourth and fifth are propagated by offsets, as other bulbous-rooted flowers; theſe are very pretty ornaments to borders in a ſmall flower-garden: they are extreme hardy, but do not increaſe very faſt, ſeldom producing ſeeds with us; and their bulbs do not multiply very much, eſpecially if they are often tranſplanted; they love a light ſandy ſoil, and ſhould be ſuffered to remain three years undiſturbed, in which time they will produce ſeveral offsets. The beſt ſeaſon for tranſplanting them is from May to Auguſt, when the leaves begin to die off; for if they are taken up when the leaves are freſh, it will greatly weaken their roots.

6, 7, 8, 9, 10, 12, 13, 14. If the ſeeds of theſe are permitted to ſcatter, the plants will come up without any trouble, and require no other care but to thin them where they are too cloſe, and to keep them clean from weeds. Theſe thrive beſt on old walls and buildings and on rocks; they ſcatter their ſeeds from their elaſtic pods, and require no care in the cultivation.

15. This is propagated by ſeeds, which ſhould be ſown upon a moderate hot-bed in the ſpring; and when the plants are fit to remove, they muſt be each planted in a ſmall pot filled with light earth, and plunged again into the hot-bed, where they muſt be ſhaded from the ſun till they have taken new root; after which they ſhould have a large ſhare of air admitted to them at all times in mild weather, to prevent their drawing up weak; and as ſoon as the ſeaſon is favourable, they ſhould be inured to bear the open air, to which they may be removed the beginning of June, when they may be ſhaken out of the pots, preſerving all the earth to their roots, and planted in a warm border, where their ſtalks ſhould be ſupported with ſticks to prevent their trailing on the ground; and in July the plants will flower, and continue a ſucceſſion of flowers till the froſt deſtroys the plants. The ſeeds ripen in autumn. See ADOXA.

FUMAY,

FUMAY', a town of France, in the department of the Ardennes, and chief place of a canton, in the diſtrict of Rocroy; the principal trade is in ſlates, of which there are quarries near the town: two poſts and three quarters ſouth of Givet, and one and three quarters north of Rocroy. Lat. 50. N. lon. 22. 20. E. Ferro.

To FUM'BLE, *v. n.* [*fommelen*, Dut.] To attempt any thing awkwardly or ungainly.—Our mechanic theiſts will have their atoms never once to have *fumbled* in theſe their notions, nor to have produced any inept ſyſtem. *Cudworth.*—To puzzle; to ſtrain in perplexity.—Am not I a friend to help you out? You would have been *fumbling* half an hour for this excuſe. *Dryden.*—To play childiſhly.—I ſaw him *fumble* with the ſheets, and play with flowers, and ſmile upon his finger's end. *Shakeſpeare.*

To FUM'BLE, *v. a.* To manage awkwardly:

As many farewels as be ſtars in heav'n,
With diſtinct breath and conſign'd kiſſes to them,
He *fumbles* up all in one looſe adieu. *Shakeſpeare.*

FUMB'LER, *ſ.* One who acts awkwardly.
FUMB'LINGLY, *adv.* In an awkward manner.
FUME, *ſ.* [*fumée*, Fr. *fumus*, Lat.] Smoke:

Thus fighting fires awhile themſelves conſume;
But ſtraight, like Turks, forc'd on to win or die,
They firſt lay tender bridges of their *fume*,
And o'er the breach in unctuous vapours fly. *Dryden.*

Vapour; any volatile parts flying away:

Love is a ſmoke rais'd with the *fume* of ſighs:
Being purg'd, a fire ſparkling in lovers' eyes. *Shakeſp.*

Exhalation from the ſtomach.—The *fumes* of drink diſcompoſe and ſtupify the brains of a man overcharged with it. *South.*

Pow'r, like new wine, does your weak brain ſurpriſe,
And its mad *fumes* in your diſcourſes riſe;
But time theſe yielding vapours will remove:
Meanwhile I'll taſte the ſober joys of love. *Dryden.*

Rage; heat of mind; paſſion.—The *fumes* of his paſſion do really intoxicate and confound his judging and diſcerning faculty. *South.*—Any thing unſubſtantial:

When Duncan is aſleep, his two chamberlains
Will I with wine and waſſel ſo convince,
That memory, the warder of the brain,
Shall be a *fume*. *Shakeſpeare.*

Idle conceit; vain imagination.—To lay aſide all that may ſeem to have a ſhew of *fumes* and fancies, and to ſpeak ſolids, a war with Spain is a mighty work. *Bacon.*

To FUME, *v. n.* [*fumer*, Fr. *fumo*, Lat.] To ſmoke:

From thence the *fuming* trail began to ſpread,
And lambent glories danc'd about her head. *Dryden.*

Strait hover round the fair her airy band;
Some, as ſhe ſipp'd, the *fuming* liquor fann'd. *Pope.*

To vapour; to yield exhalations, as by heat:

Thoſe conſtant cups lay *fuming* to his brain,
And always boil in each extended vein. *Roſcommon.*

To paſs away in vapours.—Their parts are kept from *fuming* away by their fixity, and alſo by the vaſt weight and denſity of the atmoſpheres incumbent upon them. *Cheyne.*

The firſt freſh dawn then wak'd the gladden'd race,
Of uncorrupted man, nor bluſh'd to ſee
The ſluggard ſleep beneath its ſacred beam;
For their light ſlumbers gentle *fum'd* away. *Thomſon.*

To be in a rage; to be hot with anger:

When he knew his rival free'd and gone,
He ſwells with wrath; he makes outrageous moan:
He frets, he *fumes*, he ſtares, he ſtamps the ground,
The hollow tow'r with clamours ring around. *Dryden.*

To FUME, *v. a.* To ſmoke; to dry in the ſmoke.—Thoſe that ſerve for hot countries they uſed at firſt to *fume*, by hanging them upon long ſticks one by one, and drying them with the ſmoke of a ſoft fire. *Carew.*—To perfume with odours in the fire.—The *fuming* of the holes with brimſtone, garlic, or other unſavory things, will drive moles out of the ground. *Mortimer.*

She *fum'd* the temples with an od'rous flame,
And oft before the ſacred altars came,
To pray for him who was an empty name. *Dryden.*

To diſperſe in vapours.—The heat will *fume* away moſt of the ſcent. *Mortimer.*

FUMEL, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the diſtrict of Monflanquin, ſituated on the Lot: three leagues eaſt ſouth eaſt of Monflanquin, and three north of Tournon.

FU'MET, *ſ.* The dung of the deer.

FUME'TTE, *ſ.* [French.] A word introduced by cooks, and the pupils of cooks, for the ſtink of meat:

A haunch of ven'ſon made her ſweat,
Unleſs it had the right *fumette*. *Swift.*

FU'MID, *adj.* [*fumidus*, Lat.] Smoky; vaporous.—A craſs and *fumid* exhalation is cauſed from the combat of the ſulphur and iron with the acid and nitrous ſpirits of aquafortis. *Brown.*

FUMI'DITY, *ſ.* Smokineſs; tendency to ſmoke.
FU'MIDNESS, *ſ.* Smokineſs. *Scott. Little uſed.*
FUMIF'EROUS, *adj.* [*fumus*, Lat. ſmoke, and *fero*, to bring.] Producing ſmoke. *Scott. Not much uſed.*
FUMIF'IC, *adj.* [*fumus*, Lat. ſmoke, and *facio*, to make.] Making ſmoke, producing fumes. *Scott. Little uſed.*
FUMIF'ICATE, *v.* To make a fume; to perfume. *Bailey. Not much uſed.*
FU'MIGANT, *adj.* Smoking, fuming.
To FU'MIGATE, *v. n.* [from *fumus*, Lat. *fumiger*, Fr.] To ſmoke; to perfume by ſmoke or vapour:

Would'ſt thou preſerve thy famiſh'd family,
With fragrant thyme the city *fumigate*,
And break the waxen walls to ſave the ſtate. *Dryden.*

To medicate or heal by vapours.
FUMIGA'TION, *ſ.* [*fumigatio*, Lat. *fumigation*, Fr.] Scents raiſed by fire.—*Fumigations*, often repeated, are very beneficial. *Arbuthnot.*

My *fumigation* is to Venus juſt
The ſouls of roſes, and red coral's duſt:
And, laſt, to make my *fumigation* good,
'Tis mixt with ſparrows brains and pigeons blood.
Dryden.

The application of medicines to the body in fumes, or of vapours to the air, for the purpoſe of eradicating miaſmata and contagion. By the ſubtle fumes that are inſpired as well as inhaled into our bodies, much benefit or prejudice may be produced, according to the nature of the matter, and the conſtitution into which it is received; as is evident from the palſies produced among workers in lead-mines, &c. and the benefits received in many caſes when putrid air is impregnated with ſalutary materials. A very ſatisfactory and intereſting proof of this fact was given by Dr. Carmichael Smyth, on board the Union hoſpital ſhip in 1795, as ſtated under the article CONTAGION, vol. v. p. 132; and ſince that by Mr. Cruickſhank, by ſimilar experiments made at Woolwich, with the ſame important views. Theſe laudable attempts of our countrymen to remove, by eaſy and obvious methods, the fatal effects of noxious and peſtilential effluvia, have been more recently purſued by M. Morveau, to a ſtill greater extent, and with additional intereſt. Conceiving it ſufficiently proved by experiment, that the mineral acids have the power of deſtroying contagious miaſmata, as well as the putrid odour which denotes their preſence, he inquires whether theſe acids all act in a ſimilar manner; if they exert the ſame affinities; if their effects are equally prompt and certain; if their action be increaſed by oxygen; if ammoniac makes a neceſſary part of theſe compounds;

pounds; whether they are always accompanied by carbonic acid gas; and, laſtly, whether the vegetable acids are capable of affecting decompoſition. Such are the points which this author undertakes to diſcuſs, and to determine by chemical experiment.

With this view, ſome pieces of raw beef were incloſed under a large glaſs bell filled with atmoſpheric air, and inverted over water, and left to putrefy in this ſtate. When the putrefaction was complete, the air contained in the glaſs was expoſed to different trials; and the following is the reſult in general terms. When the air was waſhed with lime-water, a copious precipitation took place, marking the preſence of carbonic acid gas. The air preſerved, nevertheleſs, its putrid ſmell. Another portion of the putrid air was agitated with a ſolution of nitrate of ſilver, which became inſtantly blackened, and a browniſh pellicle formed on the ſurface, part of which ſunk to the bottom of the veſſel. Nearly the ſame phenomena took place with the nitrates of mercury and copper, and with the acetite of lead.

The putrid gas being introduced into a bottle with a ſolution of ſulphur of lime, the latter ſoon grew turbid, and carbonate of lime was depoſited, but without any appearance of a black or brown precipitate, or the diſengagement of ammoniac. Nor did ſlips of paper, tinctured with different vegetable colours, or with nitrate of copper, undergo any change on expoſure to putrid gas, which indicated in any degree the preſence of ammoniac, or other alkali in a free ſtate. When, however, quicklime was added to the water which had been in contact with the putrid gas, and which had abſorbed ſufficient of this to give it an offenſive odour, a vapour was diſengaged from the water which ſenſibly evinced the preſence of ammoniac.

When the air was agitated with a ſolution of ſulphate of zinc, there was no trace of the white precipitate which ſulphurated hydrogen, and the hydro-ſulphures, occaſion in that liquor: nor was the putrid odour diminiſhed in any remarkable degree. The oxyds which are known to act moſt powerfully on the hydro-ſulphures, ſuch as the oxyd of zinc, the black oxyd of manganeſe, and the brown oxyd of lead, all reduced to fine powder, and ſlightly moiſtened with diſtilled water, were ſhut up in contact with the putrid gas: but, after twenty-four hours of expoſure in this way, no change in the colour of thoſe oxyds was perceptible, no trace of the diſengagement of ammoniac, nor any phenomenon indicating the preſence of ſulphur. The fetid odour merely appeared to be ſomewhat diminiſhed in the veſſel containing the oxyd of manganeſe, and the water acquired the property of precipitating, of a dirty grey colour, the ſolutions of nitrate of mercury and of the acetite of lead.

In the putrid air was next burnt a conſiderable quantity of gum benzoin; but the effect was merely to cover, in ſome degree, its offenſive odour, without at all deſtroying it. The effect was the ſame when the air was agitated with ſpirituous ſolutions of different aromatic gums and balſams. When the thieves' vinegar was employed in the ſame way, the putrid odour was modified merely, but not deſtroyed. The pyro-ligneous acid ſeemed to have rather more effect, as, after two hours, a ſlight degree only of offenſive ſmell was perceivable, combined with the empyreumatic odour of the acid. When gunpowder was repeatedly exploded in the gas, the offenſive odour diſappeared; but it ſeemed rather to be owing to the diſperſion of the gas than to its correction. The gaſes produced, indeed, during the exploſion of gunpowder, being merely carbonic acid and azotic gas, with a very conſiderable proportion of ſulphureous gas, could not be expected to act chemically on the putrid vapour. Good vinegar cauſed the putrid odour to diſappear; as did the vapour of diſtilled vinegar. When the acetic acid, or radical vinegar, was ſubſtituted for the two former, the effect was much more ſtriking, the fetid odour diſappearing inſtantly, without the agreeable pungency of the acid being ſenſibly diminiſhed.

The mineral acids were next examined, as to their power of deſtroying the contamination of putrid air. The vapour of ſulphureous acid, and the ſame in a ſtate of gas, let looſe during the combuſtion of ſulphur, were very effectual for the purpoſe. The ſulphuric acid, both concentrated and diluted with three times its bulk of water, completely deſtroyed the putrid ſmell when agitated with the air. When the nitric acid vapour was employed, in the manner recommended by Dr. Smyth, no traces of putridity remained, nor did the air occaſion any alteration of colour in the ſolutions of acetite of lead or of nitrate of mercury.

Whatever care was taken in the execution of the laſt experiment, the author always obſerved ſome ſlight traces of red vapours of nitrous gas during the proceſs: he proceeded, therefore, to aſcertain, by direct experiment, whether the opinion of Mr. Keir was well founded, that oxygen gas is given out during the proceſs, and thus the air meliorated by it. Probability, certainly, was againſt ſuch a ſuppoſition; for it would be ſurpriſing, if a diſtillation, the eſſential and rigorous condition of which is, that not a particle of acid is decompoſed, ſhould furniſh a ſenſible quantity of oxygen. But the author ſtill leſs expected to find, that, in oppoſition to Mr. Keir's aſſertion, inſtead of being meliorated by the proceſs, the air was rendered worſe by many degrees than before. This, however, was the fact.

The powerful action of the muriatic acid gas has been already mentioned. On repeating the experiments of Mr. Cruickſhank with the oxygenated muriatic acid gas, the author's reſults fully confirmed thoſe of that gentleman. The advantages of this proceſs, eſpecially when ſimplified in the way here adviſed, are clearly demonſtrated. Into a bottle, whoſe capacity was three centilitres (about $\frac{1}{2}$ oz.) were put four grammes (about $\mathfrak{Z}i\frac{1}{2}$) of black oxyd of manganeſe, groſsly powdered; the bottle then filled about two-thirds full with the nitro-muriatic acid (aqua regia). In a few minutes, on being agitated, the oxygenated muriatic acid gas was diſengaged with ſuch intenſity, that vegetable colours preſented to the mouth of the bottle were ſoon radically deſtroyed. The facility, and particularly the promptitude, with which, without the aid of a diſtilling apparatus, this powerful reagent is thus obtained, induced the author to give it the name of *extemporaneous oxy-muriatic acid*; and he afterwards diſcovered another property of this preparation, which may render it ſtill more generally uſeful. It is well known how difficult it is, even in the cloſeſt veſſels, to preſerve unchanged the oxygenated muriatic acid, as procured by the common proceſſes. A bottle prepared in the manner here indicated, after being laid aſide and forgotten for eight years, was found to have retained its priſtine pungency.

Having thus examined the power of the various ſubſtances employed for the deſtruction of contagion, the author gives a general view of the concluſions deducible from his experiments with reſpect to the comparative efficacy of the different means; and points out the beſt method of employing thoſe which are moſt deſerving of confidence. Water, cold or warm, employed in waſhing, may carry away infectious matter, but without decompoſing it: and it has been found that lye itſelf has not always deſtroyed the contagion in linen; but that this has afterwards communicated the infection, in the caſe of plague. Lime is only really uſeful for decompoſing animal matters before putrefaction begins, or for the abſorption of carbonic acid; for putrid air is not ſweetened by paſſing through lime water. Reſinous ſubſtances, even thoſe which give out a volatile acid on diſtillation, merely diſguiſe the putrid miaſmata, without at all deſtroying them, or changing their infectious nature. Fire occaſions currents of air, which may carry off and diſperſe putrid vapours,

vapours, when confined in a narrow ſpace; but beyond this it is rather hurtful than ſalutary. It can only decompoſe the putrid effluvia when carried to the degree of actual combuſtion. No advantage can be expected from burning different ſubſtances on live coals. Vinegar, thus employed, is rather burnt than evaporated. Nitre itſelf gives only irreſpirable gaſes, after having ſerved by its oxygen to augment the intenſity of the fire. It is the ſame with gunpowder, which merely exerts a mechanical action on the air.

With ſulphur it is otherwiſe, its combuſtion being never complete, and producing only the firſt ſtage of oxydation; whether lighted, or thrown on live coals, it emits a ſulphureous acid vapour, which acts powerfully on the miaſmata which it reaches; it, however, exerts its operation at no great diſtance, and is inadmiſſible in places that are inhabited. It may, nevertheleſs, be uſefully employed for the purification of goods and merchandiſe that are not readily ſpoiled, and of the air of narrow paſſages, as in hoſpitals. Common vinegar, or the acetous acid, may be reckoned amongſt the beſt purifiers for ſubſtances that admit of being immerſed in it, or which are capable of being well waſhed with it; but it is not ſufficiently volatile to be employed with advantage in fumigation. The pyroligneous acid has an action very analogous to that of vinegar, but leſs powerful.

With reſpect to the acetic acid, or radical vinegar, frequent fumigations with this could not be made in places at all ſpacious, without incurring a very heavy expence. Its action on infected matter is, however, more rapid and intenſe than that of common vinegar. Its quick and penetrating ſcent, which it emits at all temperatures, ſerves, in the author's opinion, not only to change the condition of the ſurrounding air, but affords, at the ſame time, a powerful ſtimulus to the organs of reſpiration, which ſupports the vital powers to a degree of energy capable of reſiſting the impreſſion of contagion. The acetic acid, therefore, may be carried about the perſon in times of contagion, and, when expoſure to it is unavoidable, with great advantage.

The mineral acids, in general, are anti-ſeptic, and check all fermentation, both animal and vegetable, and are capable of decompoſing contagious virus; they are not all, however, equally advantageous. The ſulphuric acid cannot, on account of its fixity, ſerve to purify the air. The ſulphureous, in a liquid ſtate, produces but little effect; its action, in the ſtate of vapour, as ariſing during the combuſtion of ſulphur, has been already mentioned. The nitrous acid acts only on the reſpirable portion of the atmoſphere, and the vapours which it exhales are highly ſuffocating. The nitric acid, diſengaged in Dr. Smyth's proceſs, deſtroys with great certainty putrid miaſmata; but it diffuſes itſelf to no great diſtance, is readily condenſed, and only acts as an oxygenant in giving out nitrous gas: a repetition of the proceſs, likewiſe, is requiſite, even in a ſmall apartment. The proceſs, beſides, is expenſive, and requires many cautions in its performance.

The muriatic acid offers here the greateſt advantages, on account of its prodigious expanſibility. The manner of employing it is as ſimple as it is cheap, and the proceſs is performed with leſs riſk of accidents from fire than that of Dr. Smyth; ſince no greater heat is required than what is produced by the mixture of the ingredients. By the addition of a little of the oxyd of manganeſe, the oxygenated muriatic acid gas is procured, which is the moſt certain preſervative, and which is recommended by the facility with which it may be applied in all caſes.

In the liſt of ſubſtances ſuſceptible of a quick evaporation, and capable of producing all the ſalutary effects of the moſt powerful ſuper-oxygenants, may be mentioned the oxygenated muriate of tin *(liquor fumans Libavii.)* The uſe of this was firſt ſuggeſted by M. Vic-d'Azyr. This is ſo extremely volatile, that the veſſel containing it cannot be opened for an inſtant without the diſengagement of the moſt pungent vapours: it is neceſſary, therefore, to preſerve it in veſſels very cloſely ſtopt. It is, however, liable to the inconvenience of cauſing the ſtopper often to adhere ſo tightly, as to be with difficulty withdrawn.

With reſpect to the muriatic acid fumigation, the following is recommended as the moſt ſimple method of performing the proceſs. In caſes where it is requiſite to purify the air of places that are not inhabited, a chafing diſh is to be placed in the centre, and on it an iron pot half filled with ſand or aſhes. On this is to be placed a large glaſs veſſel, or one of porcelain or ſtone ware, containing muriate of ſoda (common ſalt): when this begins to be heated, ſulphuric acid (oil of vitriol) is to be added, when the perſon officiating is to retire, keeping the doors and windows as cloſely ſhut as poſſible for ſix or eight hours. A ward or apartment containing twenty beds would require the following quantities of ingredients to anſwer the intended purpoſe: common ſalt, nine or ten ounces; oil of vitriol, about eight ounces.

In the purification of inhabited places, different precautions are required; very ſmall quantities only of the ingredients are to be employed at once; or, which is better, the ſalt ſhould be carried round the apartment, and the acid added by degrees only; by this means, the extrication of the acid vapours takes place at any point, and in any degree that may be judged neceſſary. The only apparatus requiſite for the purpoſe are, a bottle of ſulphuric acid (oil of vitriol), a large glaſs goblet, and ſome common ſalt. The goblet being placed on the ground, or on a table, in the middle of the room, a large ſpoonful of common ſalt is to be put in the glaſs, and a very ſmall liqueur glaſsful of the ſulphuric acid is to be added, but at two or three different times, and at intervals. At each affuſion of the acid a quantity of vapour is diſengaged and diffuſed around the apartment, without occaſioning any inconvenience to the aſſiſtants.

The fumigation with the oxygenated muriatic acid differs only from that above deſcribed, in the addition of a little of the black oxyd of manganeſe (commonly called *manganeſe* ſimply.) The proportions of the ingredients, however, ſhould not be exactly thoſe of Mr. Cruickſhank, but the following, in order to effect a complete ſaturation of principles, and to avoid waſte:

Common ſalt	10	decagrammes—about	3 oz.	2 dr. 10 grs.
Manganeſe	2		0 5	17
Water	4		1 2	33
Oil of vitriol	6		1 7	50

The ſalt and manganeſe in powder are to be firſt mixed together, and the mixture put into a glaſs or ſtone-ware veſſel, and the water added; laſtly the oil of vitriol, at once, or at different times, according as the diſengagement of vapour is required to be quick or gradual.

From the account that has now been given, the value of the treatiſe before us will be ſufficiently apparent. M. Morveau has ſucceeded in rendering the deſtruction of the contamination ariſing from putrefaction moſt ſimple and certain. That contagious miaſmata are always equally within our power, is not, from the nature of the ſubject, ſo readily demonſtrable: that uncertainty which attaches itſelf, unfortunately, to every thing medical, applies here. But although it cannot be proved that contagious miaſmata are one and the ſame with the particles iſſuing from putrefying ſubſtances, and which are ſufficiently obvious to the ſenſe of ſmell, there is great reaſon to ſuppoſe them intimately connected, and capable of being deſtroyed by ſimilar agents. If putrefaction, it has been properly obſerved, is not the cauſe of contagion, there can be no doubt that it is a frequent vehicle of it; and there are very ſatisfactory proofs of the latter having on different occaſions been effectually deſtroyed, by means adapted to the deſtruction of the former. Indeed, whatever be the nature of contagious particles, it is difficult

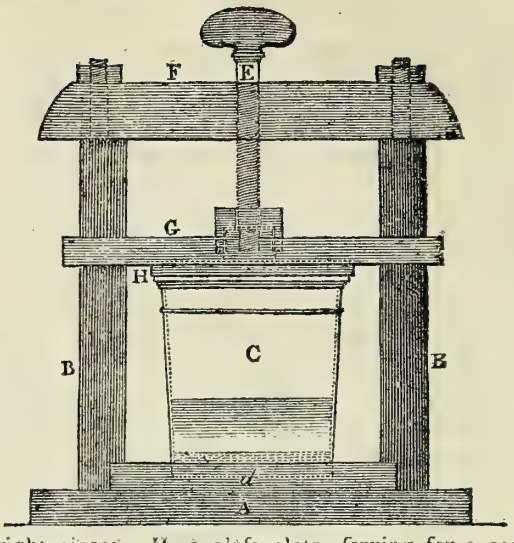
to conceive them ſo compounded, as to reſiſt the all-powerful chemical influence of the oxy-muriatic acid gas, or even the muriatic acid gas in its ſimple ſtate.

M. Guyton, in 1803, availing himſelf of the reſults of theſe experiments of M. Morveau, contrived the following apparatus for purifying the atmoſphere of hoſpitals, barracks, places of public reſort, &c.—Take a jar of very thick flint glaſs, that may be procured in any of the ſhops, of the capacity of about 35 cubic inches. The edge muſt be prepared to receive a cover formed of a flat plate of glaſs. The bottom of the jar is to be faſtened to a board, made to ſlide horizontally in the grooves of two ſide pieces. Theſe ſides ſupport a covering, through which paſſes a ſcrew that ſerves to lift off or put down the cover of the jar by means of a nut fixed to a moveable piece. The veſſel being thus diſpoſed, and admitting its capacity to be 35 cubic inches, there muſt be poured into it ſucceſſively ſix inches of nitric acid, at the degree of concentration above mentioned, and ſix inches of muriatic acid; to theſe muſt be added 600 grains of black oxyd of manganeſe pulveriſed, and the veſſel muſt be immediately cloſed by preſſing down the cover. Theſe proportions are given on account of the neceſſity of leaving at leaſt two thirds of it empty.

If the infection be very noxious, or if the places from which it proceeds are ſo numerous as to renew it from time to time, it would be adviſable to have two or three of theſe jars in different parts of the ward. In an apartment of leſs extent than that here ſuppoſed, for inſtance in one containing only ten or twelve beds, or in places of reſort, where the air is vitiated only by a momentary accumulation of animal effluvia, inſtead of the above veſſel, one of thoſe bottles, with a very wide neck, for the uſe of laboratories, may be employed.

By putting into one of theſe bottles $3\frac{1}{2}$ cubic inches of each of the two acids and 360 grains of black oxyd of manganeſe, a ſupply of anti-infectious gas is procured in the moſt ſimple manner. The only cauſe of apprehenſion here, and which is removed by the apparatus, is, that the ſtopper, being kept down only by its own weight, might be forced out by the expanſion of the gas; but, to prevent this accident, nothing more is neceſſary than to faſten a lump of lead to the ſtopper.

The only inſtruction to be given relative to the manner of uſing theſe reſervoirs of anti-infectious gas, is to open them when found proper, and to ſhut them as ſoon as thoſe neareſt them begin to be affected. The expanſion of the portion of gas emitted follows of courſe, and the effect is ſuch, that if the veſſel remains open only four or five minutes, thoſe who enter an hour afterwards at the fartheſt door from it will immediately perceive that there has been a diſengagement of oxygen gas.—It will doubtleſs be admitted, that of all the proceſſes for acid fumigations, at preſent known, this is the moſt ſimple, the leaſt liable to accident, and the beſt calculated for common uſe. Every one who conſiders that the gas thus produced is acknowledged to be the moſt efficacious even by thoſe who ſeemed to doubt its activity before the means of regulating it at pleaſure were diſcovered; in a word, every one who adopts the decided opinion of many philoſophical men, that this gas excels all others in the property of exciting the vital powers, muſt agree, that when petty paſſions are exhauſted in oppoſing the evidence of facts, the ſuperiority of the oxygenated muriatic acid gas, as a purifying and anti-contagious gas, will be eſtabliſhed, and that its extemporaneous preparation will be the common preſcription for the preſervation of health.—The form of the apparatus is given in the following figure: A, a flat piece of wood, on which are fixed the two uprights B, B. C, a glaſs jar, glued to a ſmall moveable board, *d*, which ſlides into the grooves of the two uprights. E, a wooden ſcrew, paſſing through the croſs-bar F, and faſtened at its extremity to the moveable horizontal piece G, which ſlides up and down the two



upright pieces. H, a glaſs plate, ſerving for a cover, and glued to the lower ſurface of the moveable piece G.

FU'MINGLY, *adv.* Angrily; in a rage.—That which we move from our better learning and inſtruction ſake, turneth unto anger and choler in them: they grow altogether out of quietneſs with it; they anſwer *fumingly*, that they are aſhamed to defile their pens with making anſwer to ſuch idle queſtions. *Hooker.*

FU'MITER, *ſ.* A plant; fumitory:

Why, he was met even now,
As mad as the vext ſea; ſinging aloud,
Crown'd with rank *fumiter* and furrow weeds. *Shakeſpeare.*

FU'MITORY, *ſ.* See FUMARIA and ADOXA.

FUMOS'ITY, *ſ.* Smokineſs. *Scott. Not much uſed.*

FU'MOUS, or FUMY, *adj.* [*fumeux, ſe*, Fr.] Producing fumes:

From dice and wine the youth retir'd to reſt,
And puff'd the *fumy* god from out his breaſt:
Ev'n then he dreamt of drink and lucky play;
More lucky had it laſted till the day. *Dryden.*

FUN, *ſ.* [A low word.] Sport; high merriment; frolicſome delight:

Don't mind me, though, for all my *fun* and jokes,
You bards may find us bloods good-natur'd folks. *More.*

FUNAMBULA'TION, *ſ.* [from the Lat. *funis*, a rope, and *ambulo*, to walk.] The act of walking or dancing on a rope.

FUNAM'BULUS, *ſ.* among the Romans, ſignified a rope-dancer; called by the Greeks *ſchænobates*. At Rome, the funambuli firſt appeared under the conſulate of Sulpicius Præticus and Licinius Stolo, who were the firſt introducers of the ſcenic repreſentations. It is added, that they were firſt exhibited in the iſland of the Tyber, and that the cenſors Meſſala and Caſſius afterwards promoted them to the theatre. In the Floralia, or *ludi Florales*, held under Galba, there were funambulatory elephants, as we are informed by Suetonius. Nero alſo ſhowed the like, in honour of his mother Agrippina. Vopiſcus relates the ſame in the times of Carinus and Numerianus.

FUNA'RIA, *ſ.* In botany, a genus of moſs; the ſame with Koelreutera of Hedwig. The generic characters are—Capſule obovate: fringe double; outer of ſixteen oblique wedge-form teeth, cohering at their tips; inner a membrane divided into ſixteen flat teeth: veil ſquare.

Species. 1. Funaria hygrometica: leaves ovate, acute, concave, entire, inflected; capſule ſwelling, drooping.

2. Funaria

2. Funaria muhlenbergii: leaves obovate, awned, concave, ferrulate, ſpread; capſule obovate, oblique.

3. Funaria anguſtata: leaves cloſely ſheathing; capſule narrowed at the baſe.

FUNCH, or FUNCIUS (John), a German lutheran divine in the ſixteenth century, born at Werden, near Nuremberg, in 1518. He married a daughter of Oſiander, profeſſor of divinity at Konigſberg, and became the ſecond to that fanciful divine in the diſputes which he introduced into the lutheran church. Funch was afterwards choſen court preacher to Albert duke of Pruſſia, and, unfortunately for himſelf, was perſuaded to turn politician, and engage in cabals unfavourable to the intereſts of the Poliſh nation. For this conduct he was proſecuted in the name of the province, and was condemned to be put to death as a diſturber of the public peace. He was beheaded at Konigſberg, in 1566, in the forty-ninth year of his age. He was the author of a Chronology, very favourably received by the learned world; in writing which he is ſaid to have been aſſiſted by his father-in-law Oſiander, who was no mean hiſtorian. The firſt part of it, reaching from Adam to the birth of Chriſt, was printed in 1544. In 1554 the whole of the Chronology was publiſhed, beginning with the creation of the world, and ending with the year of Chriſt 1552. In a third edition, he brought it down as far as the year 1560. He was alſo the author of Commentaries upon the Apocalypſe; the Life of Andrew Oſiander; the Life of Vitus Theodorus, &c.

FUNCHAL', or FUNCHIAL, a ſeaport town and capital of the iſland of Madeira, ſituated in a valley on the ſouth coaſt of the iſland: ſaid to be ſo called from the quantity of fennel (*funcha* in Portugueſe) which grew on the ſpot. The harbour is defended by ſeveral batteries, and a caſtle. It contains ſix pariſhes, ſeveral chapels, and ſix convents, with ſeveral hoſpitals. When Funchal was fortified, it would ſeem the engineer had nothing in view beſides rendering it ſtrong on the ſea ſide; for there all the works, except a ſingle wall, are directed. This was certainly a great overſight, as there are ſeveral bays not far diſtant from the land ſide, where an enemy might ſafely diſembark, and march to the very walls without oppoſition. The Portugueſe, though numerous, do not conſtitute the bulk of the inhabitants, the Engliſh and French Roman Catholics, who live in the Portugueſe manner, are juſtly ſuppoſed to exceed the others in number and wealth; beſides theſe, there is an infinity of mulatto and negro freemen. The ſtreets of Funchal are drawn by a line, all the houſes neat, and the windows faſhed with lath-work, but with openings wide enough for thoſe within to ſee and be ſeen. The principal trade of the inhabitants conſiſts in wine and ſweetmeats. Lat. 32. 32. N. lon. 16. 49. W. Greenwich.

On the night of the 9th of October, 1803, a torrent ruſhed down from the mountains on the town of Funchal, with irreſiſtible violence, bearing every thing before it in its paſſage to the ſea. The bed of the river, not being capable of containing this increaſe of water, overflowed on each ſide to a conſiderable extent, and ſwept away three of its bridges, and a magnificent church. Manſions, warehouſes, inhabitants, cattle, and effects of all ſorts, were indiſcriminately involved in this reſiſtleſs element, and hurried to the ocean. The ſtreets of two-thirds of the town were completely inundated: in moſt places the water reached to the firſt floor. The darkneſs of the night, the ruſh and roar of the waters, the cries of the ſufferers, the terror of all, formed ſuch a ſcene as mocks all powers of deſcription. Towards morning, however, the violence of the torrent abated, and towards the noon of next day had nearly ſubſided. The vaſt aggregate of water is conjectured to have been produced by the burſting of a water-ſpout in the mountains, (an accident not unfrequent;) for, although it had rained on the day of, and on that preceding, the event, yet the quantity which had fallen was not at all ſufficient to produce ſuch a flood. The village of Santa Cruz and Machico were more than half ſwept away. At the former three or four, and at the latter twenty-three, perſons periſhed. Two hundred perſons at leaſt loſt their lives in the iſland. The effects of this diſaſter extended to the north eaſt part of the iſland, but to the weſtward was not much felt beyond Magdalenar. Betwixt that place and Funchal the rivers did much damage, but only nine perſons were drowned. The friary at Serros de Deos was carried away, but the church ſtood.

FUN'CHEON, a river of Ireland, which runs into Blackwater river, five miles north Rathcormuck, in the county of Cork.

FUNC'TION, *ſ.* [*functio*, or *fungor*, Lat. to perform.] Diſcharge; performance.—There is hardly a greater difference between two things than there is between a repreſenting commoner in the function of his public calling, and the ſame perſon in common life. *Swift.*—Employment; office.—The miniſtry is not now bound to any one tribe: now none is ſecluded from that *function* of any degree, ſtate, or calling. *Whitgifte.*—Let not theſe indignities diſcourage us from aſſerting the juſt privileges and pre-eminence of our holy *function* and character. *Atterbury.*—Single act of any office.—They have ſeveral offices and prayers againſt fire, tempeſts, and eſpecially for the dead, in which *functions* they uſe ſacerdotal garments. *Stillingfleet.*—Trade; occupation.—Follow your *function*; go, and batten on cold bits. *Shakeſpeare.*—Office of any particular part of the body.—The bodies of men, and other animals, are excellently well fitted for life and motion; and the ſeveral parts of them well adapted to their particular *functions*. *Bentley.*—Power; faculty: either animal or intellectual.—Though every human conſtitution is morbid, yet are their diſeaſes conſiſtent with the common *functions* of life. *Arbuthnot.*

Whatever warms the heart, or fills the head,
As the mind opens, and its *functions* ſpread,
Imagination plies her dang'rous art,
And pours it all upon the peccant part. *Pope.*

FUNC'TION, in mathematics, a term uſed in analytics, for an algebraical expreſſion any how compounded of a certain letter or quantity with other quantities or numbers: and the expreſſion is ſaid to be a function of that letter or quantity. Thus, $a-4x$, or $ax+3x^2$, or $2x-a\sqrt{a^2-x^2}$, or x^c, or c^x, is each of them a function of the quantity x.

In a memoir inſerted in the Berlin Acts for the year 1772, M. La Grange, who has made many important diſcoveries in pure analyſis, and has contributed very largely to the preſent opulence of aſtronomical ſcience, aſſerted that the theory of the developement of functions contained the true principles of the differential calculus, freed from all conſideration of infinitely ſmall quantities, or of limits. To eſtabliſh this poſition more fully and particularly was the expreſs object of a treatiſe on the Theory of Analytical Functions, which he publiſhed at Paris in 1798, 4to. His definition of a function is as follows:—A function, of one or more quantities, is every expreſſion in which theſe quantities enter after any manner whatever, combined or not with other quantities of given or invariable values, while the quantities of the function may receive all poſſible values. Thus: fx deſignates a function of x; $f(x^2)$, $f(a+bx)$ functions of x^2 and $a+bx$. Let, then, fx deſignate a function of any variable quantity x. If, inſtead of x, $x+i$ be ſubſtituted, i being any indeterminate quantity, fx becomes $f(x+i)$; which, by the method of ſeries, may be expanded into this form: $fx+pi+qi^2+ri^3+$, &c. in which, p, q, r, &c. the coefficients of the powers of i, are new functions of x, derived from the primitive function fx, and independent of the quantity i.

Having eſtabliſhed the general form of the developement of the function $f(x+i)$, the author proceeds to examine more particularly in what this developement

conſiſts, and what each of its terms ſignifies. He remarks that it is evident that, if in this function we ſeek what is independent of i, we have only to make $i=o$, which reduces $f(x+i)$ to fx; thus fx is the part of $f(x+i)$ which remains by making $i=o$; hence $fx=f(x+i)$, added to a quantity which vaniſhes when $i=o$, and which ſhall be multiplied or may be ſuppoſed to be multiplied by a poſitive power of i: but it has been demonſtrated that, in the developement of $f(x+i)$, no fractional power of i can enter; therefore the quantity concerned can only be multiplied by ſome poſitive and whole power of i; it will then be of the form iP, P being a function of x and i, and which ſhall not be infinite when $i=o$. After ſome examples, M. La Grange demonſtrates this important theorem, that, in the ſeries $fx+pi+qi^2+$, &c. i may always be taken ſufficiently ſmall, ſo that any term whatever ſhall be greater than the ſum of all the ſucceeding terms.

In the ſecond part of his work, M. La Grange applies his theory to geometry and mechanics. The common and known methods in the fluxionary and differential calculus for determining tangents, radii of curvature, &c. are excellent, if we regard their ſimplicity and generality, but are deficient in that rigour of proof for which the ancient demonſtrations are celebrated. Such a deficiency in the theory of fluxions is ſupplied by that of functions; and the problems of tangents, of the curves of contact and oſculation, are in this work placed under a very perſpicuous point of view, and demonſtrated rigorouſly. The proofs of theſe problems depend on a form ſhewn in the firſt part to belong to the developement of $f(x+i)$; namely, $fx+if'x+\frac{i^2}{2}f''x+\frac{i^3}{2\,3}f'''(x+j)$ j being an indeterminate quantity, but contained between the limits of o and i;—and on a theorem, in which it is proved that i may always be taken ſufficiently ſmall, ſo that any term ſhall be greater than the ſum of all the preceding terms.

The problems of the maxima and minima of quantities are demonſtrated in a moſt ſatisfactory manner. It is ſhewn that, if the function fx be a maximum, or minimum, the prime function $f'x$ muſt $=o$; and that $f''x$ muſt be $<o$ in caſe of a maximum, or $>o$, in the caſe of a minimum: but that, if $f''x=o$, $f'''x$ likewiſe $=o$, and $f''''x$ is $<o$ or $>o$, according as the quantity is a maximum or minimum; in general, that, if the derived function of any even order diſappear, the function of the uneven order following diſappears likewiſe, and the function of the ſucceeding even order is negative for the maximum or poſitive for the minimum.

The author extends his theory to the determination of queſtions relative to curves of double curvature, and of thoſe problems which belong to that branch of analyſis called *Calcul des Variations*, firſt introduced by John Bernouilli in the ſolution of his famous problem of the curve of quickeſt deſcent, (brachyſtochrone,) and ſince perfected by Euler and the author of the work we are ſpeaking of.

In the application of the theory of functions to mechanics, the ſpace is conſidered as a function of the time, and is repreſented by the equation $x=ft$; hence at the end of a time $(t+\theta)$ the ſpace deſcribed will be $f(t+\theta)-ft$; or, by the form for the developement of functions, $\theta f't+\frac{\theta^2}{2}f''t+\frac{\theta^3}{2\,3}f'''(t+\lambda\theta)$ λ being an unknown coefficient, the value of which is compriſed between o and i. Now in this form the firſt term repreſents uniform motion, $f't$ the relation of the ſpace and time being the meaſure of that which is called *velocity*; the ſecond term repreſents motion uniformly accelerated where the quantity $\frac{f''t}{2}$ repreſents the accelerating force; the third term repreſents the total of the other motions; now θ may be taken ſo ſmall that the motion compoſed of the motions repreſented by the firſt two terms ſhall approach nearer to the true motion, than any other motion can, compoſed of an uniform motion and a motion uniformly accelerated. From the developement of the function $f(t+\theta)$, it appears that, in any rectilinear motion where the ſpace deſcribed is a given function of the time, the prime function of this function will repreſent the velocity, and the ſecond function the accelerating force in any inſtant: whence it appears that the prime and ſecond functions naturally preſent themſelves in mechanics, where they have a determinate value and ſignification; and it is this circumſtance which induced Newton to eſtabliſh fluxions on the conſideration of motion.

It has been ſaid that the true principles of any invention are moſt ſatisfactorily and truly explained by the inventors themſelves; yet it is at the diſtance of more than an hundred years from the diſcovery of the fluxionary calculus, that its principles are firſt clearly and rigorouſly eſtabliſhed. It has been reſerved for the mathematicians of theſe days, to effect what was denied to a Newton and a Leibnitz; and to ſupply to their theory that evidence and exactneſs, the want of which makes us attribute its invention rather to the felicity of the times in which they lived, than to the excellence of their genius. See the article FLUXIONS, vol. vii.

FUND, *ſ.* [*fond*, Fr. *fando*, Lat. a bag.] Stock; capital; that by which any expence is ſupported.—He touches the paſſions more delicately than Ovid, and performs all this out of his own *fund*, without diving into the arts and ſciences for a ſupply. *Dryden.*

Part muſt be left, a *fund* when foes invade,
And part employ'd to roll the watry tide. *Dryden.*

Stock or bank of money.—As my eſtate has been hitherto either toſt upon ſeas, or fluctuating in *funds*, it is now fixed in ſubſtantial acres. *Addiſon.*

The PUBLIC FUNDS *of* ENGLAND, are the taxes appropriated by parliament for the ſupport of civil government, and for the payment of the principal and intereſt of money borrowed for public ſervices. They are formed into four diviſions or claſſes, called the *Aggregate Fund*, the *South-Sea Fund*, the *General Fund*, and the *Sinking Fund*.

The *aggregate fund* was eſtabliſhed by an act of Geo. I. c. 12. in 1715. It had this name given it, becauſe it conſiſted of a great variety of taxes and ſurpluſſes of taxes and duties which were in that year conſolidated, and given as a ſecurity for the diſcharge of the intereſt and principal of debts due to the bank of England, and ſome other public debts; and alſo for the payment of 120,000l. per ann. to the civil liſt. Into this fund are brought the two thirds and one half ſubſidy of tonnage and poundage; half the inland duties on tea and coffee; the houſe-money granted by the 7th of Wm. III. the duty on hops; the duties on low wines, brandy, and Britiſh ſpirits; all arrears of land-taxes; all public monies not appropriated; the ſurpluſſes of the nine-penny exciſe, of the five-ſevenths of the bank nine-penny exciſe, of the revenues in the annuity acts of the 4th, 5th, and 6th, of queen Anne, &c. and by an act of the 1ſt of Geo. III. all the duties conſtituting the revenue of the civil liſt. The whole produce or income of this fund had been for ſome years about 2,600,000l. per ann.

The *South-Sea fund* was eſtabliſhed, by ſtat. 3 Geo. I. c. 9, in 1716; and is ſo called, becauſe appropriated to pay the intereſt of ſuch part of the national debt, as was advanced by that company and its annuitants. It conſiſts of a duty on candles, and certain impoſts on wines, vinegar, tobacco, and Eaſt-India goods.

The *general fund* was alſo eſtabliſhed, by ſtat. 3 Geo. I. c. 7. in 1716, and conſiſts of a ſubſidy on goods exported; a tax on hackney-coaches and chairs; duties on ſoap, hides, ſtamps, and policies of inſurance; 700l. per week letter-money; a moiety of the inland duties on tea and coffee; and 39,855l. per annum out of the hereditary exciſe on beer for bankers annuities. All theſe taxes and payments have for ſome years amounted to a little more than a million per ann. and are appropriated to the diſcharge

charge of the intereſt of 7,808,087l. originally 10,000,000l. capital ſtock of South-Sea annuities, together with charges of management.

All that remained of the produce of the taxes thus digeſted into theſe three funds, after ſatisfying the charges upon them, was, in the ſame year, 1716, carried into a fourth fund, to which was given the name of the *ſinking fund*, becauſe appropriated to the purpoſe of ſinking or decreaſing the public debt. The words of the act of the 3d of Geo. I. which eſtabliſhed this fund, are, "that all the monies to ariſe from time to time, from the ſaid funds, being the exceſſes and ſurpluſſes thereof, ſhall be appropriated to the diſcharging the principal and intereſt of ſuch national debts as were incurred before the 25th of December, 1716, and are declared to be national debts; and to or for *no other uſe, intent, or purpoſe, whatſoever*."

The operations and progreſs of this *ſinking fund* form ſo important a part of the hiſtory of the national debt, that a more particular account of it will here be proper. Before its eſtabliſhment there had exiſted many ſmaller funds of the ſame nature: that is, ſuch duties or taxes had been provided for paying the intereſts of particular loans, as afforded ſurpluſſes by which the principal itſelf was to be gradually redeemed: this was the common practice in the reigns of king William and queen Anne. Moſt of the public duties were given for terms of years; and at the end of thoſe terms they ceaſed of courſe, unleſs continued for farther terms by new acts of parliament: and, in general, it was provided, when any money was raiſed, that the principal ſhould be cancelled either by time, as in the caſe of the ſale of long and ſhort annuities, or by the ſurpluſſes of the duties charged with the payment of the intereſt. This was an excellent plan; but it was by no means carried ſteadily into execution. In the year 1720, moſt of the long and ſhort annuities were converted into redeemable perpetuities, at the expence of above three millions; and the ſurpluſſes of the duties charged with particular loans were often ſo broken into, by being either charged with new loans before they had cancelled the old, or ſpent on current ſervices, as to be rendered incapable of anſwering the end intended by them. In conſequence partly of this bad management, the public debts at the acceſſion of the houſe of Hanover were ſo much increaſed as to be generally reckoned inſupportable; and their reduction was made one of the firſt objects of parliamentary attention. This gave riſe, in 1716, to the inſtitution of the *ſinking fund*, of which we are now ſpeaking; the father of which was, as has been generally ſaid, ſir Robert Walpole, but, in reality, the earl of Stanhope. Upon this fund, the future happineſs and glory of the kingdom were thought to depend; and the law which eſtabliſhed it was declared to be a fundamental law of the realm. In conformity to this, the words of this law were made as ſtrong as they could well be; and, in order to give additional force to it, a repetition of it, in the ſame words, was inſerted in an act of the 5th of Geo. I. c. 3. Particular notice ſhould be taken of theſe words: they order that all the ſurpluſſes of the taxes then made perpetual, ſhall be applied to the diſcharge of the public debts, and *to no other uſe or intent whatever*. When, therefore, a debt had been paid off, the addition ariſing from that payment to the ſurpluſſes (or the annuity diſengaged by it) became a part of the fund, and, together with it, was to be employed in diſcharging farther debts. And the ſame being true of every ſucceſſive annuity diſengaged by every payment, the fund, if never miſapplied, muſt neceſſarily have operated in ſinking the public debt, in the ſame manner that money accumulates, when put out to bear compound intereſt. And in this way this fund did in fact operate for a few years. While in its infancy, it was watched over with great care: the improvement, and the inviolable application of it, were recommended in moſt of the ſpeeches from the throne, and echoed back in the addreſſes of the houſe of commons. It is particularly obſervable, that ſo well did our miniſters then underſtand the nature and importance of this fund, that rather than encroach upon it, they frequently borrowed money in order to defray the neceſſary expences of government. From ſome publications in 1726, it appears, that ſome perſons had been led to apprehend this zeal of the miniſtry would not be permanent, becauſe it was not their intereſt to pay off the public debt, on account of the dependence and influence created by it. In anſwering this objection, the writers on the ſide of the court called ſuch an apprehenſion an indecent jealouſy, and took upon them to aſſure the public, "that in no poſſible exigence of affairs, could our miniſters ever approve of or recommend the alienation of the ſinking fund." Happy would it have been for Britain had this proved true: but in a little time it appeared, that the apprehenſions which had been ſtiled indecent jealouſies, were too well grounded. Men in power came ſoon to ſee, that this fund was advancing too faſt in its operations, and to change their zeal for it into a reſolution to deſtroy it: this will abundantly appear from the following facts.

Charging the income of the ſinking fund with the payment of the intereſt of new loans, is an encroachment upon it, no leſs ſubverſive of its efficacy, than depriving it of groſs ſums; there being no difference between taking from it the annual intereſt of a ſum, and that ſum itſelf. Between the years 1727 and 1732, ſeveral encroachments of this kind had been made upon it; but, being of a leſs obvious nature, they paſſed without meeting with any particular oppoſition. The finiſhing blow was given in the year 1733. In that year, in order to keep the land-tax at one ſhilling in the pound, as it had been the year before, it was neceſſary either to borrow half a million for the current ſervice, or to take this ſum from the ſinking fund. The laſt method was choſen, and propoſed by ſir Robert Walpole to the houſe of commons. Long and warm debates enſued. A propoſal to alienate, in a time of profound peace, a fund which the law had made ſacred, and the alienation of which *no poſſible exigence of public affairs* could juſtify, only for the ſake of keeping the land-tax for one year at one ſhilling in the pound, juſtly kindled the indignation of the patriotic party. They urged the prohibition of the law, the faith of parliament, and the ſecurity of the kingdom. The propoſer of the alienation was reminded of his inconſiſtency and treachery, in endeavouring to beat down that very monument of glory which he had boaſted of having erected for himſelf; and ſir John Barnard warned him, that he was drawing upon him the curſes of poſterity. But all arguments were vain. The miniſtry pleaded that the landed intereſt wanted eaſe, that there was no occaſion for being in a hurry to pay the national debt; and that the circumſtances of the kingdom had altered ſo much ſince the eſtabliſhment of the ſinking fund, that the competition then among the public creditors was, not who ſhould be firſt, but who ſhould be laſt paid. Thus argued, among others, ſir Robert Walpole. His reaſons prevailed; and the houſe of commons, not uſed to refuſe him any thing, conſented. The practice of alienating the ſinking fund having been thus begun, went on of courſe. In the next year, or 1734, 1,200,000l. was taken from it. In 1735, and 1736, it was anticipated and mortgaged. Thus expired, after an exiſtence of a few years, the ſinking fund; that ſacred bleſſing, (as it was once thought,) and the nation's only hope. Could it have eſcaped, it would long before this time have eaſed Britain of all its debts, and left it a much more free and happy country.

By an act of the 25th of Geo. II. 1752, a change was made in the ſinking fund, which it is neceſſary to mention. Before this act, the ſinking fund conſiſted only of the clear ſurpluſſes of the aggregate, the general, and the South-Sea company's, funds. By the war, which began in 1740, there was an addition made to the public debts of near thirty-two millions. This occaſioned a great increaſe of taxes; and the practice was, whenever any new tax produced leſs than the intereſt with which it was charged, to make good the deficiency out of the ſinking

fund, and afterwards to replace the ſum taken from it out of the ſupplies for the following year. But whenever a tax produced more than the charge upon it, the overplus, inſtead of being carried to the ſinking fund, was made a part of the ſupplies for the year. By the act juſt mentioned, all the new taxes, together with all the annuities to the payment of which they had been appropriated, were ordered to be carried into the ſinking fund, and formed into one general account. Moſt of the new taxes having proved deficient, this fund at firſt loſt more than it gained by the change. But the loſs was afterwards more than made up; firſt, by the ſaving which was produced by the reduction of intereſt from three and a half per cent. to three per cent. in 1757; and, ſecondly, by the addition, in the ſame year, of the ſalt-duties to this fund, after they had completed the redemption of a million with which they had been charged in 1745.

The war which began in 1756, added ſeventy-one millions and a half to the public debts. This produced a new increaſe of taxes, which (in conformity to the conſolidating act juſt mentioned) have been brought to the general ſinking fund account, together with the annuities or intereſts with the payment of which they are charged. And it is now the conſtant practice, whenever a new fund or tax is created for paying the intereſt of a loan, to carry both into the ſinking fund; in conſequence of which, this fund gains when the tax happens to produce more, but loſes when it produces leſs than the intereſt which it has been given to pay. The ſinking fund, therefore, which, before the conſolidating act, conſiſted only of the ſurpluſſes of the aggregate, general, and South-Sea company's, funds, conſiſts now of the clear ſurplus of all the appropriated taxes. There is but one tax excepted; and that is, the additional tax upon houſes and windows, granted in 1758, towards paying the intereſt of four millions and a half then borrowed. This tax has never been made a part of the ſinking fund; and, having always proved deficient to the amount of about 45,000l. per ann. the deficiency is conſtantly made good by the ſinking fund, and afterwards replaced from the ſupplies.

Before the laſt reduction of the intereſt of the public debts, the ſinking fund, having ſuffered greatly from various encroachments upon it, produced little more than a million per ann. But after this reduction, and its increaſe by the addition of the ſalt-duties, it produced near two millions per ann. In 1764, it produced at Michaelmas, after making good deficiencies, 2,105,000l. nearly. For five years after 1764, its average produce, reckoned to Chriſtmas in every year, was 2,234,780l. For five years, ended in 1774, its average produce was 2,610,759l. In 1775, it produced 2,917,869l. In 1776, 3,166,517l. In 1777, it was charged with an annuity of 100,000l. per ann. to the civil liſt; and, after paying this annuity and half a year's intereſt of five millions borrowed in that year, it produced nearly 2,700,000l. In 1778, it was taken at three millions; but did not produce, after paying the ſaid annuity, and making good the intereſts of the new loans in 1777 and 1778, more than two.

It appears from this detail, that ſince the peace in 1763, the income of the ſinking fund has increaſed conſiderably. The cauſes of this have been partly the falling in of life-annuities, and the great productiveneſs of the taxes occaſioned by the increaſe of luxury. But the principal cauſe has been the falling in of the intereſt of about ten millions and a half of the public debts, which had been diſcharged during the twelve years of peace between 1763, and 1775. This diminution of the public debts has been made, not by the ſinking fund, but by a contribution from the Eaſt-India company of 400,000l. per ann. begun in 1768, and continued for five years; by the profits of ten lotteries; by the compoſition for maintaining French priſoners; ſale of French prizes taken before the declaration of war in 1756; and other extraordinary receipts, amounting in all to above eight millions. This fund, therefore, did not pay off more than two millions and a half, the reſt of its produce having been employed in bearing the expences of the peace eſtabliſhment, which, during this period, was nearly double to what it had been in any former period.

To the ſum juſt mentioned, add three millions paid off in the peace between 1748 and 1756, and three millions paid off in 1736 and 1737, and it will appear that the whole amount of the public debts paid off by the ſinking fund, ſince its firſt alienation in 1733, was only eight millions and a half; whereas it has been ſhewn, that had only 1,212,000l. per ann. of it been applied inviolably to the redemption of the public debts, one hundred and forty-nine millions would have been paid.

It has been ſaid, that when money is wanted for defraying public expences, it makes no difference whether it is obtained by diverting the ſinking fund, or by a new loan. There cannot be a more deluſive fallacy than this. Money in a ſinking fund, if never alienated, is improved at compound intereſt; but, when procured by a loan, bears only ſimple intereſt. A nation therefore, whenever it applies the income of ſuch a fund to current expences rather than the redemption of its debts, chooſes to loſe the benefit of compound intereſt in order to avoid paying ſimple intereſt; and the loſs in this caſe is equal to the difference between the increaſe of money at compound and ſimple intereſt. This obſervation was very fully eſtabliſhed in an ingenious pamphlet publiſhed by a Mr. John Adam in the year 1727, when the reduction of intereſt on the national debt from five to four per cent. took place; by which meaſure this famous ſinking fund was increaſed to above a million per annum. He obſerves, "that, ſuppoſing the *then* national debt, which was fifty millions, and the ſaid ſinking fund of one million, to be both at four per cent. intereſt, the latter increaſing annually in like proportion as ſuch a ſum put out at compound intereſt would do, the whole national debt would have been diſcharged by the year 1756. Thus," for illuſtration, "at Midſummer 1728, one million would be paid off; and at Midſummer 1729, the ſinking fund would be one million and forty thouſand pounds, and that ſame year and term the debts would be leſſened two millions and forty thouſand pounds. At Midſummer 1730, the ſinking fund would be increaſed to one million and eighty thouſand pounds, and the debts would be leſſened three millions one hundred and twenty-one thouſand ſix hundred pounds; and ſo on to the ſaid year 1756, when the ſaid ſinking fund would be increaſed to thirty millions, and the total amount of the debts paid would be fifty millions. Again, ſuppoſing the fifty millions had been at three per cent. from Midſummer 1727, then at Midſummer 1751, inſtead of 1756, the ſinking fund would be increaſed to thirty millions, and the debt of fifty millions would then be diſcharged."

Theſe obſervations of Mr. Adam, have been ſince carried farther by the late Dr. Price, who, in his Appeal to the Public on the national debt, proves, "that one penny put out at our Saviour's birth to 5 per cent. compound intereſt, would in the year 1781 have increaſed to a greater ſum than would be contained in 200,000,000 of earths all ſolid gold; but, if put out at ſimple intereſt, it at the ſame time would have amounted to no more than ſeven ſhillings and ſixpence. He adds, a million borrowed annually for twenty years, will pay off, in this time, 55 millions 3 per cent. ſtock, if diſcharged at 60l. in money for every 100l. ſtock; and in 40 years more, without any farther aid from loans, 333 millions (that is 388 millions in all) would be paid off. The addition of nineteen years to this period would pay off 1000 millions. A ſurplus of half a million per annum, made up to a million by borrowing half a million every year for twenty years, would diſcharge the ſame ſums in the ſame periods."

The ſinking fund, notwithſtanding the force of theſe obſervations, went on from year to year alienated and neglected; until the opening of parliament in 1786, when the late chancellor of the exchequer, Mr. Pitt, with a zeal

a zeal which juſtly entitles him to the ſupport and praiſe of every true friend to this country, came forward with a plan for liquidating the national debt, upon the above principle, by the application of one million per annum to the ſinking fund; the money to be provided from the ſurpluſſes and exceſſes of the annual taxes; and, in caſe thoſe taxes ſhould be found ſhort of that amount, then the deficiency to be charged upon and made good by further aids.

For the purpoſe of enſuring the due application of this ſinking fund of 1,000,000l. per annum to its deſtined object, it was propoſed to veſt in a certain number of commiſſioners the full power of diſpoſing of it in the purchaſe of ſtock for the public in their own names; the ſpeaker of the houſe of commons, the chancellor of the exchequer, the maſter of the rolls, the governor and deputy governor of the bank of England, and the accountant general of the court of chancery, were named amongſt the commiſſioners, with a power to receive the annual million by quarterly payments of 250,000l. each, to be iſſued out of the exchequer before any other money, except the intereſt of the national debt. By theſe proviſions, the fund would be ſecured, and no deficiencies in the national revenues could affect it, as all ſuch were intended to be ſeparately provided for by parliament. By recent calculations, as well as former, made upon this reform, it appears, that the accumulating compound intereſt on a million of money yearly, together with the annuities that muſt naturally expire and fall into that fund, in the courſe of twenty-eight years, will amount to ſuch a ſum, as will leave a ſurplus of four millions annually, to be applied, if neceſſary, to the exigencies of the ſtate. The good policy of thus making the income of the nation ſo far exceed its expenditure as to leave a million annually towards the liquidation of the public debt, has been univerſally acknowledged; and ſo far as experience has hitherto been able to bear teſtimony, the ſcheme promiſes to anſwer, in the fulleſt extent, the patriotic purpoſes intended by it. To prove this, as well as to inform the reader more fully of the progreſs hitherto made, we ſhall here ſtate what the commiſſioners have already done towards the reduction of the public debt, and what that debt amounted to at the commencement of the preſent year.

Total amount of national debt of Great Britain on the 5th January, 1805 - -	£603,925,792
Stock created by loan of 1805 -	38,700,000
	642,625,792
Transferred for the redemption of the land-tax - - -	22,000,000
	620,625,792
Redeemed by the commiſſioners for management of the ſinking fund -	113,500,000
Leaving as the amount on the 31ſt of January, 1806 - - -	507,125,792

In the laſt year 1805, 7,615,167l. 7s. 9d. were expended by the commiſſioners; and 1,906,104l. 17s. 1¾d. is to be applied in the quarter between the 1ſt of February and the 1ſt of May, 1806. It appears that the following ſtock has been purchaſed between the 3d of February, 1805, and 31ſt of January laſt, viz.

Capital Stock.	Caſh paid.
£6,093,000 3 per Cent. long An.	£3,570,573 5 6
6,468,492 Red An. Conſol. - -	3,804,486 18 3
161,400 Old South Sea Ann. - -	96,562 15 0
133,000 New South Sea Ann. - -	77,374 7 6
22,000 3 per Cent. Ann. 1751 -	12,816 5 0
92,021 Imp. 3 per Cent. Ann. -	53,403 16 6
£12,972,913	

The intereſt of this 12,972,913l. of ſtock is 389,187l. 7s. 9d. which added to the amount of laſt year gives nearly eight millions to be applied in the preſent year.

Of this debt of 507 millions, nearly 100 millions conſiſt of 4 and 5 per cent. ſtock, which being converted into 3 per cents. makes the total amount in 3 per cent. ſtock 557 millions; and valuing the 3 per cent. ſtock at 60 per cent. (which is the preſent average price,) the total capital of the debt in money is 334 millions of pounds ſterling.

The original proviſion of the ſinking fund of a million per annum, with the additions that have ſince been made to it, and the dividends on ſtock bought up by the commiſſioners who manage that fund for the nation, amount altogether at this time to about 8,000,000 per annum. We have thus the evidence of facts, and of about twenty years experience to prove, that a ſingle million per annum, laid by ſince 1786 for purpoſes of accumulation, has multiplied itſelf, on principles of compound intereſt, ſo as to amount at this time to eight millions per annum; and has created a capital in the hands of the commiſſioners of upwards of a hundred and thirteen millions.—In other words, by the plan of that acute calculator, Dr. Price, the nation began about twenty years ſince to buy up its own debts. The fund appropriated for this purpoſe was to be one million per annum, to be laid out in the purchaſe of ſuch portions of ſtock as might be brought to market by the public. The commiſſioners have ſince applied the intereſt ariſing from the ſtock which they have purchaſed, to the increaſe of their funds; and the reſult is, that one hundred and thirteen millions of the national debt, with its intereſt, have thus been redeemed to the nation from its public creditors. The intereſt of this amount of the redeemed ſtock, and the annuity of one million regularly appropriated to this purpoſe, give to the commiſſioners an income for the current year (1806) of eight millions!

The temporary advantages from the actual operation of this plan, are of ſcarcely leſs conſequence to our public credit, than will be its ultimate benefits. The large ſums which the commiſſioners have every week at their diſpoſal, occaſion perſons who are deſirous of ſelling their ſtock, or converting it into money, to find no difficulty in meeting with purchaſers. Hence it may be aſſerted, that at the ſtock exchange there are at this time generally more buyers of ſtock than ſellers; and the ſtate of our national credit is ſuch, that inſtead of there being occaſion, as ſome deſponding perſons have urged, to paſs an act of parliament to extinguiſh the debt, and ruin all the creditors of the nation at a blow, it will rather be neceſſary at ſome diſtant period, to compel the national creditors to receive back their money. To make theſe poſitions plain to the meaneſt underſtanding, we have calculated the future accumulations of the preſent revenue of the commiſſioners, at the ſame rate of increaſe which has hitherto attended the ſinking-fund. That rate has hitherto been 5 per cent. and any perſon ordinarily verſed in arithmetic may verify theſe calculations for his own ſatisfaction. The preſent annual income of the commiſſioners for managing the ſinking-fund, conſiſting of eight millions, will generate by the

Year 1810, the ſum of	£34,480,000
1820, ———	156,700,000
1830, ———	356,000,000

an amount which will exceed the preſent national debt.

However, in 1840 the ſum would be	680,500,000
in 1850 - -	1209,000,000
in 1860 - -	2070,000,000
in 1870 - -	3472,700,000
in 1880 - -	5757,000,000

ſums which outſtrip any accumulation of new debt that the moſt deſponding politician can anticipate.

There exiſted no occaſion for carrying the calculation beyond the year 1830, by which year, if the ſinking-fund continues to be invariably applied, the preſent debt will be extinguiſhed, and the load of taxes taken off which till then will be neceſſary to pay the annual intereſt. But, ſome will exclaim, "In the mean time what becomes of your new debts?—The war-expenditure of the

country will require new loans, and a new debt will probably be accumulated equal in amount to the preſent. —How is this to be diſpoſed of?—What are the funds by which it is to be diſcharged?" We ſhall anſwer the foregoing queries by explaining the proviſion for future debts, which was alſo pointed out by Dr. Price, and which has been adopted by the legiſlature. In 1792 it was enacted, that on all future loans a ſum equal to one per cent. on the ſtock created by ſuch loans ſhould be added to the ſinking-fund as a proviſion for their gradual and ſucceſſive redemption. This appropriation of one per cent. on every loan at the aforeſaid increaſe of 5 per cent. amounts to 100l. in 37 years, or at 4 per cent. intereſt, in leſs than 42 years. Therefore whatever addition is made to the debt every year, if ſuch a fund of one per cent. be regularly and ſacredly allotted for its redemption, the total of that portion of debt muſt in 37 or 42 years be diſcharged. See NATIONAL DEBT, REVENUE, STOCKS, and TAXES.

FUN'DAMENT, *ſ.* [*fundamentum*, Lat.] The back part of the body.—They threw him on the bed, thruſt into his *fundament* a red hot iron. *Hume.*

FUNDAMEN'TAL, *adj.* [*fundamentalis*, Lat.] Serving for the foundation; that upon which the reſt is built; eſſential; important; not merely accidental.—Gain ſome general and *fundamental* truths, both in philoſophy, in religion, and in human life. *Watts.*

Such we find they are, as can controul
The ſervile actions of our wav'ring ſoul,
Can fright, can alter, or can chain the will;
Their ills all built on life, that *fundamental* ill. *Prior.*

FUNDAMEN'TAL, *ſ.* Leading propoſition; important and eſſential part which is the groundwork of the reſt.—It is a very juſt reproach, that there ſhould be ſo much violence and hatred in religious matters among men who agree in all *fundamentals*, and only differ in ſome ceremonies, or mere ſpeculative points. *Swift.*

FUNDAMEN'TALLY, *adv.* Eſſentially; originally. —As virtue is ſeated *fundamentally* in the intellect, ſo perſpectively in the fancy; ſo that virtue is the force of reaſon, in the conduct of our actions and paſſions to a good end. *Grew.*

FUNDAMEN'TALNESS, *ſ.* The ſtate of being fundamental. *Scott.*

FUNDAMEN'TALS, in muſic. See the article MUSIC.

FUNDA'ON, a town of Portugal, in the province of Beira: twenty-two miles weſt of Alfayates.

FUN'DI, in ancient geography, a town of Latium, near Cajeta, on the Appian road, at the bottom of a bay called *Lacus Fundanus*, or Bay of Fundi. It enjoyed all the privileges of Roman citizens, except the right of ſuffrage and of magiſtracy. Now *Fondi*, a city of Naples, on the confines of the pope's dominions. Lat. 41. 35. N. lon. 14. 20. E.

FUNDI'BLE, *adj.* [*fundo*, Lat. to pour out.] Capable of being poured. *Johnſon. Not much uſed.*

FUN'DO, a town of European Turkey, in the province of Moldavia: forty-four miles weſt-north-weſt of Birlat.

FUN'DUS, *ſ.* [Latin.] A bottom, the loweſt part, a cavity. *Scott.*

FUN'DY, a large bay in North America, which opens between the iſlands in Penobſcot bay, in Lincoln county, Maine, and Cape Sable, the ſouth-weſtern point of Nova-Scotia. It extends about 200 miles in a north-eaſt direction; and with Verte bay, which puſhes into the land in a ſouth-weſt direction from the ſtraits of Northumberland, forms a very narrow iſthmus, which unites Nova-Scotia to the continent; and where the diviſion line runs between that province and New-Brunſwick. From its mouth up to Paſſamaquoddy bay, on its north-weſt ſide, ſituated between the province of New-Brunſwick and the diſtrict of Maine, are a number of bays and iſlands on both ſides, and thus far it contracts its breadth gradually. It is twelve leagues acroſs from St. John's, in New-Brunſwick, to the Gut of Annapolis, in Nova-Scotia; where the tides are rapid, and riſe thirty feet. Above this it preſerves nearly an equal breadth, until its waters are formed into two arms, by a peninſula, the weſtern point of which is called *Cape Chignecto*. At the head of the north-eaſtern arm, called *Chignecto channel*, which, with bay Verte forms the iſthmus, the tides riſe ſixty feet. In the Baſin of Minas, which is the eaſt arm or branch of this bay, the tides riſe forty feet. Theſe tides are ſo rapid as to overtake animals feeding on the ſhore.

FUNE'BRAL, and FUNEBROUS, *adj.* [*funebris*, Lat. mournful.] Belonging to a funeral, doleful, diſmal. *Scott. Not much uſed.*

FU'NEN, or FYEN, an iſland of Denmark, at the entrance of the Baltic, nearly of an oval form, with ſome irregularities, extending from north to ſouth about thirty-five miles, eaſt to weſt about thirty. It is a fertile and a pleaſant iſland: moſt of the Daniſh nobility have ſeats here. The ſoil yields great crops of corn, ſo that near 100,000 barrels are annually exported to Norway and Sweden, excluſive of the conſumption at home. The inhabitants keep a great number of bees, and with the honey produced make mead, which forms a conſiderable article of trade, being ſent to every part of the kingdom. Here are ſeveral lakes and rivers, abounding in fiſh, but none navigable; great quantities of cod, herrings, turbots, and other fiſh, are caught in the bays along the coaſt. Odenſee is the capital. Lat. 55. 7. to 55. 42. N. lon. 9. 40. to 10. 50. E. Greenwich.

FU'NERAL, *ſ.* [*funus*, Lat. *funerailles*, Fr.] The ſolemnization of a burial; the payment of the laſt honours to the dead; obſequies.—He that had caſt out many unburied, had none to mourn for him, nor any ſolemn *funerals*, nor ſepulchre with his fathers. 2 *Mac.* v. 10.

Here, under leave of Brutus, and the reſt,
Come I to ſpeak in Cæſar's *funeral*. *Shakeſpeare.*

The pomp or proceſſion with which the dead are carried. —You are ſometimes deſirous to ſee a *funeral* paſs by in the ſtreet. *Swift.*—Burial; interment:

May he find his *funeral*
I' th' ſands, when he before his day ſhall fall. *Denham.*

FU'NERAL, *adj.* Uſed at the ceremony of interring the dead:

Our inſtruments to melancholy bells,
Our wedding cheer to a ſad *funeral* feaſt. *Shakeſpeare.*

Thy hands o'er towns the *funeral* torch diſplays,
And forms a thouſand ills ten thouſand ways. *Dryden.*

FU'NERAL RITES, ceremonies, which uſually accompany the interment of the dead.—Theſe rites differed among the ancients, according to the genius and religion of different countries. The firſt people who ſeem to have paid any particular reſpect to their dead, were the poſterity of Ham. The firſt cultivators of idolatrous worſhip and ſuperſtition after the flood; they were alſo the firſt who aſſerted the migration of the ſoul into all kinds of animals in earth, air, and ſea, and its return to the human body; which they ſuppoſed to be within the term of 3000 years. Hence proceeded the very great care in embalming of dead bodies, and the vaſt expence of providing mauſoleums or repoſitories for them. This alſo gave birth to thoſe wonders of the world, the pyramids of Egypt, which were built to receive the dead bodies of kings. Whenever a perſon died among the Egyptians, his parents and friends put on mournful habits, and abſtained from all banquets and entertainments. This mourning laſted from forty to ſeventy days, during which time they embalmed the body. See the article EGYPT, vol. vi. p. 352.

The

The funeral rites among the Hebrews were ſolemn and magnificent. When any perſon died, his relations and friends rent their clothes; which cuſtom is but faintly imitated by the modern Jews, who now cut off a bit of their garment, in token of affliction. When they came to the burying-place, they made a ſpeech to the dead, concluding with, "Bleſſed be God, who has formed thee, fed thee, maintained thee, and taken away thy life. O dead! he knows your numbers, and ſhall one day reſtore you to life." Then they ſpoke the elogium, or funeral oration; after which they ſaid a prayer, called the *righteouſneſs of judgment*; then turning the face of the deceaſed towards the heavens, they exclaimed, "Go in peace."

Among the ancient Greeks, the rites and ceremonies by which they expreſſed their ſorrow for the death of their friends, were ſolemn and various. They abſtained from banquets and entertainments; they diveſted themſelves of all ornaments; they cut off, or ſhaved, their hair, which they caſt into the funeral pile, to be conſumed with the body of their deceaſed friend. Sometimes they threw themſelves on the ground, and rolled in the duſt, or covered their head with aſhes; they beat their breaſts, and even tore their fleſh, upon the loſs of a perſon they much eſteemed. When perſons of rank, ſuch as public magiſtrates or great generals, died, the whole city put on mourning; all public meetings were interdicted; the ſchools, baths, ſhops, temples, and all places of public reſort, were ſhut up.

The Grecian ſoldiers who died in war, had not only their tombs adorned with inſcriptions ſhowing their names and exploits, but were alſo honoured with an oration in their praiſe. Particularly the cuſtom among the Athenians in the interment of their ſoldiers was as follows: "They uſed to place the bodies of their dead in tents three days before the funeral, that all perſons might have opportunity to find out their relations, and pay their reſpects to them. Upon the fourth day, a coffin of cypreſs was ſent from every tribe, to convey the bones of their own relations; after which went a covered hearſe, in memory of thoſe whoſe bodies could not be found. All theſe, accompanied with the whole body of the people, were carried to the public burying place, called *Ceramicus*, and there interred. One oration was ſpoken in commendation of them all, and their monuments adorned with pillars, inſcriptions, and all other ornaments uſual about the tombs of the moſt honourable perſons. The oration was pronounced by the fathers of the deceaſed perſons who had behaved themſelves moſt valiantly. Thus, after the famous battle at Marathon, the fathers of Callimachus and Cynægyrus were appointed to make the funeral oration. And upon the return of the day, upon which the ſolemnity was firſt held, the ſame oration was repeated annually."

Interment, or laying the dead in the ground, ſeems to have been the moſt ancient practice among the Greeks; though burning came afterwards to be generally uſed among them. It was cuſtomary to throw into the funeral pile thoſe garments the deceaſed uſually wore. The pile was lighted by one of the deceaſed's neareſt relations or friends, who made prayers and vows to the winds to aſſiſt the flames, that the body might quickly be reduced to aſhes; and during the time the pile was burning, the dead perſon's friends ſtood by it, pouring libations of wine, and calling upon the deceaſed.

The funeral rites among the ancient Romans were equally ſolemn and ceremonious. The deceaſed was kept ſeven days; and every day waſhed with hot water, and ſometimes with oil, that, in caſe he were only in a trance, he might be thus awaked; and every now and then his friends meeting, made a loud outcry or ſhout, with the ſame view; which laſt action they called *conclamatio*. The third conclamation was on the ſeventh day; when, if no ſigns of life appeared, the defunct was dreſſed and embalmed by the pollinctores; placed in a bed near the door, with his face and heels towards the ſtreet; and the outſide of the gate, if the deceaſed were of condition, was garniſhed with cypreſs boughs. In the courſe of theſe ſeven days, an altar was raiſed near his bed-ſide, called *acerra*; on which his friends every day offered incenſe; and the libitinarii provided for the funeral. On the ſeventh day a crier was ſent about the city to invite the people to the funeral in theſe words: *Exequias L. Tit. L. filii, quibus eſt commodum ire, jam tempus eſt. Ollus* (i. e. *ille*) *ex ædibus effertur.* The people being aſſembled, the laſt conclamation ended, and the bed was covered with purple: a trumpeter marched forth, followed by matrons called *præficæ*, ſinging ſongs in praiſe of the deceaſed: laſtly, the bed followed, borne by the next relations; and if the perſon were of quality and office, the waxen images of all his predeceſſors were carried before him on poles. The bed was followed by his children, kindred, &c. in mourning: from which act of following the corpſe, theſe funeral rites were called *exequiæ*. The body thus brought to the roſtra, the next of kin, *laudabat defunctum pro roſtris*, made a funeral oration in his praiſe, and in that of his anceſtors. This done, the body was carried to the funeral pile, and there burnt: his friends firſt cutting off a finger, to be buried with a ſecond ſolemnity. The body being conſumed, the aſhes were gathered; and the prieſt ſprinkling the company thrice with clean water, the eldeſt of the *præficæ* crying aloud, *ilicet*, diſmiſſed the people, who took their leave of the deceaſed in this form, *Vale, vale, vale: nos te ordine quo natura permiſerit, ſequemur.* The aſhes, incloſed in an urn, were laid in the ſepulchre or tomb.

It was cuſtomary alſo for perſons of quality, among the ancient Greeks and Romans, to inſtitute games, with all ſorts of exerciſes, to render the death of their friends more remarkable. This practice was generally received, and is frequently mentioned by ancient writers. Patroclus's funeral games take up the greateſt part of one of Homer's Iliads; and Agamemnon's ghoſt is introduced by the ſame poet, telling the ghoſt of Achilles, that he had been a ſpectator at a great number of ſuch ſolemnities.

The celebration of theſe games among the Greeks conſiſted chiefly of horſe-races; the prizes were of different value, according to the quality and magnificence of the perſon that celebrated them. The garlands given to victors on this occaſion were uſually of parſley, which was thought to have ſome particular relation to the dead. Theſe games, among the Romans, conſiſted chiefly of proceſſions; and ſometimes of the combats of gladiators around the funeral pile. They, as well as the Greeks, had alſo a cuſtom of executing criminals before the pile, as victims to appeaſe the manes of the deceaſed. The funeral games were finally aboliſhed by the emperor Claudius, as unſuitable to ſo melancholy an occaſion.

In the various accounts given of Egyptian interment, may be perceived the firſt rudiments of funeral orations, and what was the ſubject of them, which were afterwards moulded into a more regular form by other nations, who adopted this cuſtom. Nor can we omit remarking, that thoſe funeral ſolemnities were attended not only with orations in praiſe of the deceaſed, but with prayers for him; which prayers were uſually made by one who perſonated the deceaſed: an entire form of one of which is preſerved by Porphyry, as follows: "O lord, the ſun, and all the gods who give life to men, receive me, and admit me into the ſociety of the immortal ones; for as long as I lived in this world, I religiouſly worſhipped the gods whom my parents ſhowed me, and have always honoured thoſe who begat my body: nor have I killed any man, nor have I defrauded any of what has been committed to my truſt, nor have I done any thing which is inexpiable. Indeed, whilſt I was alive, if I have ſinned either by eating or drinking any thing which was not lawful; not through myſelf have I ſinned, but through theſe, (ſhowing the cheſt where the entrails were). And having thus ſpoke, he

casts it into the river, but the rest of the body he embalms as pure."

The Grecians, and from them the Romans, adopted the custom of making funeral orations in praise of the dead; and the manner in which it was performed, is thus described by Dr. Kennet: "In all the funerals of note, especially in the public or indictive, the corpse was first brought with a vast train of followers into the forum; here one of the nearest relations ascended the rostra, and obliged the audience with an oration in praise of the deceased. If none of the kindred undertook the office, it was discharged by some of the most eminent persons in the city for learning and eloquence, as Appian reports of the funeral of Sylla. And Pliny the younger reckons it as the last addition to the happiness of a great man, that he had the honour to be praised at his funeral by the most eloquent Tacitus, then consul; which is agreeable to Quintilian's account of this matter, *Num et funebres, &c.* For the funeral orations (says he) depend very often on some public office, and by order of senate are many times given in charge to the magistrates to be performed by themselves in person. The invention of this custom is generally attributed to Valerius Poplicola, soon after the expulsion of the regal family. Plutarch tells us, that honouring his colleague's obsequies with a funeral oration, it so pleased the Romans, that it became customary for the best men to celebrate the funerals of great persons with speeches in their commendation." Thus Julius Cæsar, according to custom, made an oration in the rostra, in praise of his wife Cornelia, and his aunt Julia, when dead; wherein he showed, that his aunt's descent, by her mother's side, was from kings, and by her father's from the gods. Plutarch says, that "he approved of the law of the Romans, which ordered suitable praises to be given to women as well as to men, after death."

The *funeral pile*, among the Greeks and Romans, was a pyramidal stack of wood, whereon were laid the bodies of the deceased to be burnt. It was partly in the form of an altar, and differed in height according to the quality of the person to be consumed. Probably it might originally be considered as an altar, on which the dead were consumed as a burnt-offering to the national deities. The trees made use of in the erection of a funeral pile were such as abounded in pitch or rosin, as being most combustible; if they used any other wood, it was split, that it might the more easily take fire. Round the pile were placed cypress boughs to hinder the noisome smell. The Hindoos are still in the habit of burning their dead; and it not unfrequently happens that the affectionate widow of a deceased husband will ascend the funeral pile, and commit herself to the flames with her husband's corpse. See the article HINDOOSTAN.

M. Pauw remarks, that the custom of burning the dead obtained almost universally, until about 1900 years ago, when it became politically necessary to bury them, because arts, population, and the clearing of grounds, had thinned the forests to such a degree, that towns and entire provinces were menaced with an approaching want of fuel. In the second century of the christian era, the Romans foresaw the necessity of abandoning their ancient practice, of changing their funeral piles into graves, and of committing the remains of their dearest connections, with infinite regret, to worms and putrefaction. See the article BURIAL, vol. iii. p. 520.

FU'NERAL CHAR'GES, by the laws of England, are the first of all debts to be paid and satisfied by executors and administrators. A person died in debt, and 600l. was laid out in his funeral; decreed the same should be a debt, payable out of a trust estate, charged with payment of debts, he being a man of great estate and reputation in his country, and buried there; but had he been buried elsewhere, it seemed his funeral might have been more private, and the court would not have allowed so much. *Prec. Ch.* 27.

Where a citizen of London devised 700l. for mourning, the question was, if it should come out of the whole estate, or out of the legatory part only; it was insisted that if there had been no direction by the will, or if the will had directed, that the expences of the funeral should not exceed such a sum, there the deduction must have been out of the whole estate. Mourning devised by the will, must come out of the legatory part, and not to lessen the orphanage and customary part. 2 *Vern.* 240. Executor is not however liable to pay for funeral expences, unless he orders or contracts for it. 12 *Mod.* 256.

Settlements for separate maintenance of the wife shall never extend to funeral charges; and though she made a will, (according to a power given her,) and an executor, and gave several legacies, but there was no residuum for the executor, the husband's estate in the hands of a devisee subject to the payment of debts was made liable to the funeral charges of the wife. 9 *Mod.* 31. In strictness of law, no funeral expences are allowable against creditors, except for the coffin, ringing of the bell, parson, clerk, and bearers' fees; but not for pall or ornaments; per Holt, 1 *Salk.* 296. Ten pounds was allowed for the funeral of a person in debt; by lord chief justice Holt. Baron Powell in his circuit would allow but 11s. 6d. as all the necessary charge. *Comb.* 342. Forty shillings seems to have been the most usual sum in cases of insolvency. *Salk.* 196. *Godolph.* p. 2. c. 26.

FU'NERARY, *adj.* [*funerarius*, Lat.] Belonging to a funeral. *Scott. Not much used.*

FUNE'REAL, *adj.* [*funerea*, Lat.] Suiting a funeral; dark; dismal:

But if his soul hath wing'd the destin'd flight,
Inhabitant of deep disastrous night,
Homeward with pious speed repass the main,
To the pale shade *funereal* rites ordain. *Pope.*

FUNE'ST, *adj.* [*funestus*, Lat.] Deadly, mortal.

FUNF'KIRCHEN, or FIVE CHURCHES, a town of Hungary, situated in a fertile soil between the Drave and the Danube; the see of a bishop: 110 miles north-west of Belgrade, and 140 south-south-east of Vienna. Lat. 46. 12. N. lon. 35. 41. E. Ferro.

FUNGE'NO, or FUNGANDO, a kingdom of Africa, situated between the river Zaire and Coanza. Subject to Anziko.

FUN'GI, *f.* [*fungus*, from σφογγος, Gr. on account of its spongy nature.] In botany, FUNGUSES, or MUSHROOMS. The first of the great families; and the ninth of the nations, tribes, or casts, into which Linnæus has distributed the whole vegetable world. Also the sixty-seventh order in his Fragments of a Natural Method: the fifty-eighth of his Natural Orders; and the fourth order of the class Cryptogamia, in his Artificial System. See BOTANY, vol. iii. p. 288, and the correspondent engraving. Hedwig and other modern botanists have made some important discoveries respecting the fructification of funguses, by the help of high magnifiers. The seeds are a dark powder in the gills of the agarics; in the boleti the seeds are within the membrane that lines the tubes; in peziza cyathoides they appear to be inclosed in a sort of pod, &c. See the article BOTANY, vol. iii. p. 288.

The *fungi* have all their fructifications in a more or less spongy body. They are extremely numerous, and are divided into the following genera, viz.

1. AGARICUS: fungus with gills underneath.
2. MERULIUS: fungus with veins underneath.
3. BOLETUS: fungus with pores underneath.
4. THÆLÆPHORA: fungus warty underneath.
5. HYDNUM: fungus prickly underneath.
6. PHALLUS: fungus smooth underneath, cellular above.
7. HELVELLA: fungus turbinate, plaited, wrinkled.
8. ATRACTOBOLUS: fungus sessile, cupular, with a lid, ejecting fusiform vesicles bearing the seeds.

9. TYMPA-

9. TYMPANIS: fungus cup-ſhaped; the cupola with a curtain above; ſeeds dry, mouldering to powder.

10. MYROTHECIUM: fungus cup-ſhaped; the cupola with a curtain above; ſeeds rather viſcid.

11. XYLOSTROMA: fungus expanded, coriaceous, ſmooth, equal; ſeeds globular, very minute, ſeated within the fibres of the fungus.

12. HELOTIUM: fungus with a fleſhy-membranaceous convex-hemiſphærical cup, bearing the naked ſeeds underneath.

13. CLAVARIA: fungus elongated, erect, clavate, emitting the ſeeds from every part of its ſurface.

14. CLATHRUS: fungus roundiſh, concealed with fleſhy branches interwoven with each other.

15. PEZIZA: fungus concave; ſeeds contained in the cup.

16. VOLUTELLA: fungus ſalver-ſhaped, on a ſhort ſetaceous ſtalk; upper-ſurface of the cap dotted and umbilicate; the margin at firſt revolute; ſeeds ſimilar.

17. EPICHYSUM: fungus rounded and concave; ſeeds globular, tailleſs, affixed by a branched thread creeping within.

18. CYATHUS: fungus campanulate or cylindrical, bearing lentiform. capſules within.

19. ASCOBOLUS: fungus hemiſphærical; veſicles oblong, ſcatteringly and ſlightly immerſed on the diſk, elaſtically ejecting the ſeeds.

20. THELEOBOLUS: fungus ſeſſile, gelatinous, ſolid, ejecting a gelatinous ſubſtance bearing the ſeeds.

21. SPHÆROBOLUS: fungus ſeſſile, globular-concave, opening in a radiate manner, and ejecting a globular capſule.

22. PILOBOLUS: fungus on a capillary ſtalk inflated and watery at top; cap hemiſphærical, elaſtically ejecting the ſeeds.

23. PUCCINIA: fungus cylindrical, filled with tailed ſeeds, diſpoſed in a radiate manner, and eſcaping elaſtically.

24. LYCOPERDON: fungus becoming powdery and fibrous within; ſeeds attached internally to the fibres.

25. SPUMARIA: follicles branched, filled internally with ſeminiferous fibres, covered with a cellular branny bark.

26. FULIGO: fungus with a cellular-fibrous bark; the fibres penetrating in a reticulate manner through a ſeminal maſs.

27. STEMONITIS: fungus covered with a fugacious or membranaceous bark, filled with ſeminiferous fibres elaſtically expanding themſelves.

28. MICROCARPON: fungus with a membranaceous caſe opening irregularly, filled with ſeminiferous filaments reticulately compact and fixed to the baſe.

29. CRIBRARIA: fungus with the caſe furniſhed with a double membrane; the outer thin and fugacious; the inner reticulate; ſeeds without filaments, ejected through the foramina.

30. RETICULARIA: fungus roundiſh, furniſhed with a caſe filled with ſeeds diſperſed among reticulate filaments.

31. TUBIFERA: fungus furniſhed with caſes ſuperimpoſed on an expanded membrane, connected with each other, and filled with nearly naked ſeeds.

32. ÆCIDIUM: fungus furniſhed with membranaceous caſes, glabrous both ſides, filled with naked ſeeds not cohering.

33. SPHÆRIA: fungus furniſhed with caſes, filled with roundiſh naked gelatinous ſeeds.

34. HISTERIUM: fungus ſeſſile, hollow, with a tranſverſe cleft at top; ſeeds globular, tailleſs, covering the diſk.

35. VERMICULARIA: capſule globular, ſeſſile, filled with looſe worm-ſhaped ſeminiferous bodies.

36. PYRENIUM: fungus globular, ſeſſile, very entire, incloſing naked conglobate ſeeds like a nucleus.

37. TUBER: fungus nearly globular, fleſhy; the fleſh diſtinguiſhed internally with veins.

38. SCLEROTIUM: fungus quite ſimple, globular-oblong, tough, hardiſh, gaping a little at length in the centre, covered with an inſeparable bark never opening above.

39. UREDO: powder mealy, deſtitute of a caſe, effuſed under the cuticles of leaves and ſtems, burſting at laſt with an even margin.

40. TUBERCULARIA: fungus gelatinous; cap tubercled; ſtalk thick, filled, cloſely appreſſed, bearing the ſeeds on the upper ſurface.

41. SPERMODERMIA: fungus quite ſimple, globular, ſeſſile, ſpongy; ſeeds crowded, ſupplying the place of a bark.

42. ACROSPERMUM: fungus quite ſimple, nearly erect, emitting the ſeeds exteriorly from the tip.

43. STILBUM: fungus aggregate, gelatinous, on a ſtalk; head diaphanous, ſhining, ſolid, permanent, bearing the ſeeds externally.

44. ASCOPHORA: fungus erect, on a ſetaceous ſtalk: head globular-oblong, inflated, opake, elaſtic, bearing the ſeeds eternally.

45. CHORDOSTYLUM: fungus very tenacious, on a very long tenacious ſlightly branched ſtalk; head globular, ſomewhat deciduous, bearing the ſeeds.

46. MUCOR: fungus fugacious; heads at firſt diaphanous, becoming opake, fixed to ſimple or branched ſtalks.

47. HYDROPHORA: fungus globular, watery, on a nearly erect capillary ſtalk.

48. PERICONIA: fungus globular; ſeeds ſeſſile, deciduous, every where clothing the head and ſtalk.

49. GRANULARIA: fungus roundiſh, filled with granulations immerſed in a mucilage.

50. MEDUSULA: fungus ſolid, globular, on a ſtalk, crowded; ſeeds external, filiform, flexile, colliquescent.

51. MONILIA: conſiſting of moniliform filaments cluſtered into a head.

52. MUCILAGO: conſiſting of moſt ſimple fugacious filaments.

A new claſſification of fungi has been recently publiſhed at Leipſic, (1805,) according to the method of Perſoonia, by I. B. de Albertini and L. D. de Schweinitz. The ſpecies and varieties they have added are 127 in number, on twelve beautifully coloured plates. The whole is divided into two claſſes and ſix orders. Their new genera appear to be the following:

53. Stilboſpora. 54. Hyloma. 55. Næmaſpora. 56. Geaſtrum. 57. Boviſta. 58. Tuloſtoma. 59. Scleroderma. 60. Piſolithus. 61. Lycogala. 62. Phyſarum. 63. Trichia. 64. Arcyria. 65. Lycea. 66. Tubulina. 67. Onygena. 68. Trichoderma. 69. Conoplea. 70. Amanita. 71. Siſtotrema. 72. Meriſma. 73. Geogloſſum. 74. Spathularia. 75. Leotia. 76. Morchella. 77. Tremella. 78. Agerita. 79. Ceratium. 80. Iſaria. 81. Botrytis. 82. Dematium. 83. Erineum. 84. Racodium. 85. Hemantia. 86. Rhizomorpha. 87. Meſenterica.

See all theſe deſcribed, under their reſpective titles, in this work, with appropriate engravings.

FUN'GI ESCULEN'TI. See PHALLUS.

FUN'GI PAR'VI. See LICHEN BYSSOIDES.

FUNGIL'LI, in botany. See LICHEN ERICETORUM.

FUNGOIDAS'TER. See HELVELLA.

FUNGOI'DES. See AGARICUS, CLAVARIA, HELVELLA, and PEZIZA.

FUNGOS'ITY, *ſ.* Unſolid excreſcence.

FUN'GOUS, *adj.* Excreſcent; ſpongy; wanting firmneſs.—It is often employed to keep down the *fungous* lips that ſpread upon the bone; but it is much more painful than the eſcharotic medicines. *Sharp.*

FUN'GOUSNESS, *ſ.* The ſtate of being fungous. *Scott.*

FUN'GUS, *ſ.* [from σφογγος, Gr. ſponge.] Strictly a muſhroom. See FUNGI. A word uſed to expreſs ſuch excreſcences of fleſh as grow out upon the lips of wounds, or any other excreſcence from trees or plants not naturally belonging to them; as the agaric from the larch-

larch-tree, and auriculæ judæ from elder. *Quincy.*—The ſurgeon ought to vary the diet as the fibres lengthen too much, are too fluid, and produce *funguſes*, or as they harden and produce calloſities. *Arbuthnot.*—This eminence is compoſed of little points or granula, called *fungus* or proud fleſh. *Sharp.*—For its cauſe and cure, ſee the article SURGERY.

FUN'GUS, *ſ.* a common name for the caoutchouc or Indian rubber. See CAOUTCHOUC, vol. iii. p. 744.

FU'NICLE, *ſ.* [*funiculus*, Lat.] A ſmall cord; a ſmall ligature; a fibre.

FUNI'CULAR, *adj.* [*funiculaire*, Fr.] Conſiſting of a ſmall cord or fibre.

FUNI'CULUS, *ſ.* [dim. of *funis*, a rope.] The navel-ſtring.

FU'NIS, in botany. See CISSUS, MELASTOMA, UVARIA, MENISPERMUM, and TRAGIA.

FUNK, *ſ.* A ſtink. A low word.

To FUNK, *v. n.* To ſtink through fear:

The beſt part of the veal, and the Greek for *hunc*,
Is the name of a man that makes us *funk*. *Epig. on Burton.*

FUNK ISLAND, a ſmall iſland in the Atlantic, near the north-eaſt coaſt of Newfoundland. Lat. 50. N. lon. 52. 15. W. Greenwich.

FUNK'ABUN, a town of Perſia, in the province of Mazenderan: fifteen miles weſt of Ferabat.

FUN'NEL, *ſ.* [*infundibulum*, Lat.] An inverted hollow cone with a pipe deſcending from it, through which liquors are poured into veſſels with narrow mouths; a tundiſh.—If you pour a glut of water upon a bottle, it receives little of it; but with a *funnel*, and by degrees, you ſhall fill many of them. *Ben Jonſon.*

Some the long *funnel's* curious mouth extend,
Through which ingeſted meats with eaſe deſcend.
Blackmore.

A pipe or paſſage of communication.—Towards the middle are two large *funnels*, bored through the roof of the grotto, to let in light or freſh air. *Addiſon.*

FUN'NEL-FASHIONED, and FUN'NEL-SHAPED, *adj.* Shaped in the manner of a funnel.

FUN'NY, *adj.* Full of fun, merry.

FUOR'LI, a town of Italy, in the kingdom of Naples, and province of Abruzzo Citra: twenty-one miles ſouth-ſouth-eaſt of Solmona.

FUR, *ſ.* [*fourrere*, Fr.] Skin with ſoft hair, with which garments are lined for warmth, or covered for ornament.—'Tis but dreſſing up a bird of prey in his cap and *furs* to make a judge of him. *L'Eſtrange.*

And lordly gout wrapt up in *fur*,
And wheezing aſthma, loth to ſtir. *Swift.*

Soft hair of beaſts found in cold countries, where nature provides coats ſuitable to the weather; hair in general:

This night, wherein the cub-drawn bear would couch,
The lion and the belly-pinched wolf
Keep their *fur* dry, unbonnetted he runs,
And bids what will take all. *King Lear.*

Any moiſture exhaled to ſuch a degree as that the remainder ſticks on the part:

Methinks I am not right in every part;
I feel a kind of trembling at my heart:
My pulſe unequal, and my breath is ſtrong;
Beſides a filthy *fur* upon my tongue. *Dryden.*

To FUR, *v. a.* To line or cover with ſkins that have ſoft hair:

Through tatter'd clothes ſmall vices do appear;
Robes and *furr'd* gowns hide all. *Shakeſpeare.*

To cover with ſoft matter.—To make lampblack, take a torch and hold it under the bottom of a latten baſon; and, as it groweth to be *furred* and black within, ſtrike it with a feather into ſome ſhell. *Peacham.*

A dungeon wide and horrible; the walls
On all ſides *furr'd* with mouldy damps, and hung
With clots of ropy gore. *Addiſon.*

The *fur-trade* has, for a great number of years paſt, formed a ſpeculation of conſiderable extent amongſt the maritime powers of Europe. The poliſhed nations of antiquity, however, not only rejected the uſe of fur, either as an ornament in dreſs, or as an article of commerce; but ſtigmatiſed thoſe with the epithet of barbarians, who were clothed in any manner with the ſkins of animals. Strabo deſcribes the Indians as covered with the ſkins of lions, tigers, and bears; and Seneca, the Scythians, clothed with the ſkins of foxes, and the ſmaller quadrupeds; while Virgil exhibits a picture of the ſavage Hyperboreans, clad, like the wild Americans, in the ſkins of brute beaſts. It does not appear that the Greeks or early Romans ever made uſe of fur. It undoubtedly originated in thoſe regions where ſeverity of climate required ſuch warm clothing. At firſt it conſiſted of the ſkins only, almoſt in the ſtate in which they were taken from the beaſt; but as ſoon as civilization took place, and manufactures were introduced, fur became the lining of the dreſs, and often an elegant facing for the robes. It is probable that the northern conquerors firſt introduced the faſhion into Europe. We find, that about the year 522, when Totila king of the Viſigoths reigned in Italy, the Suethons of modern Sweden found means, by the commerce of intervening people, to tranſmit, for the uſe of the then Roman people, *ſaphilinas pelles*, the precious ſkins of the ſables. As luxury advanced, furs, even of the moſt valuable ſpecies, were uſed by princes as linings for their tents: thus Marco Polo, in 1252, found thoſe of the cham of Tartary lined with ermines and ſables. He calls the laſt *zibelines* and *zambolines*. He ſays that they were brought from countries far north; from the Land of Darkneſs, and regions almoſt inacceſſible by reaſon of moraſſes and ice. The ancient Welſh ſet a high value on fur, as early as the time of Howel Dda, who began his reign about 940. In the next age, fur became the faſhionable magnificence of Europe. When Godfrey of Boulogne and his followers appeared before the emperor Alexis Comnene, on their way to the Holy Land, he was ſtruck with the richneſs of their fur dreſſes, *tam ex oſtro quam aurifrigio et niveo opere harmelino et ex mardrino griſioque et vario.* How adverſe was the ſtate of luxury in France in the time of their great monarch Charlemagne, who contented himſelf with the plain fur of the otter! In England, fur was deemed a kingly ornament ſo early as the reign of Alfred the Great; and in 1337, the luxury had ſo univerſally prevailed, that Edward III. enacted, that all perſons who could not ſpend a hundred a year, ſhould be prohibited the uſe of this ſpecies of finery.

The French, ſoon after their eſtabliſhment in Canada, in 1608, were the firſt who brought this commerce into enviable repute, by extending their traffic for ſkins to the remoteſt ſettlements of the Indian tribes in North America. When this traffic had been carried on for near half a century by the French, it was thought to be ſo extremely profitable and advantageous, as to become the leading temptation for incorporating the Engliſh Hudſon's-Bay company, in 1670, by Charles II.—See vol. iv. p. 883. But notwithſtanding the exertions of this company to monopolize the *fur-trade*, it continued to be carried on by the French to a very conſiderable extent, until Canada was taken by the Engliſh in 1760. Under the French government, the fur-trade from Canada had been extended as far weſt as the Saſkatchiwine river, in 53 degrees north latitude, and 102 degrees weſt longitude from Greenwich. Numbers of the natives of Canada were induced to penetrate into the Indian countries, to prevail on them to bring ſkins to barter with the French at their ſettlements. It is not neceſſary to examine the cauſe, though experience proves, that it requires much leſs time for a civilized people to deviate into the manners and cuſtoms of ſavage life, than for ſavages

vages to riſe into a ſtate of civilization. Such was the event with thoſe who thus accompanied the native Indians on their hunting and trading excurſions; for they became ſo attached to the Indian mode of life, that they loſt all reliſh for their former habits and native homes. Hence they derived the title of *Coureurs des Bois*, became a kind of pedlars, and were extremely uſeful to the merchants engaged in the fur trade; who gave them the neceſſary credit to proceed on their commercial undertakings. Three or four of theſe people would join their ſtock, put their property into a birch bark canoe, which they worked themſelves, and either accompanied the Indians in their excurſions, or went at once to the country where they knew they were to hunt. At length, theſe excurſions occupied the ſpace of twelve or fifteen months, when they returned with rich cargoes of furs, followed by great numbers of Indians. During the ſhort time requiſite to ſettle their accounts with the merchants, and procure freſh credit, they generally contrived to ſquander away all their gains, when they returned to renew their favourite mode of life; their views being anſwered, and their labour ſufficiently rewarded, by indulging themſelves in extravagance and diſſipation during the ſhort ſpace of one month out of twelve or fifteen. This indifference about amaſſing property, and the pleaſure of living free from all reſtraint, ſoon brought on a licentiouſneſs of manners which could not long eſcape the vigilant obſervation of the French miſſionaries, who had much reaſon to complain of their being a diſgrace to the chriſtian religion; by not only ſwerving from its duties themſelves, but by thus bringing it into diſrepute with thoſe of the Indians who had become converts to it; and, conſequently, obſtructing the great object to which thoſe pious men had devoted their lives. They, therefore, exerted their influence to procure the ſuppreſſion of theſe people, and accordingly, no one was allowed to go up the country to traffic with the Indians, without a licence from the government. The grant of theſe licences was ſoon conſidered as a favour, and they were made transferable, and of courſe ſaleable. Thoſe who bought were allowed to appoint their own agents, and the agents thus employed were generally the *coureurs des bois*, whoſe conduct had given ſuch cauſe of complaint; ſo that the remedy ſoon proved worſe than the diſeaſe. At length, military poſts were eſtabliſhed at convenient places, and ſeveral reſpectable men proſecuted the trade on their own accounts in perſon; which mode was attended with the twofold benefit of ſecuring the reſpect of the Indians, and the obedience of the people employed in the laborious parts of the buſineſs.

As for the miſſionaries, if ſufferings and hardſhips in the proſecution of the great work which they had undertaken deſerved applauſe and admiration, they had an undoubted claim to be admired and applauded: they ſpared no labour and avoided no danger in the execution of their important office; and it is to be ſeriouſly lamented, that their pious endeavours did not meet with the ſucceſs which they deſerved: for there is hardly a trace to be found, beyond the cultivated parts, of their meritorious functions. The cauſe of this failure muſt be attributed to a want of due conſideration in the mode employed by the miſſionaries to propagate the religion of which they were the zealous miniſters. They habituated themſelves at length to the ſavage life, and finally naturaliſed themſelves to the ſavage manners; and, by thus becoming dependent, as it were, on the natives, they acquired their contempt rather than their veneration.

After the conqueſt of Canada by the Engliſh, the trade for furs in that country was for ſome time ſuſpended; the new poſſeſſors having neither knowledge of the Indian language, nor confidence in the natives, who had been taught to entertain hoſtile diſpoſitions towards the Engliſh. By degrees, however, the trade revived, and was ſoon carried beyond the French limits, partly by what is called the North Weſt Company, and partly by private individuals on their own account. This company does not poſſeſs any particular privileges by law, but from its great capital merely it is enabled to trade to certain remote parts of the continent, to the excluſion of thoſe who do not hold any ſhares in it. It was formed by the merchants at Montreal, in 1783; who wiſely conſidered that the trade could be carried on to thoſe diſtant parts of the continent, inhabited ſolely by Indians, with more ſecurity and greater profit, if they joined together, in a body, than if they continued to trade ſeparately. The ſtock of the company was divided into forty ſhares; and as the number of merchants in the town at that time was not very great, this arrangement afforded an opportunity to every one of them to join in the company if he thought proper. The company principally carries on its trade by means of the Utawas or Grand river, which falls into the St. Lawrence about thirty miles above Montreal, and which forms, by its confluence with that river, the lake of the Two Mountains and the lake of St. Louis, wherein are ſeveral large iſlands. To convey the furs down this river, they make uſe of the above-mentioned canoes, formed of the bark of the birch-tree, ſome of which are upon ſuch a large ſcale that they are capable of containing two tons; but they ſeldom put ſo much in them, eſpecially on this river, it being in many places ſhallow, rapid, and full of rocks, and contains no leſs than thirty-two portages.

The canoes are navigated by the Canadians, who are particularly fond of the employment, prefering it in general to that of cultivating the ground. A fleet of them ſets off from Montreal about the month of May, laden with proviſions, conſiſting chiefly of biſcuit and ſalt pork, ſufficient to laſt the crews till their return, and alſo with the articles given in barter to the Indians. At ſome of the ſhallow places in the river, it is ſufficient if the men merely get out of the canoes, and puſh them on into the deep water; but at others, where there are dangerous rapids and ſharp rocks, it is neceſſary for the men to unlade the canoes, and carry both them and the cargoes on their ſhoulders, till they come again to a ſafe part of the river. At night they drag the canoes upon ſhore, light a fire, cook their proviſions for the following day, and ſleep upon the ground wrapped up in their blankets or furs. In general they remain wholly under the canopy of heaven, copying exactly the Indian mode of life, and many of them even wear the Indian dreſſes, which they find more convenient than their own.

Having aſcended the Utawas river for about two hundred and eighty miles, which it takes them about eighteen days to perform, they then croſs by a portage into Lake Niſpiſſing, and from this lake by another portage they get upon French river, which falls into Lake Huron on the north-eaſt ſide; then coaſting along this laſt lake they paſs through the Straits of St. Mary, where there is another portage into Lake Superior; and coaſting afterwards along the ſhores of Lake Superior, they come to the Grand Portage on the north-weſt ſide of it; from hence by a chain of ſmall lakes and rivers they proceed onward to the Rainy Lake of the Woods, and for hundreds of miles beyond it, through Lake Winnipeg, &c. The canoes, however, which go ſo far up the country, never return the ſame year; thoſe intended to bring back cargoes immediately, ſtop at the Grand Portage, where the furs are collected ready for them by the agents of the company. The furs are made up in packs of a certain weight, and a particular number is put into each canoe. By knowing thus the exact weight of every pack, there can be no embezzlement; and at the portages there is no time waſted in allotting to each man his load, every one being obliged to carry ſo many packs.

At the Grand Portage, and along that immenſe chain of lakes and rivers which extend beyond Lake Superior, the company has regular poſts, where the agents reſide; and with ſuch aſtoniſhing enterpriſe and induſtry have the

affairs of this company been carried on, that trading poſts are now eſtabliſhed within five hundred miles of the Pacific Ocean. One gentleman, Mr. Mackenzie, a partner in the houſe at Montreal, has even penetrated to the Pacific Ocean itſelf. The journal kept by him upon theſe expeditions, and which has been recently publiſhed, is replete with information of the moſt intereſting nature. In the firſt attempt which Mr. Mackenzie made to penetrate to the ocean, he ſet out early in the ſpring from the remoteſt of the poſts belonging to the company. He took with him a ſingle canoe, and a party of choſen men; and after paſſing over prodigious tracts of land, never before traverſed by any white perſon, he at laſt came to a large river. Here the canoe, which was carried by the men on their ſhoulders, was launched, and having all embarked, they proceeded down the ſtream. From the courſe this river took for a very great diſtance, Mr. Mackenzie was led to imagine that it was one of thoſe rivers he was in queſt of; namely, one which emptied itſelf into the Pacific Ocean; but at the end of ſeveral weeks, during which they had worked their way downward with great eagerneſs, he was convinced, from the gradual inclination of the river towards another quarter, that he muſt have been miſtaken; and that it was one of thoſe immenſe rivers, ſo numerous on the continent of North America, that run into Baffin's Bay, or the Arctic Ocean. The party was now in a very critical ſituation; the ſeaſon was far advanced, and the length of way which they had to return was prodigious. If they attempted to go back, and were overtaken by winter, they muſt in all probability periſh for want of proviſions in an uninhabited country; if, on the contrary, they made up their minds to ſpend the winter where they were, they had no time to loſe in building huts, and going out to hunt and fiſh, that they might have ſufficient ſtores to ſupport them through that dreary ſeaſon. Mr. Mackenzie repreſented the matter, in the moſt open terms, to his men, and left it to themſelves to determine the part they would take. The men were for going back at all hazards; and the reſult was, that they reached their friends in ſafety. The difficulties they had to contend with, and the exertions they made in returning, were almoſt ſurpaſſing belief.

The ſecond expedition entered upon by Mr. Mackenzie, and which ſucceeded to his wiſhes, was undertaken ſoon afterwards. He ſet out in the ſame manner, but well provided with thoſe articles which he found the want of in his firſt expedition. He was extremely well furniſhed with aſtronomical inſtruments, and in particular with a good time-piece, that he procured from London. He took a courſe ſomewhat different from the firſt, and paſſed through many nations of Indians who had never before ſeen the face of a white perſon, amongſt ſome of whom he was for a time in imminent danger; but he found means to conciliate their good will. From ſome of them he learned, that there was a ridge of mountains at a little diſtance, beyond which the rivers all ran in a weſtern direction. Having engaged ſome guides, he proceeded according to their directions until he came to the mountains, and after aſcending them with prodigious labour, found, to his great ſatisfaction, that the account the Indians had given was true, and that the rivers on the oppoſite ſide did indeed all run to the weſt. He followed the courſe of one of them, and finally came to the Pacific Ocean, not far from Nootka Sound. Here he was given to underſtand by the natives, and their account was confirmed by the ſight of ſome little articles they had amongſt them, that an Engliſh veſſel had quitted the coaſt only ſix weeks before. This was a great mortification to Mr. Mackenzie; for had there been a ſhip on the coaſt, he would moſt gladly have embarked in it rather than encounter the ſame difficulties, and be expoſed to the ſame perils, which he had experienced in getting there: however there was no alternative; he ſet out after a ſhort time on his journey back again, and having found his canoe quite ſafe under ſome buſhes, near the head of the river, where he had hid it, together with ſome proviſions, leſt on going down to the coaſt the natives might have proved unfriendly, and have cut off his retreat by ſeizing upon it, he finally arrived at one of the trading poſts in ſecurity.

Many other individuals belonging to the North Weſt Company, before Mr. Mackenzie ſet out, penetrated far into the country in different directions, and much beyond what any perſon had done before them, in order to eſtabliſh poſts. In ſome of theſe excurſions they unexpectedly fell in with the agents of the Hudſon's Bay Company, who were alſo extending their poſts from another quarter; this caſual meeting between the two companies, gave riſe to ſome very unpleaſant altercations, and the Hudſon's Bay Company threatened the other with an immediate proſecution for an infringement of its charter. The North Weſt Company, however, reſted perfectly eaſy about the menaces of a proſecution, ſatisfied that they had infringed upon the rights of no one. The Hudſon's Bay Company, though it threatened, never attempted to put its threats in execution: but continued nevertheleſs to watch the motions of its rival with a jealous eye; and as in extending their reſpective trades, the poſts of the two companies were approximating nearer and nearer to each other every year, there was great reaſon to imagine that their differences would become ſtill greater, and finally, perhaps, lead to conſequences of a ſerious nature. A circumſtance, however, unexpectedly took place, which happily reconciled them to each other, and terminated all their diſputes.

A very powerful nation of Indians, called the *Aſſiniboins*, who inhabit an extended tract of country to the ſouth-weſt of Lake Winnipeg, conceiving that the Hudſon's Bay Company had encroached unreaſonably upon their territories, and had otherwiſe maltreated a part of their tribe, formed the reſolution of deſtroying a poſt eſtabliſhed by that company in their neighbourhood. A large body of them ſoon collected together, and breathing the fierceſt ſpirit of revenge, marched unperceived and unſuſpected by the party againſt whom their expedition was planned, till within a ſhort diſtance of their poſt. Here they halted according to cuſtom, waiting only for a favourable moment to pounce upon their prey. Some of the agents of the North Weſt Company, who were ſcattered about this part of the country, fortunately got intelligence of their deſign. They knew the weakneſs of the place about to be attacked, and forgetting the rivalſhip ſubſiſting between them, and thinking only how to ſave their countrymen, they immediately diſpatched a meſſenger to give the party notice of the aſſault that was meditated; they at the ſame time ſent another meſſenger to one of their own poſts, deſiring that inſtant ſuccour might be ſent to that belonging to the Hudſon's Bay Company, which the Indians were about to plunder. The detachment arrived before the attack commenced, and the Indians were repulſed; but had it not been for the timely aſſiſtance their rivals had afforded, the Hudſon's Bay people were fully perſuaded that they muſt have fallen victims to the fury of the Indians. This ſignal ſervice was not undervalued nor forgotten by thoſe who had been ſaved; and as the North Weſt Company was ſo much ſtronger, and on ſo much better terms with the Indians in this part of the country, than its rivals, it now evidently appeared to be the intereſt of the latter to have the poſts of the North Weſt Company eſtabliſhed as near its own as poſſible. This was accordingly done for their mutual ſafety, and the two companies, in July 1787, adopted the wiſe reſolution of forming an union of intereſts.

Beſides the furs thus conveyed down to Montreal from the north-weſtern parts of the American continent, by means of the Utawas river, there are large quantities alſo brought there acroſs the lakes, and down the river St. Lawrence. Theſe are collected at the various towns and poſts along the Lakes Huron, Erie, and Ontario, where the

the trade is open to all parties, the ſeveral poſts being protected by regular troops, at the expence of the government. Added likewiſe to what are thus collected by the agents of the company, and of private merchants, there are conſiderable quantities brought down to Montreal for ſale by traders, on their own account. Some of theſe traders come from parts as remote even as the Illinois country, bordering on the Miſſiſſippi. They aſcend the Miſſiſſippi as far as Oniſconſing river, and from that by a portage of three miles get upon Fox River, which falls into Lake Michigan. In the fall of the year theſe two rivers overflow, and it is then practicable to paſs in a light canoe from one river to the other, without any portage whatſoever. From Lake Michigan they get upon Lake Huron, afterwards upon Lake Erie, and thus reach the St. Lawrence. Before the month of September is over, the furs are all brought down to Montreal; as they arrive they are immediately ſhipped, and the veſſels diſpatched in October, beyond which month it would be dangerous for them to remain in the river on account of the ſetting in of winter. Furs are alſo ſhipped in conſiderable quantities at Quebec, and at the town of Trois Rivieres. The reader may form ſome judgment of the extent of the fur-trade in the hands of the North Weſt Company only, from the following account of the furs and peltries which were the produce of the year 1798:

106,000 Beaver ſkins,	6000 Lynx ſkins,
2100 Bear ſkins,	600 Wolverine ſkins,
1500 Fox ſkins,	1650 Fiſher ſkins,
4000 Kitt Fox ſkins,	100 Racoon ſkins,
4600 Otter ſkins,	3800 Wolf ſkins,
17,000 Muſquaſh ſkins,	700 Elk ſkins,
32,000 Martin ſkins,	750 Deer ſkins,
1800 Mink ſkins,	1200 Deer ſkins, dreſſed,

500 Buffalo robes, and a quantity of caſtorum.

The number of men employed by them in the year above-mentioned, amounted to fifty clerks; ſeventy-one interpreters and clerks; 1120 canoe men; and thirty-five guides.

Mr. Mackenzie, after laying open the particulars of this intereſting commerce, concludes with obſerving, "that the fur-trade would be productive of more advantage both to the public and to the merchants, if the Hudſon's Bay and the North Weſt Companies were to unite. Experience (he ſays) has proved, that this trade, from its very nature, cannot be carried on by individuals. A very large capital, or credit, or indeed both, is neceſſary: and conſequently an aſſociation of men of wealth to direct, with men of enterpriſe to act, in one common intereſt, muſt be formed on ſuch principles, as that in due time the latter may ſucceed the former, in continual and progreſſive ſucceſſion. Such was the equitable and ſucceſsful mode adopted by the merchants from Canada, which has been already deſcribed. The junction of ſuch a commercial aſſociation with the Hudſon's Bay Company is the important meaſure which I would propoſe, and the trade might then be carried on with a very ſuperior degree of advantage, both private and public, under the privilege of their charter, and would prove, in fact, the complete fulfilment of the conditions on which it was firſt granted. It would be an equal injuſtice to either party to be excluded from the option of ſuch an undertaking; for, if the one has a right by charter, has not the other a right by prior poſſeſſion, as being ſucceſſors to the ſubjects of France, who were excluſively poſſeſſed of all the then known parts of the country, before Canada was ceded to Great Britain, except the coaſt of Hudſon's Bay, and having themſelves been the diſcoverers of a vaſt extent of country ſince added to his majeſty's territories, even to the Hyperborean and the Pacific Oceans? If, therefore, that company ſhould decline, or be averſe to engage in, ſuch an extenſive, and perhaps hazardous, undertaking, it would not, ſurely, be an unreaſonable propoſal to them, from government, to give up a right which they refuſe to exerciſe, on allowing them a juſt and reaſonable indemnification for their ſtock, regulated by the average dividends of a certain number of years, or the actual price at which they transfer their ſtock. By enjoying the privilege of the company's charter, though but for a limited period, there are adventurers who would be willing, as they are able, to engage in, and carry on, the propoſed commercial undertaking, as well as to give the moſt ample and ſatisfactory ſecurity to government for the fulfilment of its contract with the company." In conſideration of the perils and dangers ſuſtained by exploring the unknown regions of North America, for the purpoſe of extending this commerce, and of the conſequent advantages to geography and commerce, the king has beſtowed the honour of knighthood on the indefatigable projector of the ſcheme, now ſir Alexander Mackenzie.

The ſkins of wild animals are now every where dreſſed with the hair on, for the various purpoſes of ornamental decoration, as well as for the uſe of the army, both horſe and foot. The furs of many ſkins are likewiſe uſed in the felting trade, in which caſe the pelts, ſtripped of the hair or fur, are tanned for leather. A patent has been lately granted to Mr. Thomas Chapman, of Bermondſey near London, for his diſcovery of a method of getting off the wool or fur from ſeal and other ſkins, in a more perfect ſtate than has hitherto been done, for the purpoſe of manufacturing the ſame into hats, or any other article of cloathing; whereby the ſkins or pelts are leſs damaged than by any other proceſs yet adopted, and are preſerved in a perfect ſtate, for the purpoſe of tanning into any kind of leather. Mr. Chapman ſtates his method to be as follows: "When the fur ſkin is in the raw or natural ſtate, lay it in clean freſh water for twelve hours; afterwards take the ſkin to a beam uſually worked on, and, with a proper fleſhing or beaming knife, ſcrape off the blubber or oily ſubſtance that adheres to the pelt. Then waſh the ſkin very clean in ſcalding water, in which the following ingredients have been before mixed and diſſolved; that is to ſay, to every fourteen pails of water, each pail containing about two gallons, put three pounds and a half of ſoft or other ſoap and two pounds of pearl-aſh, and ſo in proportion for a ſmaller or larger quantity. Then put the fur-ſkin in hoops to dry in the ſun, or in a ſtove-room, and make them as dry as poſſible. As the ſkins are ſo dried, take them out of the hoops, and carefully waſh them again in the aforeſaid compoſition, made freſh, and as hot as before. The ſkins are then to be taken to the beam, and again ſcraped with the beaming knife; and the knife will then draw, at every ſtroke of the workman, the coarſe hair only from the ſkin or pelt, leaving the fur or wool adhering thereto, cleared from all the coarſe hair. Then immerſe the ſkin in warm water for twelve hours, in which water the following ingredients muſt have been previouſly mixed and diſſolved; that is to ſay, to every fourteeen pails, each pail containing about two gallons, three pounds of ſoft or other ſoap, one pound and a half of pearl-aſh, and one or two pounds of barilla, more or leſs, according to the temper and pliability of the ſkin. After the ſkins have lain in the water for the above time, take them and lay them on the beam, and ſcrape them with a proper beaming knife; and the workman will, at every ſtroke, draw, or diſcharge, from the ſkin or pelt, ſome of the wool or fur, until all the wool or fur be extracted or diſcharged; and thereby the ſkin or pelt will be left free from every particle of hair, fur, or wool, and will be in no wiſe injured or damaged in its ſurface, or inward ſubſtance. After the wool or fur is thus ſeparated from the ſkin, put it into a hair-bottomed ſieve; then take either two copper kettles, or iron pans, or boilers, of ſufficient ſize to hold fourteen pails of water: fill one of the veſſels with water, and put therein three pounds and a half of ſoft or other ſoap, two pounds and a half of pearl-aſh, and heat the water ſufficiently to diſſolve the ingredients; the wool or fur, in the hair-bottomed ſieve, is to be immerſed in this water; ſtirring it about frequently; and, preſſing it with the hand, or other-

otherwiſe, about five minutes, when you will perceive the roots of the wool or fur ſeparate, expand, and divide freely. After the above operation has been effected, take the other veſſel, fill it with warm water, and therein immerſe the wool or fur; and thoroughly waſh, cleanſe, and preſs from it all filth or dirt that adheres thereto. After it is ſo cleanſed, let it be dried by a ſlow fire-ſtove, or by heat of the ſun, if the ſeaſon will permit. After it is completely dried, pull or part it by hand, or otherwiſe, as it will freely part. After it is thus parted, bow it with the bow-ſtring; and the wool or fur will be fit for the purpoſe of being uſed in the manufacture of hats, or other articles of clothing, and to be nearly equal to every purpoſe for which the wool or fur called beaver is uſed; and is alſo of ſo fine a texture, and ſo good a ſtaple, as to be convertible to any other article of felting or clothing." The patent is dated June 6, 1799.

FUR, *adv.* [It is now commonly written *far.*] At a diſtance:

The white lovely dove
Doth on her wing her utmoſt ſwiftneſs prove,
Finding the gripe of faulcon fierce not *fur.* *Sidney.*

FUR, or FURR, [ſometimes written *Dar-Fur*, but not properly; *dar* being only an appellative, equally applicable to a town, a village, or a kingdom; and thus written, it means literally *the kingdom of Fur.*] A kingdom in the interior of Africa, ſituated between the territories of Bergoo and Kordofan; great part of the latter of which was conquered by the ſultan of *Fur*, in 1794 and 1795. The chief towns are Cobbè, Sweini, Kurma, Cubcabia, Ril, Cours, Shoba, Gidid, and Gelle. The town of Sweini is the inlet to all merchants and traders from Egypt, who come with the caravan; and here they are obliged to wait till the pleaſure of the ſultan is known as to their further approach and deſtination, which is communicated to them by the melek or governor. Cobbè, which is upwards of two miles in length, appears to be the capital of the empire, and is the principal reſort of trade, and reſidence of the merchants. The ſultan reſides in a plain but extenſive building, a conſiderable part of which forms the harem, or apartments for his women, who are numerous.

As the Mahometan religion prevails in Dar-Fur, the monarch can do nothing contrary to the Koran; but, as there is no council to control or even to aſſiſt him, his power may well be termed deſpotic. He ſpeaks in public of the ſoil and its productions as his perſonal property, and of the people as little elſe than his ſlaves. His power in the provinces is delegated to officers who poſſeſs an authority equally arbitrary. In thoſe diſtricts, which have always or for a long time formed an integral part of the empire, theſe officers are generally called *meleks.* In ſuch as have been lately conquered, or perhaps, more properly, have been annexed to the dominion of the ſultan under certain ſtipulations, the chief is ſuffered to retain the title of *ſultan*, yet is tributary to and receives his appointment from the ſultan of Fur. In this country, on the death of the monarch, the title deſcends of right to the oldeſt of his ſons; and in default of heirs male, as well as during the minority of thoſe heirs, to his brother. But under various pretences this received rule of ſucceſſion is frequently infringed. The ſon is ſaid to be too young, or the late monarch to have obtained the government by unjuſt means; and, at length, the pretenſions of thoſe who have any apparent claim to the regal authority are to be decided by war, and become the prize of the ſtrongeſt. It was in this manner that the preſent ſultan, Abd-el-rachmân, gained poſſeſſion of the imperial dignity, in the year of the hejira 1202, of the chriſtian æra 1787. Of the appearance of this monarch and his court (in the year 1795) Mr. Browne gives the following deſcription: I found the monarch ſeated on his throne (*cârſi*), under a lofty canopy, compoſed not of one material, but of various ſtuffs of Syrian and even of Indian fabric, hung looſely on a light frame of wood, no two pieces of the ſame pattern. The place he ſat in was ſpread with ſmall Turkey carpets. The meleks were ſeated at ſome diſtance on the right and left, and behind them a line of guards, with caps, ornamented in front with a ſmall piece of copper and a black oſtrich feather. Each bore a ſpear in his hand, and a target of the hide of the hippopotamus on the oppoſite arm. Their dreſs conſiſted only of a cotton ſhirt, of the manufacture of the country. Behind the throne were fourteen or fifteen eunuchs, clothed indeed ſplendidly in habiliments of cloth or ſilk, but clumſily adjuſted, without any regard to ſize or colour. The ſpace in front was filled with ſuitors and ſpectators, to the number of more than fifteen hundred. A kind of hired encomiaſt ſtood on the monarch's left hand, crying out, *à pleine gorge*, during the whole ceremony, "See the buffaloe, the offſpring of a buffaloe, a bull of bulls, the elephant of ſuperior ſtrength, the powerful ſultan Abd-el-rachmân-el-raſhîd! May God prolong thy life!—O maſter—May God aſſiſt thee, and render thee victorious!" I was told there were occaſions when the ſultan wears a kind of crown, as is common with other African monarchs; but of this practice I had no opportunity to bear teſtimony. When he appeared in public, a number of troops armed with light ſpears uſually attended him, and ſeveral of his ſlaves were employed to bear a kind of umbrella over his head, which concealed his face from the multitude. When he paſſes, all the ſpectators are obliged to appear barefooted, and commonly to kneel; his ſubjects bow to the earth, but this compliance is not expected from foreigners. The ſultan Abd-el-rachmân, ſoon after he became poſſeſſed of ſovereign authority, with the oſtenſible motive of teſtifying his attachment to the religion of the prophet, but more perhaps with a view of obtaining greater weight among his ſubjects, by ſome mark of the conſideration of the firſt of Mohammedan princes, thought proper to ſend a preſent to Conſtantinople; it conſiſted of three of the choiceſt eunuchs, and three of the moſt beautiful female ſlaves that could be procured. The Othman emperor, when they were preſented, had, it is ſaid, never heard of the ſultan of Dar-Fur; but he returned an highly ornamented ſabre, a rich peliſſe, and a ring ſet with a ſingle diamond of no inconſiderable value.

Previouſly to the eſtabliſhment of Iſlamiſm (about 150 years ago) and kingſhip, the people of Fur ſeem to have formed wandering tribes, in which ſtate many of the neighbouring nations to this day remain. In their perſons they differ from the negroes of the coaſt of Guinea. Their hair is generally ſhort and woolly, though ſome are ſeen with it of the length of eight or ten inches, which they eſteem a beauty. Their complexion is for the moſt part perfectly black. The Arabs, who are numerous within the empire, retain their diſtinction of feature, colour, and language. They moſt commonly intermarry with each other. The ſlaves, which are brought from the country they call Fertît, (land of idolaters,) perfectly reſemble thoſe of Guinea, and their language is peculiar to themſelves. In moſt of the towns, except Cobbè, which is the chief reſidence of foreign merchants, and even at court, the vernacular idiom is in more frequent uſe than the Arabic; yet the latter is pretty generally underſtood. The judicial proceedings, which are held in the monarch's preſence, are conducted in both languages, all that is ſpoken in the one being immediately tranſlated into the other by an interpreter.

On all merchandize imported into the kingdom of Fur, the ſultan has a duty, which in many inſtances amounts to near a tenth; and when they are about to leave Dar-Fur on their return to Egypt, another tax is demanded on the ſlaves exported, under pretence of a voluntary douceur, to be exempt from having their ſlaves ſcrutiniſed. All forfeitures for miſdemeanors are due to the king; and this is a conſiderable article; for in caſe of a diſpute in which blood is ſhed, as often happens, he makes a demand

mand of juſt what portion he thinks right of the property of the village in which the offence was committed, of the whole, of an half, of a third, of every ſpecies of poſſeſſion, and this moſt rigorouſly eſtimated. In addition to this, every one who is concerned in a judicial proceeding before him, muſt bring a preſent according to his rank and property: this is another conſiderable ſource of revenue. Of all the merchandiſe, but eſpecially ſlaves, which are brought from the roads, as they call it, that is, from all quarters except Egypt, the king is entitled to a tenth; and in caſe of a *felatèa*, that is, an expedition to procure ſlaves by force, the tenth he is entitled to becomes a fifth, for the merchants are obliged to wait ſix weeks or two months before they can ſell any of their ſlaves, and then are obliged to pay in kind one tenth of the number originally taken, one half of which is by that time generally dead. At the time of leathering the kettle-drum, which happens every year on the 27th of the month Rabia-el-awil, all the principal people of every town and village, nay, every houſekeeper, is obliged to appear at El Faſher, with a preſent in his hands, according to his rank and ability. A number of preſents are daily and hourly received from all the great people of the country, as well as from the merchants who come on buſineſs, and thoſe who ſolicit offices. The merchants generally preſent ſome kind of manufacture for clothing, ſuch as light woollen cloth, carpets, arms, &c. and the people of the country, camels, ſlaves male and female, *tokèas*, oxen, ſheep, &c. But one of the moſt conſiderable articles of revenue is the tribute of the Arabs who breed oxen, horſes, camels, ſheep. Thoſe who breed horſes ſhould bring to the monarch all the males which are yearly produced by their mares; but this they often contrive to avoid. The cuſtomary tribute of the Arabs who breed oxen, or *bukkara* as they are called, is one tenth. If the tribute were regularly paid, it might amount to four thouſand oxen per annum: but theſe Arabs live in tents, and conſequently change their habitations frequently; and, when they feel themſelves united, are not much inclined to pay tribute. Thoſe who breed camels ſhould alſo pay a tenth of their property yearly; but theſe alſo are ſometimes rebellious, and then nothing is received from them. The owners of ſheep and goats pay a tenth. Every village is obliged to pay annually a certain ſum in corn, which is collected by the king's ſlaves. The monarch has alſo lands of his own, which are cultivated by his ſlaves, and which ſerve to ſupply his houſhold; for, though a merchant, he does not ſell corn. Such are the revenues of the monarch of Fur. The king is alſo chief merchant in the country, and not only diſpatches with every caravan to Egypt a great quantity of his own merchandiſe, but alſo employs his ſlaves and dependents to trade with the goods of Egypt, on his own account, in the countries adjacent to Soudan.

The people of Fur are repreſented as uſing many ſuperſtitious ceremonies at their great feaſts. Among others, it is ſaid, they put to death, in the form of a ſacrifice, a young boy and girl. Even to this day, many idols are worſhipped by the women of the ſultan's harem. The mountaineers offer a kind of ſacrifice to the deity of the mountains, when they are in want of rain. Several ſuperſtitious notions prevail among the ſlaves. One of them having died ſuddenly, it was imagined that he had been poſſeſſed by the devil, and none of them would waſh the body. It was with difficulty that they could be prevailed on even to carry it to the place of interment.

The people of Dageou, a country on the weſt, repreſented as not far from Bergoo, it is ſaid, conquered the country now called Fur, and retained it till they were exhauſted by mutual contentions: upon which the preſent race of kings ſucceeded, but from what origin we have not been able to diſcover: probably, Moors driven from the north by the Arabs. The race of Dageou is ſaid to have come from the vicinity of Tunis. It is reported, that they had a cuſtom of lighting a fire on the inauguration of their king, which was carefully kept burning till his death. At preſent there is a cuſtom in Fur, of ſpreading the carpets on which the ſeveral deceaſed ſultans uſed to ſit, before the new prince, and from the one he prefers, it is judged his character will be analogous to that of its former poſſeſſor.

The climate of Fur is ſimilar to the other regions of Africa, which are ſituated ſo contiguous to the torrid zone. The perennial rains, which fall in Fur, from the middle of June till the middle of September, in greater or leſs quantity, but generally both frequent and violent, ſuddenly inveſt the face of the country, till then dry and ſteril, with a delightful verdure. Except where the rocky nature of the ſoil abſolutely impedes vegetation, wood is found in great quantity, nor are the natives aſſiduous completely to clear the ground, even where it is deſigned for the cultivation of grain. As ſoon as the rains begin, the proprietor, and all the aſſiſtants that he can collect, go out to the field, and having made holes at about two feet diſtance from each other, with a kind of hoe, over all the ground he occupies, the *dokn*, a peculiar grain, is thrown into them, and covered with the foot, for their huſbandry requires not many inſtruments. The time for ſowing the wheat is nearly the ſame. The dokn remains ſcarcely two months before it is ripe; the wheat about three. Wheat is cultivated only in ſmall quantities; and the preſent ſultan having forbidden the ſale of it, till the portion wanted for his domeſtic uſe be ſupplied, it is with difficulty to be procured by purchaſe. The harveſt is conducted in a very ſimple manner. The women and ſlaves of the proprietor are employed to break off the ears with their hands, leaving the ſtraw ſtanding, which is afterwards applied to buildings and various other uſeful purpoſes. They then collect them in baſkets, and carry them away on their heads. When threſhed, which is awkwardly and incompletely performed, they expoſe the grain to the ſun till it become quite dry; after this a hole in the earth is prepared, the bottom and ſides of which are covered with chaff to exclude the vermin. This cavity or magazine is filled with grain, which is then covered with chaff, and afterwards with earth. In this way the maize is preſerved tolerably well. In uſing it for food, they grind it, and boil it in the form of polenta, which is eaten either with freſh or ſour milk, or ſtill more frequently with a ſauce made of dried meat pounded in a mortar, and boiled with onions, &c. The Furians uſe little butter; with the Egyptians and Arabs it is an article in great requeſt. There is alſo another ſauce which the poorer people uſe and highly reliſh, it is compoſed of an herb called cowel or cawel, of a taſte in part aceſcent and in part bitter, and generally diſagreeable to ſtrangers. As a ſubſtitute for bread, cakes of the ſame material are alſo baked on a ſmooth ſubſtance prepared for the purpoſe, which are extremely thin, and if dexterouſly prepared not unpalatable. Theſe are called kiſſery (fragments or ſections); they are alſo eaten with the ſauce above-mentioned, or with milk, or ſimply water; and in whatever form the grain be uſed, the rich cauſe it to be fermented before it be reduced to flour, which gives it a very agreeable taſte. They alſo make no heſitation in eating the dokn raw, but moiſtened with water, without either grinding or the operation of fire.

The ſultan here does not ſeem wholly inattentive to that important object, agriculture. At the beginning of the Harif, or wet ſeaſon, which is alſo the moment for ſowing the corn, he goes out with his meleks and the reſt of his train, and, while the people are employed in turning up the ground and ſowing the ſeed, he alſo makes ſeveral holes with his own hand. The ſame cuſtom, it is ſaid, obtains in Bornou, and other countries in this part of Africa. It calls to the mind a practice of the Egyptian kings, mentioned by Herodotus. In what are called gardens, are *bamea*, *meluchia*, lentils, (*adis*,) kidney beans, (*lubi*,) and ſome others. The water-melon, and that

called in Cairo *abd-el-awi*, together with ſome other kinds, abound during the wet ſeaſon, and indeed before, if they be watered. Sultan Teraub was ſolicitous to procure every thing the gardens of Egypt produce, and cauſed much care to be taken of the culture of each article brought: but the preſent prince does not turn his thoughts to that kind of improvement, and little of the effect of his predeceſſor's laudable anxiety is at this moment diſtinguiſhable. There are ſeveral ſpecies of trees, but none that produces fruit worth gathering, unleſs it be the tamarind. The date trees are in very ſmall number, and their fruit diminutive, dry, and deſtitute of flavour. That tree ſeems not indigenous in the country, but to have been tranſported from the neighbourhood of the Nile, Dongola, Sennaar, &c. The inhabitants appear not well to underſtand the management of this uſeful production; and perhaps the great drought will never admit of its flouriſhing, whatever diligence or care may be uſed to increaſe the number or improve the kind.

The camels of Fur are of a mixed breed, and they are found of all colours and ſizes. Thoſe which come directly from the weſt or ſouth are large, ſmooth-haired, and moſt frequently of a colour approaching to white, or light brown. Thoſe which are brought from Kordofân are many of them black, and are remarked to be leſs docile than the others. There are few countries where the animal abounds more than in Dar-Fur. They are remarkable for enduring thirſt, but not for bearing great burthens. The camels in this country are particularly ſubject to the mange, (*gerab*,) which attacks them chiefly in winter, and in ſome paſtures much more than in others. This malady is very contagious. It is cured by the application of a kind of tar, procured by diſtillation per deliquium, from the ſeeds of the water-melon. When the male camel is found unruly, they ſometimes deprive him of one or both teſticles. It is a cruel operation, as immediately after having incided with an ordinary knife, they ſear the wound with an hot iron till the hemorrhage be ſtopped. It may be doubted whether this practice be permitted by the law of the prophet; but, however bigoted their minds, where advantage is hoped for, their faith is ductile. The fleſh of the camel, particularly of the female, (*naka*,) which is fattened for the purpoſe, is much uſed for food. It is inſipid, but eaſily digeſted, and no way unpleaſant. The milk alſo is much in eſteem. The camels bred in Fezzân, and other countries to the weſt, as well as thoſe of Arabia, are for labour reckoned ſuperior to thoſe of Fur, and fetch a higher price. The former are larger, and able to carry a heavier burthen, but not ſo capable of enduring thirſt. In Soudân they ſeldom carry above five hundred weight, and oftener three or three and a half: while in Egypt they are frequently obliged to toil under eight, ten, or even more. From theſe are ſelected the camels which bear the ſacred treaſure to the tomb of the prophet. Soudân affords many fine dromedaries, but thoſe of Sennaar are moſt celebrated. Incredible ſtories are told of the long and rapid journies performed by them; as that they will hold out for four-and-twenty hours, travelling conſtantly at the rate of ten miles per hour: however this be, they are indiſputably ſwift, and perform long journeys almoſt without refreſhment.

The wild or ferocious animals are, principally, the lion, the leopard, the hyena, the wolf, the jackal, (*canis aureus*,) the wild buffaloe: but they are not commonly ſeen within the more cultivated part of the empire, excepting the hyena jackal; the former come in herds of ſix, eight, and often more, into the villages at night, and carry off with them whatever they are able to maſter. They will kill dogs, and aſſes, even within the incloſure of the houſes, and fail not to aſſemble wherever a dead camel or other animal is thrown, which, acting in concert, they ſometimes drag to a prodigious diſtance; nor are they greatly alarmed at the ſight of a man, or the report of fire-arms.

Alabaſter, and various kinds of marble, exiſt within the limits of Fur. The rocks chiefly conſiſt of grey granite. But of ſtone adapted to building, or convertible into lime, either there is none, or the quantity muſt be extremely ſmall. The granite ſerves for hand-mills, without being cut, for the metal of which their tools are compoſed is too ſoft to be employed for that purpoſe. Foſſile ſalt is common within a certain diſtrict: and there is a ſufficient ſupply of nitre, of which however no uſe is made.

FUR'-WROUGHT, *adj.* Made of fur:

Silent along the mazy margin ſtray,
And with the *fur-wrought* fly delude the prey. *Gay.*

FU'RA, a ſmall iſland near the weſt coaſt of Scotland: four miles and a half weſt of Udrigill Head.

FURA'CIOUS, *adj.* [*furax*, Lat.] Thieviſh; inclined to ſteal.

FURA'CIOUSNESS, *ſ.* Thieviſhneſs, propenſity to theft. *Scott.*

FURA'CITY, *ſ.* [*furax*, Lat.] Diſpoſition to theft thieviſhneſs.

FU'RAN, *ſ.* in botany. See EPIDENDRUM.

FU'RANS, a river of France, which runs into the Iſere, near Romans.

FUR'BELOW. *ſ.* A piece of ſtuff plaited and puckered together, either below or above, on the petticoats or gowns of women. This, like a great many other words, is the child of mere caprice. *Trev. Dict.*

Nay, oft in dreams invention we beſtow
To change a flounce, or add a *furbelow*. *Pope.*

To FUR'BELOW, *v. a.* To adorn with ornamental appendages of dreſs.—She was flounced and *furbelowed*; every ribbon was crinkled, and every part of her garments in curl. *Addiſon.*

When arguments too fiercely glare,
You calm them with a milder air;
To break their points, you turn their force,
And *furbelow* the plain diſcourſe. *Prior.*

To FUR'BISH, *v. a.* [*fourbir*, Fr.] To burniſh; to poliſh; to rub to brightneſs.—*Furbiſh* the ſpears, and put on the brigandines. *Jer.* xlvi. 4.

Inferior miniſters, for Mars repair
His broken axle-tree, and blunted war;
And ſend him forth again, with *furbiſh'd* arms. *Dryden.*

FUR'BISHER, *ſ.* [*fourbiſſeur*, Fr.] One who poliſhes any thing.

FUR'CA, *ſ.* [from פרק *farkah*, Heb. to divide.] A fork; a prong. In botany, it means ſometimes the thorn, ſometimes the fork, of a plant or tree. In antiquity, a piece of timber reſembling a fork, uſed by the Romans as an inſtrument of puniſhment. Sentence to the furca was of three kinds: the firſt only ignominious, when a maſter, for ſmall offences, forced a ſervant to carry a furca on his ſhoulders about the city. The ſecond was penal, when the party was whipped round the circus, or other place, with the furca about his neck. The third was capital, when the malefactor, having his head faſtened on the furca, was whipped to death.

FUR'CA ET FOS'SA, the gallows and the pit. An ancient privilege granted by our kings. It ſignified a juriſdiction of puniſhing felons; that is, men by hanging, and women with drowning. And ſir Edward Coke, ſays *foſſa* is taken away, but that *furca* remains. 3 *Inſt.* 58.

FUR'CAM ET FLAGEL'LUM, the meaneſt of all the ancient ſervile tenures, when the bondman was at the diſpoſal of his lord for life and limb.

FUR'CATION, *ſ.* [*furca*, Lat.] Forkineſs; the ſtate of ſhooting two ways like the blades of a fork.—When ſtags grow old they grow leſs branched, and firſt loſe their brow-antlers, or loweſt *furations* next the head. *Brown.*

FURCHE', *ſ.* in heraldry, a croſs forked at the ends.

FURETIE'RE (Antony), a French author, born at Paris

Paris in 1620. He firſt purſued the ſtudy of the law, and for a time exerciſed the charge of procureur-fiſcal of the abbey of St. Germain des Près. He then entered into the eccleſiaſtical ſtate, and obtained the abbacy of Chalivoi, and the priory of Chuines. He made himſelf known by various compoſitions in verſe and proſe, and became a member of the French academy. That body was then engaged in the compilement of its Dictionary, of which circumſtance Furetiere was ſuppoſed to take advantage in framing one of his own, of which a ſpecimen appeared in 1684. This embroiled him with the academy, and cauſed his expulſion from that ſociety in 1685. He publiſhed a *factum* in his own juſtification, but it was ſo full of ſatire and perſonal abuſe, that it ſerved only to widen the breach; and though his place remained unoccupied, he continued in a ſtate of excluſion till his death in 1688. The academy manifeſted its ſurviving reſentment, by decreeing that the uſual funeral ſervice on the death of a member ſhould not be performed for him. The dictionary of Furetiere was publiſhed in 1690, under the title of *Dictionnaire Univerſel*, two volumes folio. Baſnage de Beauval publiſhed an improved edition of it in 1701, three volumes folio, which was reprinted at Amſterdam in 1725, four volumes folio. It has ſerved as the baſis of what is called the *Dictionnaire de Trevoux*, of which the laſt edition was printed in 1771, eight volumes folio. Furetiere's other works were, Five Satires, in verſe; the Goſpel Parables, in verſe; and *Le Roman Bourgeois*. A *Furetiana* appeared after his death, but is little eſteemed.

FUR'FUR, *ſ.* [from פרפר *farfarah*, Heb. to break into ſmall pieces.] Huſk or chaff, ſcurf or dandriff, that grows upon the ſkin, like bran.

FURFURA'CEOUS, *adj.* [*furfuraceus*, Lat.] Huſky; branny; ſcaly.

FURFURA'TION, *ſ.* [from *furfur*, bran.] A diſeaſe of the head, in which it is covered with a ſcalineſs or ſcurf like bran; a ſcald head. Alſo a branny ſediment in the urine.

FURGO'LE (John-Baptiſt), a learned writer on legal antiquities, born in 1690, at Caſtel-Ferrus, in Lower Armagnac, was an advocate in the parliament of Toulouſe. He was eſteemed and patroniſed by the chancellor d'Agueſſeau, who encouraged him to publiſh the works by which he obtained his reputation. Of theſe, the moſt generally intereſting are, *Traité des Curés Primitifs*, 4to. 1736; *Traité des Teſtamens & autres Diſpoſitions de dernier Volonté*, four volumes 4to. 1745; *Traite de la Seigneurie feodale univerſelle, & du Franc-aleu naturel*, 12mo. 1767. He was made capitoul of Toulouſe in 1745, and died much regretted in 1761.

FU'RIA, *ſ.* [from *furio*, to enrage, becauſe of the excruciating torments it occaſions.] In helmintology, a genus of worms belonging to the order of inteſtina; the characters of which are: body linear, equal, filiform, and ciliate on each ſide with a ſingle row of reflected prickles, preſſed cloſe to the body. There is only one ſpecies at preſent known, called *furia infernalis*. It inhabits the vaſt marſhy plains of Bothnia and Finland; where it crawls up ſhrubs and ſedge-graſs, and being carried forwards by the wind, penetrates ſuddenly into ſuch expoſed parts of men and horſes as are not perpendicularly ſituated. It quickly inſinuates itſelf under the ſkin, leaving a black point where it had entered, which is ſoon ſucceeded by the moſt excruciating pain, inflammation, and gangrene of the part, ſwooning and death. This will ſometimes happen in the courſe of a day or two, frequently within a few hours, unleſs the worm be immediately extracted, which is effected with great caution and difficulty, by applying a poultice of curds or cheeſe; or carefully diſſecting between the muſcles where it had entered.—A correct figure of it is given in the engraving, conſiderably magnified, to ſhew only the ciliated prickles on its ſides.

FU'RIBUND, *adj.* [*furibond*, Fr. *furibundus*, Lat.] Full of madneſs, or like a madman.

FU'RIES, in pagan mythology, certain goddeſſes whoſe office it was to puniſh the wicked after death. They were three in number: Alecto, Megæra, and Tiſiphone; who were deſcribed with ſnakes inſtead of hair, and eyes darting lightning, carrying iron chains and whips in one hand, and in the other flaming torches; the latter to diſcover, and the former to puniſh, the guilty: and they were ſuppoſed to be conſtantly hovering over ſuch perſons as were planning or premeditating any enormous crime. Mythologiſts ſuppoſe, that Tiſiphone puniſhed the crimes which ſprang from hatred or anger; Megæra, thoſe from envy; and Alecto, thoſe from an inſatiable purſuit after riches and ambition. They were worſhipped at Caſina in Arcadia, and at Carmia in Peloponneſus. They had a temple at Athens near the Areopagus, and their prieſts were choſen from amongſt the judges of that court. At Telphuſia, a city in Arcadia, a black ewe was ſacrificed to them.

FURIGEL'DUM, *ſ.* a mulct paid for theft: by the laws of king Ethelred, it is allowed, that they ſhall be witneſſes *qui nunquam* furigeldum *reddiderunt*, i. e. who never were accuſed of theft.

FU'RIOUS, *adj.* [*furieux*, Fr. *furioſus*, Lat.] Mad; phrenetic.—No man did ever think the hurtful actions of *furious* men and innocents to be puniſhable. *Hooker.*—Raging; violent; tranſported by paſſion beyond reaſon:

Who can be wiſe, amaz'd, temp'rate and *furious*,
Loyal and neutral, in a moment? No man. *Shakeſpeare.*

Violent; impetuouſly agitated:

With clamour thence the rapid currents drive,
Towards the retreating ſea their *furious* tide. *Milton.*

FU'RIOUSLY, *adv.* Madly; violently; vehemently.—They obſerve countenance to attend the practice; and this carries them on *furiouſly* to that which of themſelves they are inclined. *South.*

She heard not half, ſo *furiouſly* ſhe flies;
Fear gave her wings. *Dryden.*

FU'RIOUSNESS, *ſ.* Frenzy; madneſs; tranſport of paſſion.

FURI'NA, the goddeſs of robbers, worſhipped at Rome. Some ſay that ſhe is the ſame as the Furies. Her feſtivals were called *Furineia*.

FU'RIUS AN'TIAS, an ancient Latin poet, contemporary with Q. Lutatius Catulus, who is recorded to have ſent him a treaty made during his conſulate, B.C. 102. This circumſtance renders it probable that it was this Furius (and not the following) who compoſed annals in verſe. A. Gellius mentions him as having been cenſured by a grammarian for certain innovations in language, and quotes ſome lines from him, which appear inflated. Macrobius affirms that Virgil borrowed conſiderably from Furius the annaliſt, and copies ſome lines in proof of his aſſertion.

FU'RIUS BIBA'CULUS, a Latin poet, born at Cremona, B.C. 102, and contemporary with Cicero. He wrote a poem on the Gallic war, in which, probably, were contained thoſe contumelious verſes againſt Cæſar which are referred to by Tacitus and Suetonius. He was intimate with the grammarian Valerius Cato, whoſe learning he praiſes, while he laments his indigence, in ſome lines, written in an eaſy ſtyle, quoted by Suetonius in his book On illuſtrious Grammarians. The fragments remaining of both the Furii are to be met with in the *Corpus Poetar. Latin.*

FUR'KENBERG, a town of Germany, in the circle of Lower Saxony, and duchy of Mecklenburg: thirty-ſix miles north of Spandau.

To FURL, *v. a.* [*freſler*, Fr.] To draw up; to contract:

When fortune ſends a ſtormy wind,
Then ſhew a brave and preſent mind:
And when with too indulgent gales
She ſwells too much, then *furl* thy ſails. *Creech.*

FU'RLONG, *ſ.* [ꝑanlanȝ, Sax.] A meaſure of length, containing 660 feet, or 220 yards, or 40 poles or perches, or the eighth part of a mile.—If a man ſtand in the middle of a field and ſpeak aloud, he ſhall be heard a *furlong* in a round, and that in articulate ſounds. *Bacon.*

FUR'LOUGH, *ſ.* [*verlof*, Dut.] A temporary diſmiſſion from military ſervice; a licence given to a ſoldier to be abſent:

Brutus and Cato might diſcharge their ſouls,
And give them *furlo's* for another world;
But we, like ſentries, are oblig'd to ſtand
In ſtarleſs nights, and wait th' appointed hour. *Dryden.*

FUR'MENTY, *ſ.* [more properly *frumenty*, or *frumety*, of *frumentum*, Lat.] Food made by boiling wheat in milk:

Remember, wife, therefore, though I do it not,
The ſeed-cake, the paſties, and *furmenty* pot. *Tuſſer.*

FUR'MION, a town of Venetian Iſtria: eighteen miles eaſt-ſouth-eaſt Umago.

FUR'NACE, *ſ.* [*furnus*, Lat.] An incloſed fireplace.—The fining pot is for ſilver, and the *furnace* for gold. *Prov.*—Whoſo falleth not down and worſhippeth, ſhall the ſame hour be caſt into the midſt of a burning fiery *furnace*. *Dan.*

Heat not a *furnace* for your foe ſo hot
That it may ſinge yourſelf. *Shakeſpeare.*

FURNACES have increaſed in number and variety, in proportion as they have daily become more and more inſtrumental in diffuſing the light of ſcience, in promoting the extenſion of the arts, and in perfecting and enlarging our moſt valuable manufactures. The origin of the furnace might be traced to the moſt remote antiquity; but its improved conſtruction, and application to ſo many important objects, are to be attributed to the ingenuity of the modern chemiſts. Indeed, it was impoſſible for them to ſucceed in any of the eſſential operations by the agency of fire, without ſuch aids; and accordingly we find ſeveral furnaces conſtructed for theſe uſes, which ſoon became the foundation for others in the large way. Among thoſe adapted to chemical experiments, are, 1. The ſmall evaporating furnace, for digeſtion, diſtillation, &c. 2. The reverberatory or condenſing furnace, for operations with the retort. 3. Macquer's docimaſtic or aſſaying and cupelling furnace, for ſmelting ores, and refining metals. 4. Dr. Black's regiſter furnace, for the more equable diſtribution of heat, or rather for more immediate and intenſe combuſtion. See theſe ſeveral furnaces deſcribed, with figures of them, in the article CHEMISTRY, vol. iv. p. 191, 192.

BLAST FURNACE.

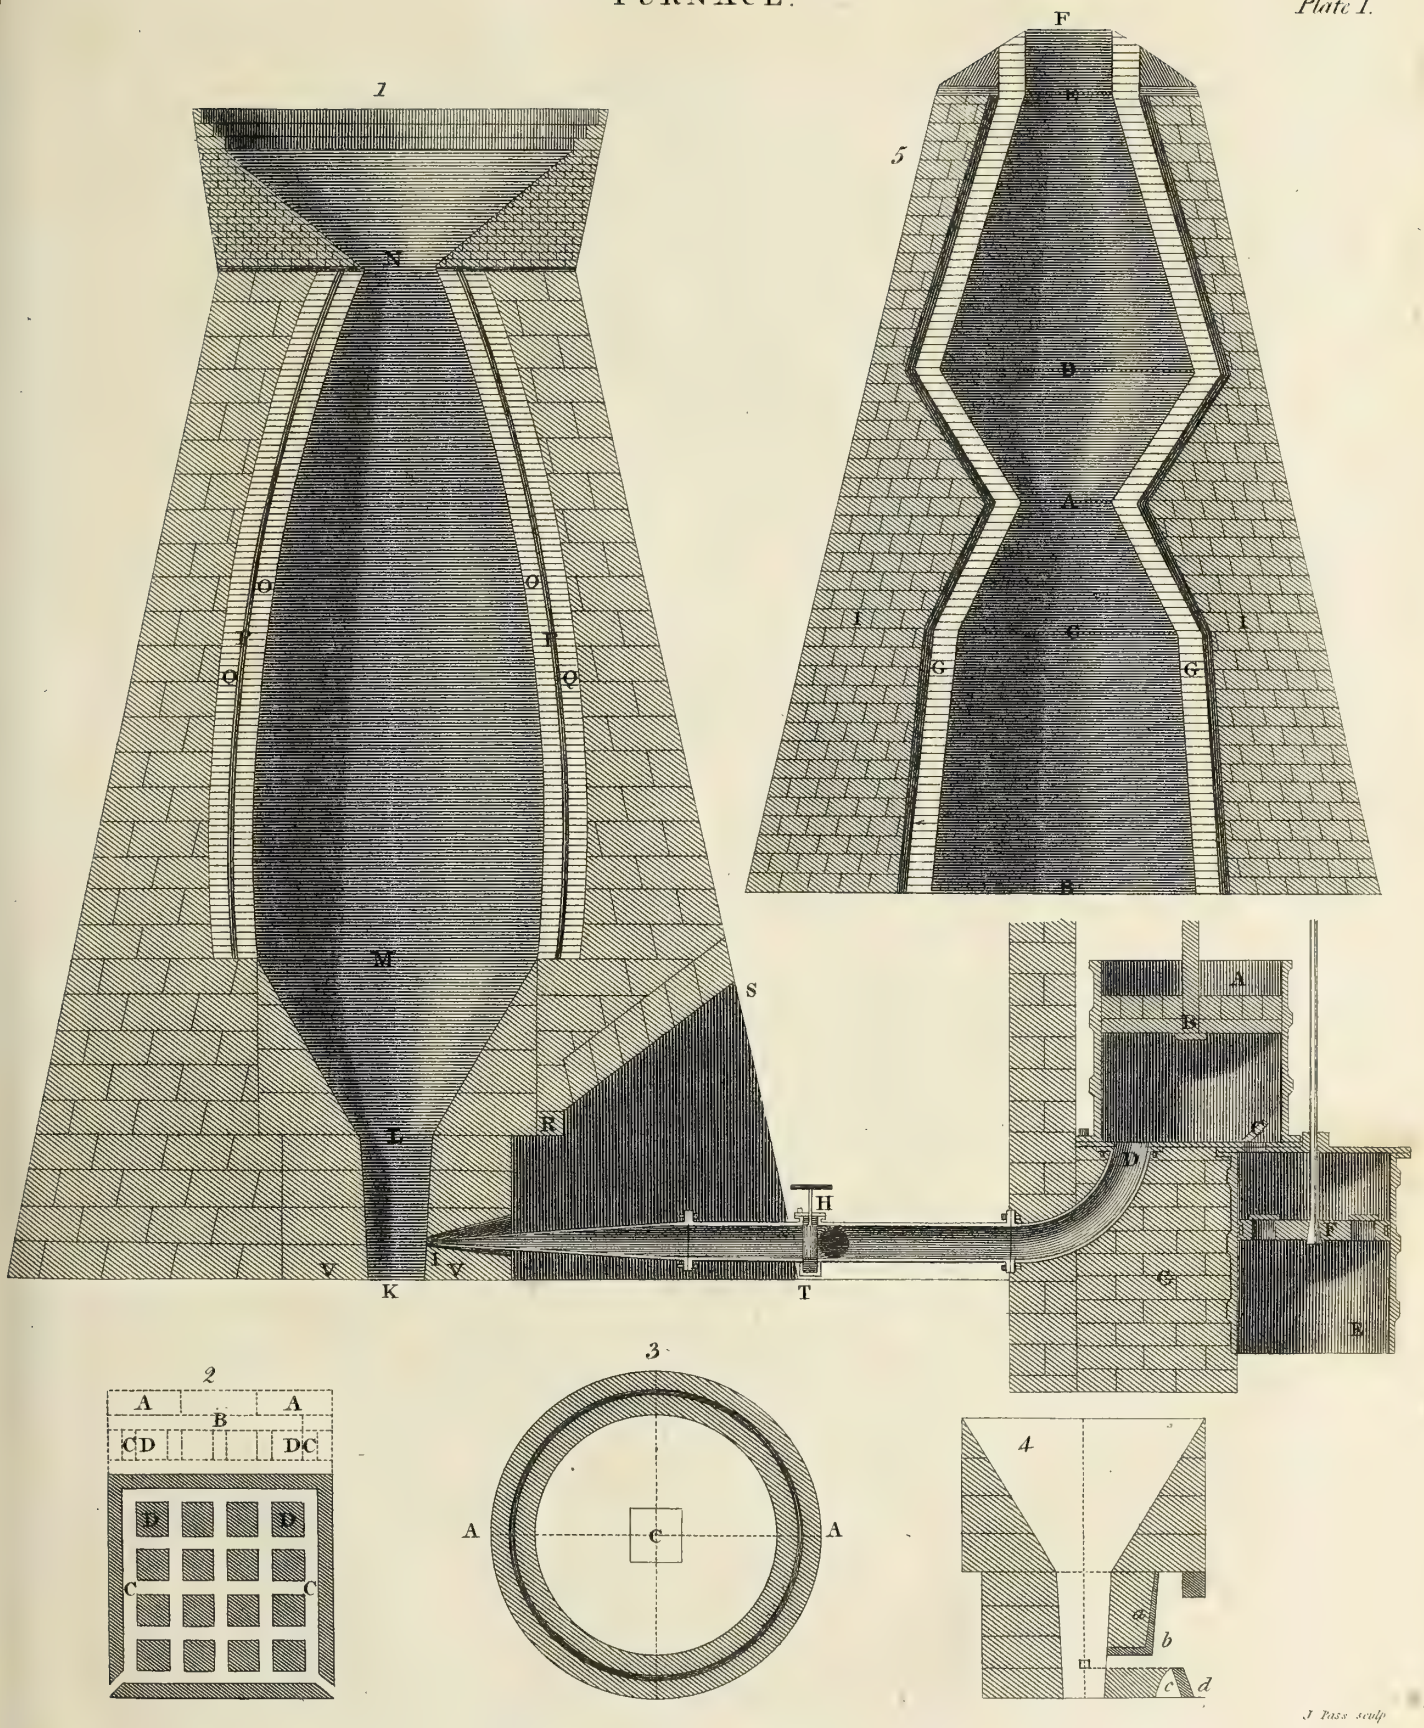
This is uſually conſtructed in a large conical or quadrangular building, and calculated on a principle of very high combuſtion, for the purpoſe of ſmelting iron-ſtone or ores, in the great iron founderies. Its velocity is promoted by the impelling power of a blowing machine, forcing the whole contents of the air-pump through one or two ſmall apertures called noſe-pipes; and in proportion to the power of the engine, air of various denſities can be produced, ſo that denſity and velocity are intimately connected, and mutually implied. The well-known combuſtibility of iron, and the indiſpenſible neceſſity of exciting combuſtion by the introduction of large quantities of condenſed air into this furnace, in contact with ore in various ſtates of maturity as to ſeparation, into contact with iron exiſting in all the modifications of quality as to carbonation, and into contact with an immenſe body of ignited fuel, render this proceſs the moſt important in the grand ſcale of our manufactures. The annexed engraving, fig. 1. repreſents a blaſt-furnace, with part of its blowing machine. A, the regulating cylinder, eight feet diameter and eight feet high. B, the floating piſton, loaded with weights proportionate to the power of the machine. C, the valve, by which the air is paſſed from the pumping cylinder into the regulator: its length is twenty-ſix inches, and breadth eleven inches. D, the aperture by which the blaſt is forced into the furnace. Diameter of this range of pipes eighteen inches. The wider theſe pipes can with conveniency be uſed, the leſs is the friction, and the more powerful are the effects of the blaſt. E, the pumping cylinder, ſix feet diameter, nine feet high: travel of the piſton in this cylinder, from five to ſeven feet per ſtroke. F, the blowing piſton, with one of the valves, of which there are ſometimes two, and ſometimes four, diſtributed over the ſurface of the piſton. The area of each is proportioned to the number of valves: commonly they are 12+16 inches. G, a pile of ſolid ſtone building, on which the regulating cylinder reſts, and to which the flanch and tilts of the blowing cylinder are attached. H, the ſafety-valve, or cock; by the ſimple turning of which the blaſt may be admitted to, or ſhut off from, the furnace, and paſſed off to a collateral tube on the oppoſite ſide. I, the tuyere, by which the blaſt enters the furnace. The end of the tapered pipe, which approaches the tuyere, receives ſmall pipes of various diameters, from two to three inches, called noſe-pipes. Theſe are applied at pleaſure, and as the ſtrength and velocity of the blaſt may require. K, the bottom of the hearth, two feet ſquare. L, the top of the hearth, two feet ſix inches ſquare. KL, the height of the hearth, ſix feet ſix inches. L is alſo the bottom of the boſhes, which here terminate of the ſame ſize as the top of the hearth; only the former are round, and the latter ſquare. M, the top of the boſhes, twelve feet diameter and eight feet of perpendicular height. N, the top of the furnace, at which the materials are charged; commonly three feet diameter. MN, the internal cavity of the furnace from the top of the boſhes upwards, thirty feet high. NK, total height of the internal parts of the furnace, forty-four feet and an half. OO, the lining. This is done in the neceſt manner with fire-bricks made on purpoſe, thirteen inches long and three inches thick. PP, a vacancy which is left all round the outſide of the firſt lining, three inches broad, and which is beat full of coke-duſt. This ſpace is allowed for any expanſion which might take place in conſequence of the ſwelling of the materials by heat when deſcending to the bottom of the furnace. QQ, the ſecond lining, ſimilar to the firſt. R, a caſt iron lintel, on which the bottom of the arch is ſupported. RS, the riſe of the arch. ST, height of the arch; on the outſide fourteen feet, and eighteen feet wide. V V, the extremes of the hearth, ten feet ſquare. This and the boſh-ſtones are always made from a coarſe gritted freeſtone, whoſe fracture preſents large rounded grains of quartz, connected by means of a cement leſs pure.

Fig. 2 repreſents the plan of the hearth, and a view of the manner in which the falſe bottom is conſtructed. AA, the bottom ſtones of the hearth. B, ſtratum of bedding ſand. CC, paſſages by which the vapour, which may be generated from the damps, are paſſed off. DD, pillars of brick. The letters in the horizontal ſection, correſpond to ſimilar letters in the dotted elevation.

Fig. 3, AA, horizontal ſection of the diameter of the boſhes, the lining and vacancy for ſtuffing at M, in fig. 1. C, view of the top of the hearth at L, in fig. 1.

Fig. 4, vertical ſide-ſection of the hearth and boſhes; ſhewing the tymp and dam-ſtones, and the tymp and dam-plates. *a*, the tymp-ſtone. *b*, the tymp-plate, which is wedged firmly to the ſtone, to keep it firm in caſe of ſplitting by the great heat. *c*, dam-ſtone, which occupies the whole breadth of the bottom of the hearth, excepting about ſix inches, which, when the furnace is at work, is filled every caſt with ſtrong ſand. This ſtone is ſurmounted by an iron plate of conſiderable thickneſs, and of a peculiar ſhape, *d*, and from this called the dam-plate. The top of the dam-ſtone and plate is two, three,

or



J. Pass sculp.

The Blast Furnace.

London Published as the Act directs June 21. 1806 by J. Wilkes

or four, inches under the level of the tuyere hole. The ſpace betwixt the bottom of the tymp and the dotted line is alſo rammed full of ſtrong ſand, and ſometimes fire-clay. This is called the tymp-ſtopping, and prevents any part of the blaſt from being unneceſſarily expended. The ſquare of the baſe of this furnace is thirty-eight feet; the extreme height from the falſe bottom to the top of the crater is fifty-five feet.

The furnace, round the bottom and ſides, for two feet up the ſquare funnel, receives a lining of common bricks upon edge, to prevent the ſtone from ſhivering or mouldering when the fire comes in contact with it. On the front of the furnace is erected a temporary fire-place, about four feet long, into the bottom of which are laid correſponding bars. The ſide walls are made ſo high as to reach the under-ſurface of the tymp-ſtone; excepting a ſmall ſpace, which afterwards receives an iron-plate of one inch and a half thickneſs, by way of a cover: this alſo preſerves the tymp-ſtone from any injury it might ſuſtain by being in contact with the flame. The fire is kindled upon the bars, and is fed occaſionally with ſmall coals. As the whole cavity of the furnace ſerves as a chimney for this fire, the draught in conſequence is violent, and the body of heat carried up is very conſiderable. In the courſe of three weeks, by means of this fire, the furnace will, from its erection, become entirely free from damp, and fit for the reception of the materials: when this is judged proper the fire-place is removed, but the interior bricks are allowed to remain till the operation of blowing commences. Some looſe fuel is then thrown upon the bottom of the furnace, and a few baſkets of cokes are introduced; theſe are allowed to become thoroughly ignited before more are added. In this manner the furnace is gradually filled; ſometimes entirely full, and at other times 5-8ths or 3-4ths full. The number of baſkets full depend entirely upon the ſize of the furnace: that repreſented in the engraving, will contain 900 baſkets. If the coal is ſplint, the weight of each baſket-full will be nearly 110lb. × 900 = 99,000lb. cokes. As this quality of cokes is made with a loſs of nearly fifty per cent. the original weight in raw coals will be equal to 198,000lb. When we reflect that this vaſt body of ignited matter is replaced every third day, when the furnace is properly at work, an idea may be formed of the immenſe quantity of materials requiſite, as alſo the conſequent induſtry exerted, to ſupply one or more furnaces for the ſpace of one year.

When the furnace is ſufficiently heated throughout, ſpecific quantities of cokes, iron-ſtone, and blaſt-furnace cinders, are added: theſe are called *charges*. The cokes are commonly filled in baſkets, which, at all the various iron-works, are nearly of a ſize. The weight of the baſket, however, depends entirely upon the nature and quality of the coal, being from 70 to 112lb. each. The iron-ſtone is filled into boxes, which, when moderately heaped, contain 56lb. of torrefied iron-ſtone; they often exceed this when the ſtone has been ſeverely roaſted. The firſt charges which a furnace receives, contain but a ſmall proportion of iron-ſtone to the weight of cokes: this is afterwards increaſed to a full burden, which is commonly four baſkets cokes, 320lb. two boxes iron-ſtone, 112lb. one box blaſt-furnace cinders, 60 or 70lb. At new works, where theſe cinders cannot be obtained, a ſimilar quantity of limeſtone is uſed.

The deſcent of the charge, or burden, is facilitated by opening the furnace below two or three times a-day, throwing out the cold cinders, and admitting, for an hour at a time, a body of freſh air. This operation is repeated till the approach of the iron-ſtone and cinder, which is always announced by a partial fuſion, and the dropping of lava through the iron bars, introduced to ſupport the incumbent materials while thoſe on the bottom are carried away. The filling above is regularly continued, and when the furnace at the top has acquired a conſiderable degree of heat, it is then judged time to introduce the blaſt; the preparations neceſſary for which are the following:—

The dam-ſtone is laid in its place firmly imbedded in fire-clay; the dam-plate is again imbedded on this with the ſame cement, and is ſubject to the ſame inclination. On the top of this plate is a ſlight depreſſion, of a curved form, towards that ſide fartheſt diſtant from the blaſt, for the purpoſe of concentrating the ſcoria, and allowing it to flow off in a connected ſtream, as it tends to ſurmount the level of the dam. From this notch to the level of the floor a declivity of brick-work is erected, down which the ſcoria of the furnace flows in large quantities. The opening betwixt the dam and ſide-walls of the furnace, called the *fauld*, is then built up with ſand, the looſe bricks are removed, and the furnace bottom is covered with powdered lime or charcoal duſt. The ignited cokes are now allowed to fall down, and are brought forward with iron bars nearly to a level with the dam. The ſpace between the ſurface of the cokes and the bottom of the tymp-plate is next rammed hard with ſtrong binding ſand; and theſe cokes, which are expoſed on the outſide, are covered with coke-duſt. Theſe precautions being taken, the tuyere-hole is then opened and lined with a ſoft mixture of fire-clay and loam: the blaſt is commonly introduced into the furnace at firſt with a ſmall diſcharging-pipe, which is afterwards increaſed as occaſion may require. In two hours after blowing, a conſiderable quantity of lava will be accumulated; iron bars are then introduced, and perforations made in the compreſſed matter at the bottom of the furnace; the lava is admitted to all parts of the hearth, and ſoon thoroughly heats and glazes the ſurfaces of the fire-ſtone. Shortly after this it riſes to a level with the notch in the dam-plate, and by its own accumulation, together with the forcible action of the blaſt, it flows over. Its colour is at firſt black; its fracture denſe, and very ponderous; the form it aſſumes in running off is flat and branched, ſometimes in long ſtreams, and at other times leſs extenſive. If the preparation has been well conducted, the colour of the cinder will ſoon change to white; and the metal, which in the ſtate of an oxyd formerly coloured, will be left in a diſengaged ſtate in the furnace. When the metal has riſen nearly to a level with the dam, it is then let out by cutting away the hardened loam of the fauld, and conveyed by a channel, made in ſand, to its proper deſtination; the principal channel, or runner, is called the *ſow*, the lateral moulds are called the *pigs*.

In ſix days after the commencement of blowing, the furnace ought to have *wrought herſelf clear*, and have acquired capacity ſufficient to contain from 5000 to 7000 weight of iron. The quality ought alſo to be richly carbonated, ſo as to be of value and eſtimation in the pig-market. At this period, with a quality of coal as formerly mentioned, the charge will have increaſed to the following proportions:—five baſkets cokes, 400lb. ſix boxes iron-ſtone, 336lb. one box limeſtone, 100lb.

An analyſis of the ſmelting operation, and the tendency which the individual agents have to produce change in the quality and quantity of the iron, next demand conſideration. Let us, however, firſt notice the characteriſtic features exhibited by the different kinds of iron while in fuſion, whereby the quality of the metal may be juſtly defined.—When fine N° 1, or ſupercarbonated crude iron, is run from the furnace, the ſtream of metal, as it iſſues from the fauld, throws off an infinite number of brilliant ſparkles of carbon. The ſurface is covered with a fluid pellicle of carburet of iron, which, as it flows, rears itſelf up in the moſt delicate folds: at firſt the fluid metal appears like a denſe ponderous ſtream, but, as the collateral moulds become filled, it exhibits a general rapid motion from the ſurface of the pigs to the centre of many points; millions of the fineſt undulations move upon each mould, diſplaying the greateſt nicety and rapidity of movement, conjoined with an uncommonly beautiful variegation of colour, which lan-

guage is inadequate juſtly to deſcribe. Such metal, in quantity, will remain fluid for twenty minutes after it is run from the furnace, and when cold, will have its ſurface covered with the beautiful carburet of iron, of an uncommonly rich and brilliant appearance. When the ſurface of the metal is not carbureted, it is ſmooth like forged iron, and always convex. In this ſtate iron is too rich for melting without the addition of coarſe metal, and is unfit to be uſed in a cupola furnace for making fine caſtings, where thinneſs and a good ſkin are requiſite.

N° 4, or oxygenated crude iron, when iſſuing from the blaſt-furnace, throws off from all parts of the fluid ſurface a vaſt number of metallic ſparks: they ariſe from a different cauſe than that exerted in the former inſtance. The extreme privation of carbon renders the metal ſubject to the combination of oxygen ſo ſoon as it comes into contact with atmoſpheric air. This truth is evidently manifeſted by the ejection of ſmall ſpherules of iron from all parts of the ſurface: the deflagration does not, however, take place till the globule has been thrown two or three feet up in the air; it then inflames and ſeparates, with a ſlight hiſſing exploſion, into a great many minute particles of brilliant fire. When theſe are collected they prove to be a true oxyd of iron, but ſo much ſaturated with oxygen as to poſſeſs no magnetic obedience. The ſurface of oxygenated iron, when running, is covered with waving flakes of an obſcure ſmoky flame, accompanied with a hiſſing noiſe; forming a wonderful contraſt with the fine rich covering of plumbago in the other ſtate of the metal, occaſionally parting and exhibiting the iron in a ſtate of the greateſt apparent purity, agitated in numberleſs minute fibres, from the abundance of the carbon united with the metal. When iron thus highly oxygenated comes to reſt, ſmall ſpecks of oxyd begin to appear floating upon the ſurface: theſe increaſe in ſize; and when the metal has become ſolid, the upper ſurface is found entirely covered with a ſcale of blue oxyd of various thickneſſes, dependent upon the ſtage of oxygenation or extreme privation of carbon. This oxyd, in common, contains about 15 per cent. of oxygen, and is very obedient to the magnet. In place of a dark blue ſmooth ſurface, convex and richly carbonated, the metal will exhibit a deep, rough, concave face, which, when the oxyd is removed, preſents a great number of deep pits. This iron in fuſion ſtands leſs convex than carbonated iron, merely becauſe it is leſs ſuſceptible of a ſtate of extreme diviſion; and indeed it ſeems a principle in all metallic fluids, that they are convex in proportion to the quantity of carbon with which they are ſaturated. This iron flows dead and ponderous, and rarely parts in ſhades but at the diſtance of ſome inches from each other.

The above is a ſlight ſketch of the appearance of the two extreme qualities of crude or pig-iron, when in a ſtate of fuſion; but there ſtill remain two intermediate ſtages of quality to be deſcribed: theſe are, carbonated and carbo-oxygenated iron; that is, N° 2 and 3 of the manufacturers. Carbonated iron exhibits, like N° 1, a beautiful appearance in the runner and pig. The breakings of the fluid, in general, are leſs fine; the agitation leſs delicate; though the diviſion of the fluid is equal, if not beyond that of the other. When the internal ebullition of the metal is greateſt, the undulating ſhades are ſmalleſt and moſt numerous: ſometimes they aſſume the ſhape of ſmall ſegments; ſometimes fibrated groups; and at other times minute circles, of a mellower colour than the ground of the fluid. The ſurface of this metal, expoſed to external air, when cooling is generally ſlightly convex, and full of punctures: theſe, in iron of a weak and fuſible nature, are commonly ſmall in the diameter, and of no great depth. In ſtrong metal, the punctures are much wider and deeper. This criterion, however, is not infallible, when pig-iron of different works is taken collectively. At each individual work, that iron will be ſtrongeſt whoſe honeycombs are largeſt and deepeſt.

Carbo-oxygenated, or N° 3, pig-iron, runs ſmoothly, without any great degree of ebullition or diſengagement of metallic ſparks. The partings upon its ſurface are longer, and at greater diſtances from each other, than in the former varieties; the ſhape they aſſume is either elliptical, circular, or curved. In cooling, this metal acquires a conſiderable portion of oxyd; the ſurface is neither markedly convex nor concave; the punctures are leſs, and frequently vaniſh altogether. Their abſence, however, is no token of a ſmooth face ſucceeding; in qualities of crude iron oxygenated beyond this, a concave ſurface is the conſequence of the extreme abſence of carbon; and, in proportion as this principle is abſent, the ſurface of the iron acquires roughneſs and aſperity. It may be proper here to mention, once for all, that although, for convenience, the manufacturer has, from a juſt eſtimation of the value of the metal in a ſubſequent manufacture, affixed certain numbers for determinate qualities of iron, yet it is difficult to decide at what degree of ſaturation of carbon each reſpective term commences: ſuffice it to ſay, that the two alterative principles, oxygen and carbon, form two diſtinct claſſes, that in which oxygen predominates, and that in which carbon predominates; the latter comprehends N° 1 and 2 of the manufacturers, the former includes oxygenated, white, and mottled; and the equaliſation of theſe mixtures form carbo-oxygenated crude iron.

N° 1 and 2, with their intermediate qualities, poſſeſs ſurfaces more or leſs convex, and frequently with thin bliſters: this we attribute to the preſence of carbon, which being plentifully interſperſed betwixt and throughout the particles of the metal, the tendency which the iron has to ſhrink in cooling is entirely done away; it helps to diſtend the aggregate of the maſs, and to give a round face, by gradually elevating the central parts of the ſurface, which are always laſt to loſe their fluidity. Again, that quality of iron known by the name of N° 3, or carbo-oxygenated, is moſt commonly found with a flat ſurface. If we ſtill farther trace the appearance of the ſurface of pig-iron, when run from the furnace, we ſhall find N° 4, either with a white or mottled fracture, poſſeſſed of concave faces rough and deeply pitted. Beyond this it may be imagined that every degree of further oxygenation would be productive of a ſurface deeper in the curve, and rougher, with additional aſperities. The contrary is, however, the caſe: when crude iron is ſo far debaſed as to be run from the furnace in clotted lumps highly oxygenated, the ſurface of the pigs is found to be more convex than that of the iron N° 1, but then the fracture of ſuch metal preſents an impure maſs covered on both faces with a mixture of oxydated iron, of a blueiſh colour, nearly metallic. In ſhort, this quality of iron is incapable of receiving ſuch a degree of fluidity as to enable us to judge whether the convexity of its ſurface is peculiar to its ſtate, or is owing to its want of diviſion as a fluid, whereby the gradual conſolidation of the metal is prevented.

Theſe features ſufficiently diſtinguiſh betwixt the various qualities of crude iron after they are obtained from the blaſt-furnace: they are, however, criterions not leſs infallible, whereby we can prejudge the quality of the metal many hours before it is run from the furnace. Theſe are the colour and form of the ſcoria, the colour of the vitrid cruſt upon the working bars, and the quantity of carburet which is attached to it. The variety of colour and form in the cinder almoſt univerſally indicate the quality of the metal on the hearth. Hence, from a long courſe of experience, have ariſen the following denominations: Cinder of ſulphury iron; Cinder of N° 1, N° 2, and N° 3; and Cinder of ballaſt iron. Although at different works, from local circumſtances, the ſame kind of ſcoria may not indicate preciſely the ſame quality of iron, yet the difference is ſo ſmall, that the following deſcription of the various cinders may convey a very juſt idea of their general appearance.

When the ſcoria is of a whitiſh colour and ſhort form,

branching from the notch of the dam, and emitting from its ſtream beautiful ſparks of ignited carbon, reſembling thoſe ejected from a crucible of caſt ſteel in fuſion, expoſed to external air, or to the combuſtion of fine ſteel filings in a white flame; if, when iſſuing from the orifice of the furnace, it is of the pureſt white colour, poſſeſſing no tenacity, but in a ſtate of the greateſt fluid diviſion, and, when cold, reſembles a maſs of heavy torrefied ſpar, void of the ſmalleſt vitrid appearance, hard and durable, it is then certain that the furnace contains ſulphury iron, i. e. ſuper-carbonated iron. At blaſt-furnaces, where a great quantity of air is thrown in per minute, ſuper-carbonated crude iron will be obtained with a cinder of a longer form, with a rough flinty fracture towards the outſide of the column.

That cinder or lava, which indicates the preſence of carbonated iron in the hearth of the furnace, forms itſelf into circular compact ſtreams, which become conſolidated and inſerted into each other; theſe are in length from three to nine feet. Their colour, when the iron approaches the firſt quality, is a beautiful variegation of white and blue enamel, forming a wild profuſion of the elements of every known figure; the blues are lighter or darker according to the quantity of the metal and the action of the external air while cooling. When the quality of the pig-iron is ſparingly carbonated, the blue colour is leſs vivid, leſs delicate; and the external ſurface rougher, and more ſullied with a mixture of colour. The ſame ſcoria, when fuſed in veſſels which are allowed to cool gradually, parts with all its variety of light and ſhade, and becomes of a yellowiſh colour, ſometimes nearly white when the quantity of incorporated metal has been ſmall.

The lava or cinder which is emitted from the blaſt-furnace when carbo-oxygenated (or N° 3) iron is produced, aſſumes a long ziz-zag form. The ſtream is ſlightly convex in the middle; broad, flat, and obliquely furrowed, towards the edges. The end of the ſtream frequently rears itſelf into narrow tapered cones, to the height of ſix or eight inches: theſe are generally hollow in the centre, and are eaſily demoliſhed, owing to their exceſſive brittleneſs. The colour of this lava is very various; for the moſt part it is pale yellow mixed with green. Its tenacity is ſo great, that if, while fluid, a ſmall iron hook is inſerted into it at a certain degree of heat, and then drawn from it with a quick but ſteady motion, twenty to thirty yards of fine glaſs thread may be formed with eaſe. If the colours are vivid and variegated, the thread will poſſeſs, upon a minute ſcale, all the various tints of colouring which is found in the columnar maſs. When by accident a quantity of this lava runs back upon the diſcharging-pipe, it is upon the return of the blaſt impelled with ſuch velocity as to be blown into minute delicate fibres, ſmaller than the moſt ductile wire; at firſt they float upon the air like wool, and when at reſt very much reſemble that ſubſtance.

The preſence of oxygenated crude iron (N° 4) on the furnace-hearth, is indicated by the lava reſolving itſelf into long ſtreams, ſometimes branched, ſometimes columnar, extending from the notch to the loweſt part of the declivity; here it commonly forms large, flat, hollow cakes, or inclines to form conical figures: theſe are, however, ſeldom perfect; for the quantity of fluid lava, conveyed through the centre of the column, accumulates faſter than the external ſides of the cone are conſolidated; and thus, when the ſtructure is only half finiſhed, the ſmall crater vomits forth its ſuperabundant lava, and is demoliſhed. The current of ſuch lava falls heavily from the dam as if ſurcharged with metal, and emits dark red ſparks reſembling the agitation of ſtraw embers. Its colour is ſtill more varied than the former deſcriptions of ſcoriæ, and is found changing its hues through a great variety of greens ſhaded with browns. Another variety of ſcoria, which indicates the ſame quality of iron, aſſumes a ſimilar form; but has a black ground colour mixed with browns, or is entirely black. When the latter colour prevails, the texture of the cinder becomes porous; the quantity of iron left is now very conſiderable, and ſuch as will be eaſily extracted in the aſſay-furnace with proper fluxes. In caſes of total derangement in the furnace, the ſcoria will ſtill retain this black colour, although the quantity of metal may amount to 25 per cent. the fracture, however, becomes denſe, and its ſpecific gravity increaſes in proportion to the quantity of metal it holds incorporated.

The next ſource of information, as to the quality of the iron in the furnace, is to be got from the colour of the ſcoria upon the working bars, which are from time to time inſerted to keep the furnace free from lumps, and to bring forward the ſcoria. When ſuper-carbonated crude iron is in the hearth, the vitrid cruſt upon the bars will be of a black colour and ſmooth ſurface, fully covered with large and brilliant plates of plumbago. As the quality of the metal approaches to N° 2 (carbonated), the carburet upon the ſcoria decreaſes both in point of quantity and ſize. When carbo-oxygenated iron, or N° 3, is in the furnace, the working bars are always coated with a lighter coloured ſcoria than when the former varieties exiſt; a ſpeck of plumbago is now only found here and there, and that of the ſmalleſt ſize. When the quality of the metal is oxygenated, as N° 4, not only have the plates of carburet diſappeared, but alſo the coally colour on the external ſurface of the ſcoria; what now attaches to the bars, is nearly of the ſame nature and colour as the lava emitted at the notch of the dam. Theſe criterions are infallible; for, as the fuſibility or carbonation of the metal is promoted in a direct ratio to the comparative quantity of the coally principle preſent in the furnace, ſo in the ſame proportion will the vitrid cruſt encircling the working bars exhibit the preſence of that principle in the furnace.

Thus combuſtion, in the blaſt furnace, conſiſts in the rapid ignition of a given quantity of fuel, and its accompanying portion of ore, in a certain given time. That furnace which can in the ſhorteſt time reduce the greateſt quantity of fuel, all things elſe being in proportion, will conſtantly manufacture the greateſt quantity of iron. In common, before the introduction of the blaſt, the furnace is filled with alternate ſtrata of coke, iron-ſtone, and limeſtone, heated by ſimple atmoſpheric preſſure to a bright red or white heat, and the iron ſtone to a melting heat. This temperature is then quickly increaſed throughout the furnace, by the application of the blaſt. The blowing orifices or tuyeres of the furnace, exhibit the fuel increaſing in whiteneſs, and the iron-ſtone rapidly diſſolving before the blaſt, of a blackiſh colour. At this period, the lava which flows from the furnace, in conſequence of the reduction of the ore and lime-ſtone, is conſiderably charged with iron, and is of a blackiſh brown, or greeniſh brown, colour. Theſe appearances continue for twelve, twenty-four, or thirty-ſix, hours, according to the mode of treatment in bringing forward the furnace after blowing. The tuyere (if a bright tuyere furnace) will appear like a blaze of pure light, at times very oppreſſive to the eye; it ſoon, however, becomes accuſtomed to it, and will with facility diſcern the individual maſſes of coke, as they are forced away, with the rapidity of lightning, before the concentrated force of the air. The concrete ore and lime-ſtone are no longer viſible; but a fine metallic ſpray is conſtantly deſcending, and, forced from the fuel, precipitates itſelf to the bottom of the furnace. The ſcoria formed by the fuſion and union of the lime-ſtone, with the immetallic parts of the ore, is carried before the blaſt in a ſimilar manner and form, but eaſily diſtinguiſhable from the fluid metal by its buoyancy, want of velocity when impelled, and by its opaque colour. In this ſtate, the furnace is conſidered in excellent ſmelting order. The iron is generally revived with little loſs; and the colour and purity of the cinder or lava ſufficiently indicate the perfection of the ſeparation.

tion. When at any time the brightneſs of the tuyere fails, and becomes dull white or reddiſh white, then a change is indicated; the iron-ſtone and lime-ſtone will again appear in the ſolid unſeparated ſtate, and the change of colour in the cinder infallibly betokens an irregularity in the movements of the furnace.

At the introduction of the blaſt, the interior of the furnace at the tuyere is ſimply a mixture of ignited maſſes of cokes and iron-ſtone, the latter partly ſemifuſed, but the greateſt part merely heated to a bright red heat. In the deſcent through the furnace, in contact with ignited coke, the particles of metal in the ore may, by parting with the oxygen, have received a diſpoſition to become revived. The increaſed temperature creates an additional tendency, by eſtabliſhing a greater force of affinity betwixt the fuel and the iron. But the metal approaching to its proper ſtate, meeting the current of blaſt, is immediately ſubject to a partial combuſtion. The portion thus oxydated conveys to the lava, in proportion to its quantity and oxygenation, the colour already mentioned. As ſoon as the continuation of the blaſt conveys a higher temperature to the ſuperior regions of the furnace, the appearance of the ſolid matter at the tuyere ceaſes. The fuſion and ſeparation of the metal from the ore are effected in ſituations more remote from the blaſt, or chief ſource of decompoſition, in a temperature more ſuited to the nature and exiſtence of the metal. The iron, once formed into a fluid, and its fluidity preſerved, its deſcent to the blaſt is attended with little or no injury to its carbonation.

The quantity of air diſcharged into the furnace, under the appellation of *blaſt*, depends upon the number of ſtrokes of the blowing cylinders which the engine makes per minute, and on the area and diameter of the air pump. This is independent of every conſideration of denſity and increaſe of power in the ſteam cylinder; ſo long as the blowing or air cylinder remains the ſame, and the engine performs the ſame diſcharges, the meaſure of atmoſpheric air, which enters the furnace, will remain the ſame. The rapid improvements, which of late years have been made in the blowing machine, have increaſed the quantity from 1000 to 4000 feet per minute per furnace; and the quantity or produce in iron has been thus conſiderably increaſed.

In the manufacture of iron, it has always been the unceaſing object of the iron-maker to improve his blowing apparatus; for uniformly he has found, that in proportion as he can raiſe air, and make it enter the furnace, ſo will his weekly quantity of metal be increaſed. When charcoal of wood was the matter of fuel made uſe of, the affinities betwixt the latter and the ore were eſtabliſhed with more facility. Small furnaces, called *bloomeries*, were ſufficiently large, and deemed of profitable capacity, if they produced a bloom or two of iron per day, of 90 to 120lbs. each. Hand bellows, and what were called fuel blaſts, were ſufficiently large for the minor operations. After the general introduction of the refinery furnaces, and the diviſion of the manufacture into the making of pig iron, and the refining of this into bar or malleable iron, the advantages of a powerful blaſt were immediately perceived. Water wheels, working two pairs or more of leather bellows, were found to produce powerful effects, and, in conſequence, almoſt every ſituation that preſented a command of materials and a waterfall, became the ſcite of an iron mill. The ſimple mode of blowing furnaces by means of a trompe, was at the ſame time introduced; but in general it was found, that much greater advantage could be derived from the deſcent of water upon a wheel, either as to denſity or quantity, than by means of the beſt conſtructed trompe.

The uſe of water wheels and leather bellows continued general throughout the iron buſineſs, until the principles and mechaniſm of the ſteam-engine were eſtabliſhed upon unerring grounds. This wonderful invention was ſoon applied with the happieſt effect in many ſituations rich with mineral treaſures, but to which nature had denied the advantage of water ſufficient to turn machinery. Cylinders, compoſed of wood, firmly jointed and hooped, were firſt introduced as a ſubſtitute for leather bellows: theſe were ſoon after replaced by bored cylinders of caſt iron; and with this great diſcovery and application of the art of caſting, the blowing machine aſſumed a general and well-proportioned form. This took place about forty years ago, and continued with a few temporary deviations until the introduction of Bolton and Watt's highly improved engine, with the *water-blaſt*. The following is a deſcription of the air-pump blowing cylinder, mentioned above: The diameter of the cylinder for one furnace varies from twenty-five to thirty-ſix inches, and for two furnaces from thirty-ſix to fifty inches. Upon the oppoſite of the main or working beam, ſometimes at equal, and ſometimes at unequal, diſtances from the centre, is placed the air-pump or blowing cylinder. This, in common, is equal to four or five times the area of the former; and, with the ſmall working power of the ſteam cylinder, ſeldom condenſe the air beyond $1\frac{1}{2}$ to $1\frac{3}{4}$ lbs. per ſquare inch. The air-pump is commonly conſtructed open below, as ſhewn at E, in the above-mentioned engraving. This plan was ſometimes deviated from, and the cylinder inverted. The blowing piſton is loaded with weights, and the air expreſſed by its deſcent. In this mode of working, the act of the ſteam piſton, deſcending in vacuum, raiſes the air-pump piſton loaded with weights. Upon the return of the ſtroke, or while the ſteam piſton aſcends in the cylinder, this piſton loaded with weights ſinks the whole length of the ſtroke, and by means of this loading, proportioned to the powers of the engine, forces the air either into the regulator or the furnace. Above, or parallel to the air-pump is placed the regulating cylinder, as ſhewn in the plate. This has a valve of communication, which opens every ſtroke the engine makes, and admits the whole diſcharge of the air. The piſton of the cylinder, frequently called the fly piſton, is loaded with weights, and kept conſtantly vibrating; ſo that when any deficiency of preſſure ariſes from the remitting action of the air-pump piſton, the blaſt is comparatively equalized by the preſſure of the fly piſton upon the included air. The ſize of this cylinder is generally in the proportion of nine to ſix of the air-pump.

The chief objections to this mode of blowing, are founded upon the great inequality of the blaſt, and a very conſiderable waſte of air that takes place at the *ſnort*, or ſafety valve, to prevent the fly piſton being blown entirely out of the cylinder. The ſnort is an opening made in the top of the air-pump cylinder, on which reſts a heavy iron valve, faced with leather ſtuffed with wool; this is, by means of an upright iron rod, attached to a lever, which runs acroſs the top of the regulating cylinder. As ſoon as the fly piſton riſes to a certain height, a block of wood, or other contrivance, lifts one end of the lever, and along with it the valve, to a certain height, and permits a quantity of the denſeſt air to eſcape, ſufficient to inſure the ſafety of the piſton. Notwithſtanding theſe precautions, however, many accidents and ſtops are found to enſue. In conſequence of this, ſome iron maſters contrived to take the ſpare or waſte air from the ſnort, to receive it in an inverted cheſt above water, and blow to its extent ſmithy and finery fires. Endeavours of this kind, to economiſe the air, raiſed and condenſed at a great expence, were ſufficient proofs that a method was ſtill wanting to complete the blowing machine, to render its motions ſteady and uniform, and to equaliſe the denſity of the blaſt throughout the whole ſtroke. This was at length accompliſhed by inverting large cheſts, or cylinders, in ciſterns of wood, ſtone, or iron. The ſpace betwixt the inner and outer ciſterns was conſtructed of ſufficient capacity to oppoſe the expanſive force of the blaſt of a column of water of equal or ſuperior reſiſtance. Hence this invention is called the *water-blaſt*.

A blowing machine, with the water-blaſt, capable of ſupporting two blaſt furnaces, ought to have the inverted cheſt of the regulator equal to three or four hundred

ſquare

ſquare feet of area. In calculating the proportions and dimenſions of water regulators in general, the principle is, to allow the ſpace around the inverted cheſt equal in point of ſuperficial meaſurement to the area of the interior of the cheſt, that the deſcending column of water may diſplace no more in the perpendicular aſcent, than it is itſelf abſolutely depreſſed. If the area or ſpace, in which the water riſes and falls, is only equal to half the area of the inverted cheſt, then for every foot of water which is depreſſed in the bottom of the cheſt, a column of two feet will be raiſed and maintained on the outſide. On the contrary, if the outſide ſpace for water be equal to twice the area, then every foot of water depreſſed in the cheſt will only elevate the external column ſix inches. It is evident, therefore, from theſe general facts, that a conſiderable latitude may at any time be aſſumed in conſtructing the water regulator, particularly in old eſtabliſhed works, where local circumſtances and convenience confine its ſituation to one ſpot.

Where it is not inconvenient to uſe a high perpendicular column of water, the inverted cheſt may be increaſed one half, double, or even triple, the ſuperficial meaſurement of the outſide ſpace; ſo that if the power of the blowing machine is equal to three pounds upon the ſquare inch, the water in the cheſt will be depreſſed nearly three feet and a half, and raiſed in the perpendicular column five feet three inches in the firſt, ſeven feet in the ſecond, and ten feet and a half in the laſt, caſe. This plan, to ſuit former eſtabliſhments, may be adopted with conſiderable modifications, always keeping in mind, that every foot of area gained upon the ſurface of the water, is a material acquiſition to the equaliſing powers of the regulator.

One imperfection, however, attends this want of equilibrium on the two ſpaces for the action and re-action of the water.—Whatever ſpace the waters would fall, at the return of the ſtroke, ſuppoſing the inſide and outſide columns exactly balanced, would in this caſe be increaſed one half, double, or triple. Again, where ſituation does not admit of the perpendicular column being raiſed beyond, or not even to the extent, of the depreſſion that takes place within the inverted cheſt, and where an additional ſpace cannot be procured for an increaſe of its diameter, an inverted cheſt of much leſs height than common may be uſed, loaded with a material of great weight, ſuch as iron. The water in that caſe would diſtribute itſelf over the ſurface of the cheſt, inſtead of riſing in perpendicular height.

But a ſerious objection is notwithſtanding made to cheſts or cylinders, where the eduction pipe approaches within a ſhort ſpace of the ſurface of the water; namely, water riſing in the pipes, and being conveyed along with the air into the furnace. This may take place in two ways; by an inſenſible and uniform diſcharge of water into the furnace, making the blaſt at the tuyere viſible, like the reſpiration of the human body in a froſty day; or ſometimes in quantity, ſufficient to hazard the deſtruction of the furnace and buildings. The former is occaſioned by the air from the eduction pipe, at the commencement of the ſtroke, impinging violently upon the ſurface of the water, and raiſing a portion of it in the ſtate of ſpray. This is ſpeedily diſſolved or entangled in the maſs of condenſed air before the return of the next ſtroke, and becomes expreſſed along with the blaſt into the furnace. The other hazardous conſequence is occaſioned chiefly by undulation in the column of water, when the blowing machine is, by derangement or accident, working under its proper power or number of ſtrokes. In theſe caſes, when the pauſe at the end of the ſtroke is prolonged, an exhauſtion ſometimes takes place in the air-pipes, the water riſes and is carried in a ſtream through the blowing-pipe into the furnace. The ſame caſualties will alſo occur, if the ſurface of the water is upon a level, or nearly ſo, with the tuyere.

In judicious erections this danger is moſt carefully avoided; the ſurface of water in the inverted cheſt or cylinder is kept at leaſt eight, nine, or ten, feet under the level of the tuyere, even at the laſt period of return, when the water has riſen to its greateſt height within. This precaution alſo enſures an advantage of much importance. A large ſpace is obtained betwixt the top of the cheſt and the depreſſed ſurface of the water; this becomes a ſpacious reſervoir for the condenſed air, and, by generating a conſiderable portion of elaſticity, prevents any violent perturbation upon the water at any period of the ſtroke. The increaſed diſtance betwixt the ſurface of the water, and the pipe which conducts the air from the cylinder, has a complete tendency to prevent the elevation of the aqueous particles, and always enſures a quantity of air comparatively free from moiſture.

The application of water regulators to blowing machines, by Meſſrs. Bolton and Watt, was ſoon followed by an attempt at further improvement, by the introduction of the air-vault; the principle of which was to form a receiver of ſuch capacity, that the elaſticity or ſpring of the condenſed air would be ſufficient to expreſs and equaliſe the blaſt during the return of the ſtroke. To effect this, an immenſe magazine was requiſite; to erect which of any metallic ſubſtance would have been ruinouſly expenſive, and, if conſtructed of wood, inſufficient for retaining the air. It became therefore requiſite to try the experiment upon building, or by excavation from the ſolid rock.

Air-vaults of this kind were conſtructed both at the Clyde and Muirkirk iron-works in Scotland, and a conſtant current of air produced; but nearly one half the quantity lifted by the air-pump eſcaped through the walls and arches of the building. This was made viſible by rubbing ſoapy water upon the external walls. At Devon iron works in Scotland, an air-vault was excavated from the ſolid rock, ſeventy-two feet long, fourteen feet wide, and thirteen feet high; equal to thirteen thouſand feet of cubical meaſurement. This immenſe excavation was made comparatively air-tight, by cauking the ſeams and fiſſures of the rock, plaſtering and then covering the whole with alternate layers of pitch and cloſe wove paper. This was the moſt perfect experiment ever tried upon the air-vault; and if an opinion is to be formed of the perfection of the apparatus by the quantity of iron at one time manufactured, a very trifling portion of air indeed muſt have been loſt. It has been frequently noticed in Scotland, that at works where the materials were in any degree ſimilar, three thouſand to three thouſand five hundred cubical feet of air per minute will, in the courſe of a week, produce from thirty to thirty-five tons of pig-iron, whatever may be the denſity at which it is thrown into the furnace. In both theſe ways has the air-vault been tried; but with ſuch indifferent conſequences as to its ſuperiority, that the plan ſeems now to be given up.

Several other modes of conſtruction for the blaſt-furnace have of late been tried, but without even reaching the advantages of the one already deſcribed. The vertical ſection of a very curious furnace of this kind, cut acroſs from the top of the boſhes, is exhibited in the preceding engraving at figure 5. The conſtruction is truly ſingular; and from this alone great advantages were expected to reſult. The originality of the principle conſiſts in the double ſquare, or throat; one immediately above the hearth, which is not ſhewn in this figure, and another half way up the cone, four feet in diameter, as repreſented in the plate at A.—B, the top of the boſhes, where the ſection or cone is cut off, twelve feet in diameter. C, an inferior diameter of ten feet, previous to the formation of the throat at A. D, the top of the ſecond row of boſhes, of the ſame diameter as B. E, the furnace mouth, or termination of the ſecond cone, four feet diameter, and proportioned to A. F, the funnel top for carrying off the flame occaſioned by the blaſt, ſo as not to interfere

with the workmen in filling the furnace. The dimensions, as to height, are as follow:

From B to C	height	12 feet
C to A	ditto	6
A to D	ditto	6
D to E	ditto	13
Height of the hearth, and first row of boshings, not shewn in the figure		15
Height of the bottom stones, and false bottoms,		4
Total height of this furnace from the foundation,		56 feet.

G G, the lining, made of fire bricks. I I, the common building, which might be either of sand-stone, or of bricks.

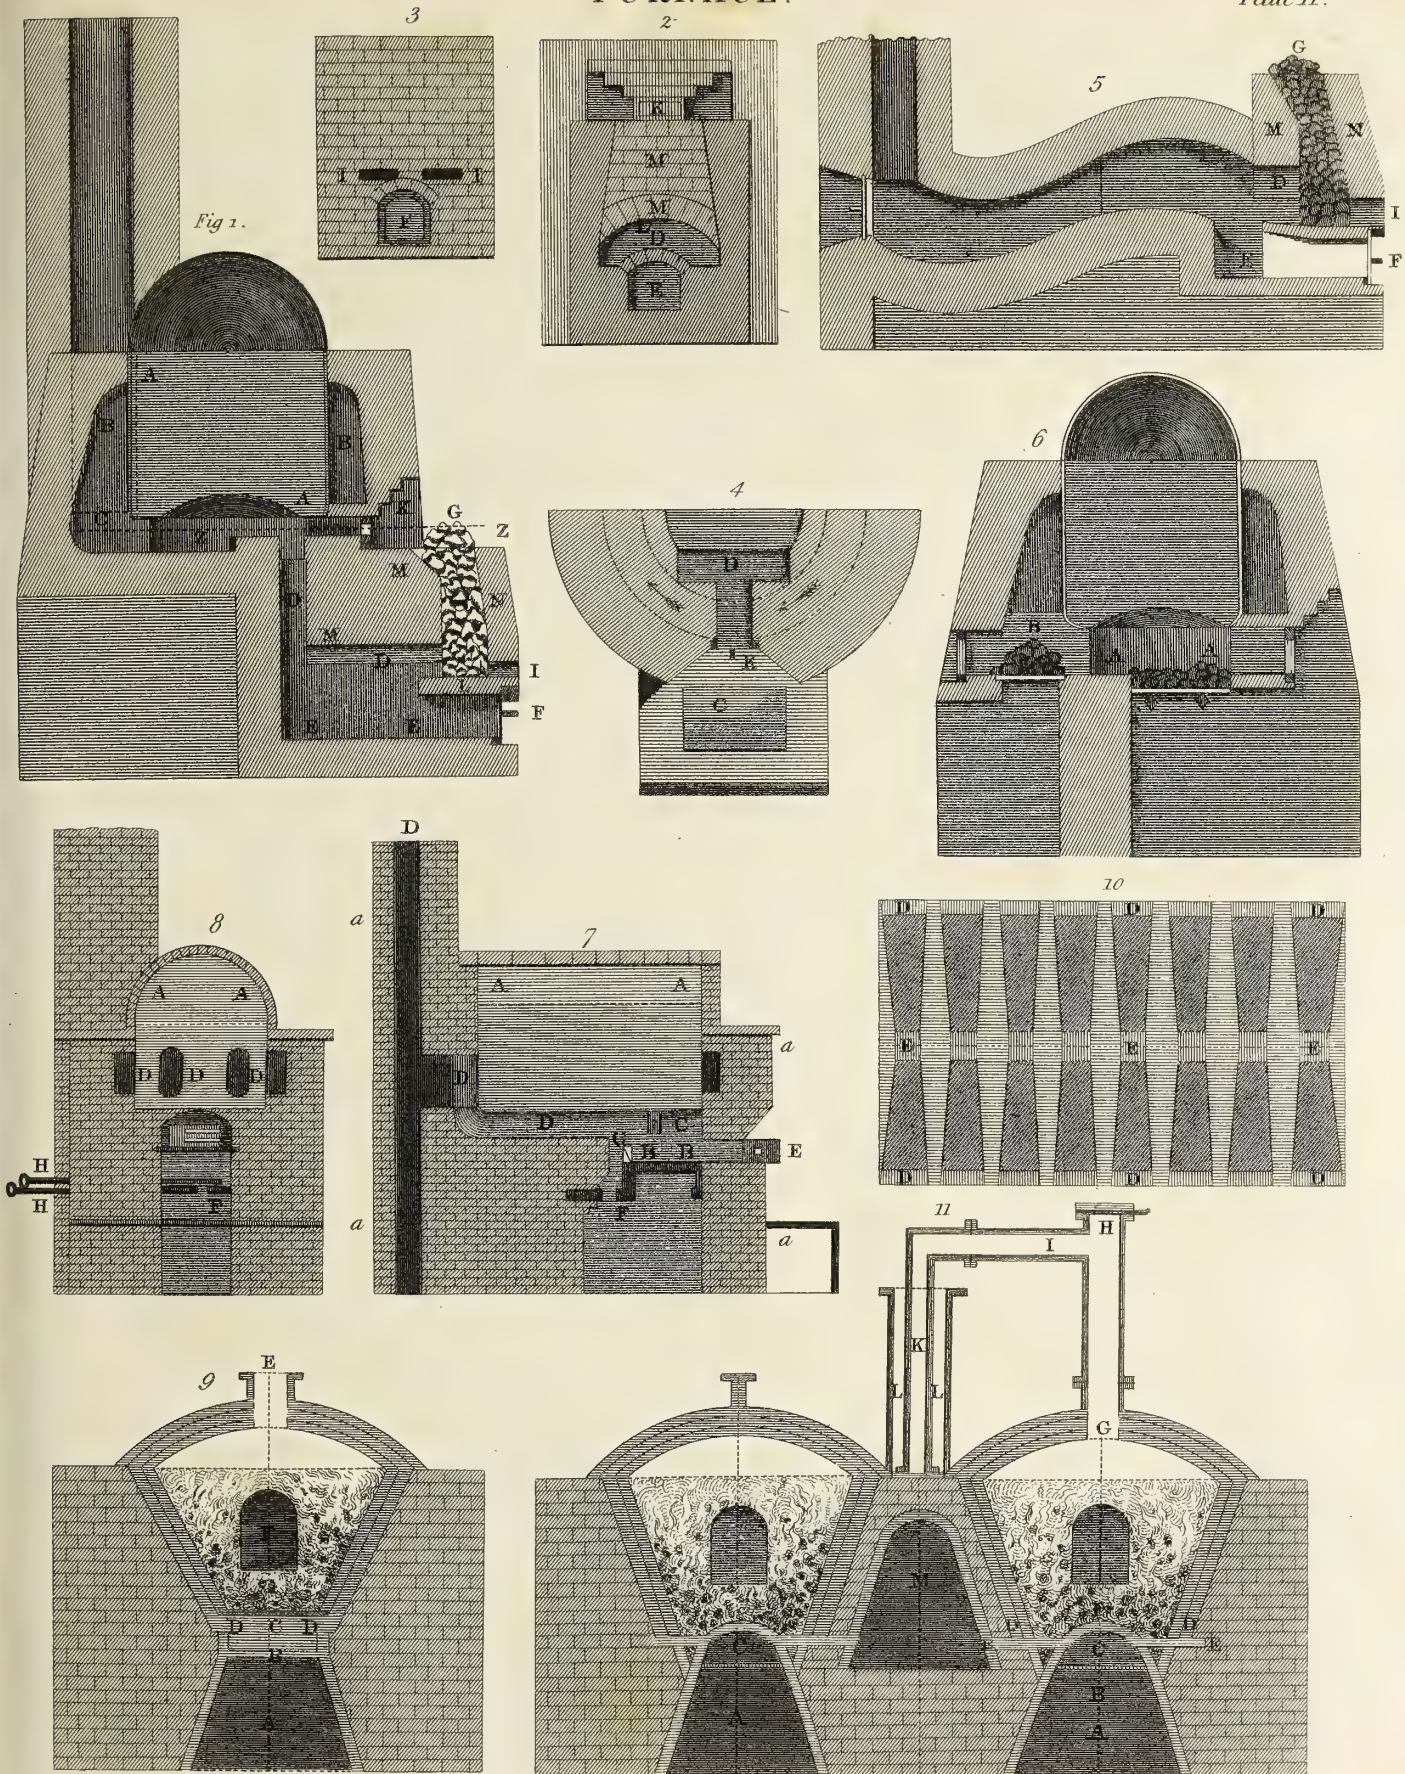
The reasoning which led to the construction of this furnace, proceeded from a belief that the boshes and throat or square of a blast-furnace were of the greatest importance on two accounts. First, because they supported the weight of the materials; and secondly, because they concentrated the heat. These acting conjointly, permitted the least possible quantity of materials to pass, till they dropt away in a state of semi-fusion, or complete separation. In furnaces, however, the cones of which were 30 feet high and upwards, this was conceived impossible to take place for any length of time, to any considerable extent. The height and gravitating pressure of the materials were more than sufficient to counteract the most favourable construction of boshes: and as this could not admit of diminution, the suspension of the materials and the concentration of the heat must be effected by some other means. This, at one time, was believed to have been completely effected by the scheme of an additional square, and an extra set of boshes; and there is little doubt but that, by converting perpendicular to lateral pressure, the suspension of the materials was reduced at least to one half of its former intensity. It was not doubted but that the process of smelting and separation would commence, in part, at A; that what escaped fusion and separation in that quarter, would be easily resolved below; and that the process of combustion intensely at work in two different places at once, would greatly facilitate the general reduction, and add considerably to the produce in iron of the furnace. These sanguine expectations were however unfortunately not realized; the solitary instance of one furnace only being constructed in support of this theory, and its mere temporary endurance, was a high proof of the inutility of the plan. From this we therefore proceed to the new-invented furnace of Mr. Watt of Birmingham.

STEAM-ENGINE FURNACE. The construction of this furnace is described in the specification of the patent obtained for the invention by Mr. Watt as follows: His "improved methods of constructing furnaces or fire-places, consist in causing the smoke or flame of the fresh fuel, in its way to the flues or chimney, to pass, together with a current of fresh air, through, over, or among, fuel which has already ceased to smoke, or which is converted into coaks, charcoal, or cinders, and which is intensely hot; by which means the smoke and grosser parts of the flame, by coming into close contact with, or by being brought near unto, the said intensely-hot fuel, and by being mixed with the current of fresh or unburnt air, are consumed, or converted into heat, or into pure flame free from smoke." This is done, "first, by stopping up every avenue or passage to the chimney or flues, except such as are left in the interstices of the fuel, by placing the fresh fuel above, or nearer to, the external air than that which is already converted into coaks or charcoal; and by constructing the fire-places in such manner that the flame, and the air which animates the fire, must pass downwards, or laterally, or horizontally, through the burning fuel, and pass from the lower part, or internal end or side, of the fire-place, to the flues or chimney. In some cases, after the flame has passed through the burning fuel, it is made to pass through a very hot funnel, flue, or oven, before it comes to the bottom of the boiler, or to the part of the furnace where it is proposed to melt metal, or perform other office, by which means the smoke is still more effectually consumed. In other cases, the flame is carried immediately from the fire-place into the space under a boiler, or into the bed of a melting or other furnace." In Plate II. of Furnaces, fig. 1 shews a section of a fire-engine boiler, and its furnace or fire-place, which has been chosen for an example of the application of this new method to the heating and evaporating of water. A A, the boiler, which may be made of any form suitable to its use. B B, a flue, surrounding the boiler as usual. C, the uptake, or passage from the space under the boiler to the flues. D D, a funnel or flue for the flame to come from the fire-place to the boiler. E E, a place to contain the ashes; and F, is a door to take them out at, which must be kept continually shut during the time of working. G H, the fire-place: the fresh fuel is put in at G, and gradually comes down as the fuel below consumes. The part at H, is very hot, being filled with the cokes or coals which have ceased to smoke. I, an opening or openings, to admit fresh air and regulate the fire. K, a door into the space under the boiler; which, being opened, admits air, and stops the draught of the chimney when the operation is wanted to cease. Fig. 2. represents a section of the same fire-place in the other direction; in which M M, is the back of the fire-place; L, the brick arch on which the fuel lies; and E, the ash-hole. Fig. 3, gives an outside view of the same fire-place, shewing the air-holes II, and the ash-hole door F; and fig. 4 is a plan of the same, with part of the boiler seating, taking in the line Z Z of fig. 1. The dotted lines represent the flues, and the arrows point out the direction of the flame. The fire is first kindled upon the brick arch L, fig. 1; and, when well lighted, more fuel is gradually added until it is filled up to G; and care is taken to leave proper interstices for the air to pass, either among the fuel, or between the fuel and the front wall N; and as much air is admitted at II, as can be done without causing the smoke to ascend perpendicularly from G, which it will do if too much air is admitted at I I. The dimensions of this fire-place are adjusted for burning about eighty-four pounds weight of coals in an hour; where greater or less quantities are required to be burnt, the furnaces must be enlarged or diminished accordingly; or, if much greater, more furnaces than one must be employed. Fig. 5, represents this new fire-place as applied to a furnace for smelting iron and other metals, and is constructed without the funnel or perpendicular flue D, in fig. 1. In this description, the same letters refer to the same parts in all the preceding figures.

Mr. Watt also constructs his new fire-places so that the part G H lies sloping, or horizontal, and otherwise varies the figure or form, and proportions; but in all cases the principle is the same; the fresh or raw fuel being placed next the external air, and so that the smoke or flame passes over or through the coaked or charred part of the fuel. He also occasionally covers the opening G, and causes the air to enter only, or principally, at I I. In particular cases, he places the fresh fuel on a grate as usual, as at A A, fig. 6. and beyond that grate, at or near the place where the flame passes into the flues or chimneys, he places another smaller grate B, on which he maintains a fire of charcoal, cokes, or coals which have been previously burnt until they have ceased to smoke; which, by giving intense heat and admitting fresh air, consumes the smoke of the first fire. Lastly, he states his new invention to consist only in the method of consuming the smoke, and increasing the heat, by causing the smoke and flame of the fresh fuel to pass through very hot funnels or pipes, or among, through, or near, fuel which is intensely hot, and which has ceased to smoke; and by mixing it with fresh air when in these circumstances; and in the form and nature of the fire-places above-mentioned: the boilers and other parts of the furnaces being

FURNACE.

Plate II.



Improved Furnaces.

London. Published as the Act directs July 12th 1806, by J. Wilkes

I. Pass sculp.

being ſuch as are in common uſe. Theſe new-invented fire-places are alſo applicable to furnaces for almoſt every other purpoſe.

An invention of a ſimilar kind has alſo been preſented to the public by Mr. W. Thompſon, of Bow-lane, London. He deſcribes it to be "a furnace which will effectually conſume the ſmoke ariſing from it, without requiring more coals than uſual, as has been the caſe with former contrivances for that purpoſe. It may be adapted to any boiler or copper already ſet up, and at a very ſmall expence. Fig. 7, in the engraving, is a ſection of an oblong boiler and fire-place; *aaaa*, the brick-work in which boilers are uſually ſet. AA, the boiler. Two iron flues run through this boiler, and alſo go round it. BB, the fire-place; which muſt be about one-third longer than they are generally made. C, an arch, which runs acroſs the fire-place, two inches lower than the bottom of the flue under the boiler, and about the middle of the fire-place. DDDD, flues through which the hot air aſcends, and ſpends its heat on the boiler. E, the door of the fire-place; which muſt have a ſmall ſhutter in it. Through this ſhutter the coals muſt be gently ſtirred up, by the ſlice or poker, taking care not to injure the arch, nor to raiſe too great a quantity of coals at once. F, is a ſmall ſpace left behind the fire for a current of air to come through, as in the patent lamps. G, a brick placed with its whole length acroſs the fire-place, to hinder the coals from falling down the ſpace F, and choking it. Fig. 8, is a front view of the ſame boiler and fire-place, in which the ſame letters repreſent the ſame parts. HH, are two ſlides, the one ſhifting backwards, the other forwards, to make the ſpace F, for the current of air, larger or ſmaller, as by practice may be found neceſſary.

"The manner in which this furnace operates is thus: The arch C, hinders the ſmoke from going up the chimney, and obliges it to paſs through the fire behind it; which has a very ſtrong draught, and burns the ſmoke as it paſſes through. The air which comes up through the ſpace F, gives freſh vigour to the flame, which conſumes any ſmoke that may be left. It muſt be obſerved that too much air will have a very bad effect, as it will cool the flame; therefore the ſlides HH, muſt be regulated in ſuch a manner as the operator may find moſt advantageous. The ſhutter in the door E, muſt alſo be of a proper ſize; as its being too large, or too ſmall, will be prejudicial."

A further improvement on Furnaces has been recently made by Mr. David Muſhet, of Glaſgow, for the purpoſes of metallurgy, in forming bars, ingots, &c. The inventor deſcribes it as follows: "The general principles of my proceſſes are, the fuſion of malleable iron, or of iron ore, in ſuch manner as immediately to convert them into *caſt-ſteel*; and likewiſe, in certain caſes, the after cementation of this ſteel, to give it malleability, and the property of welding, in order to fit it for ſuch purpoſes as require ſteel poſſeſſing thoſe properties. Theſe principles can be acted upon for the production of the various qualities of ſteel, in a variety of ways; but the principle of my invention, and the mode of operation, may be fully underſtood by the inſtances which I ſhall adduce, and which will enable any perſon to perform the ſame, and to vary and alter the mode of operation, according to his intention, and the particular quality of ſteel he may wiſh to manufacture. Thus caſt-ſteel may be made by taking any convenient quantity of malleable iron, according to the ſize of the furnace and crucible to be employed, and introducing it into the crucible, along with a proper proportion of charcoal, charcoal-duſt, pit-coal, pit-coal duſt, black-lead, or plumbago, or of any ſubſtance containing the coally or carbonaceous principle; but in general charcoal, pit-coal, pit-coal cokes, eſpecially if prepared in the manner hereafter deſcribed, will be found to anſwer beſt; for this proceſs not only bar-iron may be employed, but alſo what is commonly called *ſcraps* or *waſte iron*; but when the latter is uſed, a little more carbonaceous matter muſt be added to the mixture to revive the ruſt or oxyd of iron adhering to the ſcraps: the mixture in the crucible muſt be put into a furnace capable of giving a ſufficiently intenſe degree of heat to run down or fuſe the mixture, which muſt be then poured out into bar, ingot, or other, moulds, according as the manufacturer intends to produce bars or ingots, or various articles or utenſils that are or may be made of caſt-ſteel; for the whole iron by fuſion, with the charcoal or other ſubſtances, or things containing carbonaceous matter, will be found to have paſſed into the ſtate of caſt-ſteel. If caſt into bars or ingots, and a proper quantity of charcoal or other ſubſtances or things containing carbonaceous matter has been employed, ſuch bars, or ingots, will be found in a ſtate ready to take the hammer, and to be drawn or rolled into other ſhapes, according to the intention of the manufacturer. In ſome caſes, eſpecially where a heavy charge is to be run down, the crucibles muſt be previouſly diſpoſed in the furnace, and the mixture introduced into them afterwards by the proceſs before deſcribed, and which may be varied by any prudent operator. Caſt-ſteel may be made in a few hours, which by the proceſſes hitherto diſcovered, has uſually required many days, and ſometimes weeks; for caſt-ſteel by the common method of manufacture has been hitherto made from bar-ſteel which had previouſly required for its own converſion into that ſtate, from the ſtate of bar-iron or ſcrap-iron, a tedious cementation with charcoal in a furnace conſtructed for the purpoſe, and uſually known among manufacturers by the name of a *converting* furnace. It cannot therefore eſcape obſervation, that this is not the only ſaving in point of time and expence gained by my proceſs or proceſſes; for when I meet with or procure iron-ſtones, or iron-ores, ſufficiently rich, and free from foreign mixtures, I ſave even the time and expence neceſſary for the converſion of ſuch iron-ſtone, or iron-ore, firſt into caſt or pig iron, and afterwards by a tedious and expenſive proceſs, accompanied with a great waſte of metal, into bar-iron; for ſuch ore, or iron-ſtones, being previouſly roaſted or torrified, when that proceſs may be found neceſſary, may be ſubſtituted for the bar-iron ſcraps, or waſte iron, as before deſcribed, and the reſult will be caſt-ſteel, if a proper quantity of charcoal, charcoal-duſt, pit-coal, pit-coal duſt, plumbago or black-lead, or of any ſubſtances or things containing carbonaceous matter, had been uſed for the common and ordinary qualities of caſt-ſteel; a much ſmaller quantity of carbonaceous matter is requiſite in the mixture than perhaps would have been ſuſpected, before my invention: when charcoal from wood is employed, a ſeventieth to a ninetieth of the weight of the iron will generally be found ſufficient: when the quantity of the carbonaceous matter or principle exceeds one ſeventieth, and is increaſed from one ſixtieth to one fortieth or more of the weight of the iron, the ſteel becomes ſo completely fuſible that it may be run into moulds of any ſhape, and be capable afterwards of being filed and poliſhed. Hence by caſting may be conſtructed ſtoves, grates, kitchen utenſils, many kinds of wheels, and mill works, a great variety of ſmall machinery, and many other articles, which could not be ſo made by the proceſſes before in uſe, and which way of making ſuch articles conſtitutes a part of my invention. By my proceſs various kinds of ſteel, differing as much from each other in their qualities as the various kinds of pig or caſt-iron differ from each other, can be formed by merely varying the proportion of carbonaceous matter. Caſt-ſteel of the common and ordinary quality is ſo volatile when in fuſion, as to admit of being run into any ſhape, except ſtraight moulds of a conſiderable diameter; but ſteel of ſuch denſity as to admit of being caſt into any form may be produced by my proceſs, by increaſing the quantity of charcoal or matter containing the carbonaceous principle, and then fuſing the mixture as before directed. When I wiſh to produce qualities of ſteel ſofter than is uſually manufactured by the common proceſs, I find.

find it beſt to uſe a ſmall proportion of charcoal, ſometimes ſo little as a two hundredth part of the weight of the iron: ſteel produced with any proportion of charcoal, not exceeding one hundredth, will generally be found to poſſeſs every property neceſſary to its being caſt into thoſe ſhapes which require great elaſticity, ſtrength, and ſolidity; it will alſo be found generally capable of ſuſtaining a white heat and of being welded like malleable iron, and indeed as the proportion of charcoal or other carbonaceous matter is reduced, the qualities of the ſteel will be found to approach nearer to thoſe of common malleable iron. By further purſuing the principle of my new invention, I fuſe down malleable bar or ſcrap iron, in a crucible, without any viſible addition of carbonaceous matter, and run it into bar, ingot, or other moulds; in this ſtate the metal is nearly of the ſame quality as when put in, only altered by the combination of a ſmall portion of carbonaceous matter which the iron by its chemical affinity attracts from the ignited fuel, or from the ignited carbonic gas of the furnace, and which enters by the mouth or through the pores of the crucible, probably diſſolved in caloric at a very high temperature: but whether ſo diſſolved or not, the fact is, that a proportion of the carbon paſſes from the fire into union with the iron, and thereby converts it into an extremely ſoft ſteel. Beſides the different modes of operation above ſpecified, I further reduce iron-ore, bar-iron, or ſcrap-iron, by the addition of lime, or chalk, or other carbonates, or of carburets with clay, glaſs, and other fluxes, in various proportions, and form all the various qualities of ſteel formerly enumerated. If the various kinds and qualities of ſteel obtained by the proceſs or proceſſes above-mentioned, be introduced into the common converting or other ſteel furnaces, in contact with carbonaceous matter, or with earths, and heated for five days, more or leſs, according to the thickneſs of the bars or other forms, and the quantity introduced, the bars, ingots, or other ſhapes, being then taken from the furnace, will be found to poſſeſs all the ſolidity which they were formerly poſſeſſed of as caſt-ſteel, with that property of welding peculiar to bliſtered-faggot, or German-ſteel, of the uſual mode of manufacture.

"By this invention I obtain ſteel, which for ſolidity may be uſed for the purpoſes of caſt-ſteel, uniting at the ſame time the property of welding without deſtroying the ſolidity or quality of the metal, a circumſtance of the higheſt importance to our manufactures. Ingots, bars, plates, and every ſhape into which this ſteel is caſt, rolled, or hammered, will be poſſeſſed of uniformity of quality without thoſe numerous reeds, flaws, bliſters, and diſjoined laminas, found in ſteel made by the proceſſes in uſe before my invention. When pit-coal cokes are to be uſed in any of the foregoing operations, either in mixture with the ore, or with the iron, or for fuel in the furnaces, in which the crucibles containing the mixture are expoſed to the action of the fire, it is of the utmoſt importance that the cokes be properly prepared. The proceſs which I have found to anſwer beſt for this purpoſe, though common cokes will alſo do, is founded upon the principle that all acceſs of oxygen to the coals to be coked ſhould be prevented: this end is gained by preparing the cokes in iron veſſels in the ſame manner as wood is now charred for the purpoſe of being employed in the manufacture of gun-powder; the bitumens, or coal-tar, as it is commonly called, which is volatilized from the coals to be coked by the heat applied to the exterior of the iron veſſel, or other chamber, containing the ſaid coals, is thus ſaved, inſtead of being burnt or diſſipated in the atmoſphere, as is the caſe in the common proceſs of coaking, in which the coals are expoſed to combuſtion in open heaps, and which alſo partially, though in a leſs degree, takes place in the proceſs, commonly known by the name of "Lord Dundonald's proceſs for preparing coal-tar;" but as it is of importance in large manufactories that the proceſs of coaking ſhould keep pace with the other proceſſes connected with metallurgy, that a ſufficient quantity of cokes may always be at command, of an uniform quality, it may be neceſſary in many caſes to prepare furnaces ſomewhat different in conſtruction, but agreeing in principle with the one for preparing charcoal, which has above been generally alluded to." The following conſtruction of a coaking furnace, but which may be varied in form according to the form of the ſcite of particular manufactories, and other circumſtances, will be found calculated to produce cokes of an excellent quality, and at the ſame time a ſaving of all the bitumen, or coal-tar, volatilized by the proceſs, and where circumſtances render it adviſable, will admit of metallic ores being roaſted at the ſame time, along with the coals to be coked in the interior of the ſtructure, or with ſuch a proportion of coally matter as ſimply to torrify the ores, or iron ſtones, for the blaſt-furnace.

Fig. 9, in the preceding Plate II. repreſents an end ſection of this furnace. A, the aſh-pit, ſix feet wide at the bottom, and narrowing to four feet at the bearer, which is placed acroſs to ſupport the furnace bars. B, the iron bearer. C, the fire-place. D D, the commencement of the flue, which ſurrounds the interior building of the furnace ſix inches high, and two feet broad; of theſe flues there are eight in the length of the preſent furnace, and their number may be extended or diminiſhed in proportion as the furnace is conſtructed of a larger or ſmaller ſize, as theſe flues conduct the flame and heat from the ignited coals upon the grates, the interior part of the furnace and its contents become thoroughly heated. The vapour ariſing from the coals or ores expoſed to ignition, together with the flame and ſmoke of the coals uſed for fuel, eſcape by the aperture E, of which there are alſo eight in the extreme length of the preſent furnace: any greater length of chimney may be added above the preſent, as circumſtances may point out; the ſame apertures may alſo ſerve to charge the furnace. F, a ſmall door in the front of the furnace, which ſerves to empty it of its contents. G, plate of caſt iron which ſerves for the bottom of the furnace, and on which the ſide walls are built; the under ſurface of this plate is caſt with a number of ſmall protuberances, which, when covered with a coating of clay, keep hold of the ſame, and prevent the oxydation of the iron, although expoſed to a conſiderable degree of heat. In place of an iron plate, an arch of fire bricks on edge may be ſubſtituted, particularly where there is no ſcarcity of ſmall-coal or other fuel: inſtead of making the ſides of fire bricks as repreſented in the engraving, caſt-iron plates with flanges may be ſubſtituted, which will tranſmit the heat with greater facility than brick. Fig. 10, exhibits a top view of the furnace cut acroſs at the ſpring of the arch. D D, D D, D D, the ſide flues as they riſe from the ſides of the furnace, to convey the heat and flame betwixt the inner and outer arches. E, E, E, apertures by which the ſmoke and vapour, ariſing from the ſide flues, and from the cavity of the furnace, make their eſcape; their dimenſions are twelve inches, and may be either round or ſquare; in order to facilitate the ignition of the materials acted upon for diſtillation, it will be neceſſary to introduce into every ſecond flue, a wooden plug, to reſt with its under end upon the bottom of the furnace, which are withdrawn when the furnace is filled. The fire is then laid upon the grates at C, and ſed with culm or waſte coals; in a ſhort time the cavity of the furnace, or coaker, and its contents, become completely ignited, vapour and ſmoke are diſengaged in large quantities, and carried off through the apertures E, E, E.

Fig. 11, repreſents a furnace of a ſimilar ſhape, and conſtructed upon the ſame principles, but which is calculated to collect and condenſe the ſmoke and vapour into pit-coal tar, which is volatilized in this new proceſs of charring. A, the aſh-pit. B, the bearing bar, or plate. C, the fire-place. D, D, the ſide flues, as deſcribed in fig. 9. E, E, flues by which the ſmoke ariſing from the

FURNACE.

I. Pass sculp.

Birch's Patent Smelting Furnace.

London, Published as the Act directs, August 2nd 1806, by J. Wilkes

fuel may be eaſily conducted into adjoining chambers, and the ſoot collected for forming lamp-black; this is eaſily facilitated by ſhutting the correſpondent damper at the furnace top, till nearly all the ſmoke has entered the chamber. F, the furnace bottom, an arch of fire-bricks upon edge, in place of a caſt iron plate, deſcribed in fig. 9. G, one of the apertures by which the ſmoke and vapour ariſes from the cavity of the furnace; the damper is kept ſhut upon the top of the pipe or chimney H, and the ſmoke is conducted along the horizontal pipe I, and enters the cylinder K; the external cylinder L L, being conſtantly kept full of cold water, condenſes the ſmoke in K, which, falling down the internal ſides of the tapered cylinder, iſſues out below, and is conducted by means of a rhone, or pipe, to a general receiver. A furnace of the preſent ſize has eight flues in all, four of which ſerve to conduct the ſmoke of the cavity to the condenſer; the other four are ſimply mounted with dampers, for alternately forcing the ſmoke of the fuel into the vault M, and for admitting the free circulation of air neceſſary to maintain the combuſtion on the grates. In operating with furnaces of this conſtruction, I ſhall remark upon the whole, that, when the furnace without the condenſing apparatus is uſed, the cokes preparing in the interior of the furnace ought to be expoſed ſome hours after the ſmoke has diſappeared; but the neceſſary length of time will immediately depend upon the quantity of the coal ſubmitted to be coaked. The ſame precaution is neceſſary in uſing the condenſing furnace; for this end all the dampers ought to be opened, and remain ſo for a conſiderable ſpace after the ſmoke and vapour have diſappeared.

An improved ſmelting furnace has been lately projected by Mr. Birch, of Abernant, in Glamorganſhire; which received the ſanction of his majeſty's letters patent, dated April 6, 1802; and of which the following is a deſcription: "I the ſaid James Birch, do hereby deſcribe and aſcertain the nature of my invention, and the manner in which the ſame is to be performed, by the plan and elevation annexed, and exemplified in the Furnace Plate III. the different views in which are all marked with the ſame correſponding letters.

Fig. 1, repreſents a front elevation of the furnace, and its two caſt-houſes. A, the ſtack of the furnace. B, B, the two caſt-houſes. C, the bridge-houſe. *a*, *a*, the two new-invented tuyeres.

Fig. 2, an end view of the ſame furnace and caſt-houſes. A, the ſtack of the furnace. B, the caſt-houſe. C, the bridge-houſe.

Fig. 3, the ground-plan of the furnace and caſt-houſes. A, the ſtack of the furnace. B, B, the two caſt-houſes. *a*, *a*, the two new-invented tuyeres; *b*, *b*, the two new-invented tymps; *c*, the hearth wherein the metal is contained; *d d* and *d d* the two beds of pigs recently caſt; *f*, *f*, the two new-invented blowing-pipes.

Fig. 4, gives the ſection of the furnace-ſtack, ſhewing the two new-invented tymps and tuyeres. A, A, the outſide walls of the furnace-ſtack; *a*, *a*, the two new-invented tuyeres; *b*, *b*, the two new-invented tymps; *c*, the hearth wherein the metal is contained; *e*, the inſide of the furnace-ſtack. Parts of the furnace, as heretofore conſtructed, are alſo introduced, for the purpoſe of more accurately explaining the ſaid invention, which conſiſts chiefly in the application of two tuyeres on the ſame ſide, and two tymps oppoſite each other, as ſhewn in the engraving. By this invention a much greater quantity of iron may be made out of one furnace with leſs materials than heretofore, and with leſs blaſt, and a power will likewiſe be obtained of always making the iron better in quality."

A patent for a *Philoſophical* Furnace and Boiler, has alſo been granted to Mr. William Raley, of Newbald in Yorkſhire, which he deſcribes thus: "I William Raley do declare, that my invention is deſcribed in manner following; that is to ſay: The above-mentioned boiler, of any ſize, is made of copper, iron, or other metal, as thought proper; the form or ſhape of which is either circular, ſquare, oblong, or otherwiſe, as may be found neceſſary, or moſt convenient. The dimenſions of the boiler may be in the following proportions, viz. ſuppoſe a circular or round boiler is ſix feet high or deep, from its top or rim, which reſts or hangs on the furnace; its width or diameter at its top or rim, five feet; and its diameter at bottom, three feet; adding about one foot and a half more, in height, (above its rim,) for the convex or outer part of its cover, as in common boilers for ſteam-engines. And, with an intent to increaſe the quantity or force of ſteam, the whole, or as much as poſſible, of the inſide of the boiler (above the level of the water in its bottom) is to be kept wet with water, by means of certain cells, cavities, aqueducts, troughs, tubes, or other contrivances, being placed in the inſide of the boiler, to contain a quantity of water above the level of that in its bottom. And, to convey the ſaid water to the extremity of the inſide of the boiler, above the level of that in its bottom, a contrivance with cells is effected in the following manner, viz. divide the whole circumference or inner extremity of the boiler, (from its top to the bottom,) into a number of equal parts or diviſions, by narrow pieces of copper, (or other metal,) from one to four inches broad, or more, according to the ſize of the boiler; which pieces are to be fixed to its ſides: the number of the above-mentioned parts or diviſions may be from eight to ſixteen, more or leſs, according to the ſize of the boiler. In each of theſe diviſions (beginning near the top or rim of the boiler) are placed pieces of thin copper, or other metal, each piece reaching from one partition to another; which pieces ſtand perpendicular edge-wiſe round the inſide of the boiler: the bottom or lower edge of which pieces are joined to, or brought into contact with, the inſide of the boiler, ſo as to form a circle, or kind of hoop, round the extremity of the inſide of the boiler. Hence, the above-mentioned thin pieces of copper, or other metal, being thus arranged, form a kind of cells, ſo as to contain a portion of water in each cell. The above-mentioned circular or hoop-like arrangement of cells, ſhould be continued, at certain diſtances, from near the top or rim of the boiler, down to its bottom, or nearly ſo. At the end of each of the above-mentioned cells, cloſe to each partition, is a ſmall hole to let out the water, ſo that it may fall into another circle or hoop-like arrangement of cells, placed below. Theſe holes are at one end of thoſe cells, contained in one circular or hoop-like arrangement thereof, and at the other end of thoſe contained in the next circle, &c. Hence the water, in its deſcent, runs firſt one way and then the other, thereby forming a kind of ſerpentine motion in each diviſion. The diſtance theſe circular arrangements of cells are one from the other, may be about one foot, more or leſs, according to the ſize of the boiler. In caſe they are at the diſtance of one foot, the thin pieces of copper, or other metal, need only be about half a foot broad. The above-mentioned cells are ſupplied with water, either from that within the boiler, or from ſome reſervoir, or other containing veſſel, on the outſide thereof. They are ſupplied with water from without the boiler, by tubes from a cloſe reſervoir of water, placed a convenient height above the level of the boiler; each tube having a cock, or kind of valve, ſo as to let a due quantity of water into the cells in each diviſion, within the boiler. A ſteam-tube is placed from the ſaid cloſe reſervoir to the boiler, to preſerve an equal balance of power of the ſteam in each of the two veſſels. The above-mentioned cloſe reſervoir may (for a boiler of the ſame dimenſions) be about one foot and a half high or deep, three feet in diameter at its top, and two feet and a half in diameter at its bottom. The water is thrown either into the cloſe reſervoir, or boiler, by a pump, worked by the force of ſteam, or otherwiſe, (from the hot

well, or other convenient place;) or by a tube, from an open ciſtern or reſervoir, whoſe height, above the ſaid cloſe reſervoir, is ſo high, that the water therein may be more than ſufficient to counterbalance the ſtrength of the ſteam in the cloſe reſervoir and boiler. The above-mentioned tube has a cock or valve, to let the water into the cloſe reſervoir, or boiler; which cock is regulated by a float, or other contrivance. The water in the cloſe reſervoir is made boiling hot, by placing the ſaid reſervoir over the vents or chimneys of the furnace. The cells, or other contrivances, are ſupplied with water from within the boiler by a ſmall pump, placed within the boiler, by which the water is raiſed into a kind of open reſervoir, within the boiler; from which it is conveyed, by tubes, or open aqueducts, to thoſe parts where it is wanted. The rod or ſhaft of this pump, which actuates its bucket or piſton, paſſes through a packed collar, in the centre of the boiler's cover. Or, inſtead of a pump, the water within the boiler is conveyed into the cells, or other contrivance, by a kind of ſpoons, or other ſmall veſſels, placed at the extremity of ſmall pieces of iron, or other metal, croſs-wiſe, or in a ſtar-like poſition, where they are to act as types. From the centre of theſe ſmall pieces of iron, where they croſs each other, is a rod or ſhaft, the ſame as the pump, whereby the ſtar-like arrangement of ſpoons, or other ſmall veſſels, are made to deſcend and aſcend. By their deſcent they are filled with water; and in their aſcent they are emptied into the cells, cavities, aqueducts, &c. their tails or types ſtriking againſt a kind of rim or hoop, or other contrivance, for that purpoſe. The height of the water in the boiler is adjuſted or regulated by a common balance-float, or other contrivance, as in common boilers belonging to ſteam-engines. If the water in the boiler becomes too high, or too much in quantity, it is to be diminiſhed by ſtraightening the cocks or valves of the tubes deſcending from the reſervoir which ſupply it: and if the water is too low, they muſt be widened. And, in caſe the water is much too high, (through inattention,) it is to be diminiſhed by opening a ſmall cock or valve, placed near the bottom of the boiler, or by means of a ſyphon, with its cock or valve. If the ſize of the boiler is very large, the quantity or force of ſteam therein may be increaſed by raiſing its bottom concave next the fire, ſo that it becomes conical, broad at its baſis, (viz. about two-thirds of the diameter of the boiler's bottom,) and terminating at its apex in a ſmall tube, paſſing through the cover of the boiler, ſo as to give the heat a little vent, and terminating in the cavity under the cloſe reſervoir. The above contrivance may either be conical, pyramidical, angular, &c. according to the ſhape of the boiler; around which are placed cells, cavities, aqueducts, tubes, &c. the ſame as thoſe round the inner extremity of the boiler, and ſupplied with water either from within or without the boiler, by the ſame pump, or reſervoir, placed a ſufficient height above the boiler, as above obſerved.

"Steam, produced by means of the above-mentioned philoſophical boiler, is applicable to ſteam-engines, and other mechanical purpoſes, and to various branches of pharmacy, by its being admitted into double pans, ſtills, or other proper veſſels. The furnace in which the philoſophical boiler is fixed, is of the ſame ſhape as the boiler, and about four or five inches, more or leſs, according to the ſize thereof, wider in diameter; ſo that the boiler may hang therein by its top or rim, leaving a kind of cavity, or narrow flue, for the heat to act uniformly round the whole of the boiler to its top or rim. From the above flue the heat is to aſcend, by four or more flues or chimneys, in oppoſite directions, cloſe by the top or rim of the boiler. Theſe flues or chimneys are to incline arch-wiſe over the top of the boiler; where, meeting, they are to form an opening or cavity, in which the cloſe or undermoſt reſervoir is to be hung; from which the heat is to aſcend by three or more ſmall flues or vents, placed in an angular or oppoſite direction, cloſe by the rim or top of the reſervoir, until they riſe above it, where they are to meet, and form one common chimney. The aſh-hole and fire-place are made ſo that the air may not enter in at the front, or on one ſide of the aſh hole only, as is common; but in different directions, ſo as to meet under the centre of the fire, which is to be directly under the centre of the boiler's bottom. Where the furnace is uſed as a ventilator, there need only be one opening in the front of the aſh-hole, which muſt have a door, the ſame as the fire-place; both of which are to ſhut as cloſe as poſſible, to prevent the acceſs of air; the fire being wholly ſupplied therewith by tubes in different parts of the aſh-hole, with their ends inclining, to prevent the aſhes, &c. from entering. The lower ends of theſe tubes join a larger tube, at the outſide of the aſh-hole; the lower end of which terminates in the pit, mine, &c. where it is divided into a number of ſmaller tubes, extended to different parts thereof, ſo as to attract or draw air and vapours therefrom; a cock or damper being placed near the top of the large tube, to regulate the air neceſſary for the fire. It may at times be neceſſary to open the door of the aſh-hole a little, to aſſiſt in ſupplying the fire with more air. If the engine, to which the above philoſophical furnace and boiler are applied, raiſe a conſiderable quantity of water, the ſaid water is made to aſſiſt in the act of ventilation, by letting it into a cloſe veſſel, having three tubes from its upper part; one to let in the water from a reſervoir, into which the engine has raiſed it; another to let out the air; and the third, which deſcends into the pit, mine, &c. to draw air and vapours therefrom; alſo another tube, from its bottom, to let out the water; each of which tubes has a cock. Suppoſe the above veſſel empty, and the cocks cloſed: open the cocks of two of the uppermoſt tubes, viz. that for letting in the water from the reſervoir, and the other for letting out the air, and the water will enter the veſſel, and diſcharge the air by the other tube. When the veſſel is full of water, cloſe the cocks of the two tubes laſt mentioned, and open thoſe of the other two; ſo will the water run out of the veſſel, which will be filled with air and vapours, from the pit, mine, &c. The above cocks are opened and cloſed by the action of the engine, or otherwiſe: hence, by two or more of the above veſſels, a conſtant and regular diſcharge of air and vapours is effected. Where the water, raiſed by the engine, is not employed in the act of ventilation, it may be applied to the following actuating wheel, of a kind of tubular conſtruction, as follows: A tube of copper, or other ſubſtance, whoſe diameter and length is according to the quantity of water raiſed and the height of its fall, being wideſt at its top, to receive the water as it ſtands perpendicular on the point of an axis, paſſing through its centre. The bottom of the ſaid tube is, towards its extremity, cut into a number of diviſions, or kind of fans, reſembling the fly of a ſmoke-jack, or common ventilator, placed in windows, doors, &c. The water paſſing through the openings, between the fans, cauſes the tube to have an horizontal motion. Above the tube, on its axis, is a ſmall wheel, applicable to pumps, or any other devices which require motion."

A very ingenious method of applying an elementary or phyſical power to blaſt furnaces, has been lately ſuggeſted by Mr. Robert Hindmarſh, of Walworth, near London; for which he obtained the king's patent, and ſets forth his invention as follows: "It is well known that the preſſure of water and other fluid bodies, in any containing veſſel, is in proportion to the altitude of the fluid, without any regard to the quantity. Thus, if a cylindrical or otherwiſe figured veſſel, whoſe bottom, for example, is three feet in diameter, have a cloſe top, with a tube twenty feet high fitted into it, and the veſſel and tube, when full, contain only one pint of water, which weighs only one pound, yet the preſſure of this water upon the bottom of the ſaid veſſel, will be equal to 10737 lb. which is the

ſame

ſame as it would be, were the veſſel a perfect cylinder, twenty feet high, and three feet in diameter throughout, and filled with water; and this preſſure is exerted, not only in a downward direction upon the bottom of the veſſel, but, by the peculiar property of fluids, is alſo exerted with the ſame power at equal depths, upwards, laterally, and in all directions. It is of no conſequence whether the tube be perpendicular or inclined; the preſſure being always in proportion to the abſolute height of the fluid, and the baſe againſt which it preſſes, whatever the form of the veſſel or tube may be. This aſtoniſhing property of fluid bodies is called the *hydroſtatic paradox*; and, though long known to ſcientific men, has hitherto been thought incapable of being applied to machinery with mechanical advantage. But, having diſcovered a method of bringing it into effect, it is in the *application* thereof, under an indefinite variety of forms, that the principle of my invention conſiſts.

"Suppoſe a ſtream of water to run from the ſide of a hill, or other elevated ſituation, into a tube communicating with the top and bottom of a cylinder, ſuppoſe three feet in diameter, in which is a moveable piſton, water-tight, with a rod working through a ſtuffing-box, alſo water-tight. If, by means of a cock or valve, the communication be opened for the water to paſs into the cylinder below the piſton, while the communication with the part above the piſton is cut off by another cock or valve, the water will force the piſton up; and, by ſhutting the cock or valve below, and opening that above, the piſton will be forced down again. Whenever the piſton deſcends, the water below it paſſes off through a pipe at the bottom of the cylinder; and, when the piſton aſcends, the water above it paſſes off through a pipe at the top of the cylinder, the cocks or valves of which pipes are previouſly opened for that purpoſe. And thus the piſton is worked alternately upward and downward, with a power equal to 5368 lb. if the water in the tube be ten feet high; with a power equal to 10737 lb. if it be twenty feet high; with a power equal to 21475 lb. if it be forty feet high; and, with a power equal to 53689 lb. if it be one hundred feet high; the power increaſing in arithmetical proportion, according to the altitude of the water in the tube; and in geometrical proportion, according to the diameter or ſurface of the baſe againſt which the water preſſes. On this principle, the piſton-rod, by being connected in the uſual way with machinery of any kind, will act upon it with great advantage; being applicable to blaſt furnaces, to mills of every deſcription, to cranes for raiſing and lowering goods, &c. to pumps, preſſes, and all other machinery where power is required.

"The above deſcription is given on a ſuppoſition that the water, which works the piſton of the cylinder, runs away either wholly or partially in waſte. But the following deſcription ſhews how the ſame water may be returned back, ſo as to work the machine over and over again, and, conſequently, how the principle of this invention may be applied in all ſituations, even where there is no natural fall of water. In addition to the before-mentioned cylinder, let there be provided a ſecond cylinder, ſuppoſe four feet in diameter, with a piſton, water-tight, the rod of which communicates motion to any other machinery: upon this piſton let there be placed weights equal to 20282 lb. The piſton being down, with this great weight upon it, is raiſed in the following manner. At the bottom of this ſecond cylinder a tube is inſerted, the lower part of which may be of iron, or other ſtrong materials, and the reſt of leather, for the convenience of bending. The upper end of this tube terminates in a large cup or reſervoir, capable of holding as much water as will fill the cylinder at the bottom of the tube; and the cup, ſo fitted to the end of the tube, is placed at the top of a wheel, which we will ſuppoſe to be twenty feet or more above the cylinder, and of a diameter ſufficient to anſwer the under-mentioned purpoſe. Pour water into the cup, and it will deſcend through the tube into the cylinder below the piſton, which will be immediately forced up, ſay two, three, or more feet, together with the weight of 20282 lb. upon it. The piſton being elevated, the cylinder is now full of water, as is the tube up to the bottom of the cup, which itſelf is empty. In order to diſcharge the water from this ſecond cylinder, and permit the piſton to be again depreſſed, the wheel, by a connecting rod, or other medium paſſing between it and the piſton of the firſt cylinder while at work, is cauſed to make half a revolution; by which motion, the empty cup, together with the upper end of the tube, is lowered to the bottom of the wheel; and, conſequently, the preſſure of the water, againſt the under part of the piſton of the ſecond cylinder, is ſo far taken off, that the great weight of 20282 lb. upon the piſton, preſſes it downward, and urges the water out of the cylinder, through the tube into the cup; which cup is again elevated to its former poſition by another half revolution of the wheel, effected as before by the piſton-rod of the firſt cylinder; and ſo on, alternately, without any loſs of water in the ſecond cylinder. The waſte water from the firſt cylinder may run into a reſervoir, and be raiſed thence to its former ſituation, by the action of the piſton in the ſecond cylinder, working a pump or other engine, beſides having ſufficient power to drive other machinery. The elevation and depreſſion of the cup and upper end of the tube may alſo be effected in a variety of other ways, as by a man or a horſe working it; but the method here deſcribed is ſufficient to explain this part of the principle of my invention, which conſiſts in applying and taking off, in certain required proportions, the preſſure of water in the cylinder, by alternately elevating and depreſſing the upper end of the tube, on the altitude of which fall of water depends the momentum of the power produced. Or, the ſame effect may be produced by ſubſtituting a heavy rolling weight, ſuppoſe of nine tons, inſtead of the ſecond cylinder with its apparatus: this weight, by means of the piſton rod of the firſt cylinder, is to be made to roll withinſide the arch of a large wheel, like that of a crane, backwards and forwards, over the centre of a balance, the frame-work of which is ſo contrived as to keep the rolling weight always on the ſame level, while the balance moves freely up and down.

"In the above deſcriptions, no allowance is made for the friction of the piſtons in the two cylinders, as is uſual in other machines; for, having invented a method of working the piſtons without any friction at all, I apply the power thereby ſaved to the actual working of the machinery itſelf; and, therefore, the ſaid method of working without friction is conſidered as a part of my invention, and is deſcribed as follows. Let the piſton be fitted to the cylinder, but neither air nor water tight, ſo that it may ſlide up and down without any friction. The upper and under part of the piſton muſt be lined with leather, or any other ſubſtance that is water-tight; which leather, or other ſubſtance, muſt be continued from the piſton, when elevated, down to the bottom of the cylinder, and, when depreſſed, to the top of the cylinder, in the form of a bag on each ſide of the piſton: the extreme ends of both bags muſt be well faſtened to the cylinder, leaving the ſides looſe, and free to fall in folds, during the aſcent and deſcent of the piſton. Now, when the water ruſhes into either end of the cylinder, it enters the cavity of one of theſe bags, and, preſſing againſt the piſton, endeavours indeed to force the bag through the inſenſible ſpace between the edge of the piſton and the cylinder; but, it being impoſſible for the bag to paſs that way, without being doubled and alſo incloſing a portion of the water, and the piſton being fitted to the cylinder ſo cloſely as not to admit even the ſubſtance of the bag ſingly, much leſs doubly and with a portion of water incloſed, the conſequence is, that the piſton riſes and falls without any friction at all; and yet the water is prevented from paſſing between the piſton and cylinder. Thus, the power which is uſually loſt by the friction of the piſton, is here

completely ſaved, without detriment to the work; and the phyſical operation of the water, or other ponderous ſubſtance, is permitted to have its full effect."

To FUR'NACE, *v. a.* To throw out as ſparks from a furnace. *A bad word:*

He *furnaces*
The thick ſighs from him. *Shakeſpeare.*

FUR'NACE-BURNING, *adj.* Burning like a furnace:

I cannot weep; for all my body's moiſture
Scarce ſerves to quench my *furnace-burning* heart. *Shakeſ.*

FUR'NAGE, *ſ.* [*furnagium*, Lat.] A fee paid to the lord of the manor by his tenants, for baking their bread in his common oven.

FURNEAU'X, an iſland in the ſouthern Pacific ocean, diſcovered by Bougainville, and afterwards by captain Cooke; the iſland is low, and ſurrounded by a coral bank: ſome cocoa trees and inhabitants were ſeen. Lat. 17. 11. S. lon. 143. 7. W. Greenwich.

FURNEAU'X (Philip), a learned Engliſh nonconformiſt divine, born at Totneſs in Devonſhire, in 1726. His claſſical education he received at the free-ſchool in his native town, at the ſame time with the learned Dr. Kennicott, with whom he contracted an intimacy and friendſhip, which laſted through life. Being deſigned for the profeſſion of the miniſtry, he was ſent at a proper age to an academical inſtitution in London, which was ſupported by the funds bequeathed by Mr. Coward. Soon after he commenced public preacher he was choſen aſſiſtant to Mr. Henry Read, paſtor of a preſbyterian congregation in St. Thomas's, Southwark; and afterwards he became one of the Sunday-evening lecturers at Salters'-hall, in the city of London. In 1753 he ſucceeded the reverend Mr. Lowman as paſtor of the congregation at Clapham, in the county of Surrey. In this ſituation he continued his miniſterial ſervices for more than twenty-three years, and was reſpected for his extenſive learning and eminent talents by the diſſenters in general. During this time he was choſen one of the truſtees of thoſe funds, to which he was partly indebted for his education; and received the diploma of doctor of divinity from one of our northern univerſities. In 1777 he was attacked by a malady, which terminated in a derangement of his mental powers, from which he never recovered to the time of his death in 1783, when he had nearly completed the fifty-ſeventh year of his age. He was the author of Letters to the Honourable Mr. Juſtice Blackſtone, concerning his Expoſition of the Act of Toleration, and ſome Poſitions relating to religious Liberty, in his celebrated Commentaries on the Laws of England, 8vo. 1770. The other treatiſe was an Eſſay on Toleration, 8vo. 1778; in which he had a particular view to an application to parliament, for that relief in matters of ſubſcription, which was obtained by an act paſſed in 1779.

FUR'NES, or VUERNE, a town of Flanders, ſituated on the canal made from Bruges to Dunkirk, about a league from the ſea. The town-houſe is a good building, adorned with many figures of kings and princes; it has a handſome tower, with muſical chimes. The French took Furnes three times, and kept it by the ſecond article of the peace of Aix-la-Chapelle made in 1668, but abandoned it in 1692: ſoon after which, the allies fortified it, and the French, under the command of marquis de Boufflers, afterwards mareſchal of France, laid ſiege to it the 29th of December, the ſame year. The comte de Hornes, general of the Dutch artillery, who was governor, and commanded a garriſon of four thouſand men, ſurrendered the place the 5th of January following, before the French had attacked it in form: fifteen miles ſouth weſt of Oſtend, and twenty north-north-weſt of Ypres. Lat. 51. 4. N. lon. 20. 13. E. Ferro.

FUR'NESS, a promontory on the coaſt of Lancaſhire. See FOURNESS, vol. vii. p. 629.

FUR'NIMENT, *ſ.* [*furnire*, low Lat.] Furniture:

Lo! where they ſpyde with ſpeedie whirling pace
One in a charet of ſtraunge *furniment*
Towards them driving. *Spenſer.*

To FUR'NISH, *v. a.* [*fournir*, Fr.] To ſupply with what is neceſſary to a certain purpoſe.—Thou ſhalt *furniſh* him liberally out of thy flock. *Deut.* xv.—Come, thou ſtranger, and *furniſh* a table, and feed me of that thou haſt ready. *Eccleſ.*

She hath directed
How I ſhall take her from her father's houſe;
What gold and jewels ſhe is *furniſh'd* with. *Shakeſpeare.*

To give; to ſupply.—Theſe ſimple ideas, the materials of all our knowledge, are ſuggeſted and *furniſhed* to the mind only by theſe two ways, ſenſation and reflection. *Locke.*—To fit up; to fit with appendages.—Plato entertained ſome of his friends at dinner, and had in his chamber a bed or couch, neatly and coſtly *furniſhed*. Diogenes came in, and got up upon the bed, and trampled it, ſaying, I trample upon the pride of Plato. Plato mildly anſwered, But with greater pride, Diogenes. *Bacon.*—To equip; to fit out for any undertaking.—Will your lordſhip lend me a thouſand pounds to *furniſh* me? *Shakeſ.*

Ideas, forms, and intellects,
Have *furniſh'd* out three diff'rent ſects. *Prior.*

To decorate; to ſupply with ornamental houſehold ſtuff:

The wounded arm would *furniſh* all their rooms,
And bleed for ever ſcarlet in the looms. *Hallifax.*

FUR'NISHER, *ſ.* [*fourniſſeur*, Fr.] One who ſupplies or fits out.

FUR'NISHING, *ſ.* External pretence:

Something deeper
Whereof perchance theſe are but *furniſhings*. *Shakeſ.*

FUR'NITURE, *ſ.* [*fourniture*, Fr.] Moveables; goods put in a houſe for uſe or ornament.—No man can tranſport his large retinue, his ſumptuous fare, and his rich *furniture*, into another world. *South.*—Appendages.—By a general conflagration mankind ſhall be deſtroyed, with the form and all the *furniture* of the earth. *Tillotſon.*—Equipage; embelliſhments; decorations:

The duke is coming: ſee the barge be ready,
And fit it with ſuch *furniture* as ſuits
The greatneſs of his perſon. *Shakeſpeare.*

FU'ROR, *ſ.* [*furo*, Lat. to be mad.] A high degree of hyſterics in women, is called a *furor uterinus*, when it is attended with a moſt violent irritability of the uterus and pudenda.

FU'ROT-LA-VALET'TE, a town of France, in the department of the Rhône and Loire: twelve miles from St. Etienne.

FURRACKABAD', a town of Hindooſtan, in the circar of Rohilcund, on the weſt ſide of the Ganges: and capital of a ſmall diſtrict belonging to a prince of the Patan Rohilla tribe: about thirty miles in length along the bank of the Ganges: ſeventy-five miles eaſt Agra, and ſeventy-ſix north-weſt Lucknow. Lat. 27. 23. N. lon. 79. 52. of E. Greenwich.

FURRACKABAD', a town of Hindooſtan, in the country of Bengal, near the Ganges: forty-two miles north-north-weſt of Moorſhedabad.

FUR'REN LOUGH, a lake of Ireland, in the county of Mayo: twelve miles north-weſt of Caſtlebar.

FUR'RIER, *ſ.* A dealer in furs.

FUR'ROW, *ſ.* [furh, Sax.] A ſmall trench made by the plow for the reception of ſeed.—Wheat muſt be ſowed above *furrow* before Michaelmas. *Mortimer.*

Then ploughs for ſeed the fruitful *furrows* broke,
And oxen labour'd firſt beneath the yoke. *Dryden.*

Any long trench or hollow; as a wrinkle:

My lord it is, though time has plow'd that face
With many *furrows* ſince I ſaw it firſt;
Yet I'm too well acquainted with the ground quite to forget it. *Dryden.*

FUR'ROW-WEED, *ſ.* A weed that grows in furrowed land.—Crown'd with rank fumiter, and *furrow-weeds*. *Shakeſpeare.*

To FUR'ROW, *v. a.* [from furian, Sax.] To cut in furrows:

While the ploughman near at hand,
Whiſtles o'er the *furrow'd* land. *Milton.*

To divide in long hollows.—No briny tear has *furrow'd* her ſmooth cheek. *Suckling.*

The billows fall, while Neptune lays his mace
On the rough ſea, and ſmooths its *furrow'd* face. *Dryden.*

To make by cutting:

There go the ſhips that *furrow* out their way;
Yea, there of whales enormous ſights we ſee. *Wotton.*

FUR'RY, *adj.* Covered with fur; dreſſed in fur:

From Volga's banks th' imperious czar
Leads forth his *furry* troops to war. *Felton.*

Conſiſting of fur:

Stretch out thy lazy limbs, awake, awake,
And winter from thy *furry* mantle ſhake. *Dryden.*

FURRYS-TOWN, a town of the iſland of Jamaica, in St. James county: twenty miles north-eaſt of Savanna la Mar.

FUR'SEY, a ſmall iſland of England, at the entrance into Poole harbour.

FUR'STENAU, a town of Germany, in the circle of Weſtphalia, and biſhopric of Oſnabruck: fifteen miles north-north-weſt of Oſnabruck, and eight ſouth-eaſt of Lingen.

FUR'STENAU, a town of Germany, in the circle of Upper Saxony, and marggraviate of Meiſſen: three miles ſouth of Lauenſtein.

FUR'STENBERG, a principality of Germany, in the circle of Swabia, founded in the thirteenth century, and divided into ſeveral branches, all which are extinct except that of Stuhlingen: the chief of the houſe and his eldeſt ſon have the title of princes, the brothers and other children are called land-graves. The eſtates give ſix voices in the aſſemblies of the circle, and a ſeat on the bench of princes at the diet of the empire. The title is taken from an ancient caſtle, ſituated near the town of Furſtenberg. The pretenſions of cardinal Furſtenberg, to the archbiſhopric of Cologne, ſupported by the king of France, in oppoſition to the emperor and the pope, gave occaſion to the breaking out of the war that began to diſturb Europe in 1689. The Roman month amounts to 372 florins; and the tax to the chamber of Wetzlar is 291 rixdollars.

FUR'STENBERG, a town of Germany, in the circle of Swabia, and principality of Furſtenberg, with an ancient caſtle, which gives name to an illuſtrious family, princes of the empire: fourteen miles north-north-weſt of Schaff hauſen, and thirteen weſt-ſouth-weſt of Durlingen.

FUR'STENBERG, a town of Germany, in the circle of the Upper Rhine, and county of Waldeck: ten miles weſt of Waldeck, and twenty-ſeven weſt of Caſſel.

FUR'STENBERG, a town of Germany, in the circle of Weſtphalia, and biſhopric of Paderborn: two miles north-eaſt of Wunnenburg.

FUR'STENBERG, a town of Luſatia, on the Oder, taken by the Pruſſians, in the year 1745, to open a way to Sileſia. Its tolls bring in about 5000 crowns yearly to the king of Pruſſia: thirteen miles ſouth Frankfort on the Oder.

FUR'STENBERG, a town of Germany, in the circle of Upper Saxony, and duchy of Mecklenburg, on the Havel: ten miles ſouth-eaſt of Strelitz.

FUR'STENBERG (Ferdinand de), an eminent prelate, deſcended from the free barons of that name in Weſtphalia, and born at Bilſtein in 1626. He ſtudied at Cologne, where he contracted an intimate friendſhip with the nuncio Chigi, who, upon his return to Rome, and elevation to the cardinalate, invited Furſtenberg to reſide with him. When ſeated in the papal chair by the name of Alexander VII. he conferred ſeveral benefices on him, and by his recommendation procured his election to the biſhopric of Paderborn, in 1661. The high reputation Furſtenberg acquired in this ſtation cauſed him to be appointed by the famous biſhop of Munſter, Van Galen, his coadjutor; and upon the death of that prelate, in 1678, he ſucceeded to the ſee, and was declared by the pope apoſtolical vicar of all the north of Europe. He ſhewed himſelf worthy of this truſt by extraordinary zeal in making converts, which he carried ſo far as to ſupport conſiderable foundations for the propagation of the catholic religion in China and Japan. At the ſame time he did not neglect the cultivation of the belles-lettres, either by his own efforts, or thoſe of many learned men whom he patroniſed. He collected a number of manuſcripts and monuments of antiquity, and gave to the world a valuable work relative to theſe objects, entitled *Monumenta Paderbornenſia, Amſt.* 1672, 4to. He alſo printed at Rome a collection of Latin poems, under the title of *Septem Virorum illuſtrium Poemata*, which contained ſeveral of his own, written with much purity. He died in 1683. Soon after his death a magnificent edition of his Latin poems was written at the Louvre, at the expence of the king of France.

FUR'STENECK, a town and caſtle of Germany, in the circle of the Upper Rhine, and biſhopric of Fulda: thirteen miles north of Fulda.

FUR'STENFELD, a town of Germany, in the duchy of Stiria, ſituated on the confines of Hungary, near the conflux of the rivers Feiſtritz and Laufnitz: thirty miles eaſt of Gratz, and ſixty-eight ſouth of Vienna. Lat. 47. 6. N. lon. 34. 6. E. Ferro.

FUR'STENFELD, a town of Germany, in the circle of Upper Saxony, and New Mark of Brandenberg: ten miles north of Coſtrin.

FUR'STENWALDE, a town of Germany, in the circle of Upper Saxony, and Middle-Mark of Brandenberg: twenty-ſix miles eaſt of Berlin, and twenty weſt of Frankfort on the Oder.

FUR'STENWALDE, a town of Germany, in the circle of Upper Saxony, and marggraviate of Meiſſen: two miles ſouth of Lauenſtein.

FUR'STENWERDER, a town of Germany, in the circle of Upper Saxony, between the Damſee and Wahrenſee, in the Ucker Mark of Brandenburg: ten miles weſt-north-weſt of Prenzlow.

FURT, a town of Germany, in the circle of Lower Bavaria, on the Champl: fifty-ſix miles north-north-weſt of Paſſau, and eighty-ſix north-north-eaſt of Munich. Lat. 49. 13. N. lon. 30. 32. E. Ferro.

FURTH, a town of Germany, in the circle of the Lower Rhine, and electorate of Mentz: ſix miles ſouth-eaſt of Heppenheim.

FURTH, a town of Germany, in the circle of Franconia, and principality of Anſpach, on the Rednitz; large and well peopled, with a great number of artiſans. The Jews have a ſynagogue and a printing-office: four miles weſt of Nuremberg.

FUR'THER, *ad.* [from *forth*, not from *far*, as is commonly imagined; *forth*, *further*, *furtheſt*, corrupted from *forther*, *fortheſt*, forðer, Sax. *Forther* is uſed by Sir Thomas More. See FORTH and FARTHER, of which the examples are to be referred to this word.] At a greater diſtance. Beyond this.—What *further* need have we of witneſſes? *Matth.* xxvi. 65.

Satan had journey'd on, penſive and ſlow:
But *further* way found none, ſo thick intwin'd,
As one continu'd brake, the undergrowth
Of ſhrubs and tangling buſhes had perplex'd
All path of man or beaſt that paſs'd that way. *Milton.*

Further has in ſome ſort the force of a ſubſtantive in the phraſe *no further*, for *nothing further*:

Let this appeaſe
Thy doubt, ſince human reach *no further* knows. *Milton.*
And now *what further* ſhall enſue behold. *Milton.*

FUR'THER, *adv.* [from *forth.*] To a greater diſtance.—And the angel of the Lord went *further*, and ſtood in a narrow place. *Numb.* xxii. 26.

To FUR'THER, *v. a.* [from the adverb; ꝑonꝺꝑian, Sax.] To put onward; to forward; to promote; to countenance; to aſſiſt; to help.—Grant not, O Lord, the deſires of the wicked: *further* not his wicked device. *Pſ.* cxl. 8.

Things thus ſet in order, in quiet and reſt,
Shall *further* thy harveſt, and pleaſure thee beſt. *Tuſſer.*

FUR'THERANCE, *ſ.* [from *further.*] Promotion; advancement; help.—Our diligence muſt ſearch out all helps and *furtherances* of direction, which ſcriptures, councils, fathers, hiſtories, the laws and practices of all churches afford. *Hooker.*

Cannot my body, nor blood ſacrifice,
Intreat you to your wonted *furtherance?* *Shakeſpeare.*

FUR'THERER, *ſ.* [from *further.*] Promoter; advancer.—That earneſt favourer and *furtherer* of God's true religion, that faithful ſervitor to his prince and country. *Aſcham.*

FUR'THERMORE, *adv.* Moreover; beſides:

This ring I do accept moſt thankfully,
And ſo, I pray you, tell him: *furthermore*,
I pray you, ſhew my youth old Shylock's houſe. *Shakeſ.*

FUR'THEST, *adv.* The ſuperlative of *forth.*—The *furtheſt* a prudent man ſhould proceed in general is to laugh at ſome of his own foibles. *Shenſtone.*

FUR'TIVE, *adj.* [*furtive*, Fr. *furtivus*, Lat.] Stolen; gotten by theft:

Or do they, as your ſchemes, I think, have ſhown,
Dart *furtive* beams and glory not their own,
All ſervants to that ſource of light, the ſun? *Prior.*

FU'RUM, a ſmall iſland in the Baltic, near the eaſt coaſt of Sweden. Lat. 57. 17. N. lon. 16. 32. E. Greenwich.

FU'RUNCLE, *ſ.* [*furoncle*, Fr. *furunculus*, Lat.] A bile; an angry puſtule.—A *furuncle* is in its beginning round, hard, and inflamed; and as it increaſeth, it riſeth up with an acute head, and ſometimes a puſtule; and then it is more inflamed and painful, when it arrives at its ſtate, which is about the eighth or ninth day. *Wiſeman.*

FURUSU'ND, an iſland of Sweden, in the Baltic. Lat. 59. 46. lon. 18. 45. E. Greenwich.

FU'RY, *ſ.* [*furor*, Lat. *fureur*, Fr.] Madneſs:

It is a tale
Told by an ideot; full of ſound and *fury*,
Signifying nothing. *Shakeſpeare.*

Rage; paſſion of anger; tumult of mind approaching to madneſs.—He hath given me to know the natures of living creatures, and the *furies* of wild beaſts. *Wiſd.* vii. 20.

I do oppoſe my patience to his *fury*; and am arm'd
To ſuffer with a quietneſs of ſpirit
The very tyranny and rage of his. *Shakeſpeare.*

Enthuſiaſm; exaltation of fancy:

Greater than human kind ſhe ſeem'd to look,
And with an accent more than mortal ſpoke;
Her ſtaring eyes with ſparkling *fury* roll,
When all the god came ruſhing on her ſoul. *Dryden.*

[From *furia*, Lat.] One of the deities of vengeance, and thence a ſtormy, turbulent, violent, raging woman.—The ſight of any of the houſe of York, as a *fury* to torment my ſoul. *Shakeſpeare.*

FURZE, *ſ.* [ꝼyꝛꝛ, Sax. *geniſta ſpinoſa*, Lat.] Gorſe; goſs. In botany: ſee ULEX.—For fewel, there groweth great ſtore of *furze*, of which the ſhrubby ſort is called tame, and the better grown French. *Carew.*

We may know,
And when to reap the grain, and when to ſow,
Or when to fell the *furzes*. *Dryden.*

FUR'ZEBUSH, *ſ.* A buſh of furze.
FUR'ZES, *ſ. plu.* Furze-buſhes. *Dryden.*
FUR'ZIN, *ſ. plu.* Furze-buſhes. *Tuſſer.*
FUR'ZY, *adj.* [from *furze.*] Overgrown with furze; full of gorſe:

Wide through the *furzy* field their route they take,
Their bleeding boſoms force the thorny brake. *Gay.*

FUSA'NUS, *ſ.* [*fuſain*, the French name for *euonymus* or ſpindle-tree.] In botany, a genus of the claſs polygamia, order monoecia, natural order of elæagni. The generic characters are—I. Hermaphrodite. Calyx: perianth one-leafed, turbinate; half-five-cleft (four-cleft, Berg.) clefts ovate-acute, from flat ſpreading, with the tips gibboſe-uncinate, ſomewhat concave. Corolla: none. Stamina: filaments four, linear, grooved in the middle, a little longer than the germ, inſerted into the calyx near it, and occupying the ſinus of it. Antheræ roundiſh, compreſſed, four-lobed, erect. Piſtillum: germ large, turbinate, almoſt inferior; wide at top, from flat ſomewhat concave, ſtriated, quadrangular, with four hollowed ſinuſes, each on each ſide of the germ ſolitary. Style thick, very ſhort, ſubquadrangular. Stigmas four, obtuſe cruciform, ſmall. Pericarpium: a drupe. II. Male. Calyx, &c. as in the hermaphrodite, but the fruit abortive.—*Eſſential Character.* Hermaphrodite. Calyx, five cleft; corolla, none; ſtamina, four; germ inferior; ſtigmas four. Male. Calyx, &c. of the former. Fruit abortive.

Fuſanus compreſſus, or flat ſtalked fuſanus, a ſingle ſpecies. This is a tree, with compreſſed and ancipital branches. Leaves oppoſite, obovate, blunt with a point, flat, quite entire, ſmooth, on ſhort petioles; racemes from the axils of the branches, erect, compreſſed, ſcarcely longer than the leaves. The number of parts in the flower four or five. The fruitful tree has a three-leaved involucre at the baſe of the germ with five glands. According to Juſſieu, it is a glaucous ſhrub, with oppoſite branches: the leaves are ſuboppoſite, entire, and ſcarcely nerved; the flowers ſmall, in terminating panicles, ſome of them five-cleft, and moſtly males. The younger Linnæus ſees no neceſſity for ſeparating it from the Theſiums. Juſſieu doubts whether it may not be more nearly allied to the Rhamni. Native of the Cape of Good Hope; introduced in 1766, by Mr. Francis Maſſon. It may be increaſed by cuttings, planted early in the ſummer in a good loamy earth, in pots, ſet in a glaſs-caſe or hot-bed, ſhaded and watered gently till they have ſtruck root.

FU'SAROLE, *ſ.* in architecture, a ſmall round member cut in form of a collar, with oval beads, under the echinus, or quarter-round, in the doric, ionic, and compoſite, capitals.

FUSCA'TION, *ſ.* [*fuſcus*, Lat.] The act of darkening or obſcuring.

To FUSE, *v. a.* [*fundo*, *fuſum*, Lat.] To melt; to put into fuſion; to liquefy by heat.

To FUSE, *v. n.* To be melted; to be capable of being liquefied by heat.

FUSE, *ſ.* of a bomb or granado ſhell, is that which makes the whole powder or compoſition in the ſhell take fire, to do the deſigned execution. 'Tis uſually a wooden pipe or tap filled with wildfire, or ſome ſuch matter; and is intended to burn no longer than is the time of the motion of the bomb from the mouth of the mortar to the place where it is to fall, which time Anderſon makes twenty-ſeven ſeconds. *Harris.*

FU'SEE, *ſ.* [*fuſeau*, Fr.] The cone round which is wound the cord or chain of a clock or watch.—The reaſon of the motion of the balance is by the motion of the next wheel, and that by the motion of the next, and that by

by the motion of the *fuſee*, and that by the motion of the ſpring: the whole frame of the watch carries a reaſonableneſs in it, the paſſive impreſſion of the intellectual idea that was in the artiſt. *Hale.*—A firelock, [from *fuſil*, Fr.] a ſmall neat muſquet. This is more properly written *fuſil*.

FU'SEE, *ſ.* Track of a buck. *Ainſworth.*

FU'SI (Anthony), a French catholic prieſt, born in Lorrain, towards the end of the ſixteenth century. He entered young among the Jeſuits, but did not continue long in their connection. Afterwards he purſued his ſtudies in the univerſity of Lorrain, where he took his degrees in theology, and then removed to Paris, where he received the bonnet of doctor from the faculty of the Sorbonne. In that city he was preferred to the benefice of St. Bartholomew, with the annexed cures of St. Leu and St. Giles; and he had alſo the appointments of apoſtolical prothonotary, and of preacher and confeſſor in the royal houſehold. He appears to have indulged a greater liberality of opinion than could be tolerated by bigoted catholics, and to have advanced ſentiments concerning the ſalvation of children who died without baptiſm, and on other topics, which were made the ſubjects of complaint againſt him before his eccleſiaſtical ſuperiors. Fuſi was alſo an enemy to perſecution for conſcience ſake, and freely expoſed to his pariſhioners the iniquity and folly of attempting to make converts to truth by force and violence, urging them, by deeds of chriſtian charity, and their own exemplary lives, to invite deluded wanderers into the pale of the church. He entertained, however, a thorough diſlike to the Jeſuits, and would never ſuffer any of that fraternity to enter his pulpit; with that formidable and revengeful body, therefore, he became an object of deep reſentment, and they reſolved to ruin him. By their management the churchwardens of St. Leu were induced to inſtitute a criminal proceſs againſt him in 1609, in which they accuſed him of lewdneſs, hereſy, and witchcraft. While the ſuit was pending, a ſatirical piece, entitled *Le Maſtigophore, ou Precurſeur de Zodiaque, &c.* made its appearance, intended to ridicule Nicholas Vivian, firſt churchwarden of St. Leu, and the principal inſtrument in carrying on the proceſs againſt Fuſi. This piece being attributed to Fuſi, Vivian commenced a proſecution againſt him as the author, and having obtained a decree of arreſt, he ſent him to the priſon of the Chatelet, in 1612. His cauſe was tried in the biſhop's court, where he was pronounced guilty of the libel, and of hereſy; and was alſo adjudged to be deprived of his benefices, interdicted from the diſcharge of any eccleſiaſtical function, and to make reparation to Vivian. Againſt this ſentence he appealed to the parliament; but there it was confirmed by an arrêt in the ſame year. At length, after remaining in different priſons between four and five years, and making ſatisfaction to Vivian, he was ſet at liberty; upon which he withdrew to Geneva, where he embraced the proteſtant religion in 1619. The time of his death is uncertain. Beſides the Maſtigophore, he was the author of an account of his caſe, entitled *Factum pour M. Antoine Fuſi, Docteur en Theologie, &c.* 8vo. and of a large volume in octavo, 1619, employed in deſcribing the abuſes and crimes of the church of Rome. This work was entitled *Le Franc Archer de la vraie Egliſe, contre les Abus & Enormités de la fauſſe, par noble Antoine Fuſi, jadis Protonotaire-apoſtolique, Docteur Sorboniſte, Predicateur & Confeſſeur de la Maiſon du Roi, Curé des Egliſes, &c.* Prefixed to it is *Au Roi de la Grande-Bretagne, Jacques I. Remonſtrance apologétique ſur Enormités & Abus demeſurés, Attentats & Inhumanités, du Chef de la fauſſe Egliſe & de ſes Suppots, contre les vrais & legitimes Enfans de la Vraie.*

FU'SIBLE, *adj.* Capable of being melted; capable of being made liquid by heat.—Colours afforded by metalline bodies, either colliquate with, or otherwiſe penetrate into, other bodies, eſpecially *fuſible* ones. *Boyle.*

FUSIBI'LITY, *ſ.* Capacity of being melted; quality of growing liquid by heat.—The bodies of moſt uſe, that are fought for out of the depths of the earth, are the metals, which are diſtinguiſhed from other bodies by their weight, *fuſibility*, and malleableneſs. *Locke.*

FU'SILE, *adj.* [*fuſile*, Fr. *fuſilis*, Lat.] Capable of being melted; liquefiable by heat.—Some, leſs ſkilful, fancy theſe ſcapi that occur in moſt of the larger gothic buildings of England are artificial; and will have it, that they are a kind of *fuſile* marble. *Woodward.*—Running by the force of heat:

Perpetual flames,
O'er ſand and aſhes, and the ſtubborn flint,
Prevailing, turn into a *fuſile* ſea. *Philips.*

FU'SIL, *ſ.* [*fuſil*, Fr.] A firelock; a ſmall neat muſquet. [In heraldry; from *fuſus*, Lat.] Something like a ſpindle.—*Fuſils* muſt be made long, and ſmall in the middle, in the ancient coat of Montague, argent three *fuſils* in feſſe gules. *Peacham.*

FUSILI'ER, *ſ.* A ſoldier armed with a fuſil; a muſketeer.

FU'SION, *ſ.* [*fuſio*, Lat. *fuſion*, Fr.] The act of melting. The ſtate of being melted, or of running with heat.—Metals in *fuſion* do not flame for want of a copious fume, except ſpelter, which fumes copiouſly, and thereby flames. *Newton.*

The origin of the art of fuſing metals, is carried back by Mr. Bryant to the remote era of the Cyclopians. "The Idæi Dactyli, (ſays he,) were Cyclopians; and they are ſaid to have firſt forged metals, and to have reduced them to common uſe; the knowledge of which art they obtained from the fuſion of minerals at the burning of mount Ida. From this event the Curetes, and Corybantes, who were the ſame as the Idæi Dactyli, are ſuppoſed to have learnt the myſtery of fuſing and forging metals."

FUSS, *ſ.* A tumult; a buſtle. *A low cant word:*

End as it befits your ſtation;
Come to uſe and application;
Nor with ſenates keep a *fuſs:*
I ſubmit, and anſwer thus. *Swift.*

FUST, *ſ.* [*fuſte*, Fr.] The trunk or body of a column. A ſtrong ſmell, as that of a mouldy barrel.

To FUST, *v. n.* To grow mouldy; to ſmell ill.

FUS'TIAN, *ſ.* [*futaine*, Fr. from *fuſte*, a tree, becauſe cotton grows on trees.] A kind of cloth made of linen and cotton, and perhaps now of cotton only.—Is ſupper ready, the houſe trimm'd, the ſervingmen in their new *fuſtian*, and their white ſtockings? *Shakeſpeare.*—A high ſwelling kind of writing, made up of heterogeneous parts, or of words and ideas ill aſſociated; bombaſt.—*Fuſtian* is thoughts and words ill ſorted, and without the leaſt relation to each other. *Dryden.*

Chance thoughts, when govern'd by the cloſe,
Oft riſe to *fuſtian*, or deſcend to proſe. *Smith.*

By the law of England, no perſon ſhall dreſs fuſtians with any other inſtrument than the broad ſheers, under the penalty of twenty ſhillings. And the maſter and wardens of the company of clothworkers in London, &c. have power to ſearch the workmanſhip of ſheermen, as well for fuſtian, as cloth. 11 *Hen.* VII. c. 27. 39 *Eliz.* c. 13.

FUS'TIAN, *adj.* Made of fuſtian. Swelling; unnaturally pompous; ridiculouſly tumid. Uſed of ſtile.—Virgil, if he could have ſeen the firſt verſes of the Sylvæ, would have thought Statius mad in his *fuſtian* deſcription of the ſtatue on the brazen horſe. *Dryden.*

When men argue, th' greateſt part
O' th' conteſt falls on terms of art,
Until the *fuſtian* ſtuff be ſpent,
And then they fall to th' argument. *Hudibras.*

FUSIFORM, *adj.* [*fuſiformis*, from *fuſus*, Lat. a ſpindle.] In botany, it means a fuſiform or ſpindle-ſhaped root; ſimple, or generally ſo, tapering downwards to a point; as in raddiſh, carrot, parſnep. It applies alſo to the leaf, as in craſſula rubens, &c.

FUS'TIC,

FUS'TIC, *ſ.* A ſort of wood brought from the Weſt-Indies, uſed in dying of cloth. See MORUS.

To FUS'TIGATE, *v. a.* [*fuſtigo*, Lat.] To beat with a ſtick; to cane.

FUSTILA'RIAN, *ſ.* A low fellow; a ſtinkard. A word uſed by Shakeſpeare only.—Away, you ſcullion, you rampallian, you *fuſtilarian*: I'll tickle your cataſtrophe. *Shakeſpeare.*

FUS'TINESS, *ſ.* Mouldineſs; ſtink.

FUS'TY, *adj.* Ill-ſmelling; mouldy.—Hector ſhall have a great catch, if he knock out either of your brains: he were as good crack a *fuſty* nut with no kernel. *Shakeſp.*

FU'SURE, *ſ.* [*fuſura*, Lat.] The act of melting, the ſtate of being put into fuſion. *Scott. Not much uſed.*

FU'TAK, a town of Hungary, on the Danube, oppoſite Peter Wardein, ſituated in a plain, where the Imperialiſts had a camp in 1736: ſixteen miles ſouth-ſouth-eaſt of Bacs.

FU'TILE, *adj.* [*futile*, Fr. *futilis*, Lat.] Talkative; loquacious.—One *futile* perſon, that maketh it his glory to tell, will more hurt than many that know it their duty to conceal. *Bacon.*—Trifling; worthleſs; of no weight:

Scarce a ſouthern gale
Warm'd our chill air, unloaded with the threats
Of tyrant Rome, but *futile* all. *Shenſtone.*

FUTI'LITY, *ſ.* [*futilité*, Fr.] Talkativeneſs; loquacity.—This fable does not ſtrike ſo much at the *futility* of women, as at the incontinent levity of a prying humour. *L'Eſtrange.*—Triflingneſs; want of weight; want of ſolidity.—Trifling *futility* appears in their ſigns of the zodiac, and their mutual relations and aſpects. *Bentley.*

FUT'TOCKS, *ſ.* [corrupted from *foot-hooks*. *Skinner.*] The lower timbers that hold a ſhip together.

FU'TURE, *adj.* [*futurus*, Lat. *futur*, Fr.] That which will be hereafter; to come; as, the *future* ſtate:

Glory they ſung to the Moſt High! good will
To *future* men, and in their dwellings peace. *Milton.*

FU'TURE, *ſ.* Time to come; ſomewhat to happen hereafter.—The mind, once jaded by an attempt above its power, either is diſabled for the *future*, or elſe checks at any vigorous undertaking ever after. *Locke.*

Thy letters have tranſported me beyond
This ign'rant preſent time; and I feel now
The *future* in the inſtant. *Shakeſpeare.*

FU'TURE, or FUTURE TENSE, in grammar, denotes an inflexion of verbs, whereby they denote, that a thing will be in ſome time yet to come. See the article GRAMMAR.

FU'TURELY, *adv.* In time to come.—This preſcience of God, as it is preſcience, is not the cauſe of any thing *futurely* ſucceeding; neither doth God's aforeknowledge impoſe any neceſſity, or bind. *Raleigh.*

FUTURI'TION, *ſ.* The ſtate of being to be; the condition of being to come to paſs hereafter.—It is imaginable, that the great means of the world's redemption ſhould reſt only in the number of poſſibilities, and hang ſo looſe in reſpect of its *futurition*, as to leave the event in an equal poiſe, whether ever there ſhould be ſuch a thing or no? *South.*

FUTU'RITY, *ſ.* Time to come; events to come.—I will contrive ſome way to make it known to *futurity*, that I had your lordſhip for my patron. *Swift.*

Not my ſervice paſt, nor preſent ſorrows,
Nor purpos'd merit in *futurity*,
Can ranſom me. *Shakeſpeare.*

Event to come.—All *futurities* are naked before that all-ſeeing eye, the ſight of which is no more hindered by diſtance of time than the ſight of an angel can be determined by diſtance of place. *South.*

This, great Amphiarus, lay hid from thee,
Though ſkill'd in fate and dark *futurity*. *Pope.*

The ſtate of being to be; futurition.—It may be well reckoned among the bare poſſibilities, which never commence into a *futurity*; it requiring ſuch a free, ſedate, and intent, mind, as it may be, is no where found but among the platonical ideas. *Glanville.*

FUT'WAH, a town of Hindooſtan, in the country of Bengal: nine miles ſouth-eaſt of Patna.

FU'TY, *adj.* [ſuppoſed to be a corruption of *futile*.] Fooliſh, ſilly, talkative. *Scott. Not much uſed.*

FU'TY, *adj.* [*futier*, Fr.] Crafty, ſubtile. *Scott.*

FU'ZIR, a town of Hungary: twelve miles ſouth-ſouth-eaſt of Caſchan.

To FUZZ, *v. n.* [without etymology.] To fly out in ſmall particles.

FUZZ'BALL, *ſ.* A ſpecies of fungus which, when preſſed, burſts, and ſcatters duſt in the eyes.

FY, *interj.* [*fy*, French and Flemiſh; φεῦ, Gr. *vah*, Lat.] A word of blame and diſapprobation.—*Fy*, my lord, *fy!* a ſoldier, and afraid? What need we fear who knows it, when none call our power to account? *Shakeſp.*—*Fy*, madam, he cried, we muſt be paſt all theſe gaieties. *Tatler.*

But *fy*, my wand'ring muſe, how thou do'ſt ſtray!
Expectance calls thee now another way. *Milton.*

Nay, *fy*, what mean you in this open place?
Unhand me, or, I ſwear, I'll ſcratch your face:
Let go, for ſhame; you make me mad for ſpite:
My mouth's my own; and if you kiſs, I'll bite. *Dryden.*

FY'AL. See FAYAL.

FY'OT DE LA MARCHE (Claude), count de Boſjan, a French eccleſiaſtic, born at Dijon, in 1630. At twenty years of age he publicly maintained theological theſes in the college of the Jeſuits at Dijon, and was honoured by having Louis XIV. then in that city, among the number of his auditors. In 1662 that prince nominated him abbot of the collegiate church of St. Stephen, at Dijon; and he alſo created him his almoner, and prior of Notre Dame, at Portarlier on the Saone. In 1665 the abbots of the dioceſe of Langres conſtituted him their repreſentative in the eccleſiaſtical chamber at Langres; and in the ſame year the provincial aſſembly at Lyons nominated him a deputy of the ſecond order in the general aſſembly of the clergy of France, held at Paris, and at Pontoiſe. In 1668 the king gave him the rank of an honorary counſellor of the parliament of Dijon; and in the following year a brevet of counſellor of ſtate. He eſtabliſhed and endowed a ſeminary for the education of young eccleſiaſtics in his abbey, and proved himſelf in other reſpects a munificent benefactor to it. He died at Dijon in 1721, in the ninety-firſt year of his age. He was the author of ſeveral pious and devotional treatiſes; and alſo of A Hiſtory of the Abbey of St. Stephen, fol. 1696. This work is held in much eſtimation on account of the profound and curious reſearches which it contains relating to the antiquities of the city of Dijon.

FYR'DERING; FYR'THING; FYR'DUNG; [from fyrbeþunz, Sax. i. e. *expeditionis apparatus*.] In the ancient Britiſh cuſtoms, a going out to war, or a military expedition at the king's command; the not going upon which, when ſummoned, was puniſhed by fine at the king's pleaſure. *Leg. Hen.* I. c. 10.

FYRES, a river of Scotland, which runs into Loch Neſs, in the county of Inverneſs: ten miles north-eaſt of Fort Auguſtus. There is a conſiderable cataract, or fall, about two miles from its mouth.

The *Fall* of *Fyres* is conſidered as the grandeſt natural curioſity in the Highlands of Scotland. Mr. Lettice, in his Tour through Scotland, deſcribes it as follows: "The hollow way, leading through the cliffs, is called *Glenneagh*, famous for its wild and rugged ſcenery. As we laboriouſly approached the laſt acclivities, the roaring of unſeen waters increaſed upon the ear, and were decidedly thoſe of ſome tremendous cataract tumbling from a lofty precipice. A few minutes now brought us within ſight

ſight of the celebrated Fall of Fyres; a moſt majeſtic ſcene, the greateſt caſcade in the Highlands. After venturing at leaſt five hundred feet below the ſummit of the hill, we beheld this grand cataract in front, pouring down from the vaſt height above; but broken in its progreſs through the different ſtages of the rock. At the laſt ſtage but one, where the freedom of its paſſage was arreſted by a narrow channel in a cleft of the precipice, it grew furious and foaming from the obſtruction, till, at length delivered, it iſſued forth on a broad ſurface of rock juſt below, and, in one vaſt and voluminous ſheet, tumbled into the profound gulph with a momentum that ſhook the glen, and filled the circumambient ſpace with a continnal ſpray:

"Now rolling down the ſteep amain
Headlong, impetuous, ſee it pour!
The rocks and nodding groves rebellow to the roar.

"When we had re-aſcended the lofty hill, which from the bottom appeared all but perpendicular, we were led into a vaſt ſubterrain, beneath a neighbouring eminence, called the *Giant's Cave*; but, for want of light, we could not explore it ſufficiently to reward our curioſity. We were much more intereſted by the Little Fall of Fyres, which opened to us from a bridge, at no great diſtance from the great cataract. This has the character of a torrent, but owes its principal conſequence to the huge uncouth maſſes of rock which form its bed, and project above and on either ſide of it, with a ſolemn chaotic confuſion and ſavage magnificence."

FYTT (John), a celebrated painter, born at Antwerp about the year 1625. He painted in conjunction with Rubens and Jordaens. His general ſubjects were live and dead game, wild boars, dogs, fruits, flowers, and birds, particularly partridges, which he deſcribed with ſurpriſing truth. He likewiſe imitated ſucceſsfully the bas relieves on vaſes of marble or porphyry; and gave uncommon freſhneſs to his fruits and flowers; and in objects of the animal kind, he deſcribed the hairs of animals and the plumage of birds with wonderful ſpirit and freedom of pencil.

FYZABAD', a town of Hindooſtan, in the province of Oude, on the Gogra; founded by Sadatkhan, a Perſian, who was forty years governor of the province, near the ancient city of Oude. He firſt built a palace, with extenſive gardens, and made it the place of his reſidence; many houſes were added, till, by degrees, it became a large city, and for ſome time the capital of the province: it was defended with a fortreſs, a ditch, towers, ramparts, &c. Sixty-five miles eaſt of Lucknow, and eighty north of Allahabad. Lat. 26. 45. N. lon. 82. 24. E. Greenwich.

G.

G IS the ſeventh letter, and fifth conſonant, of the Engliſh alphabet; though in the alphabets of all the oriental languages, the Hebrew, Phenician, Chaldee, Syriac, Samaritan, Arabic, and even Greek, *G* is the third letter. The Hebrews call it *ghimel* or *gimel*, "camel;" on account of its reſemblance to the neck of that animal; and the ſame appellation it bears in the Samaritan, Phenician, and Chaldee: in the Syriac it is called *gamel*, in Arabic *giim*, and in Greek *gamma*. The gamma (Γ) is manifeſtly the gimel (ג) of the Hebrews or Samaritans: all the difference conſiſts in this, that the gamma is turned to the right, and the gimel to the left, according to the different modes of writing which obtained among thoſe different nations; hence all the pains Salmaſius has taken on Solinus, to prove that the G was derived from the Greek kappa, is loſt.

From the Greeks the Latins borrowed their form of this letter; the Latin G being certainly a corruption of the Greek gamma Γ, as is now clearly demonſtrated in Dr. Fry's "Pantographia;" as well as in many Greek and Latin MSS. ſhewing the progreſſive charges through which the letter paſſed from Γ to G. Diomed. lib. ii. cap. *De Litera*, calls G a new letter. His reaſon is, that the Romans had not introduced it before the firſt Punic war; as appears from the roſtral column erected by C. Duilius, on which we every where find a C in lieu of G. It was Sp. Carvilius who firſt diſtinguiſhed between thoſe two letters, and invented the figure of the G, as we are aſſured by Terentius Scaurus. The C ſerved very well for G; it being the third letter of the Latin alphabet, as the Γ or γ was of the Greek.

The G is found inſtead of C on ſeveral medals: *Vaillant, Num. Imperat.* tom. i. p. 39. M. Beger produces a medal of the *Familia Ogulnia*, where GAR is read inſtead of CAR, which is on thoſe of M. Patin. But the C is more frequently ſeen on medals in lieu of G; as, AUCUSTALIS CALLAECIA CARTACINENSIS, &c. for AUGUSTALIS, &c. Not that the pronunciation of thoſe words was altered, but only that the G was unartfully or negligently cut by the workmen: as is the caſe in divers inſcriptions of the eaſtern empire; where AUC, AUCC, AUCCC, are frequently found for AUG, &c.

The northern people frequently change the G into V or W; as in *Gallus, Wallus*; *Gallia, Wallia, Vallia*, &c. For in this inſtance it muſt not be ſaid that the French have changed the W into G; becauſe they wrote *Gallus* long before *Wallus* or *Wallia* was known, as appears from all the ancient Roman and Greek writers. And yet it is equally true, that the French change the W of the northern nations, and V conſonant, into G; as, *Willielmus*, "William," into *Guillaume*; *Wulphilas* into *Gulphilas*; *Vaſco* into *Gaſcon*, &c.

The letter G is of the mute claſs, and cannot be a y way ſounded without the help of a vowel. It is formed by the reflexion of the air againſt the palate, made by the tongue as the air paſſes out of the throat; which Martianus Capella expreſſes thus, G *ſpiritus cum palato*; ſo that G is a palatal letter. The modern G takes its form from that of the Latins. In Engliſh it has two ſounds, one from the Greek Γ, and the Latin, which is called that of the hard *G*, becauſe it is formed by a preſſure ſomewhat hard on the fore-part of the tongue againſt the upper gum; which ſound it retains before *a, o, u, l, r*; as *gate, go, gull*. At the end of a word it is always hard, as *ring, ſing*, &c. The other ſound, called that of the ſoft *G*, reſembles that of *j*; and is commonly, though not always, found before *e* and *i*, as in *geſture, giant*, &c. To this rule, however, there are many exceptions; *G* is often hard before *i*, as *give*, &c. and ſometimes before *e*, as *get*, &c. It is alſo hard in derivatives from words ending in *g*, as *ſinging, ſtronger*, &c. and generally before *er*, at the end of words, as *finger*. Before *n*, at the end of a word, *g* is commonly melted away; as in the French, from which theſe words are commonly derived: thus, from *benign, malign, condign*, we pronounce *benine, maline, condine*. It is often ſilent in the middle of the words before *h*; as, *might*. At the end of a word *gh* has often the ſound of *f*, as *laugh, rough, tough*. The Saxon Ȝ, ȝ, ſeems to have had generally the ſound of *y* conſonant; whence *gate* is by ruſtics ſtill pronounced *yate*. As a numeral, G was anciently uſed to denote 400; and with a daſh over it thus Ḡ, 40,000.

As an abbreviature, G. ſtands for *Gaius, Gellius, gens, genius*, &c. G. G. for *gemina, geſſit, geſſerunt*, &c. G. C. for *genio civitatis* or *Cæſaris*. G. L. for *Gaius libertus*, or *genio loci*. G. V. S. for *genio urbis ſacrum*. G. B. for *genio bono*. And G. T. for *genio tutelari*.

In muſic, G is the character or mark of the treble cleff;

and from its being placed at the head, or marking the firſt found in Guido's ſcale, the whole ſcale took the name *gamut*.

GA'AL, [געל, Heb. an abomination.] The ſon of Ebed.

GA'ARDE, a town of Norway, in the dioceſe of Aggerhuus: fifty-ſix miles north-weſt of Chriſtiana.

GA'ASH, a hill in Paleſtine, ſituated in the tribe of Ephraim; on the north ſide of which Joſhua the ſucceſſor of Moſes was buried. *Joſh.* xxiv. 30. *Judges* ii. 9. We read of the brooks of Gaaſh. 2 *Sam.* xxiii. 30. 1 *Chron.* xi. 32.

GA'BA or GAB'DES, a city of Paleſtine, ſituated in the tribe of Benjamin. *Joſh.* xviii. 24. 1 *Eſdr.* v. 20.

GABA'EL, a man's name.

GAB'ALA, a town of Arabia Felix: ſixty-four miles north-north-eaſt of Aden.

GABA'LE, in mythology, a deity worſhipped at Heliopolis under the figure of a lion, with a radiant head; and it is thus repreſented on many medals of Caracalla.

GABA'RA, or GAB'BARA, [from קבר *cabbar*, a ſepulchre, or גבר, Heb. *gabbar*, a man.] In antiquity, the dead bodies which the Egyptians embalmed, and kept in their houſes, eſpecially thoſe of ſuch of their friends as died with the reputation of great piety and holineſs, or as martyrs. See EMBALMING, vol. vi. p. 352.

GAB'ARAGE, *ſ.* Wrappers in which Iriſh goods are wrapped.

GABARD'INE, *ſ.* [*gavardina*, Ital.] A coarſe frock; any mean dreſs.—My beſt way is to creep under his *gabardine*; there is no other ſhelter hereabouts. *Shakeſpeare.*

You call me miſbeliever, cut-throat dog,
And ſpit upon my Jewiſh *gabardine*. *Shakeſpeare.*

GAB'ARET, a town of France, in the department of the Landes, and chief place of a canton, in the diſtrict of Mont de Marſan, on the Geliſe: five leagues weſt of Condom, and eight eaſt of Mont de Marſan.

GABARO'N, a bay on the ſouth-weſt of Louiſburg, in the iſland of Cape Breton.

GAB'AROUS BAY, a bay on the eaſt coaſt of the iſland of Cape Breton. Lat. 45. 50. N. lon. 60. W. Greenwich.

GABASEL'KI, a town of Ruſſia, in the government of Viborg: thirty ſix miles north of Serdopol.

GAB'ATHA, a man's name.

GABA'ZA, a town of Natolia, pleaſantly ſituated on the ſide of a hill, from the top of which is a fine proſpect of the Archipelago, and part of its numerous iſlands. The whole ſpace from the town to the ſea, which is about three miles, is entirely covered with gardens, orchards, and vineyards; the value of which is conſiderably enhanced by being in the vicinity of Scutari and Conſtantinople.

GAB'BATHA, [Heb. elevated.] The name of a place where Jeſus Chriſt received final ſentence of death. *John* xix. 13.

To GAB'BLE, *v. n.* [*gabbare*, Ital. *gabbaren*, Dut.] To make an inarticulate noiſe:

Flocks of fowl, that when the tempeſts roar,
With their hoarſe *gabbling* ſeek the ſilent ſhore. *Dryden.*

To prate loudly without meaning.—Have no wit, manners, nor honeſty, but to *gabble* like tinkers at this time of night? *Shakeſpeare.*

Which made ſome think, when he did *gabble*,
He had heard three labourers of Babel. *Hudibras.*

GAB'BLE, *ſ.* Inarticulate noiſe like that of brute animals.—Not to know what we ſpeak one to another, ſo we ſeem to know, is to know ſtraight our purpoſe: chough's language, *gabble* enough, and good enough. *Shakeſpeare.*—Loud talk without meaning:

Forthwith a hideous *gabble* riſes loud
Among the builders; each to other calls,
Not underſtood. *Milton.*

GAB'BLER, *ſ.* A prater; a chattering fellow.

GA'BEL, *ſ.* [*gabelle*, Fr. *gabella*, Ital. gabel, Sax. a tribute.] An exciſe; a tax. This word had the ſame ſignification among our ancient writers, as *gabelle* had formerly in France; and the term has been variouſly uſed; as for rent, cuſtom, ſervice, &c. Where it was a payment of rent, thoſe who paid it were termed *gablatores*. *Co. Lit.* 213. It is by ſome authors diſtinguiſhed from tribute; *gabel* being a tax on moveables, tribute on immoveables. When the word was formerly uſed in France without any addition to it, it ſignified the *tax on ſalt*; though afterwards it was applied to all other taxes. —The *gabels* of Naples are very high on oil, wine, and tobacco. *Addiſon.*

GA'BEL, a town of Bohemia, in the circle of Boleſlaw, where prince Henry entered Bohemia, after having gained an advantage over the Auſtrians in the month of July, 1778: nine miles north-north-eaſt of Leypa, and forty-five north of Prague.

GA'BERSTORF, a town of Germany, in the duchy of Stiria: ten miles weſt-ſouth-weſt of Gnaa.

GA'BES. See CABES.

GA'BIAN, a village of France, in the department of the Herault, with a mineral ſpring; near it from a rock iſſues petroleum, or native tar: ſeven miles north-weſt of Pezenas.

GA'BII, in ancient geography, a city of the Volſci, now extinct, taken by the artifice of Sextus, the ſon of Tarquin, who gained the confidence of the inhabitants, by deſerting to them, and pretending that his father had ill-treated him. Romulus and Remus were educated there, as it was the cuſtom at that time to ſend there the young nobility, and Juno was the chief deity of the place. The inhabitants had a peculiar mode of tucking up their dreſs, whence *Gabinus cinctus*. *Virgil.*

GA'BIN, a town of Poland, in the palatinate of Rawa: forty miles weſt of Warſaw.

GABIN'DA, or KAPINDA, a town of Africa, in the kingdom of Loango.

GABIN'IAN LAWS, in Roman antiquity, laws inſtituted upon ſeveral occaſions by perſons of the name of *Gabinius*. The firſt was the *Gabinia lex de Comitiis*, by A. Gabinius the tribune, in the year of Rome 614. It required that in the public aſſemblies for electing magiſtrates, the votes ſhould be given by tablets, and not *vivâ voce*. Another, *de Comitiis*, which made it a capital puniſhment to convene any clandeſtine aſſembly, agreeable to the old law of the twelve tables. Another, *de Militiâ*, by A. Gabinius the tribune, year of Rome 685. It granted Pompey the power of carrying on the war againſt the pirates during three years, and of obliging all kings, governors, and ſtates, to ſupply him with the neceſſaries he wanted, over all the Mediterranean ſea, and in the maritime provinces as far as 400 ſtadia from the ſea. Another, *de Uſurâ*, by Aul. Gabinius the tribune, year of Rome 685. It ordained that no action ſhould be granted for the recovery of money borrowed upon ſmall intereſt to be lent upon larger. This was an uſual practice at Rome, which obtained the name of *verſuram facere*. Another againſt fornication. See the article ROME.

GABIN'IUS (Aulus), a Roman chief, who arrived at the conſulate before Chriſt 58; and in the next year, through the intrigues of Clodius, obtained the government of the rich province of Syria. After exhauſting that unhappy country by his oppreſſions, he carried his arms into Judea againſt Alexander, ſon of Ariſtobulus, whom he reduced to ſue for peace; and he re-eſtabliſhed Hyrcan in the dignity of pontiff, and regulated the government of that country to his own mind. He next, upon promiſe of a large ſum, agreed to replace on the throne of Parthia, Mithridates, who had been expelled by his brother Orodes. He had croſſed the Euphrates upon this expedition, when he was overtaken by Ptolemy Auletes king of Egypt, who, on Pompey's recommendation, came to perſuade Gabinius to undertake his re-eſtabliſhment in his kingdom, then uſurped by his ſon-in-law, Archelaus. The Roman chief, for the enormous bribe

of

of ten thouſand talents, made no ſcruple of deſerting Mithridates; and though it was contrary to an expreſs law for a governor to march out of his province or engage in a new war without the conſent of the ſenate, yet, confiding in the friendſhip of Pompey, he proceeded with his army towards Egypt. He diſpatched his general of the horſe, Mark Antony, to ſecure the paſſes, and following into the heart of the country, gave Archelaus a total defeat, and took him priſoner. For a large ranſom he ſuffered him to eſcape; but the ambition of the young prince induced him again to take up arms, and he ſtood a long ſiege in Alexandria. At length he was ſlain in battle, and Ptolemy Auletes was quietly ſeated on his throne. In the mean time Gabinius was accuſed at Rome of high crimes and miſdemeanors, and Cicero employed his powerful eloquence againſt him, as one who had diſgraced the Roman name. Such was the indignation excited among the people, that he would have been condemned in his abſence, had he not been ſcreened by Pompey and Craſſus. Gabinius returned to Rome, B. C. 54, and was impeached of high-treaſon, of which charge he was acquitted by a ſmall majority. He was then tried for corruption and extortion, and was condemned to perpetual baniſhment. He expended his ill-gotten wealth in bribes to his advocates and judges, and lived abroad in poverty and obſcurity, till the breaking out of the civil war between Cæſar and Pompey. The former of theſe generals, knowing his military talents, made him one of his lieutenants. In this quality, marching through Illyricum, he was defeated with great loſs by the people of the province, and compelled to take refuge in Salona. There, after contending ſome months againſt great diſtreſs, he died of remorſe and grief, unpitied and unlamented, even by thoſe he had endeavoured to ſerve.

GA'BION, *ſ.* [French.] A wicker baſket which is filled with earth to make a fortification or intrenchment. —His battery was defended all along with *gabions*, and caſks filled with ſand. *Knolles.*—See the article FORTIFICATION, vol. vii. p. 592.

GABIONA'DE, *ſ.* A bulwark made with *gabions*.

GA'BISE, a town of Aſiatic Turkey, in the province of Natolia: twenty-eight miles ſouth-eaſt of Conſtantinople.

GA'BLE, *ſ.* [*gaval*, Welſh; *gable*, Fr.] A triangular end of a building carried up (perpendicularly in front) to the ridge of the roof.—Take care, that all your brick-work be covered with the tiling, according to the new way of building, without *gable* ends, which are very heavy, and very apt to let the water into the brick-work. *Mortimer.*

GA'BLE-END FO'RELAND, a cape on the eaſt coaſt of the northern iſland of New Zealand, in the South Pacific Ocean. Lat. 38. 15. S.

GABLEN'Z, a town of Germany, in the circle of Upper Saxony, and circle of Erzgeburg: ſix miles north-north-weſt of Zwickau.

GAB'LOCKS, *ſ.* Falſe ſpurs for fighting cocks, of ſteel, ſilver, &c.

GA'BON, a river of Africa, which runs into the Atlantic, near Cape St. Clara. It gives name to a country through which it paſſes.

GABO'RI, a bay on the ſouth-eaſt coaſt of Cape Breton iſland. The entrance into it, which is not more than twenty leagues from the iſles of St. Pierre, is between iſlands and rocks about a league in breadth. The bay is two leagues deep, and affords good anchorage.

GABOU', or JABOU, a country of Africa, between Benin and Dahomy, about 150 miles from the coaſt; the chief trade is in ſlaves.

GABRANTO'VICI, a people who anciently inhabited ſome part of Yorkſhire.

GA'BRES, or GAYRES, a religious ſect in Perſia and India; called alſo *Gebres*, *Guebres*, *Gaurs*, *&c.* The Turks call the Chriſtians *gabres*, *i. e.* infidels, or people of a falſe religion; the word *gabre*, among the Turks, having the ſame ſignification as *pagan* among the Chriſtians. In Perſia the word has a more peculiar ſignification; being applied to a ſect diſperſed through the country, and ſaid to be the remains of the ancient Perſians or followers of Zoroaſter, the worſhippers of fire. They have a ſuburb at Iſpahan, which is called *Gaurabad*, or "the town of the *Gaurs*," where they are employed in the meaneſt drudgery: ſome of them are diſperſed through other parts of Perſia; but they principally abound in Kerman. Some of them fled many ages ago into India, and ſettled about Surat, where their poſterity remain to this day. There is alſo a colony of them at Bombay. They are a poor, ignorant, inoffenſive people, extremely ſuperſtitious, but honeſt in their dealings.

GABRIAC', a town of France, in the department of the Aveiron, and chief place of a canton, in the diſtrict of St. Genies: four leagues north-eaſt of Rhodez.

GA'BRIEL, [גבריאל of גבר a mighty one, and אל God, Heb. *i. e.* the ſtrength of God.] The archangel placed, in the Jewiſh Talmud, at the head of the ſecond order of the celeſtial hierarchy. See the article ANGEL, vol. i. p. 693–696. A proper name of men.

GA'BRIEL (Giles de), a franciſcan monk, native of Liege, who was admitted licentiate of the univerſity of Louvain, ordained prieſt, appointed definitor-general of his order, and apoſtolic-commiſſary in the Netherlands. He was the author of ſeveral theological works, in which he inculcates a very ſevere and rigid morality. Among other pieces he publiſhed at Bruſſels, in 1675, a book entitled *Specimina Moralis Chriſtianæ & Moralis Diabolicæ*, or Specimens of Chriſtian Morality and of Diabolical Morality, 8vo. This extraordinary title excited an alarm at the court of Rome, whither the author was obliged to repair in order to juſtify himſelf, while his book was prohibited till it ſhould undergo a ſtrict examination. When it had paſſed the ordeal, and received ſome corrections, it was permitted to be reprinted by the author at Rome, in 1680, under the title of *Specimina Moralia*; but it was afterwards publiſhed at Lyons in its original form, and with its original title, in 1683, 12mo. A French tranſlation from the Roman edition, reviſed, corrected, and enlarged, made its appearance in 1680, entitled *Les Eſſais de la Théologie Morale*, *&c.* 12mo.

GA'BRIEL-SEVE'RUS, a Greek prelate, native of Monembaſia, in Peloponneſus. He was conſecrated biſhop of Philadelphia at Conſtantinople in 1577, by the patriarch Jeremy; but finding the Greeks in that dioceſe to be few in number, he removed to Venice, where he exerciſed the archiepiſcopal functions over the members of his communion in the territories of that republic. In that city he publiſhed, in the Greek language, a treatiſe on the Sacraments, a defence of the Greek church againſt the terms of the union enjoined by the council of Florence, and other treatiſes on the rites of the Greek church. They were publiſhed in a collective form at Paris, in 1671, by Richard Simon, under the title of *Fides Eccleſiæ Orientalis*, *ſeu Gabrielis Metropolitæ Philadelphienſis Opuſcula*, in 4to.

GA'BRIEL-SIONI'TA, a learned Maronite, profeſſor of the Syriac and Arabic languages at Rome, whence he was induced to proceed to Paris to take a part in editing the magnificent Polyglot Bible, publiſhed by M. Le Jay. He carried with him Syriac and Arabic verſions of the Bible, tranſcribed by himſelf from MSS. at Rome, to which, with incredible labour, he added the vowel points as they were afterwards printed, and which did not exiſt in the writings from which he took his tranſcripts. He was appointed profeſſor-royal of the Syriac and Arabic languages at Paris, and was highly eſteemed and much employed by the learned world as a tutor in them. He died in that city in 1648. Walton, in the Engliſh Polyglot, has copied the verſions introduced by Sionita. Beſides his labours on the Bible, he alſo publiſhed tranſlations of other Arabic works, and an Arabic geography, entitled *Geographia Nubienſis*, 4to. 1619.

GA'BRIEL, a mountain of Ireland, in the county of Cork: twelve miles fouth of Bantry.

GA'BRIEL, an iſland in the great river La Plata, South America, diſcovered by Sebaſtian Cabot, in 1526.

GA'BRIELITES, in eccleſiaſtical hiſtory, a ſect of anabaptiſts that appeared in Pomerania in 1530. They derive their name from Gabriel Scherling; who, after having been for ſome time tolerated in that country, was obliged to remove, and died in Poland.

GABRI'NI (Nicholas), commonly known under the name of *Rienzi*, born at Rome, in the fourteenth century. His father was a tavern keeper in a quarter of the city inhabited by the loweſt of the populace. As his name was Lorenzo, by contraction Rienzo, the ſon was uſually called Nicolo di Rienzo. He received a literary education, and early diſtinguiſhed himſelf by the elevation of his ſentiments. The glories of ancient Rome, compared with its preſent abject ſtate, deſerted for Avignon by the pontiffs, and oppreſſed by the lawleſs ſway of its nobles, appear to have excited a real enthuſiaſm in his breaſt. The common people were accuſtomed to regard him as an extraordinary perſon, deſtined to redreſs thoſe wrongs of which they were deeply ſenſible; and even the ſuperior ranks viewed him with reſpect for his knowledge and talents. He obtained the poſt of a public ſcribe; and in 1346, he was joined in a deputation from the Romans to pope Clement VI. at Avignon, for the purpoſe of exhorting him to bring back the papal court to its original ſeat. On this occaſion he ſpoke with ſo much force and freedom, and painted in ſuch ſtrong colours the inſolences and oppreſſions of the nobles, that he excited a high idea of his character. The pope created him an apoſtolic notary, but gave no explicit reply to the deputies. Rienzi, upon his return, entered upon the exerciſe of his office, which he diſcharged with a probity that added to his reputation; at the ſame time he was attentive to foment the diſcontents of the people by harangues againſt the nobility, and againſt the abuſes in the public adminiſtration. Having thus prepared men's minds for a change, and engaged many perſons of all orders in his deſigns, in the month of April, 1347, during the abſence of the governor of Rome, Stephen Colonna, he ſummoned a ſecret aſſembly upon mount Aventine, before which he made an energetic ſpeech, deſcribing the wretchedneſs and degradation into which the chriſtian capital was fallen, and from which nothing but the efforts of its own citizens could raiſe it. He then cauſed them all to ſubſcribe an oath for the eſtabliſhment of the *good eſtate*. He had the addreſs to gain over the pope's vicar to his purpoſes; and at a ſecond aſſembly in the capitol he produced fifteen articles as the baſis of the good eſtate, which were unanimouſly approved; and the people conferred upon him the title of tribune, with power of life and death, and all the other attributes of ſovereignty. The governor Colonna, upon his return, threatened him with puniſhment, but was himſelf conſtrained to leave the city; and Rienzi baniſhed with him the principal noble families of Rome, after capitally puniſhing ſeveral who were convicted of oppreſſion and other crimes. In the firſt exerciſe of his authority he conducted himſelf with ſtrict regard to juſtice and the public good. He placed the moſt reſpectable citizens at the head of the judiciary adminiſtration, and purged Rome of all thoſe violences and enormities which had ſo long diſgraced it. The pope was induced to ſanction his power, which, though termed an uſurpation, ſeems to have been as lawfully conferred as the conſent of the governed could make it. The reputation of the new tribune of Rome ſoon extended throughout Italy. The meſſengers whom he ſent to propoſe to the different ſtates a general league, were every where received with high reſpect, though unarmed and only diſtinguiſhed by a ſilver wand; and honourable embaſſies were ſent to him in return. His friendſhip was courted by Louis king of Hungary, and the emperor Louis of France. Perſons of warm imagination conceived that he was to be the inſtrument of reſtoring the ancient grandeur of Rome and Italy. Among theſe the moſt conſpicuous was the celebrated Petrarch, who had contracted an admiration of his character, when joined with him as one of the deputies to the pope. There are extant ſome eloquent and pathetic letters which he wrote to Rienzi, warmly exhorting him to proceed in his glorious undertakings. In the mean time, that intoxication which ſcarcely ever fails to ſeize upon thoſe who ſuddenly riſe to ſupreme power from mean extraction, began to betray him into extravagancies, which injured his character and reputation. He cauſed himſelf to be created a knight, with a ſingular mixture of religious and military ceremonies. He aſſumed a variety of titles; iſſued a letter declaring Rome the head of the world; and cited the two rival emperors, Charles and Louis, and the electors, to appear before him, and juſtify their pretenſions. He diſmiſſed the pope's legate, reduced the nobles to greater humiliation, and eſtabliſhed a reign of terror. He was for a time ſucceſsful againſt the attempts of the exiled nobles to reſtore themſelves by force of arms; but at length, finding that he had loſt the affection and confidence of the people, he withdrew ſecretly from Rome, and in the beginning of 1348, took refuge in the kingdom of Naples. He was at firſt received with honour by the king, but the efforts of his enemies brought him into ſuch hazard, that he thought proper to retreat to a hermitage, where he lived concealed till the commencement of 1350. He then took advantage of the jubilee to return ſecretly to Rome, where being diſcovered, he withdrew to the king of the Romans at Prague. Thence, either voluntarily or through conſtraint, he came into the hands of pope Clement at Avignon, who put him in priſon, and appointed a commiſſion of three cardinals to try him. But after the deceaſe of that pope, his ſucceſſor Innocent VI. in 1354, releaſed him from confinement, and ſent him to Rome, in order to oppoſe Baroncelli, who had ſeized the government of that capital. The Romans received him again with great demonſtrations of joy, and he recovered his former authority. But after a turbulent adminiſtration of ſome months, the nobles found means to excite a ſedition againſt him, in which he was cruelly maſſacred, in October, 1354. His body was treated with the greateſt indignity by the people; and his end adds one more ſad example to the many recorded by hiſtory, of the uſual fate of popular leaders and reformers, whoſe plans generally ariſe from vanity, and terminate in ambition.

GACE', a town of France, in the department of the Orne, and chief place of a canton, in the diſtrict of l'Aigle: four leagues weſt of l'Aigle, and four and a half eaſt of Argentan.

GACH'PAS, an Indian tribe, in North America, formerly in alliance with the Delawares.

GACIL'LE (La), a town of France, in the department of the Morbihan, and chief place of a canton, in the diſtrict of Rocheford: three leagues north-eaſt of Rocheford.

GAD, *ſ.* [ȝaꝺ, Sax. *gaddur*, Iſlandic, a club.] A wedge or ingot of ſteel.—Flemiſh ſteel is brought down the Rhine to Dort, and other parts, ſome in bars, and ſome in *gads*; and therefore called Flemiſh ſteel, and ſometimes *gad* ſteel. *Moxon.*—It ſeems to be uſed by *Shakeſpeare* for a ſtile or graver, [from ȝaꝺ, Sax. a goad.]

I will go get a leaf of braſs,
And with a *gad* of ſteel will write theſe words. *Shakeſ.*

A meaſure of nine or ten feet, a geometrical perch.

To GAD, *v. n.* [Derived by Skinner from *gadfly*; by Junius from *gadaw*, Welſh, to forſake; thought by others only the preterite of the old word aȝaan, *to go.*] To ramble about without any ſettled purpoſe; to rove looſely and idly.—Give the water no paſſage, neither a wicked woman liberty to *gad* abroad. *Eccleſ.* xxv. 25.—Envy is a *gadding* paſſion, and walketh the ſtreets, and doth not keep home. *Bacon.*

Gad not abroad at ev'ry queſt and call
Of an untrained hope or paſſion;
To court each place or fortune that doth fall,
Is wantonneſs in contemplation. *Herbert.*

GAD, one of the twelve patriarchs of Iſrael, the ſeventh ſon of Jacob, and the firſt by Zilpah the handmaid of Leah. His deſcendants were diſtinguiſhed by their courage and warlike exploits during the conqueſt of Canaan, and their ſubſequent defence of the poſſeſſions aſſigned them in the promiſed land. The Gadites were at firſt much expoſed to the hoſtile incurſions of their neighbours, but by their continual watchfulneſs and bravery they frequently diſappointed them in their hopes of plunder, and by ſucceſsful expeditions into their reſpective countries ſo far overawed them, that at length they enjoyed the portion of their inheritance in peace and ſecurity. Theſe circumſtances in their hiſtory were predicted in the laſt bleſſing pronounced by Jacob upon his ſons, when ſpeaking of Gad he ſaid, "a troop ſhall overcome him," or invade him, "but he ſhall overcome at laſt." *Gen.* xxx. 11. xlix. 19. *Joſh.* xiii. 24. &c.

GAD, a province of Paleſtine, occupied by the tribe of that name: ſituated eaſtward of the river Jordan, which formed its weſtern boundary; having the half tribe of Manaſſeh in Baſhan on the north; the land of the Ammonites on the eaſt; and the river Arnon on the ſouth, which ſeparated it from the tribe of Reuben. It contained within theſe limits, the land of Jazer, half the land of Gilead, half the land of the Ammonites, (taken from them by the Amorites. See AMMONITES, vol. i.) and a part of the kingdom of Sihon. It contained many cities, ſome of which they built ſoon after its conqueſt. Ramoth in Gilead appears to have been the chief; it formed part of the kingdom of Iſrael after the defection of the ten tribes from the houſe of David, and was afterwards ſubdued by Tilgath-pilneſer, king of Aſſyria. *Numb.* xxxii. *Deut.* iv. 43. *Joſh.* xiii. 24, 28. 1 *Kings* xxii. 3. 1 *Chron.* v. 26.

GAD, the name of a river of Paleſtine, probably ſituated in the above province. 2 *Sam.* xxiv. 5.

GAD, a Jewiſh prophet, and David's domeſtic ſeer, with whom he was accuſtomed to adviſe on affairs of importance. When the diſpleaſure of Heaven had been excited againſt David and Iſrael, by the crime of ordering the people to be numbered, Gad was divinely commiſſioned to wait upon the king, and to offer him the choice of three evils, famine, unſucceſsful war, or a peſtilence; one of which was to be inflicted as a puniſhment on that people. When the king had choſen the peſtilence, and its dreadful ravages had awakened the people to repentance, Gad was farther commiſſioned to inſtruct David to erect an altar in the threſhing-floor of Ornan the Jebuſite, and to offer on it burnt-offerings and peace-offerings, which met with a propitious acceptance. Around this ſpot the future temple was built, as it appeared to have been intended for that honour by divine ſelection. Gad wrote a hiſtory of his own times, out of which, together with the writings of the prophets Samuel and Nathan, the account of the actions of David, as given in the books of Samuel and Chronicles, was moſt probably compiled. 2 *Sam.* xxiv. 11, &c. 1 *Chron.* xxi. 9, &c. xxix. 29.

GAD'ARA, in ancient geography, a town of the Peræa, or Transjordan, in the Decapolis, a very ſtrong place. Reſtored by Pompey after its demolition by the Jews. *Joſephus.* After Herod's death it was joined to the province of Syria by Auguſtus.

GADARE'NES, or GERGESENES, country of, ſituated in Paleſtine, eaſtward of the river Jordan oppoſite Galilee; it was frequently viſited by the Saviour while upon earth; here he healed the man poſſeſſed of a legion of devils. It is likewiſe called the land of *Genneſaret*. *Matth.* xiv. 34. viii. 28. *Mark* vi. 53. *Luke* viii. 26.

GAD'DER, *ſ.* A rambler: one that runs much abroad without buſineſs.—A drunken woman, and a *gadder* abroad, cauſeth great anger, and ſhe will not cover her own ſhame. *Eccleſ.* xxvi. 8.

GAD'DI, [Heb. my troop.] A man's name.

GAD'DIEL, [Heb. the army of Gad.] A man's name.

GAD'DINGLY, *adv.* In a rambling, moving manner.

GAD'DITE, *ſ.* A deſcendant of Gad, one of the ſons of Jacob.

GA'DEBUSCH, a town of Germany, in the circle of Lower Saxony, and duchy of Mecklenburg, near which the Swedes defeated the Danes in 1712: ſixteen miles weſt-north-weſt of Schwerin.

GA'DEMIS, or GA'DEMIR, a country of Africa, weſt of Fezzan, and 100 leagues from the Mediterranean, and ſaid to contain ninety-two villages; the capital bears the ſame name. Lat. 31. 30. N. lon. 11. E. Greenwich.

GA'DEN, a town of Germany, in the archduchy of Auſtria: ten miles ſouth-weſt of Vienna.

GADERSLE'BEN, a town of Germany, in the circle of Lower Saxony, and principality of Halberſtadt: twenty miles eaſt of Halberſtadt.

GA'DES, or GADI'RA, in ancient geography, an iſland in the Atlantic, on the Spaniſh coaſt, twenty-five miles from the Columns of Hercules. It was ſometimes called *Tarteſſus* and *Erythia* according to Pliny. Geryon, whom Hercules killed, fixed his reſidence there. Hercules, ſurnamed Gaditanus, had there a celebrated temple in which all his labours were engraved with excellent workmanſhip. The inhabitants are called *Gaditani*.

GAD'FLY, *ſ.* [By Skinner, who makes it the original of *gad*, it is called *goadfly*. Suppoſed to be originally from *goad*, in Sax. ȝad, and *fly*.] A fly that ſo ſeverely ſtings the cattle, that it makes them gad or run madly about.—See the article OESTRUS, and ENTOMOLOGY, vol. vi. p. 842.

Light fly his ſlumbers, if perchance a flight
Of angry *gadflies* faſten on the herd. *Thomſon.*

GADIAG', a town of Ruſſia, in the government of Tchernigov: 112 miles ſouth-eaſt of Tchernigov.

GADO'NA, or GAD'UA, a country of Africa, on the ſouth ſide of the river Senegal, containing mines of gold, iron, and ſaltpetre. Lat. 13. 30. N. lon. 8. W. Greenwich.

GADO'LINITE, *ſ.* in mineralogy, an earth or ſtone, diſcovered by M. Gadolin in 1794, at Ytterby, or Ytterley, in Sweden; from whence it has alſo taken the name of Yttria.—See the article MINERALOGY.

GA'DUS, *ſ.* the COD-FISH: a genus of the order jugulares. The generic character is, pectoral fins ſlender, and tapering to a point. The body is long, thick, laterally compreſſed, and covered with ſmall ſmooth ſcales which eaſily rub off. The head is ſmooth, wedge-ſhaped, with a broad front. The mouth large, the jaws armed with little ſharp teeth bending inwards; ſome ſpecies have barbles hanging from the lower jaw. The tongue is broad and ſmooth; but the palate is rough, being armed with ſmall teeth; and there are ſeveral rugged bones about the throat. The eyes are near the top of the head, round, large, and covered with a membrane. The noſtrils are double, and near the eyes. The coverts and opening of the gills are large; the covert conſiſts of three laminæ, the under one edged with a ſkin. The membrane of the gills is ſtrong, with ſeven or eight rays. The fins are from ſeven to ten; two pectorals, the ſame number at the throat, ſometimes two at the anus, the tail-fin, and one, two, or three, on the back; the rays of the fins are moſtly covered with the common ſkin. The different ſpecies are found in the North and Baltic ſeas, and ſome alſo in the Mediterranean and Weſtern Ocean. They are all ſea fiſh, except the barbot, and do not often come into rivers.

I. *Three dorſal fins; and barbles at the mouth.* 1. Gadus æglefinus, the haddock: the lateral line black, and the tail bifurcated, form the ſpecific character. There are ſeven rays in the membrane of the gills, nineteen in the pectoral

pectoral fins, ſix in the ventrals, twenty-two in the firſt anal, twenty-one in the ſecond, twenty-ſeven in the tail, ſixteen in the firſt dorſal, twenty in the ſecond, nineteen in the third. The head is wedge-ſhaped, the upper jaw longer than the lower, whence hangs one barble; the mouth is narrower than in the reſt of the ſpecies. The eyes are large, pupil black, iris ſilvery. The ſcales are ſmall, round, and ſtrongly fixed in the ſkin. The back is browniſh, arched, and thick; the belly and ſides are ſilvery; and there is a black ſpot on each ſide near the pectoral fin, the prints, as it is ſaid, of the finger and thumb of St. Peter, when he held this ſpecies, and took the tribute out of its mouth: a mark which ſuperſtition has extended to the whole race of haddocks, at once to atteſt and commemorate that miracle; unfortunately, however, the haddock is not the only fiſh that has been ſuppoſed to be thus diſtinguiſhed by the marks of the apoſtolic touch.

This ſpecies inhabits the North Sea, and are taken in plenty in the autumn near Heligoland, whence they are carried to Hamburgh. It is remarkable, that the haddock does not paſs through the Sound into the Baltic; and that the next ſpecies, which lives in the Baltic, never paſſes the Straits into the North Sea, though they are found in plenty near each other in both thoſe ſeas. They are found in Holland, Eaſt Friezeland, &c. and appear upon the coaſts of Britain annually, particularly thoſe of Yorkſhire, about the middle of December, and in ſuch vaſt ſhoals, that they cover a tract frequently of many miles. They do not venture far from the ſhore; when the fiſhermen caſt their lines beyond their limits, which is commonly about three miles from land, there are ſeldom any taken. The larger haddocks quit the coaſt as ſoon as they begin to be out of ſeaſon, leaving behind only the ſmaller fiſh. This remark is applicable to all the fiſh that appear on the Yorkſhire coaſt, except the mackerel, which alone remains after becoming unfit for uſe. The haddock is the moſt common ſpecies in the London market, as it is not only plenty, but in ſeaſon during the greateſt part of the year. The larger fiſh begin to roe in the middle of November, and continue ſo till the end of January, when they are unfit for uſe. Thoſe of the middle ſize recover about the beginning of May, and are in ſeaſon till February; ſuch as are incapable of breeding remain at all times fit for the table. In ſtormy weather none of this ſpecies take the bait; the fiſhermen aſſert, that they then ooze in the bottom of the ſea, and ſhelter themſelves there, till the agitation of the water has ceaſed: in proof of this, they allege, that thoſe which are taken immediately after a ſtorm, are covered with mud upon the back. In Greenland, they live in the deeps, but riſe to the ſurface towards evening, eſpecially if the water be rough; ſometimes alſo they jump out of the water to avoid the purſuit of the dog-fiſh, which catch them in their paws between the cracks in the ice when they come to take the air. In Friezeland they fiſh for them with ground lines baited with a ſmall fiſh, which they throw in at night, and ſeldom fail to find a haddock on every hook in the morning, eſpecially in fine weather; they have alſo a laudable cuſtom among them, which is, that every fiſherman is obliged to throw in a line for the widows of fiſhermen in the village, and to ſend them what it produces. The Greenlanders catch them with their hands through holes in the ice, towards which the fiſhes preſs to take air.

The length of this fiſh is commonly a foot, and their weight a pound and a half; ſome have been ſeen of two or three feet long, and weighing forty pounds. They ſpawn in February, the females coming in towards the ſhore in great ſhoals to lay their ova; then come the males, and fecundate the eggs. The haddock eats crabs and ſea-inſects; it purſues the herrings, and grows fat upon them in the ſummer; whereas in autumn the haddock is lean, becauſe it lives then upon worms. The fleſh is white, firm, well-taſted, and eaſy of digeſtion. Several other voracious kinds, as well as the ſhark, are its enemies. The liver is whitiſh, conſiſting of two lobes of unequal lengths; the ſpleen is triangular, lying under the ſtomach, which is long, thick, and has ſeveral appendages; the inteſtinal canal has three ſinuoſities, and is wide below. The air-bladder is long, and covered with a glutinous ſubſtance. The kidneys, roe, and ovary, are double, and the eggs are yellow. There are fifteen ribs on each ſide, and thirty-five vertebræ in all.

2. Gadus callarias, the torſk: ſpecific character, the upper jaw the longeſt, tail even, the lateral line broad and ſpotted. There are ſeven rays in the branchioſtege membrane, ſeventeen in the pectoral fins, ſix in the ventrals, eighteen in the firſt anal, ſeventeen in the ſecond, twenty-ſix in the tail, fourteen in the firſt dorſal, fifteen in the ſecond, eighteen in the third. The head is leſs than the haddock's; it is of a grey colour, on which appear ſome ſpots, brown in ſummer and black in winter; the mouth is large, the upper jaw longer than the lower, with ſeveral rows of teeth; from the lower hangs a barble, and it has but one row of teeth; the palate is alſo armed with teeth. The eyes are round; the pupil black, the iris of a yellowiſh white. The trunk is grey, ſpotted with brown as far as the belly, and covered with little, thin, ſoft, ſcales; the ſpots on the body in ſome of the young ones is a light red inclining to yellow. The lateral line is near the back, and bends downwards towards the firſt anal fin. The belly is thick, mingled with black and brown, in ſome reddiſh. The fins are white, ſometimes red: hence it has been called *varius*, or varying. This ſpecies is found in the Baltic and Northern Ocean; they will enter the rivers as far as the waters of the ocean are mingled with them. They are caught near Rugenwald in Pomerania all the year, but particularly in June; they are alſo caught in plenty about Travemund, Oehland, Gothland, Bornholm, Lubec, in Pruſſia, and in Livonia. In Greenland, the moſt favourable ſeaſons for this fiſhery are the ſpring and autumn; in winter, they make holes in the ice, and invite the fiſh by ſome glittering bait. Bloch ſays, that this is the tendereſt and beſt of all the genus, and may be eaten by weakly perſons without danger. They live on other fiſh, aquatic inſects, and worms: Fabricius found in its ſtomach the father-laſher, ſome crabs, and ſeveral ſea-worms. They ſeldom weigh more than two pounds; yet they have been taken about Rugenwald weighing ſeven or eight pounds, and even to fourteen; Schoneveldt ſpeaks of one four feet long. They ſpawn in January and February; the Icelanders ſalt and dry them, and give them the name of titteling. The interior conformation is the ſame as the preceding, except that the inteſtinal canal has but two ſinuoſities: there are eighteen ribs on each ſide, and the vertebræ are fifty-three in number.

3. Gadus morhua, the common cod-fiſh: the largeneſs of the ſcales, and a ſpine in the firſt anal fin, form the ſpecific character. There are ſeven rays in the membrane of the gills, ſixteen in the pectoral fins, ſix in the ventrals, ſeventeen in the firſt anal, ſixteen in the ſecond, thirty in the tail, fifteen in the firſt dorſal, nineteen in the ſecond, twenty-one in the third. The head, back, and ſides, are grey, with yellowiſh ſpots; when the young ones haunt a rocky bottom, their belly becomes reddiſh with yellow ſpots; but this colour paſſes off as they grow bigger, and quit thoſe deeps, and then they regain their natural colours. The mouth is large; the upper jaw protruded, and a little barble hangs from the lower. The pupil of the eye is black, the iris yellowiſh. The belly is white; the tail and dorſal fins are ſpotted with yellow, the ventrals and anals are grey, and the pectorals yellow, the rays are all ſoft and ramified. The anus is nearer to the head than to the tail.

This fiſh inhabits the ocean, and is found between the fortieth and ſixty-ſixth degree of north latitude; it is alſo found in higher latitudes, as in Greenland, but then they are not ſo good, nor ſo numerous. They are taken in vaſt

vaſt quantities at Newfoundland, Cape Breton, Nova Scotia, and on the coaſts of Norway and Iceland; alſo off the Dogger-bank, and about the Orcades. But their principal reſort for centuries paſt, has been on the banks of Newfoundland, and other ſand-banks off Cape Breton. That extenſive flat ſeems to be the broad top of a ſubaqueous mountain, every where ſurrounded with a deeper ſea. Hither the cod annually repair, in numbers beyond the power of calculation, to feed upon the worms that ſwarm upon the ſandy bottom. Here they are taken in ſuch quantities, that they ſupply all Europe with a conſiderable quantity of proviſion. The Engliſh have ſtages erected all along the ſhore, for ſalting and drying them; and the fiſhermen, who take them with the hook and line, draw them as faſt as they can throw out. This immenſe capture makes no ſenſible diminution of their numbers; for, after their food is conſumed in theſe parts, or when the ſeaſon of propagation approaches, they take their departure for the polar ſeas, where they depoſit their roes in full ſecurity, and repair the waſte which has been occaſioned by death, or the depredations of their enemies. They annually make their appearance on the coaſt of Iceland, Norway, and Britain, gradually diminiſhing in their numbers as they proceed to the ſouth, and ceaſing altogether before they advance to the ſtraits of Gibraltar. Before the diſcovery of Newfoundland, the greateſt fiſheries of the cod were on the coaſts of Iceland, and the weſtern iſles of Scotland, where the Engliſh reſorted in queſt of them, as early as the beginning of the fifteenth century. Our right of fiſhing in theſe parts, however, was not acknowledged by the government of Denmark till the reign of James I. whoſe marriage with a princeſs of that country ſecured to his ſubjects that indulgence, of which they availed themſelves ſo completely, that they had then a hundred and fifty ſhips employed in the Iceland fiſhery. Even on the banks of Newfoundland, the French, Spaniards, and Portugueſe, had originally a far larger portion of the fiſhing than the Britiſh: in 1570, the former nations had upwards of three hundred veſſels employed in that trade, when thoſe of the Engliſh did not exceed fifty. Matters, however, have ſince been reverſed; and the Engliſh ſhipping on that coaſt has immenſely increaſed; it is now ſuperior to that of any other nation, and the trade is deemed a valuable acceſſion to the wealth of individuals, as well as to the naval power of the empire: 20,000 Britiſh ſeamen are at preſent employed in this fiſhery. This immenſe fiſhery is conducted in a tract of the ſea agitated by a perpetual ſwell, and involved in continual darkneſs by means of a thick fog that conſtantly hangs over it. In the cod fiſh, the ſight is probably very imperfect; for almoſt every ſmall body that is agitated by the water attracts their rapacity, ſtones and pebbles not excepted, for theſe are often found in their ſtomachs. The general weight of the cod-fiſh on the Britiſh coaſts is from fourteen to forty pounds; ſome have indeed been caught near eighty, but thoſe of the middle ſize are moſt eſteemed for the table. Their time of ſpawning is from January to April, when they depoſit their eggs in rough rocky ground. After having been exonerated of a load containing frequently three millions of young, the parent recovers its plumpneſs ſooner than almoſt any other fiſh; and is caught in good condition during almoſt the whole ſummer. Schoneveldt remarks a kind appointment of Providence in the immenſe fecundity of this fiſh; and in that abundant ſupply which it affords to the inhabitants of thoſe bleak and frozen countries, that are unfit for the production of grain. The ichthyophagi of theſe barren regions, ſays he, not only furniſh themſelves with a ſubſtitute for bread, by drying this fiſh, but ſend a vaſt quantity of their ſurplus ſtores to add to the ſupply of other nations. The numbers and fertility of theſe fiſh, ſeem indeed amply to juſtify the grateful exultations of this writer; for they are ſuch as will for ever baffle all the efforts of man, and the voracity of the inhabitants of the ocean, to exterminate their race, at leaſt while they are caught only with hook and line. Leeuenhoek reckons the number of eggs in a middle-ſize cod to be 9,344,000; Brindley reckons them at four millions only; but even that is ſufficient to ſupply all that can be deſtroyed by fiſhery, if we conſider what quantities ſpawn every year.

The cod generally haunts deep places in the open ſea, coming on the banks and ſhores in ſpawning-time; they eat crabs, whelks, herrings, and other fiſh, and are ſo greedy that they do not ſpare even their own young; like birds of prey, they have the faculty of caſting up what they cannot digeſt; but, according to Anderſon, their digeſtive powers are ſo ſtrong, that the fiſhermen of Heligoland have found the haddocks which were thrown out for baits completely digeſted in their ſtomachs in ſix hours. The ſpawning-time differs with theſe, as in other fiſh, according to age, the various degrees of cold in the bottom of the water, the nature of the air, and the temperature of the ſeaſons. July 17, 1801, Mr. Norris, cooper, of Portſmouth, hawling his ſeine-net near South-ſea-caſtle, caught a very fine cod, which weighed fifty-five pounds and three quarters. This fiſhery laſts almoſts all the year in Norway, England, and America; but the period in which the greateſt quantities are taken on the coaſts of Norway and Iceland is from February till the end of March or the middle of April; in America, the moſt conſiderable fiſhery is in May and June; in July theſe fiſh diſappear, but come again in September; but, as the waters of that country are then covered with ice, the fiſhery is not to be depended upon by Europeans at that ſeaſon. In the north, the cod-fiſhery draws together four or five thouſand men, Normans, Danes, Swedes, Hamburghers, Dutch, and French; but the Dutch are thoſe who derive the greateſt advantage from it, as they prepare and barrel up the fiſh with moſt care and ſkill; but, as they are forbidden, as well as other nations, to dry their fiſh in the country, they ſalt the greater part, hanging ſome few on poles, on-board their veſſels, to dry.

The mode of preparing the cod-fiſh for preſervation conſiſts partly in drying it in the air, partly in ſalting it, or in both. The firſt makes what is called in the north *ſtockfiſch*, or dried cod; the ſecond, *laberdan*, ſalted or green cod; a third preparation is called *klippfiſch*, (rock-fiſh,) white cod. The Icelanders, who get almoſt their whole food from this fiſh, take the greateſt pains to prevent want by preſerving it when it is plenty; they dry it, giving it then the general name of *ſtockfiſh*; but there are two preparations, one called *ſtackfiſch*, ſplit-cod, and the other *hængefiſch*. They are prepared in the following manner: when the men have landed their cargo, the women cut off the heads of the fiſh, open the belly, draw out the entrails, then ſplit the back within-ſide, and take out the back-bone except the three laſt vertebræ; then they boil the heads and eat them freſh, and the men take the gills for bait. They dry the bones, which ſerve to make fires, or as food for their cattle; and they make oil from the livers. The fiſh thus cut up, they ſpread them on the rocks till the wind has thoroughly dried them, which is generally in three weeks or a month; but, if a ſharp wind blows from the north, this is generally accompliſhed in three or four days. Where there are no rocks, and the ſoil is ſandy, they make a bed of ſtones laid cloſe together, turning the fiſh downwards upon them, that the inſide may be kept from the rain, which would ſpoil it; there they ſuffer them to lie in heaps till they find occaſion to ſell them.—The *hænge-fiſch* is prepared nearly in the ſame manner; but with this difference, that the back is cut from without, and ſplit entirely through, and that a hole is made to paſs the poles through on which they are hung on ſtages of ſtone; as theſe ſtones are only laid one upon another without any cement, the air has a free paſſage; and the whole is covered with boards or graſs to keep out the wet.

The curing of this fiſh is different among the Norwegians from what it is with the Icelanders, as they uſe ſalt.

When

When the heads are cut off and the fish cleaned out, they are put into a large tub with a quantity of French salt; and a week after they put them in heaps on a kind of grating to let the blood and brine run off; after this, they rub them with Spanish salt; then pack them up tight in casks, for sale, under the name of *laberdan*; when only dried on the rocks, they call them *klippfische*; they split the large ones that the salt may penetrate better, but the small ones have only the belly opened: the latter are called *round fish*, the former *flat-fish*; when dried on poles, they call them *rothfisch*. All these sorts are carried to Bergen, and thence transported to all parts of Europe. The heads are eaten, but where forage is scarce they are given to cattle. The inhabitants of the north dry the heads on the shore, and give them to their cattle mixed with sea-weed; cows fed in this manner we are assured give much more milk than when straw or hay is given them.

As the air-bladder of this fish is very glutinous, the Icelanders prepare from it an isinglass not much inferior to that of Russia. The following is the mode they pursue: they leave the back bones in lumps with the air-bladders attached to them till they are ready to rot; then they lay them on a block, and beat the vertebræ till the bladders are loosened, as well as the ligaments by which they were fastened, and which are called pockets; they now cut away the bladders, and place them on a table or block, on which is nailed a rough brush intended to clean them; with a jagged knife they scratch the outer skin off the bladders and ligaments. The bladders being thus cleaned, they are soaked for a time in lime-water, to take off all the fat which may yet adhere to them; then they rince them in clear water, afterwards dry them, and then they may be used as isinglass. At Newfoundland they have attempted the same thing; but, as they have neither time nor room for all these processes, they salt the air-bladders, and keep them for use; or else eat them; when wanted for the purpose of making isinglass, they must be soaked in water to take away the salt. The thickest bladders are best for the purpose, though the isinglass will not be quite so clear as that made from thin ones. The Norwegians eat the air-bladders fresh; or they salt them for sale: they call them *sunde-mauer*, or stomachic, believing them to be good for the stomach: hence the English name *sounds* or *zounds*. At Newfoundland they make the tongues also turn to advantage: they eat them either fresh or salted, and count them a delicacy. The Norwegians, Icelanders, &c. make oil from the liver; for, when it attains a certain degree of corruption, the oily parts will run out of themselves by degrees; and this oil is preferable to whale-oil, because it keeps leather a longer time moist, and when used for light it makes less smoke. The ova or eggs also are preserved with care; they are salted, put into small casks, and sold to the Dutch and French, for the French and Spaniards use them as a bait for catching the anchovy; they export annually from Bergen at least twenty thousand barrels of these eggs; each barrel sells for about 7s. sterling.

We have spoken generally of this fishery, as it regards Great Britain; but it is time to enter more particularly into the history of this considerable commerce. The vessels which go to Norway and Newfoundland commonly set out in March, some sooner, some later, according to the distance they have to go; and return about the end of September. As soon as they arrive, they make a gallery on-board each vessel from the main-mast to the poop, and sometimes from one end of the vessel to the other; this outer gallery is furnished with casks, staved at one end, in which the sailors or fishermen place themselves as a protection from the cold, and their heads are covered with a shelter which is fastened to the cask. As soon as a man takes a fish from the hook, he cuts out the tongue; then he gives it to a boy, who carries it to the *cleaner*; he cuts off the head, takes out the liver and entrails, and then drops it through a hole in the double deck, where the *preparer* gets it, and, having taken out the back-bone, drops it through another hole, into the place where they salt it and lay it in heaps; the *salter* takes care to have salt enough between the layers or beds, that the fish may not shake and rub; but he must not put too much; and on this the skill or nicety of curing them depends, for too much or too little salt hurts the fish, and lessens the price it will fetch.

Though this fishery be very considerable in the north of Europe, it is not to be compared to what is carried on in North America, particularly on the banks of Newfoundland, as hinted in the early part of this article. We may suppose, that the Newfoundland fishery is not now so considerable for the English as it was before the rupture with the American colonies, as they now share it with us, and the fishermen of Boston only take annually in Massachusetts-bay more than fifty thousand quintals of cod-fish; and a certain space in North America has also been ceded to the French for the like purpose. The fishery, however, was very plentiful for Great Britain in 1785, when two hundred and twenty vessels were employed; and Pennant assures us, in his Arctic Zoology, that such a quantity of the cheven or chub-fish are caught by us off the Dogger-bank and the Well-bank, as may make us amends for the diminution of the fishery at Newfoundland.

The French carry on the Newfoundland fishery to a pretty considerable extent. In 1768, they sent one hundred and fourteen vessels, carrying in the whole 15,590 tons; each vessel brought away on an average 6000 fish; so that the fishery of that year amounted to 24,066,000 fish, or 192,528 quintals, which may be reckoned to have produced in France 3,174,305 livres, near 150,000l. sterling: these fish would produce also near 2000 tons of oil, which would be 231,000 livres, near 10,000l. sterling, more. And as the French fish in other places also, it may be guessed what a profitable thing this fishery must be to the French government; yet all they caught could not supply that kingdom during Lent, and they constantly bought great quantities from the Dutch. According to Anderson, the first vessel sent by the French to Newfoundland was in 1537; and in 1578 they sent a considerable number. Before the last war, France employed, according to a late writer, more than three hundred vessels in this fishery. Part of these go to Newfoundland, where they dry the fish they have caught; others fish on the great bank, and thence carry salted fish; another part carry goods to St. Pierre's and Miquelon, and barter them for dried fish; the first sort of vessels have from sixty to ninety men as their complement, and the value of one of them with her cargo is estimated at 70,000 livres; those which fish on the great bank carry but fifteen men, and are estimated at 25,000 livres value; the last, which are for barter, carry from fifteen to twenty men, and their average worth is about 50,000 livres. The total number of vessels in 1786 was 330, of seamen 11,315. In a work published at Paris in 1791, the produce of the French cod-fishery at Newfoundland, is stated to have increased from six to sixteen millions within the last twenty years.

According to Frazier, the cod appears in great numbers at Chili in the month of November. Admiral Anson says they are prodigiously large; and, from the testimony of some of his people who had been at Newfoundland, asserts that they are as plenty there as at Newfoundland itself. The abbé Molina asserts, that the cod-fishery is so plentiful on the coasts of Gio Fernandez, that the same thing may be observed of it as we have remarked at Newfoundland, viz. that fish are drawn as fast as the lines are thrown in. The cod appears also on the coasts of Valparaiso in the months of October, November, and December; but only in stormy weather; and these people, who formerly set no value on the cod-fish, have within these few years applied themselves to this lucrative branch of trade, and now annually dry a great num-

London. Published as the Act directs. July 20. 1805 by J. Wilkes.

ber of theſe fiſh; a Frenchman of the name of Luiſon firſt ſet them the example in their own country.

The cod is not tenacious of life; it dies ſoon after it is taken out of the ſea, or even if put into freſh water. As they are excellent when eaten freſh, the Dutch fiſhermen endeavour, by means of perforated tubs, to convey them alive to the ſea-ports; but the Engliſh prick the air-bladder with a pin, which obliges them to remain at the bottom of the veſſel they are put in, and thus preſerves them longer alive. The ſtomach is large; and at the origin of the inteſtinal canal there are ſix appendages divided into ſeveral branches. The liver is of a pale red, and conſiſts of three lobes; the ſpleen is blackiſh, and long; the kidneys are at the back-bone, along the ventral cavity, ending in a long bladder; the ſeed-veſſel and ovary are double. See Plate I. fig. 1.

There is a variety of the cod found about the Iſle of Man, between England and Ireland, which is called *red cod* or *rock-cod*. It is of a vermilion colour, and much eſteemed. Cepede conſiders it as a diſtinct ſpecies.

4. Gadus luſcus, the bib: ſpecific character, the firſt ray of each ventral fin terminating in a long filament or briſtle. The firſt dorſal fin has thirteen rays, the ſecond twenty-three, the third ten; the pectorals eleven, the ventrals ſix; the firſt anal thirty-one, the ſecond eighteen, the tail-fin ſeventeen. The mouth is ſmall, the upper jaw ſomewhat the longeſt; a ſingle barble hangs from the corner. The ſecond dorſal fin is very long; the anus is nearer to the head than to the tail; the tail-fin is forked, and equally divided. This ſpecies is found in the European ocean; it ſeldom exceeds a foot in length. The ſcales are very firmly fixed to the ſkin, and are larger in proportion than even thoſe of the common cod. The upper ſurface is yellowiſh, or olive-colour; the under part ſilvery. It is delicate eating. The eyes are veiled by a membrane, like the reſt of the genus; but ſome have ſuppoſed in this ſpecies a peculiar power of inflating this membrane ſo as to cover entirely one or both organs of ſight; hence the trivial name *luſcus*, or blind with one eye; though probably this appearance was only an accidental circumſtance in the ſingle individual examined.

5. Gadus barbatus, the whiting-pout: ſpecific character, the breadth of the body equal to one-third of its length, indentions on each ſide of the lower jaw. There are ſix rays in the membrane of the gills, eighteen in the pectoral fins, ſix in the ventrals, twenty-five in the firſt anal, ſeventeen in the ſecond, thirty in the tail, thirteen in the firſt dorſal, nineteen in the ſecond, eighteen in the third. The head is ſmall; the mouth large; the upper jaw projects, and both jaws are armed with ſmall teeth; there are two bones in the gullet as rough as a file; in front of the lower jaw is a barble, and ſix or ſeven little holes on each ſide. The lips are ſtrong, made up of ſeveral cartilages united by a common membrane, which the fiſh can draw back or protrude at will; the tongue is ſhort, thick, and rough at the hinder part; the noſtrils are double, and placed near the eyes; the eyes are large, jutting out, and provided with a membrane; pupil black, iris ſilvery; but this muſt vary in ſome ſubjects, for Duhamel ſays the iris is lemon-colour. The gill-covert is compoſed of ſeveral laminæ; the aperture is large, and the membrane only viſible in part. This fiſh has ſmall ſcales which adhere very ſtrongly to the ſkin. The lateral line, which begins at the back of the head, is black; it forms a bend towards the belly at the extremity of the ſecond dorſal fin, and is loſt in the tail. The back is of a greeniſh brown, round, and fleſhy; the belly ſhort, and white; the ſides white inclining to red; the anus is not far from the head. Of the three dorſal fins, the firſt is ſhort, high, and ſhaped like a ſcythe. There is a black ſpot in the middle of the pectoral fin, which Fabricius, however, did not remark in thoſe he ſaw in Greenland. The fins have all ſoft rays united by a thick membrane; they are olive-colour, except the tail, which is red; and moſt of the fins are black at the extremities.

This ſpecies is known in many countries of the Northern Ocean. Gronovius found it in Holland, Rutty in Ireland, Willughby in England, Leem in Lapland, Otho Fabricius in Greenland, Duhamel in the north of France. At Croiſic in Brittany they remain moſt of the year in the open ſea, only approaching the rocky ſhores in Auguſt to caſt their ſpawn. In Greenland they ſpawn in February and March, laying their eggs in ſunny places; the young appear in June, and may then be ſeen in numbers near the ſhore. Their length is from fifteen to eighteen inches, and their weight about three pounds; with us they ſeldom grow more than a foot long, and are very plentiful. Duhamel ſays, that in the ſeaſon they catch them about Breſt from one hundred to one hundred and fifty at a haul. This is alſo of the voracious tribe, feeding particularly on the blenny ſpecies; but, for want of better fare, it will feed on crabs. Its fleſh is white and ſoft, but ſoon taints; from October to January is the ſeaſon, yet in France they are lean and dry even at that time, and conſequently little eſteemed; but with us they are fat, and reckoned good food; the Greenlanders eat them either freſh or dried, and do not like them the worſe for being a little tainted; they take out the eggs of the dried ones, and dreſs them for food; they alſo prepare the liver in a peculiar manner.

6. Gadus minutus, the poor: this ſpecies, which is never more than ſeven or eight inches long, is diſtinguiſhed by the belly being black within, and the anus midway between head and tail. There are ſeven rays in the membrane of the gills, fourteen in the pectoral fins, ſix in the ventrals, twenty-five in the firſt anal, ſeventeen in the ſecond, eighteen in the tail, twelve in the firſt dorſal, nineteen in the ſecond, twenty in the third. The body is long, the head wedge-ſhaped; the upper jaw is the longeſt, and has more rows of ſharp teeth than the lower; the lower jaw has a barble alſo, and ſeveral ſmall dents. The eyes are round, with a black pupil and a ſilvery iris, and are covered with a membrane. The cheeks, the ſides, and the belly, are ſilver-colour, ſtudded with black dots; the back is dark yellow; the lateral line is narrow and ſtraight, and the anus is in the middle of the body. The ſcales are thin, very ſmall, and eaſily rub off. This ſpecies is found in the Baltic and North Seas, and in the Mediterranean. It is the ſmalleſt of the cod kind yet diſcovered; and it is the only one found in the Mediterranean. It is taken near Marſeilles, and in ſuch quantities as ſometimes to prove a nuiſance. It is unfit either for being dried or ſalted; if the firſt is attempted, it grows as hard as a horn. When it appears in the Baltic, the fiſhermen rejoice, becauſe it announces a plentiful fiſhery of cod and haddock; and they call it the *leader*, becauſe, being ſmall and going in ſhoals, the larger ſpecies follow them with rapacity, and thus become the prey of more rapacious man. This ſpecies haunts deep places, living on young fry, ſhell-fiſh, ſnails, crabs, and ſea-worms. They come into ſmooth places to ſpawn, depoſiting their ova between ſtones and on aquatic plants. It is well-taſted when freſh; and is caught with a ground-line and in nets.

7. Gadus blennioides, the blenny-gadus: ſpecific character, the firſt ray of each ventral fin long, and divided in two. The membrane of the gills has ſix rays; the firſt dorſal fin ten or eleven, the ſecond ſeventeen, the third ſixteen; the ventrals five, the pectorals nineteen; the firſt anal twenty-ſeven, the ſecond nineteen; and the tail-fin twenty-ſeven. The head is thick, of a conical ſhape, with a blunt ſnout; the lips are double and fleſhy; the teeth are ſmall and uneven, eſpecially thoſe of the upper jaw; the tongue is pointed, fleſhy, and prominent; the palate is furrowed longitudinally within. The eyes are large, with a ſilvery iris. The gill-coverts are ſoft. The firſt dorſal fin is narrow, and of a triangular ſhape; the ſecond lower; the third ſomewhat higher, but ſhorter. The firſt anal fin is rounded, the other triangular; the pectorals are narrow, ſickle-ſhaped, and thin; the tail is bifurcated. The firſt ray of each ventral being divided,

and being alſo much longer than the reſt, occaſion at firſt ſight an appearance of only two rays to this fin; hence the trivial name of *blennioides*, becauſe the blennies in general have but two rays in the ventral or jugular fins. This ſpecies haunts the Mediterranean; grows to about a foot in length; it is not much in requeſt for food. Pallas firſt deſcribed it; it is ſometimes miſtaken for the whiting, which it much reſembles. The ſcales are ſmall; it is moſtly of a ſilvery colour, with ſome gold-yellow tints on the fins.

8. Gadus ſaida, the ſaida: ſpecific character, the lower jaw rather longeſt, the ſecond ray of each ventral fin ending in a long filament. The firſt dorſal fin has ten or eleven rays, the ſecond ſixteen or ſeventeen, the third twenty; each ventral five or ſix, each pectoral ſixteen; the firſt anal eighteen, the ſecond twenty; the tail twenty-four or twenty-ſix. This ſpecies was firſt made known by Lepechin. The jaws are armed with ſharp hook teeth; there are two rows in the palate, and two lenticular bones with ſmall teeth in the throat. The opercula, or gill-coverts, conſiſt each of three pieces; the firſt triangular, and furniſhed with two ſpines; the ſecond elliptic, the third ſemilunar. The lateral line is ſtraight, and near the back. The dorſal and anal fins are triangular: the fourth ray of the third dorſal, the fifth of the firſt anal, and ſecond of the ventrals, end in a long briſtle. The upper ſurface is of a dark colour with irregular black ſpots, which are diſtributed alſo on the ſilvery gill-coverts; the ſides are bluiſh; the under parts white; the top of the head quite black. This ſpecies ſeldom exceeds a foot in length; it is uſed as food, but not greatly eſteemed. It is found in the White Sea, in the north of Europe.

II. *Three dorſal fins; no barbles at the mouth.* 9. Gadus virens, the green gadus: ſpecific character, the back is green, the tail forked, the jaws of equal length. The firſt dorſal fin has thirteen rays, the ſecond twenty, the third nineteen; the pectorals ſeventeen, the ventrals ſix; the firſt anal twenty-four, the ſecond twenty, the tail-fin forty. This ſpecies reſembles the pollack, and has been often miſtaken for it; but beſides the equal length of the jaws, the lateral line being ſtraight, and the green colour of the upper ſurface, ſufficiently diſtinguiſh them. Theſe fiſh are very plentiful on the coaſt of Norway, and form a pretty conſiderable branch of commerce; ſo that they have five different names for them according to their age. In that country they are ſaid to be five inches and a half long at a year old, ſeventeen inches at three years, and twenty-eight inches at four years.

10. Gadus merlangus, the whiting: the ſilvery hue which pervades the whole body of this fiſh, (whence the name,) and the protruſion of the upper jaw, form the ſpecific character. There are ſeven rays in the membrane of the gills, twenty in the pectoral fin, ſix in the ventral, thirty in the firſt anal, twenty in the ſecond, thirty-one in the tail, ſixteen in the firſt dorſal, eighteen in the ſecond, and nineteen in the third. The body is long, covered with ſmall, round, thin, ſilvery, ſcales. The head ends in a point; the eyes, near which are the noſtrils, are round, with a large black pupil, and ſilvery iris. The upper jaw is armed with ſeveral rows of teeth, of which thoſe in front are the longeſt; the lower jaw has but one row; in front of the palate, on each ſide, is a large triangular bone; in the throat there are two round bones below, and above two long rugged bones; on each ſide of the lower jaw there are nine or ten little dents. The back is olive colour, and arched, as is the belly. The ſides are ſomewhat compreſſed, and the anus is nearer the head than the tail. The lateral line has a ſtraight direction; and there is a black ſpot at the origin of the pectoral fins. The fins are white, except the pectorals and tail, which are blackiſh. This fiſh is found in the Baltic and North Seas, though not numerous in the former; but they are plentiful on the coaſts of Holland, France, and England, where they are reckoned the moſt delicate and wholeſome ſpecies of the genus. They attain the length of a foot, ſometimes one and a half, rarely two; but on the Dogger-bank they are caught of the weight of from four to eight pounds. They live at the bottom of the ſea, feeding on little crabs, worms, and young fry, particularly of ſprats and herrings; which therefore are the uſual bait. They are caught uſually with a ground-line, ſixty-four fathoms long, with from a hundred to two hundred hooks. One veſſel throws out about twenty of theſe lines, armed with 4000 hooks, and they need only lie about two or three hours. The greateſt fiſhery for whiting is carried on in France from December to February; but in England and Holland in the ſpring. They appear in ſuch quantities on our coaſts, as to form ſhoals of three miles long and a mile and a half wide; and, as they are caught in too great numbers to be eaten freſh, they ſalt them, by which however they loſe the delicacy of their taſte, and are then called *buckthorn*; they are often uſed in this ſtate as ſhips' ſtores. As they purſue the herrings, they are often taken in the ſame nets; and are in greateſt perfection at this time, becauſe they are fattened by feeding on the young herrings. In October the roes and ovaries begin to ſwell; and they continue ſpawning from the end of December till the beginning of February; and about that time they become ſoft, lean, and inſipid to the taſte. They are purſued by the rapacious animals which inhabit the ſea; yet they multiply faſt.

There are ſeveral varieties of the whiting, ſome perhaps ariſing from the ſeaſon and the nature of the places they frequent, but others abſolutely in ſhape and colour. Citizen Noel has the following obſervations on the whitings caught in the department of the Lower Seine. "Nov. 1798. There is a great difference between the whitings caught about Yport, Dalles, and Fecamp, and thoſe from about Ailly to Treport, and beyond. The firſt are ſhorter, their bellies broader, and the lateral line is ſlightly curved inſtead of being ſtraight; the head and tail of a darker colour inclining to brown; the fleſh is more firm, better taſted, and conſequently much ſought after." Theſe differences in colour, &c. Noel attributes to the nature of the ſoil or bottom they haunt, and of the food they conſequently meet: about Yport and Fecamp, is moſtly a rocky bottom; but gravel or clay at Ailly, Dieppe, and Treport. He is of opinion that the whitings will be ſmaller but more delicate food in ſhallows near the ſhores, than in ſtony places far diſtant from the land.

11. Gadus carbonarius, the coal-fiſh: the mouth black, the lateral line white and ſtraight, form the ſpecific character. There are ſeven rays in the membrane of the gills, twenty-one in the pectoral fins, ſix in the ventrals, twenty-five in the firſt anal, twenty in the ſecond, twenty-ſix in the tail, fourteen in the firſt dorſal, nineteen in the ſecond, twenty in the third. The head is narrow. At the gill-coverts and the belly, a ſilvery hue ariſes from the black ground, and the belly is, as it were, encompaſſed with a ſtring of black dots; the reſt of the body and the head are of a ſhining black, whence the name in Engliſh and German. This colour, however, is conſtant only in the old ones; for when young they are olive or brown; which inclines to black as they grow older, and grows darker and darker: and hence they have different names according to their age in ſome parts of England. The mouth is ſmall; and the jaws, which are armed with teeth, end in a point; the lower is the longeſt; the tongue is a bright ſilver colour. The irides of the eyes are white, with a black ſpot on each ſide. This fiſh is furniſhed with thin ſcales, round and lozenge-ſhaped. Under the pectoral fins is a ſpot of the deepeſt black; and the anus is nearer to the head than to the tail. This ſpecies inhabits the Baltic and North Seas; they alſo frequent the rocky and deep coaſts all round this iſland, but are found in greateſt plenty in the vicinity of the Orkneys, where their fry conſtitutes a great part of the ſupport of the poor. The young begin to appear on the coaſt of Yorkſhire, in the month of July, in numbers that defy all computation: they are at that period only an inch and

a half long; in Auguſt they are from three to five inches, and are taken in vaſt quantities with the angling rod; they are then reckoned a very delicate diſh, but afterwards grow ſo coarſe, that, by the time they are a year old, few people eat them. They are ſold either freſh, or when ſalted, in the counties of York and Northumberland, at an inferior price to the other ſpecies of cod. The ſpecies in ſome counties grows to the length of two feet and a half, and the breadth of four or five inches, weighing thirty pounds and upwards. The ova are of the ſize of millet; and, by preſſing the belly never ſo little, they ooze out at the navel. The Icelanders, who have whiting in plenty, deſpiſe this ſpecies; in Norway the poor people eat them and make oil of the liver. They are caught all the year round; but particularly in ſummer, when in purſuit of the ſprat, which is therefore the beſt bait to catch them with; another bait is a bit of eel-ſkin. This ſpecies is ſalted and dried in the ſame manner as the common cod; and in that ſtate can hardly be diſtinguiſhed from it. The interior conformation is the ſame as the whiting.

12. Gadus pollachius, the pollack: ſpecific character, the lower jaw longer than the upper, the lateral line bent. There are ſeven rays in the membrane of the gills, nineteen in the pectoral fins, ſix in the ventrals, eighteen in the firſt anal, nineteen in the ſecond, forty-two in the tail, thirteen in the firſt dorſal, eighteen in the ſecond, nineteen in the third. See Plate I. fig. 2. The tail (not the fin) ends in a ſharp point, and is brown, as well as the back; the under jaw is the longer; and both jaws are armed with teeth, as in the preceding ſpecies; the tongue is ſhort, pointed, and rough towards the back part. The pupil of the eye is black, the iris yellow with numberleſs black dots. The ſcales are thin, oblong, and edged with yellow. The dark colour of the back is loſt by degrees in the white of the ſides, which are ſtudded with brown dots, as well as the belly, the ground colour of which is ſilvery. The pectoral fins are yellowiſh and ſmall; the ventrals orange-colour; the anals olive with black dots. This is alſo found in the Baltic and the Northern Ocean; lying in deep holes in the rocks, and places where the ſea is moſt agitated; a few are caught in the Baltic near Lubec, and in the North Sea; but in Norway and England they are very common, and arrive in ſummer in great ſhoals. They often riſe to the ſurface of the water, and even jump above it in divers poſitions, catching any thing that floats on the ſurface; at this time they are caught with a line and hook baited with a gooſe's feather. They grow a foot and a half long, weighing two or three pounds; but they have been caught three feet in length, and eight or ten inches wide. As food, they are white, firm, and better taſted than the coal-fiſh, though inferior to the torſk and the whiting. They feed on young fry, particularly the ſand-launce, which has been found in the ſtomach. The liver is of a pale red colour, in three lobes.

III. *Two dorſal fins.* 13. Gadus merlucius, the hake: ſpecific character, the lower jaw the longeſt, and no barbles at the mouth. The membrane of the gills is ſupported by ſeven rays, the pectoral fins, by twelve, the ventrals by ſeven, the anal by thirty-ſeven, the tail by twenty, the firſt dorſal by ten, the ſecond by thirty-nine. This ſpecies grows from one and a half to two feet in length, and is of a more ſlender ſhape than the common cod. Its form ſomewhat reſembles that of the pike; whence it is called the *ſea-pike* by the French and Italians. The mouth is large, and furniſhed with a mixture of ſhort and long teeth; and the palate, as is common to the fiſhes of this genus, is beſet with ſharp ſpines or teeth. The lateral line runs near the back, from five to ten pimples or warts appear on the part of it neareſt the head. It is white above, light grey underneath; theſe colours being ſimilar to thoſe of the aſs, it has been called *ονος* by Ariſtotle and many other writers; and the word *aſellus*, or young aſs, has been aſſumed as a generic term for many of the ſpecies. The hake is found in abundance on many of our coaſts, particularly thoſe of Ireland, where there was formerly a ſtated fiſhery on the Nymph Bank off Waterford; immenſe quantities were caught there at the two ſeaſons of their periodical appearance, June and September, when ſix men with hooks and lines frequently killed a thouſand fiſh in one night; the produce of this fiſhery was ſalted up and exported to Bilboa in Spain; it has, however, been for many years upon the decline, owing to the fiſh deſerting their wonted ſtation. This dereliction of their accuſtomed haunts, is not peculiar to the fiſhes of this ſpecies; the haddock has in the ſame manner abandoned the coaſts of Waterford, and the herrings and the baſking ſharks have diſplayed the ſame caprice, in relinquiſhing their ſtations on ſeveral parts of the Britiſh ſhores. Naturaliſts have not yet given any plauſible account of this irregularity in the migration of fiſhes. In ſome inſtances it may be occaſioned by the cloſe purſuit of an unuſual number of predatory fiſh, to avoid whoſe voracity they may be driven upon ſhores that they were formerly unaccuſtomed to frequent; a deficiency of the ſmaller fiſh, that ſupplied them, may, in other inſtances, have forced them to abandon a reſidence where they could no longer be ſupported: but the pernicious cuſtom of trawling is perhaps the moſt common cauſe of their abandoning the uſual ſtations, becauſe, by that means, not only a great part of their ſpawn is demoliſhed, which was lodged in the ſand, but the worms and inſects which conſtituted their food, are either deſtroyed by it, or driven into deeper water.

14. Gadus molva, the ling: ſpecific character, the upper jaw protruded, barbles from the lower. There are ſeven rays in the membrane of the gills, nineteen in the pectoral fin, ſix in the ventral, fifty-nine in the anal, thirty-eight in the tail, fifteen in the firſt dorſal, ſixty-three in the ſecond. The ling is the narroweſt and longeſt of the genus, whence its name in ſeveral languages. The head is large, flattened above and below, and ending in a blunt point; it is of a brown colour, as is alſo the back. The eyes are oblong, the pupil black, iris white with a ſpot of faint yellow. The mouth is large; the tongue white, thin, and ſharp pointed. The body is narrow, long, and round; yellowiſh on the ſides, and of a dirty white on the belly; the lateral line is ſtraight. The anus is ſomewhat nearer to the head than to the tail. The ſcales are oblong, and ſtrongly fixed in the ſkin. The pectoral and dorſal fins are dark grey; towards the extremity of the dorſals there is a black ſpot, and alſo on the anal, which fin is otherwiſe grey; all the fins are edged with white; the fin of the tail is black.

The ling inhabits particularly in the North Sea; and is taken often about Heligoland at the mouth of the Elbe; they are from four to ſeven feet in length. This fiſh abounds more or leſs upon the coaſts all round the Britiſh iſles; it is, however, moſt frequent near the Scilly iſles, and thoſe on the weſt of Scotland and Ireland, where it has long formed a conſiderable branch of commerce, regulations being framed concerning it ſo early as the reign of Edward III. The fiſh is in perfection from the beginning of February till May; in June they depoſit their ſpawn in the ſoft muddy bottoms near the mouths of rivers; about this time the males ſeparate from the females, many of the former being caught by fiſhermen without a ſingle individual of the latter. When the ling is in ſeaſon, its liver is white, and abounds with an oil of an excellent quality and flavour; but, as ſoon as the fiſh becomes out of ſeaſon, the liver gradually aſſumes a red colour, reſembling that of an ox, and it then produces no oil: the ſame change of colour of the liver is obſervable in cod, and ſeveral other fiſhes, but not in a degree ſo remarkable. It would ſeem, that this oil, which is lodged in the cellular membranes of fiſhes, returns into their blood, and ſupports them during the period of procreation; a ſeaſon in which they purſue the work of generation with ſo much eagerneſs, that they neglect

neglect their food. As the oil of this ſpecies can only be obtained while the animal is in ſeaſon, ſo it can be extracted from the liver only by a ſlow fire; if a violent heat be applied in melting it, a very ſmall quantity will be had from the fiſh, even in its greateſt perfection. Such fiſh as are cured for exportation, muſt meaſure a certain length from the ſhoulder to the tail, otherwiſe they are not entitled to the bounty which parliament has granted for the encouragement of this trade; twenty-ſix inches is the length of a ſizeable fiſh; thoſe of inferior dimenſions are called *drizzles*; and, becauſe incapable of procreation, they continue in ſeaſon during the whole ſummer. Next to the herring and the cod, this fiſh, on account of its rapid increaſe, is the moſt important article of commerce for ſeveral nations. In England, great quantities are ſalted for home conſumption as well as for exportation; they are prepared like the cod, but keep better in long voyages. From Norway they export annually 90,000lbs. weight of them; the ſpring is the time for the fiſhery in that country, and the beſt places are the ſand-banks near Storregen; the little bubbles which riſe to the ſurface of the water point out the ſpot where the fiſh are to be found, which is moſtly in deep places, where they feed on craw-fiſh, crabs, and ſmall fiſh; gurnards have been found in the ſtomach, and even half-digeſted plaiſe. This ſpecies is found alſo at Spitzbergen and Newfoundland, but of an inferior quality; likewiſe in Greenland and Lapland; thoſe of Iceland are ſo bad, that the inhabitants are obliged to eat them, becauſe they cannot ſell them. The beſt ſort are taken up in great plenty in the month of Auguſt near Hittland, where they dry them in the ſame manner as the common cod; they are taken with a ground line ſixty fathoms long, baited with herrings and other fiſh. Eaten freſh, they are very good food, when in ſeaſon, which is from February till May, and are even preferable to the cod.

15. Gadus albidus, the black-and-white gadus: ſpecific character, a barble from the chin, the ventral fins two long divided rays. There are ſeven rays in the membrane of the gills, ten in the firſt dorſal fin, fifty-ſix in the ſecond, eleven in each pectoral, two in each ventral, fifty-three in the anal, and ſixteen in the tail. We have already deſcribed a ſpecies, the *blennioides*, with didactylous rays in the ventral fins, ſimilar to the blenny; but the preſent, with a ſimilar appearance, belongs to a different diviſion, having but two dorſal fins and one anal. This, however, has the ſame haunts, the Mediterranean ſea; it is not more than four inches long, of an oblong ſhape, ſlippery, and ſlightly compreſſed. The head is of a pale red colour, flat at top, compreſſed at the ſides; two ſpines behind the eyes. The lower jaw is the ſhorteſt, and there are ſeven dents or punctures underneath on each ſide. The teeth are ſmall, pointed, and cloſe together. The eyes large, with a white iris. The lateral line ſtrait. The general colour is whitiſh, head reddiſh; black ſpots and edgings to the fins; the tail-fin is rounded, and of a blackiſh hue. It is placed by Cepede among the blennies.

16. Gadus tau, the toad-fiſh: many little barbles hanging from the lower jaw, and three ſpines in the firſt dorſal fin, and in each operculum, form the ſpecific character. There are ſix rays in the membrane of the gills, twenty in the pectoral fins, ſix in the ventrals, fifteen in the anal, twelve in the tail, three in the firſt dorſal, and twenty in the ſecond. The head of this fiſh is large, broad, and flattened; the under jaw is protruded, and the barbles form a ſemicircle. Both jaws are armed with ſharp teeth of various lengths; they form two rows in the lower jaw, and more in the upper: there alſo two rows on each ſide in the roof of the mouth. The tongue is ſhort, pointed, and hard. The eyes are large and protuberant, and half-way covered with a membrane; the pupil is black, the iris gold colour. Between the eyes, there is in the neck a furrow and a yellow ſtripe acroſs exhibiting ſome reſemblance to the Greek τ (tau), whence the ſpecific name; on each ſide of the eyes is a row of little warts, which take a direction towards the chin. The gill-coverts conſiſt of two laminæ, ending in three ſpines; the membrane of the gills is looſe. The head is brown; the body and fins are of the ſame colour, with white ſpots, and the belly is a dirty white. The anus is ſomewhat nearer to the aperture of the mouth than to the end of the tail fin. The body is covered with ſlime; it is ſmooth; and the ſcales are ſoft, thin, and ſo ſmall as hardly to be viſible to the eye; they are round, and of a brown colour edged with white. The pectoral fins terminate in a point, as well as the ventrals, which laſt lie under the throat, and the firſt ray is ſtrong, ſtiff, and longer than the reſt; the firſt dorſal is ſhort, and conſiſts of three ſpiny rays; the ſecond dorſal, and the anal, have ſimple rays much protruded beyond the membrane; but the tail-fin, which is round, and alſo the pectoral fins, have forked rays. This ſpecies is found in Carolina, and is there called *toad-fiſh*, on account of its colour; it is alſo found in Hudſon's Bay, and thereabouts; and is of the voracious kind, as may be concluded from the large mouth, and numerous teeth. See Plate II. fig. 3.

17. Gadus lota, the barbot, or eel-pout: ſpecific character, the jaws of equal length, with one or more barbles from the lower. There are ſeven rays in the membrane of the gills, twenty in the pectoral fins, ſix in the ventrals, ſixty-ſeven in the anal, thirty-ſix in the tail, fourteen in the firſt dorſal, ſixty-eight in the ſecond. The head is large, broad, and flatted below. The aperture of the mouth is large; the jaws are armed with ſeven rows of little ſharp teeth, and a ſingle barble hangs from the lower. The tongue is broad; and there are ſeveral jagged bones about the palate. The noſtrils are double; the foremoſt covered with a membrane. The eyes are ſmall; the pupil bluiſh, the iris yellow. The membrane of the gills lies acroſs, and is pretty broad. The body is laterally compreſſed, variegated with black and yellow; ſometimes brown with pale yellow ſpots, according to the waters in which it is bred up. It is ſoft, ſmooth, and lubricated like an eel; it has ſmall, ſoft, thin, ſcales, which have been overlooked by various authors. As the head is ſhaped like a frog's, and the body like an eel, the Dutch call it *putael*, and the Engliſh, *eel-pout*. The lateral line is ſtraight, the belly white, and the tail-fin round. The vent is nearer to the head than to the tail. The anal and dorſal fins are narrow, and mottled like the body. See Plate II. fig. 1.

Of this numerous genus, the burbot is the only ſpecies which lives in freſh water, and in rivers or lakes indifferently. It is indigenous not only to Germany, and other parts of Europe, but alſo to the Eaſt-Indies. It abounds in the lake of Geneva, and is found in ſeveral of the rivers in the north of England. According to Dr. Schæpf, it is found in Hudſon's Bay, and the waters thereabouts; and Falk ſays it lives in all the freſh-water rivers of Ruſſia and Siberia; in ſeveral places they make iſinglaſs from it, which however is not near ſo good as what comes from the ſturgeon: in Siberia and many parts of Ruſſia, eſpecially among the country people, they uſe the ſkin of this fiſh inſtead of glaſs, and it is as clear as oiled paper; the Oſtides and Tſchulymich Tartars uſe the ſkins for their ſummer-dreſs, and make bags of it to preſerve their peltry. The barbot is particularly fond of clear water, and hides in the hollows formed by ſtones, watching for the fiſh as they ſwim by; they alſo feed on worms and aquatic inſects, and, when other food fails, they devour one another; they will even attack the ſtickleback, in which they ſometimes loſe their lives, for the ſtickleback in ſtruggling drives his ſharp ſpine into the throat of the barbot, and they have been caught in this ſituation; the barbot, on the other hand, is often the prey of the pike and other rapacious kinds. When well fed, it grows pretty faſt, and attains the length of two or three feet, and weighs from ten to twelve pounds. As they are hardy and tenacious of life, they may be kept ſome time by feeding

London. Published as the Act directs Nov.r 23. 1805. by J. Wilkes.

feeding them with bullock's heart, or ſmall fiſh. The ſpawning-time is in December and January; then they leave the depths, and come into the ſtreams, ſeeking for ſmooth places to depoſit their ova; they increaſe very faſt. The fleſh is white, though bony, and well-taſted; being not very fat, it is good for weak ſtomachs, and the liver is counted a delicacy; a certain counteſs of Beuchlingen, in Thuringia, is ſaid to have expended great part of her revenue on this luxury. The liver ſuſpended in a glaſs, and placed near a ſtove, or in the ſun, gives out an oil which Aldrovandus regards as an efficacious remedy againſt hard knots or calloſities; and Haen and others confirm this opinion. This ſpecies is caught either by nets, by the floating line, or by the ground-line: this fiſhery was formerly ſo abundant about the Oder, that the fiſhermen, not being able to diſpoſe of all they caught, uſed to cut the flatteſt of them into ſlips, dry them, and uſe them as matches. The gullet is wide, with large folds or wrinkles like the pike. The inteſtinal canal has two ſinuoſities, and thirty appendages of different lengths, in which Richter diſcovered ſolitary worms. The liver is large, and of a pale red colour. The ſeed-veſſel and ovary are double, and 128,000 ſmall eggs of a pale yellow colour have been counted in one fiſh; theſe eggs are reckoned poiſonous. There are fifty-eight vertebræ in the ſpine of the back, and eighteen ribs on each ſide.

18. Gadus muſtela, the brown weaſel fiſh, or bearded cod: five barbles hanging from the mouth, the firſt dorſal fin very low, form the ſpecific character. There are five rays in the membrane of the gills, fourteen in the pectoral fins, ſeven in the ventrals, twenty in the anal, twenty-five in the tail, and forty-two in the ſecond dorſal; the rays of the firſt dorſal are ſo ſoft and ſmall, that their number cannot be exactly counted, but there are more than fifty.

The head is ſmall, flatted above and below; the palate of the mouth is rough; the jaws, the upper of which is the longeſt, are armed with very ſharp ſmall teeth; the tongue is looſe, and narrow. There is a barble at the extremity of the lower jaw, and four at the upper; behind the latter are two round holes. The pupil of the eye is black, the iris gold-yellow. The ſides of the head are ſilvery inclining to violet; the ſides and back are of a dirty yellow with black ſpots; but the colours vary greatly, as may be ſeen by the deſcriptions of different authors. The lateral line makes a bend behind the pectoral fin, then goes ſtraight to the end of the tail. The pectoral and ventral fins are reddiſh; the firſt dorſal lies ſo low as to be hardly viſible out of its furrow, and is compoſed of very ſoft and tender rays, of which the firſt or ſecond only is long; ſo that this fin is generally deſcribed as having but one ray, though it has probably fifty at leaſt. The other fins are light brown, thoſe of the anus and back having long ſpots of a darker brown, and the tail has round ſpots of the ſame colour; the rays of all the fins are ſoft. The whole fiſh is covered with mucilage, and the body with very ſoft ſcales. See Plate II. fig. 2.

This ſpecies equally belongs to the Mediterranean and the North Sea; but they appear in great quantities in the Adriatic and on the coaſt of Cornwall. In the Mediterranean they are ſeldom more than a ſpan long; but Pennant ſays they run nineteen inches long in the North Sea, yet ſtill do not weigh more than two pounds. The fleſh is ſoft and ill-taſted. They ſpawn in autumn; but do not increaſe very faſt, becauſe the cod and mackrel devour the greateſt part of their young; they live on ſhell-fiſh.

This ſpecies varies in the number of barbles. The *tricirratus*, or three-bearded cod, or cockling, is deſcribed by Bloch as having five rays in the membrane of the gills, one only perceptible in the firſt dorſal fin, fifty-ſix in the ſecond, eighteen in the pectoral fins, ſix in the ventrals, forty-ſix in the anal, and twenty in the tail. This variety has two barbles from the upper jaw, one from the lower. Turton makes it a diſtinct ſpecies.—The *ruſſicus* has one barble at the lower jaw only; body covered with brown ſpots.

19. Gadus cimbrius, the four-barbled cod: ſpecific character, four barbles, the firſt dorſal fin almoſt obliterated, its firſt ray terminated by two horizontal filaments like a T. The ſecond dorſal fin has forty-eight rays, the pectorals ſixteen, the ventrals ſeven, the anal forty-two, and the tail twenty-five. This ſpecies much reſembles the muſtela, varying in the number of barbles; but the form of the firſt ray of the firſt dorſal ſeems to be the ſpecific difference. Two barbles ariſe near the noſtrils, and one from each lip. This fiſh is found in the Atlantic, eſpecially on the Swediſh ſhores; it was firſt obſerved by M. de Struſſenfeld, and is well deſcribed by him in the Memoirs of the Stockholm Academy, tom. xxxiii. p. 46.

20. Gadus Danicus, the Daniſh cod: ſpecific character, the lower jaw the longeſt, the anal fin very long, conſiſting of ſeventy rays or thereabouts. This ſpecies has barbles from the lower jaw; it has two dorſal fins, and in every reſpect belongs to this third diviſion. Muller has a ſhort deſcription of it in his *Prodr. Zool. Dan.* and Cepede has brought it into his ſyſtem; but it is not mentioned by Linnæus nor Gmelin, nor his tranſlator Turton.

21. Gadus Leverianus, the Leverian cod: ſpecific character, ſubcinereous, with occellated whitiſh ſpots. Deſcribed by Dr. Shaw in his Gen. Zool. from a ſpecimen in the Leverian Muſeum, that beautiful collection of natural hiſtory, now, alas! no longer exiſting as a collection, having been ſold off by auction in lots in May and June 1806. Body extremely long in proportion to its depth, and of nearly uniform diameter as far as the ſecond dorſal fin, from which part it gradually leſſens towards the tail. Head large; mouth wide; lower jaw longer than the upper; both furniſhed with a row of ſharp, ſubulated, and ſlightly curved, teeth, of which thoſe in the lower jaw are by far the largeſt and longeſt: eyes rather large: gill-membrane ſix or ſeven-rayed: pectoral fins of moderate ſize: ventral rather ſmall and narrow: firſt dorſal fin ſubtriangular, ſituated at a conſiderable diſtance from the head, and the ſecond at a great diſtance from the firſt, being of a ſimilar ſhape, but rather larger: vent-fin ſmall, ſhallow, ſquariſh, and ſituated immediately beneath the ſecond dorſal: tail of moderate ſize, and even at the end. Skin ſmooth, without perceptible ſcales, and every where marked by numerous, ſmall, round, whitiſh, occellated ſpots on a pale brown ground-colour: lateral line not diſtinctly viſible, but rather marked by a continued angular elevation of the ſkin along the whole length of the body, ſo as to give the fiſh a ſquariſh form. Length about two feet two inches: depth about two inches and a half. Suppoſed to be a native of the Southern Ocean, being placed in a collection of fiſhes taken during the laſt voyage of captain Cook.

22. Gadus niger, the black gadus: black; caudal fin forked, ſecond dorſal adipous, fifty-two rays in the anal. There are ſeven rays in the membrane of the gills, ſixty in the ſecond dorſal fin, twenty in the pectorals, four in the ventrals, twenty-ſix in the tail. Obſerved by citizen Noel at the Iſle of Bute in Scotland, in Solway-frith, at Liverpool, and in the river Merſey. Length near a foot. A barble depends from the lower jaw, and two filaments from each pectoral fin; the firſt dorſal fin conſiſts of a ſingle articulated ray. This, ſays Cepede, ſhould be diſtinguiſhed from ſome black varieties of the common cod, which inhabit the lake of Strom, in Mainland, one of the Shetland Iſles, a mile or two from the ſtrait, where that lake communicates with the ſea. They are caught where the water is entirely freſh; they are very good food; a proof how eaſily many ſpecies of cod and of other kinds might be bred or kept in freſh water, which are now found only in the ſea.

IV. *One dorſal fin only.* 23. Gadus Mediterranicus, the three-bearded cod: ſpecific character, two barbles from

the upper jaw, one from the lower. The dorſal fin has fifty-four rays, the pectorals fifteen, the ventrals two, the anal forty-four. This has been ſuppoſed by Bloch to be a variety of the muſtela, and Gmelin ſeems to be of the ſame opinion, though he places it as a diſtinct ſpecies, in which we have followed him. This indeed has only one dorſal fin, and the muſtela has two; yet in that and the cimbrius the firſt dorſal is hardly viſible above the back, only one fin appearing diſtinct; ſo that, if any rudiments of another dorſal fin could be diſcovered in this, it will certainly refer it to that ſpecies. Cepede places it among the blennies.

24. Gadus broſme, the long-tailed cod: ſpecific character, the mouth bearded, the tail lanceolated. The dorſal fin has 100 rays, the pectorals twenty, the ventrals five, the anal ſixty, the tail thirty. This ſpecies is found in the ſea on the ſouth part of Greenland, and in the northern climates of Europe generally. The tail fin ſwells into an oval in the middle, and goes off to a point like the top of a pike or lance, and is ſometimes a yard long, ſays Cepede; but he does not ſay what is the length of the whole fiſh. The back is of a dark brown colour; the fins and under parts lighter; ſome long tranſverſe ſpots on the ſides.

25. Gadus ſalarias, Forſkael's gadus: ſpecific character, ſome teeth in front longer and more hooked than the reſt. There are ſix rays in the membrane of the gills, thirty-ſix in the dorſal fin, fourteen in the pectorals, two in the ventrals, twenty-ſix in the anal, and thirteen in the tail. Forſkael regards this ſpecies as holding a middle place between the gadus and the blenny, and it has ſome of the generic marks of each. Cepede places it among the blennies, probably on account of the didactylous rays of the ventral fins. The large teeth in front have ſome reſemblance to the fangs of wild beaſts. The body is clouded with ſpots of various colours; the dorſal fin runs from head to tail. This ſpecies is about a foot long; and is found in the Red Sea.

26. Gadus Scoticus, the Scotch torſk: ſpecific character, one barble from the lower jaw; the ventral fins fleſhy, and divided into four; tail rounded. The membrane of the gills has five rays, the dorſal fin thirty-one, the pectoral fins eight, the anal twenty-one. This ſpecies haunts the ſeas of Greenland, or of the north of Europe. The belly is thick, and of a white colour; the head brown; the ſides yelloviſh; the dorſal, anal, and tail fins, edged with white. This ſpecies grows to the length of two feet, and about ſix inches broad. Cepede places it among the blennies.

27. Gadus lubb, the Swediſh cod: no ſpots or bars on the body; tail forked; ſixty-five rays in the anal fin. There are ſeven rays in the membrane of the gills, 103 in the dorſal, twenty-one in the pectorals, five in the ventrals, and thirty-ſix in the tail. Inhabits the Cattegat, and the ſalt lakes of Bohus, in Sweden. Body conic, tail flat, and grows above a yard long. Jaws nearly equal, a ſhort barble from the lower. The eye is large, with a yellow iris. Teeth in the jaws, palate, and throat; tongue ſmooth, white, and fleſhy. Lateral line firſt bent, then ſtraight. Colour browniſh green; a black ſtripe along the dorſal and anal; a white and a black band on the caudal.

GA'EL, a town of France, in the department of the Iſle and Vilaine, and chief place of a canton, in the diſtrict of Montfort: three leagues and a quarter weſt of Montfort, and one ſouth of St. Meen.

GÆO'DES, *ſ.* [γαιωδης, from γαια, Gr. earth.] A ſpecies of thunderſtone found on the ſurface of the earth.

GÆRT'NER (Joſeph), the ſon of a phyſician, born at Calu, a little town in Swabia, in the kingdom of Wirtemberg, March 12, 1732. Diſcovering an early paſſion for anatomy, botany, and phyſiology, he was encouraged in theſe purſuits, and was ſent to the univerſities of Tubingen and Gottingen, at the laſt of which he remained till 1753. Quitting Gottingen, he travelled into Italy and France, and in the ſpring of 1755 came to England, where he remained till the end of the year. Returning, through France, to his native country, he received the degree of M. D. which he ſolicited not becauſe he purpoſed to devote himſelf to the practice of phyſic, but becauſe this title would facilitate the means of proſecuting his favourite ſtudies. In 1759, he went to Holland; attended the botanical courſe of the celebrated Van Royen, at Leyden; and, forming the cloſeſt friendſhip with this profeſſor, he entirely devoted himſelf to natural hiſtory, regarding the other ſciences only as they were ſubſervient to it. A ſecond viſit to England enabled him to make an acquaintance with our moſt celebrated naturaliſts; and he publiſhed ſome papers in our Philoſophical Tranſactions, and was elected a member of the royal ſociety. This honour was ſucceeded, on his re-viſiting Germany in 1761, by his being choſen to the anatomical chair at the univerſity of Tubingen, which induced him to proſecute with increaſing ardour his reſearches in comparative anatomy. The fame which he had acquired in England ſoon ſpreading over Europe, his name was inſerted among the members of the imperial academy of ſciences at Peterſburg. Being elected alſo profeſſor of botany and natural hiſtory in that city, and having more partiality for this ſcience than for anatomy, he repaired to Peterſburg in June 1768. A journey to the Ukraine enabled him to collect a great number of new plants; and, on his return to the metropolis of Ruſſia, he enjoyed the protection of the empreſs, and the reſpect of the learned. In the midſt, however, of this flattering ſituation, he was ſubject to ſuch inceſſant intruſions and interruptions, that he ſighed for ſolitude and leiſure; and renouncing fortune and ambition, he fixed his reſidence at the humble place of his nativity: where he devoted himſelf to the compoſition of that great work which occupied the remainder of his life, and is the fruit of twenty years of labour.

After having laid the plan of his Carpology, or Treatiſe on Fruits, and arranged its diviſions, he was ſoon aware that, in the little town of Calu, he could procure but few of thoſe fruits which it would be neceſſary for him to examine. In England and Holland, he had obſerved the greateſt number, of which he had taken notes: but notes alone were inſufficient; he felt the neceſſity of re-examining all theſe fruits, in order to deſcribe and delineate them with ſcrupulous exactneſs; and learning that Mr. (now ſir Joſeph) Banks was juſt returned from a voyage round the world, with immenſe ſtores of natural hiſtory, he departed for London in the ſpring of 1778, where on his arrival he experienced from the Engliſh naturaliſt the moſt liberal and generous acceſs to his treaſures. Sir Joſeph permitted M. Gærtner not only to examine, without exception, all the fruits which he poſſeſſed, but to cut and to analyſe them for the ſake of delineating their anatomy; he alſo preſented him with thoſe of which he had duplicates; and he lent him his credit to aſſiſt in procuring ſuch as were not in his poſſeſſion. Enriched by the preſents of ſir Joſeph Banks, and by others from the garden at Kew, he proceeded to Amſterdam, to enjoy an interview with M. Thunberg, lately returned from a voyage to Japan and the Cape of Good Hope; from whom he obtained a number of exotic fruits, and who promiſed to forward to Calu ſuch as had not yet come to hand.

Quitting Amſterdam, M. Gærtner repaired to Leyden, to examine ſome intereſting articles in its cabinet of natural hiſtory: but his reſearches met here with a melancholy interruption. The frequent uſe of the microſcope, added to his exceſſive application, brought on a nervous complaint which ſadly affected his eyes; and he returned to Calu ſtrongly apprehenſive of loſing his ſight, ſince nothing was found to afford him any relief. For twenty months, he was almoſt continually confined to his bed, and forced to exclude the light from his chamber. He at length renounced the uſe of all medicine, when by degrees his malady abated, and in a little time

time his ſight became perfectly re-eſtabliſhed. Though his health was feeble, he reſumed his work with ardor; and in about two years the manuſcript and deſigns intended for the firſt volume were completely finiſhed. Solicitous, however, of attaining correctneſs, he employed conſiderable time in reviſion; with which and other purſuits connected with his chief object, he was ſo fully occupied, that this firſt volume did not appear till March 1788. It was printed at his own expence at Stutgard, and dedicated to M. (ſir Joſeph) Banks.

Devoted with enthuſiaſm to his botanical ſtudies, he laboured in them with almoſt unremitting perſeverance; fearful leſt, in his declining health, the night of death ſhould ſurpriſe him before his work was finiſhed. He completed the MS. of his ſecond volume, and ſent it to the printer in April 1791; and he was ſtimulated by freſh ſpecimens of fruit preſented to him from different quarters, to commence a ſupplement: but his conſtitution, already weakened by his ſedentary avocations, was incapable of ſuſtaining the farther intenſity of his ſtudies. Conſumed by a ſlow fever, his hands grew weak and trembling; and on July 14, 1791, death terminated his ſcientific labours, in the 59th year of his age. His manners were pure, his taſte ſimple, and with unſhaken conſtancy he directed his efforts to the acquiſition and diffuſion of knowledge. He never was ſolicitous to augment his fortune, judging that the ſacrifice of his time could not be remunerated by other advantages: but he obtained by his economy, ſufficient to defray the expence of his travels, to purchaſe books and objects of natural hiſtory, and to pay for the impreſſion of his work, on which he founded no expectation of gain. To his other virtues he added that of modeſty. In the preface to his ſecond volume, he acknowledges with frankneſs the defects of his work, and points out what remains to be done. He has left among his MSS. a polyglot-dictionary of the names of plants; a publication much wanted. The ſupplement to his great work on fruits, we underſtand, will be completed by his ſon.

GÆRTNE'RA, *ſ.* [In memory of Joſeph Gærtner, M.D. F.R.S. &c. the ſubject of the preceding article.] In botany, a genus of the claſs decandria; order monogynia. The generic characters are—Calyx: perianth one-leafed, five-parted, permanent; diviſions oblong, obtuſe, ſpreading, nearly equal. Corolla: petals five, roundiſh, large, flat, ſpreading, torn and ciliate on the edge, nearly equal, with very ſhort claws. Stamina: filaments ten, filiform, very ſlightly coaleſcent at the baſe; nine ſlender, erectiſh, ſhorter than the corolla, the tenth thicker, the length of the petal, bent in at top. Antheræ parallelopiped, nine equal ſmall, the tenth on the longer filament a little larger. Piſtillium: germ ſuperior, three-toothed, ſmall: ſtyle filiform, lateral, bent in, the length of the greater ſtamen, permanent: ſtigma ſharp. Pericarpium: capſule woody, having four wings, one-celled; wings lanceolate, widening towards the tip, obtuſe; one very large, upright; two ſmaller, patulous; the fourth very ſmall, aſcending. Seed ſingle, roundiſh—*Eſſential Character.* Calyx: five-parted, the leaflets having on the outſide a ſingle marginal gland. Corolla: five-petalled, ſomewhat unequal, toothletted, furniſhed with very ſhort claws. Seed-veſſel nearly globoſe, with four wings.

Gærtnera racemoſa, a ſolitary ſpecies. According to Rheede (in Hort. Malab.) four of the petals are white, and the fifth yellow. The ſeed veſſel is nearly globular, or inverſely parabolical, leathery, thin, of a yellowiſh bay colour, marked on the ſide with the rudiment of the ſtyle; on the top it has a ſmall triangular creſt, and on the edge it has three very long leathery wings of an ovate-lanceolate ſhape, the middle one larger than the others. Seed kidney-form-globular, wrinkled, gibbous, ferruginous-reddiſh. It is a large climbing woody ſhrub, flowering in the wet and cold ſeaſon. It is cultivated all over the coaſt of Coromandel, on account of the beauty and fragrance of its flowers. It is the *vedal chitta* of the Telingas. Native of the Eaſt Indies, in the Circar mountains. See BANISTERIA benghalenſis, which is the ſame plant.

GÆSA'TÆ, a people that dwelt on the banks of the Rhone, who aſſiſted the Senones in taking and plundering Rome under Brennus. *Strabo.*

GAES'BECK, a town of Brabant: ſeven miles ſouth-weſt of Bruſſels.

GAE'TA, a ſeaport town of Italy, in the kingdom of Naples, and country of Lavora, ſituated on a bay called *the Gulf of Gaeta:* the harbour is defended by a citadel. It is the ſee of a biſhop, ſuffragan of Capua, but exempt from his juriſdiction: the ſituation is at the foot of a mountain near the ſea. This town was taken in 1707 by the imperial troops by aſſault: forty miles north-weſt of Naples. Lat. 41. 16. N. lon. 31. 10. E. Ferro.

GÆTU'LIA, in ancient geography, a country of Africa, lying to the ſouth of Mauritania, called *Gætulia Propria. Gætuli*, the people, were diſtinguiſhed by different epithets, as Nigri, Autololes, Daræ, and Baniuræ. *Pliny.* —The Gætuli were among the firſt inhabitants of Africa; a rough, unpoliſhed people, living on the ſpontaneous productions of the earth; a wandering tribe, who took up with the firſt place in which night ſurpriſed them. *Salluſt.*

GAFERA'ID, a town of Aſiatic Turkey, in the province of Caramania; thirty-two miles ſouth-eaſt of Cogni.

GAFF, *ſ.* a harpoon or large hook, uſually fixed to a pole, and uſed in ſmall ſhips, to extend the upper edge of the mizen, or thoſe ſails whoſe foremoſt edges are joined to the maſt by hoops or lacings, and which are uſually extended by a boom below.

GAF'FAREL (James), a French divine, and learned writer, born in 1602. He acquired great ſkill in the oriental languages, and in the cabaliſtic and occult ſciences. Cardinal Richelieu made choice of him for his library-keeper, and ſent him into Italy to collect ſcarce manuſcripts and books. He publiſhed *Curioſitez Inouies*, Unheard-of Curioſities. He died in 1681, aged 80. He had almoſt finiſhed an "Hiſtory of the Subterranean World;" containing an account of the caves, grottoes, vaults, catacombs, and mines, he had met with in thirty years travels.

GAF'FER, *ſ.* [ȝeferne, companion, Sax.] A word of reſpect now obſolete, or applied only in contempt to a mean perſon:

For *gaffer* Treadwell told us by the bye,
Exceſſive ſorrow is exceeding dry. *Gay.*

GAFFLEN'TZ, a town of Germany, in the archduchy of Auſtria: ſixteen miles ſouth-ſouth-eaſt of Steyr.

GAF'FLES, *ſ.* [ȝaffelucaſ, ſpears, Sax.] Artificial ſpurs put upon cocks when they are ſet to fight. A ſteel contrivance to bend croſs-bows. *Ainſworth.*

GAF'FOLDGILD, *ſ.* [Sax.] The payment of cuſtom, a tribute. *Scott.*

GAF'FOLDLAND, *ſ.* [Sax.] The land which was ſubject to the gaffoldgild, land liable to be taxed. *Scott.*

GAFF'SA, a town of Africa, in the country of Tunis: 130 miles ſouth-weſt of Cairoan.

GAFU'RIO (Franchino), an eminent profeſſor of muſic, born in 1451 at Lodi, where his father Bettino was a ſoldier in the ſervice of the duke of Mantua. He was educated for the prieſthood, and particularly applied himſelf to the ſtudy of muſic. After taking orders, he went to Mantua, and then to Verona, at which place he firſt commenced a teacher of muſic. He viſited Genoa, Naples, and other cities, continually improving himſelf in muſical ſcience, and augmenting his reputation by his writings and lectures. In 1484 he was invited to Milan, and placed at the head of the choir in that cathedral. The duke Lodovico Sforza alſo created him the firſt public profeſſor of muſic in his capital; where he reſided many years, and compoſed many learned works which

have perpetuated his name. He alſo cauſed the writings of the ancient Greek authors concerning muſic to be tranſlated into Latin. A work on Muſical Inſtruments, which he publiſhed in 1518, involved him in an angry controverſy with Giovanni Spatario, a muſician in Bologna, who gave a ſevere criticiſm of it, to which he replied with equal acrimony. It is not known to what age Gafurio lived; but as his reply to Spatario is dated in 1520, he muſt have reached his ſeventieth year. He was a man of general learning, and wrote moſt of his works in Latin, in a ſtyle of conſiderable elegance. He likewiſe compoſed poems in that language. His muſical publications, which are ſtill in high repute, are: *Theoricum Opus Muſicæ Diſciplinæ*, Neap. 1480; Milan, 1492. *Practica Muſicæ utriuſque Cantus*, Milan, 1496; Venet. 1512. *Angelicum & Divinum Opus Muſicæ materna lingua ſcript.* Milan, 1508. *De Harmonica Muſicorum Inſtrumentorum*, Mil. 1518. He likewiſe publiſhed the works of Maffeo Vegio, and an oration of Jac. Antiquario in praiſe of Louis XII. of France.

To GAG, *v.n.* [from *gaghel*, Dutch, the palate. *Minſhew.*] To ſtop the mouth with ſomething that may allow to breathe, but hinder to ſpeak.—There foam'd rebellious logic, *gagg'd* and bound. *Pope.*

GAG, *ſ.* Something put into the mouth to hinder ſpeech or eating:

Some, when the kids their dams too deeply drain,
With *gags* and muzzles their ſoft mouths reſtrain. *Dryden.*

GAG, one of the Papuan Iſlands, which having the advantage of a ſafe bay, with plenty of freſh water, and timber, induces navigators to touch there, though it is wholly uninhabited.

GAGARAWAU' BAY, a bay on the north coaſt of the Iſland of St. Vincent.

GAGA'TES, *ſ.* [γαγάτης, from Γαγης, Gr. a river in Lycia, where it is found.] A ſpecies of jet or agate-ſtone.

GAGE, *ſ.* [*gage*, Fr.] A pledge; a pawn; a caution; any thing given in ſecurity.—There is my *gage*, the manual ſeal of death. *Shakeſpeare.*

But ſince it was decreed, auſpicious king,
In Britain's right that thou ſhould'ſt wed the main,
Heav'n, as a *gage*, would caſt ſome previous thing,
And therefore doom'd that Lawſon ſhould be ſlain. *Dryd.*

A meaſure; a rule of meaſuring:

One judges as the weather dictates; right
The poem is at noon, and wrong at night;
Another judges by a ſurer *gage*,
An author's principles or parentage. *Young.*

[In ſea language.] When one ſhip is to windward of another, ſhe is ſaid to have the *weather-gage*.

To GAGE, *v. a.* [*gager*, Fr.] To wager; to depone as a wager; to impawn; to give as a caution, pledge, or ſecurity.—He found the Turkiſh merchants making merry: unto theſe merchants, he gave due ſalutations, *gaging* his faith for their ſafety, and they likewiſe to him. *Knolles.*—To bind by ſome caution or ſurety; to engage:

My chief care
Is to come fairly off from the great debts
Wherein my time, ſomething too prodigal,
Hath left me *gaged*. *Shakeſpeare.*

To meaſure; to take the contents of any veſſel of liquids particularly. More properly *gauge*. See GAUGE.

Nay, but I bar to-night: you ſhall not *gage* me
By what we do to-night. *Shakeſpeare.*

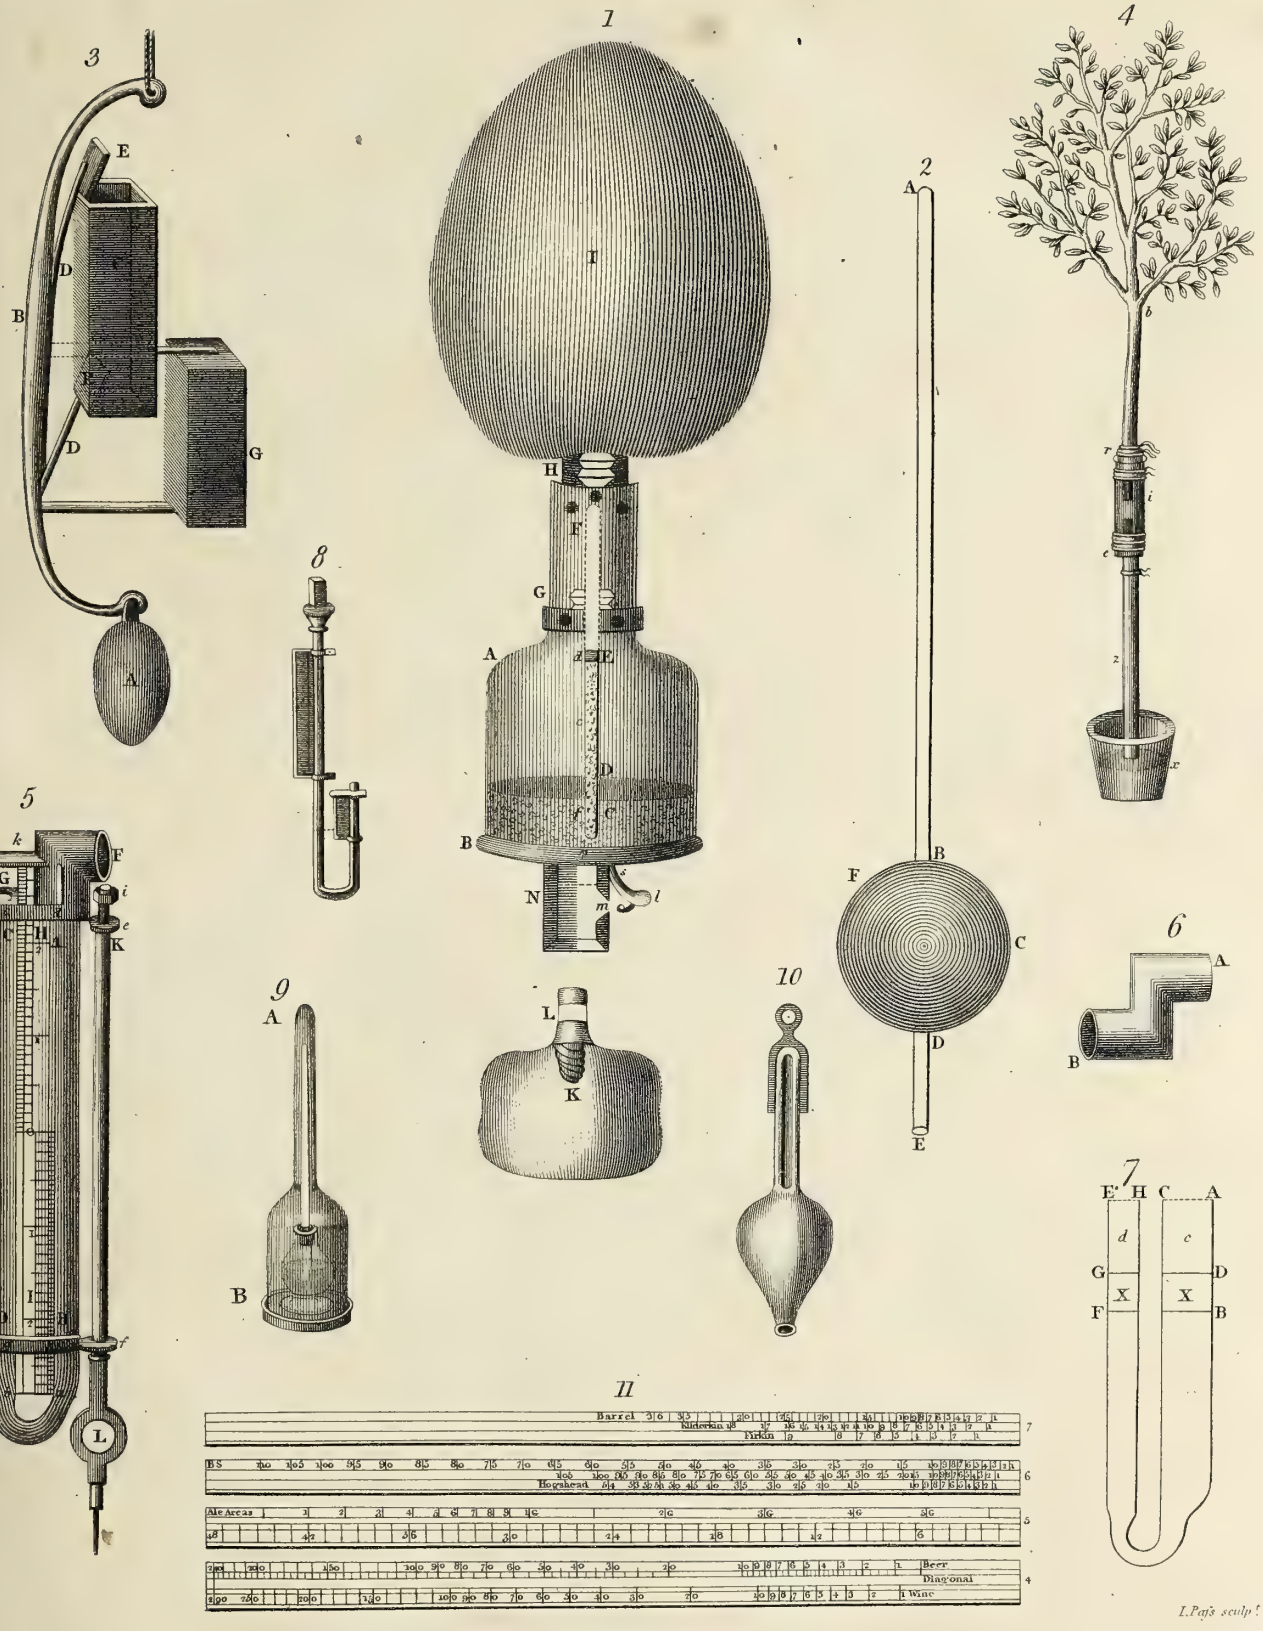
In hydroſtatics, pneumatics, &c. the *gage* is an inſtrument for aſcertaining meaſures of various kinds: viz. 1. The SEA-GAGE; which is an inſtrument for finding the depth of the ſea. Several kinds of theſe have been invented by Dr. Hales, Dr. Deſaguliers, and others. Formerly, the machines for this purpoſe conſiſted of two bodies, the one ſpecifically lighter, and the other ſpecifically heavier, than the water; ſo joined together that as ſoon as the heavy one came to the bottom, the lighter ſhould get looſe from it, and emerge; and the depth was to be eſtimated by the time the compound was in falling from the top to the bottom of the water, together with the time the lighter body was in riſing, reckoned from the diſappearing of the machine, till the emergent body was ſeen again; but no certain concluſion could be drawn from ſo precarious and incomplete an experiment. But that invented by Drs. Hales and Deſaguliers was of a more exact nature, depending on the preſſure of the fluid only. For as the preſſure of fluids in all directions is the ſame at the ſame depth, ſo a *gage* which diſcovers what the preſſure is at the bottom of the ſea, will ſhew what the true depth of the ſea is in that place, whether the time of the machine's deſcent be longer or ſhorter.

Dr. Hales, in his Vegetable Statics, deſcribes his gage for eſtimating the preſſures made in opaque veſſels; where honey, being poured over the ſurface of mercury in an open veſſel, riſes upon the ſurface of the mercury as it is preſſed up into a tube whoſe lower orifice is immerſed into the honey and mercury, and whoſe top is hermetically ſealed. Now as by the preſſure, the air in the tube is condenſed, and the mercury riſes, ſo the mercury comes down again when the preſſure is taken off, and would leave no mark of the height to which it had riſen; but the honey or treacle, put upon the mercury, by ſticking to the inſide of the tube, leaves a mark, which ſhews the height to which it had riſen, and conſequently gives the quantity of preſſure, and the height of the ſurface of the fluid. Deſaguliers's addition to this machine, conſiſted in a contrivance to carry it down to the bottom of the ſea by means of a heavy weight, which was immediately diſengaged by ſtriking the bottom, and the gage, made very light for the purpoſe, re-aſcended to the top.

A correct delineation of this gage is given in the annexed engraving at fig. 1. AB repreſents the gage-bottle or jar, in which is cemented the gage-tube F*f*, in the braſs cap at G. The upper end of tube F is hermetically ſealed, and the open lower end *f*, is immerſed in mercury, marked C, on which ſwims the treacle. On the top of the bottle is ſcrewed a tube of braſs HG, pierced with ſeveral holes to admit the water into the bottle AB. The body K is a weight hanging by its ſhank L in a ſocket N, with a notch on one ſide at *m*, in which is fixed the catch *l* of the ſpring *s*, and, paſſing through the hole L in the ſhank of the weight K, prevents its falling out when once hung on. On the top, in the upper part of the braſs tube at H, is fixed a large empty ball or full-blown bladder I, which muſt not be ſo large but that the weight K may be able to ſink the whole under water. The inſtrument is uſed in the following manner: the weight K being hung on, the gage is let fall into the water, and ſinks to the bottom: the ſocket N is ſomewhat longer than the ſhank L; and therefore, after the weight K comes to the bottom, the gage will continue to deſcend till the lower part of the ſocket ſtrikes againſt the weight: this gives liberty to the catch to fly out of the hole L, and let go the weight K: when this is done, the ball or bladder I inſtantly buoys up the gage to the top of the water. While the gage is under water, the water, having free acceſs to the treacle and mercury in the bottle, will by its preſſure force it up into the tube F*f*, and the height to which it has been forced by the greateſt preſſure, viz. that at the bottom, will be ſhown, as before obſerved, by the mark in the tube which the treacle leaves behind it. This ſhows into what ſpace the whole air in the tube F*f* is compreſſed; and conſequently the height or depth of the water which by its weight produced that compreſſion, which is the thing required.

If the gage-tube F*f* were of glaſs, a ſcale might be drawn on it with the point of a diamond, ſhowing, by inſpection, what height the water ſtands above the bottom. But the length of ten inches is not ſufficient for fathoming great depths at ſea, ſeeing that, when all the air in ſuch a length of tube is compreſſed into half an inch, the depth

GAGE.



Improved Gages.

London Published as the Act directs August 30th 1806 by J. Wilkes.

depth of water is no more than ſix hundred and thirty-four feet, which is not half a quarter of a mile. If, to remedy this, we make uſe of a tube fifty inches long, which for ſtrength may be a muſket-barrel, and ſuppoſe the air compreſſed into an hundredth part of half an inch; then, as 1 : 99 : : 400 : 39600 inches, or 3300 feet; even this is but little more than half a mile, or 2640 feet. But ſince it is reaſonable to ſuppoſe the cavities of the ſea bear ſome proportion to the mountainous parts of the land, ſome of which are more than three miles above the earth's ſurface, therefore, to explore ſuch great depths, Dr. Hales contrived a new form for his ſea-gage, or rather for the gage-tube in it, as follows. B C D F fig. 2. is a hollow metalline globe, communicating on the top with a long tube A B, whoſe capacity is a ninth part of that globe. On the lower part at D, it has alſo a ſhort tube D E, to ſtand in the mercury and treacle. The air contained in the compound gage-tube is compreſſed by the water as before; but the degree of compreſſion, or height to which the treacle has been forced, cannot there be ſeen through the tube; therefore, to anſwer that end, a ſlender rod of metal or wood, with a knob on the top of the tube A B, will receive the mark of the treacle, and ſhow it when taken out. If the tube A B be fifty inches long, and of ſuch a bore that every inch in length ſhould be a cubic inch of air, and the contents of the globe and tube together five hundred cubic inches; then, when the air is compreſſed within an hundredth part of the whole, it is evident the treacle will not approach nearer than five inches of the top of the tube, which will agree to the depth of 3300 feet of water as above. Twice this depth will compreſs the air into half that ſpace nearly, viz. two inches and an half, which correſpond to ſix thouſand ſix hundred, which is a mile and a quarter. Again, half that ſpace, or one inch and a quarter, will ſhow double the former depth, viz. thirteen thouſand two hundred feet, or two miles and an half; which may probably be very nearly the greateſt depth of the ſea.

2. The Bucket Sea-Gage. This inſtrument was alſo contrived by Dr. Hales, to find the different degrees of coolneſs and ſaltneſs of the ſea at different depths. It conſiſts of a common houſehold pail or bucket made with two heads. Theſe heads have each a round hole in the middle, about four inches in diameter, covered with ſquare valves opening upward; and that they may both open and ſhut together, there is a ſmall iron rod fixed to the upper part of the lower valve, and the other end to the lower ſide of the upper valve: ſo that, as the bucket deſcends with its ſinking weight into the ſea, both the valves may open by the force of the water, which by that means has a free paſſage through the bucket. But when the bucket is drawn up, then both the valves ſhut by the force of the water at the upper part of the bucket; ſo that the bucket is drawn up full of the loweſt ſea-water to which it has deſcended. When the bucket is drawn up, a mercurial thermometer fixed in it is examined; but great care muſt be taken to obſerve the degree at which the mercury ſtands, before the lower part of the thermometer is taken out of the water in the bucket, leſt it be affected by the different temperature of the air. In order to keep the bucket in a right poſition, there are four cords fixed to it, reaching about three feet below it; to which the ſinking weight is fixed. The reſult of ſeveral trials with this gage was, that, when it was let down to different depths from 360 feet to 5346 feet, in lat. 25. 13. N. and lon. 25. 12. W. it was diſcovered by the thermometer, that the cold increaſed gradually in proportion to the depths, till it deſcended to 3900 feet, viz. near three-fourths of a mile, whence the mercury in the thermometer came up at 53°; and though it was afterwards ſunk to 5346 feet, which is a mile and 66 feet, it came up no lower: the warmth of the water upon the ſurface, and that of the air, was all that time 84°. When the water in the bucket was become of the ſame temperature with that on the ſurface of the ſea, equal quantities of both were weighed and tried by the hydrometer; that from below was found to be the heavieſt, and conſequently the ſalteſt.

Dr. Hales was probably led to the conſtruction of this ſea-gage, from that invented by Dr. Hook, for the ſame purpoſe. This is exhibited in the engraving at fig. 3. It conſiſts of a ſquare bucket C, whoſe bottom and lid are ſo contrived, that as the weight A ſinks the iron B, to which the bucket C is faſtened by two handles D D, on the end of which are the moveable bottoms or valves E E, and thereby draws down the bucket, the reſiſtance of the water keeps up the bucket in the poſture C, whereby the water, whilſt the bucket is deſcending, hath a free paſſage through it; whereas, as ſoon as the bucket is pulled upwards by the line F, the reſiſtance of the water to that motion beats the lid downwards, and keeps it in the poſture ſhewn at G, whereby the included water is kept from getting out, and the ambient water prevented from getting in. Phil. Tranſ. No. 9. p. 149. and No. 24. p. 447. or Abr. vol. ii. p. 260.

3. The Aqueo-Mercurial Gage. An apparatus contrived by Dr. Hales, and applied in various forms to the branches of trees, in order to determine the force with which they imbibe moiſture. Let *e*, *r*, fig. 4, be a cylindric glaſs, of an inch diameter within, and eight inches long. Into this glaſs is introduced the branch of a young thriving tree *b*, about three feet long, with lateral branches; the diameter of the tranſverſe cut *i*, being three-fourths of an inch. Having fitted the joint *r* to the tube at *r*, by folding a piece of ſheep's ſkin round the ſtem, it is cemented with a mixture of bees-wax and turpentine melted together, in ſuch a proportion as to make a very ſtiff clammy paſte when cold, and over the cement folds of wet bladders are bound firmly with packthread. To the lower end *e* of the large tube, a ſmaller tube *z e* is cemented, being about one-fourth of an inch diameter, eighteen inches long, and full one-eighth of an inch thick. Theſe tubes are cemented together at *e* with common hard brick-duſt or powdered chalk cement, and the joint is farther ſecured with the cement of bees-wax and turpentine, over which a wet bladder is bound. The apparatus being thus prepared, the branch is turned downwards, and the glaſs-tube upwards, and then both tubes are filled with water; with the finger applied to the open end of the ſmall tube, it is inverted and immerſed in the glaſs ciſtern *x*, full of mercury and water. In this ſituation the lower end of the branch was immerſed ſix inches in water, viz. from *r* to *i*; the water was imbibed by the branch at its tranſverſe cut *i*; and, during its aſcent into the ſap-veſſels of the branch, the mercury roſe in the tube *e z* from the ciſtern *x*, ſo that in half an hour it was riſen five inches and three-fourths high, as far as *z*. The height of the mercury indicated, in ſome meaſure, the force with which the ſap was imbibed, though not the whole force; becauſe, while the water was imbibed by the branch, its tranſverſe cut was covered with innumerable little hemiſpheres of air, and many air-bubbles iſſued out of the ſap-veſſels, which partly filled the tube *e r*, as the water was drawn out of it: and, therefore, the height of the mercury could only be proportionable to the exceſs of the quantity of water drawn off above the quantity of air which iſſued out of the wood. If the quantity of air iſſuing from the wood had been equal to the quantity of water imbibed, it is plain that the mercury could not riſe at all, becauſe there would be no room for it in the tube: but if nine parts in twelve of the water be imbibed by the branch, and only three ſuch parts of air iſſue into the tube in the ſame time, the mercury muſt riſe near ſix inches, and ſo proportionably in other caſes. Dr. Hales obſerved, that the mercury roſe higheſt when the ſun was clear and warm, and that it ſubſided three or four inches towards evening, but roſe again the next day as it grew warm, though ſeldom ſo high as at firſt. Dr. Hales adapted the ſize and ſhape of the glaſs apparatus to a great variety of branches of ſeveral ſizes

and of different kinds of trees, and repeated the experiment in a variety of inſtances. See his Vegetable Statics, vol. i. chap. ii. p. 84, &c.

5. The TIDE-GAGE. An inſtrument uſed for determining the height of the tides by Mr. Bayly, in the courſe of a voyage towards the ſouth-pole, &c. in the Reſolution and Adventure, in 1772, 1773, 1774, and 1775. This inſtrument conſiſts of a glaſs tube, whoſe internal diameter was ſeven-tenths of an inch, laſhed faſt to a ten-feet fir rod, divided into feet, inches, and quarters: this rod was faſtened to a ſtrong poſt fixed upright and firm in the water. At the lower end of the tube was an exceeding ſmall aperture, through which the water was admitted. In conſequence of this conſtruction, the ſurface of the water in the tube was ſo little affected by the agitation of the ſea, that its height was not altered one-tenth of an inch, when the ſwell of the ſea was two feet; and Mr. Bayly was certain, that with this inſtrument he could diſcern a difference of one-tenth of an inch in the height of the tide.

6. The WIND-GAGE; an inſtrument for meaſuring the force of the wind upon any given ſurface. It was invented by Dr. Lind, and firſt deſcribed in the Phil. Tranſ. vol. lxv. The inſtrument conſiſts of two glaſs tubes, of five or ſix inches in length, as ſhewn by the letters A B C D, in the engraving at fig. 5. Their bores, which are the better for being equal, are about four-tenths of an inch in diameter. They are connected together like a ſiphon, by a ſmall bent glaſs-tube marked *a b*, the bore of which is about one-tenth of an inch in diameter. On the upper end of the leg A B there is a tube of latten braſs, which is bent perpendicularly outwards, and has its mouth open towards F. On the other leg C D is a cover with a round hole G in the upper part of it, two-tenths of an inch in diameter. This cover and the bent tube are connected together by a ſlip of braſs *c d*, which not only gives ſtrength to the whole inſtrument, but alſo ſerves to hold the ſcale H I. The bent tube and cover are fixed on with hard cement or ſealing-wax. To the ſame tube is ſoldered a piece of braſs *e*, with a round hole to receive the ſteel ſpindle K L; and at *f* there is juſt ſuch another piece of braſs ſoldered to the braſs-hoop *g h*, which ſurrounds both legs of the inſtrument. There is a ſmall ſhoulder on the ſpindle at *f*, upon which the inſtrument reſts, and a ſmall nut at *i*, to prevent it from being blown off the ſpindle by the wind. The whole inſtrument is eaſily turned upon the ſpindle by the wind, ſo as always to preſent the mouth of the bent tube towards it. The end of the ſpindle has a ſcrew on it, by which it may be ſcrewed into the top of a poſt, or a ſtand made on purpoſe. It has alſo a hole at L, to admit a ſmall lever for ſcrewing it into wood with more facility. A thin plate of braſs *k* is ſoldered to the bent tube, about half an inch above the round hole G, ſo as to prevent rain from falling into it. There is likewiſe a crooked tube, as ſhewn at A B, fig. 6, to be put occaſionally upon the mouth of the bent tube F, in order to prevent rain from being blown into the mouth of the wind-gage when it is left out all night, or expoſed in the time of rain.

The force or momentum of the wind is aſcertained by this inſtrument, by filling the tubes half full of water, and puſhing the ſcale a little up or down, till the o of the ſcale, when the inſtrument is held up perpendicularly, be on a line with the ſurface of the water in both legs of the wind-gage. The inſtrument being thus adjuſted, hold it up perpendicularly, and, turning the mouth of the bent tube towards the wind, obſerve how much the water is depreſſed by it in the one leg, and raiſed in the other. The ſum of the two is the height of a column of water which the wind is capable of ſuſtaining at that time; and every body that is oppoſed to that wind will be preſſed upon by a force equal to the weight of a column of water, having its baſe equal to the altitude of the column of water ſuſtained by the wind in the wind-gage. Hence the force of the wind upon any body where the ſurface oppoſed to it is known may be eaſily found: and a ready compariſon may be made betwixt the ſtrength of one gale of wind and that of another.

The force of the wind may be likewiſe meaſured with this inſtrument, by filling it until the water runs out at the hole G. For, if we then hold it up to the wind as before, a quantity of water will be blown out; and if both legs of the inſtrument are of the ſame bore, the height of the column ſuſtained will be equal to double the column of water in either leg, or the ſum of what is wanting in both legs. But if the legs are of unequal bores, neither of theſe will give the true height of the column of water which the wind ſuſtained. But the true height may be obtained by the following formulæ.

Suppoſe that after a gale of wind which had blown the water from A to B, in fig. 7, forcing it at the ſame time through the other tube out at E, the ſurface of the water ſhould be found ſtanding at ſome level as D G, and it were required to know what was the height of the column E F, or A B, which the wind ſuſtained. In order to obtain this, it is only neceſſary to find the height of the columns D B, or G F, which are conſtantly equal to one another; for either of theſe, added to one of the equal columns A D, E G, will give the true height of the column of water which the wind ſuſtained. Let the diameters A C, E H, of the tubes, be reſpectively repreſented by *c d*; and let $a = $ A D or E G, and $x = $ D B, or G F: then it is evident, that the column D B is to the column E G as $c^2 x$ to $d^2 a$. But theſe columns are equal. Therefore $c^2 x = d^2 a$; and conſequently $x = \frac{d^2 a}{c^2}$. But if, at any inſtant of time whilſt the wind was blowing, it was obſerved, that when the water ſtood at E, the top of the tube out of which it is forced, it was depreſſed in the other to ſome given level B F, the altitude at which it would have ſtood in each had it immediately ſubſided, may be found in the following manner. Let $b = $ A B, or E F. Then it is evident that the column D B is equal to the difference of columns E F, G F. But the difference of theſe columns is as $d^2 b - d^2 x$; and conſequently $x = \frac{d^2 b}{c^2 + d^2}$.

For the caſes when the wind blows in at the narrow leg of the inſtrument: Let A B $=$ E F $= b$, E G or A D $= a$, G F $=$ D B $= x$, and the diameters E H, G A, reſpectively $= d$, c, as before. Then it is evident that the column A D is to the column G F as ac^2 to $d^2 x$. But theſe columns are equal; therefore $d^2 x = ac^2$; and conſequently $x = \frac{ac^2}{d^2}$. It is alſo evident, that the column A D is equal to the difference of the columns A B, D B; but the difference of theſe columns is as $bc^2 - c^2 x$. Therefore $d^2 x = bc^2 - c^2 x$. Whence we get $x = \frac{bc^2}{d^2 + c^2}$.

The uſe of the ſmall tube of communication *a b*, fig. 5, is to check the undulation of the water, ſo that the height of it may be read off from the ſcale with eaſe and certainty. But it is particularly deſigned to prevent the water from being thrown up to a much greater or leſs altitude, than the true height of the column which the wind is able at that time to ſuſtain, from its receiving a ſudden impulſe whilſt it is vibrating either in its aſcent or deſcent. As in ſome caſes freſh water in this inſtrument might be liable to freeze, and thus break the tubes, Dr. Lind recommends a ſaturated ſolution of ſea-ſalt to be uſed inſtead of it, which does not freeze till Fahrenheit's thermometer falls to o.

7. GAGE of the AIR-PUMP. This is adapted for ſhewing the degree to which the air is rarefied, or the receiver is exhauſted, at any time by the air-pump. There are three ſuch gages in uſe; the firſt, called the *long barometer gage*; the ſecond, the *ſhort barometer gage*; the third, the *pear gage*, or *manometer*. The two firſt ſhew the elaſticity of the fluid in the receiver, but do not determine whether it be permanently elaſtic air; the third ſhews the

denſity

denſity of the air left in the receiver, without being affected by ſuch gaſes as may aſſume an elaſtic form in the vacuum. The long gage is often made in the form of an inverted ſiphon, with one leg open, and the other hermetically ſealed; and is ſometimes called *Mairan's gage*; and is delineated in the engraving at fig. 8. The ſhort gage, repreſented in the ſame engraving at A B, fig. 9, conſiſts of a tube ſix or eight inches long, filled with mercury, and inverted in a ſmall baſon thereof, in the ſame manner as the common barometer; in this the mercury does not begin to deſcend till about three-fourths of the air is exhauſted, after which it begins to ſhew the degree of exhauſtion, which is in proportion as the height of its column to the height of the mercury in the common barometer.

The pear gage, ſhewn at fig. 10, would be the moſt accurate of any, if it were not that moſt fluid ſubſtances aſſume an elaſtic form whenever the preſſure of the atmoſphere is removed; it therefore ſeldom indicates the elaſticity, or actual preſſure of the fluid, remaining in the receiver. See the reſults of various experiments with the pear gage, under the article AIR-PUMP, vol. i. p. 224.

8. GAGE OF THE BAROMETER. A contrivance for eſtimating the exact degree of the riſe and fall of the mercury in the tube of that inſtrument. It is well known that whilſt the mercury riſes in the tube, it ſinks in the ciſtern, and vice verſa; and conſequently the diviſions on the ſcale fixed near the top of the tube had their diſtance from the ſurface of the mercury in the ciſtern always various; from which there muſt often happen errors in determining the height of the mercury in the tube. To remedy this inconvenience, a line is cut upon a round piece of ivory, which is fixed near the ciſtern: this line is accurately placed at a given diſtance from the ſcale; for example at twenty-ſeven inches; and a ſmall float of cork, with a cylindrical piece of ivory fixed to its upper ſurface, on which a line is cut at the exact diſtance of two inches from the under ſide of the cork, is left to play freely on the quickſilver, and the cylinder works in a groove made in the other piece. From this conſtruction it appears, that if theſe marks are made to coincide, by raiſing or lowering the ſcrew which acts on the quickſilver, then the diviſions on the ſcale will expreſs the true meaſure of the diſtance from the ſurface. See BAROMETER, vol. ii. p. 734–741.

9. GAGE OF THE CONDENSER. A glaſs tube of a particular conſtruction, adapted to the condenſing engine, and deſigned to ſhew the exact denſity and quantity of the air contained at any time in the condenſer. *Deſaguliers's Exper. Philoſ.* vol. ii. p. 394.

10. SLIDING GAGE. A tool uſed by mathematical inſtrument makers, for meaſuring and ſetting off diſtances; conſiſting of a beam, tooth, ſliding ſocket, and the ſhoulder of the ſocket.

11. The ROD GAGE, commonly called *the four feet gauging rod*, delineated in the engraving at fig. 11. This is generally uſed in gauging liquors or caſks, explained under the article GAUGING.

GAGE, or GAGE DELIVERANCE, in law, is where he that hath taken a diſtreſs, and being ſued, hath not delivered the cattle that were diſtrained; then he ſhall not only avow the diſtreſs, but *gager deliverance*, i. e. put in ſurety, or pledges, that he will deliver them. *F. N. B.* 67. This gage deliverance is had on ſuing out replevins, upon the plaintiff's praying the ſame: and it is ſaid the parties are to be at iſſue, or there is to be a demurrer in law, before gage deliverance is allowed; and if a man claim any property in the goods, or the beaſts are dead in the pound, the party ſhall not gage. *Kitch.* 145. See the article REPLEVIN.

GA'GES, a town of France, in the department of the Aveiron, and chief place of a canton, in the diſtrict of Rhodez: two leagues north-eaſt of Rhodez.

GAGETOWN, a ſettlement and town of the American States, in Sunbury county, New Brunſwick, on the lands granted to general Gage, on the weſt ſide of St. John's river, on the northern ſhore of the bay of Fundy. The general's grant conſiſts of 20,000 acres of land; the upland of which is in general very bad. There is ſome interval on the river ſide, on which are a few ſettlers; excluſive of theſe ſettlements, there is very little good land of any kind.

To GAG'GLE, *v. n.* [*gagen, gagelen*, Dut.] To make a noiſe like a gooſe.—Birds prune their feathers, geeſe *gaggle*, and crows ſeem to call upon rain; which is but the comfort they receive in the relenting of the air. *Bacon.*

May fat geeſe *gaggle* with melodious voice,
And ne'er want gooſeberries or apple-ſauce. *King.*

GAGNA'NO, a town of Italy, in the kingdom of Naples, and province of Capitanata: ſeventeen miles eaſt of Leſina.

GA'GNEF, a town of Sweden, in the province of Dalecarlia: fifteen miles ſouth weſt of Fahlun.

GAGNI'ER (John), a diſtinguiſhed maſter of the oriental languages, born and educated at Paris. He particularly applied himſelf to the ſtudy of Hebrew and Arabic, in which he acquired uncommon ſkill. Becoming diſſatisfied with the Roman-catholic religion, in which he had been bred, he left his country, and came to England. His learning ſoon gained him friends, among whom were archbiſhop Sharp, and lord-chancellor Macclesfield. He was admitted to the degree of M. A. at Cambridge, and afterwards at Oxford, where he fixed his reſidence for the ſake of conſulting the Bodleian library, while he ſupported himſelf by teaching Hebrew. In 1706 he publiſhed Joſeph Ben Gorion's Hiſtory of the Jews in the original Hebrew, with a Latin tranſlation and notes, in a quarto volume. He afterwards aſſiſted Dr. Grabe in the peruſal of the Arabic MSS. in the Bodleian library, for the purpoſe of a controverſial work in which Grabe was engaged againſt Whiſton. He was appointed in 1717 to read the Arabic lecture at Oxford in the abſence of Dr. Wallis; and upon his death, was choſen to the profeſſorſhip in his ſtead, which office he filled with great reputation till his death. Gagnier publiſhed two valuable works, which have given occaſion to Gibbon to term him "the beſt and moſt authentic of the guides" reſpecting the hiſtory of Mahomet. Theſe are, *Iſmael Abulfeda de Vita & Rebus geſtis Mohammedis, &c. Latine vertit, Præfatione & Notis illuſtravit, Joh. Gagnier*, Oxon. 1723, folio; and, *La Vie de Mahomet, traduite & compilée de l'Alcoran, des Traditions authentiques de la Sonna, & des meilleurs Auteurs Arabes*, Amſt. 1748, three vols. 12mo.

GA'GO, a kingdom of Africa, with a town of the ſame name, in Negroland. It is fertile, and abounds in corn, rice, mines of gold, &c. Lat. 10. N. lon. 19. 40. E. Ferro.

GA'GUIN (Robert), a French hiſtorian, born at Colines in the dioceſe of Amiens. At an early age he took the habit of the order of Mathurines, and went to ſtudy in their college at Paris. He took the degree of doctor of laws, and ſoon after was made profeſſor of canon-law. In 1473 he was elected general of his order. His reputation made him known to Charles VIII. and Louis XII. who employed him in various embaſſies to Italy, Germany, and England. He returned with a broken conſtitution, and died at Paris in 1501. He wrote many works in proſe and verſe. Of theſe the principal are: 1. *Compendium ſuper Francorum geſtis a Pharamundo uſque ad annum* 1491; 1497, 4to. 2. The Chronicle of Archbiſhop Turpin, tranſlated from Latin into French by command of Charles VIII. 1527, 4to. 3. *Epiſtolæ & Orationes*, 4to. 4. *De Puritate Conceptionis Virginis Mariæ*; this is a poem in elegiac verſe, by no means free from groſſneſs of idea. A French verſion of Cæſar's Commentaries, and an indifferent Roman Hiſtory, are alſo in the liſt of his works.

GA'GUL, a river of European Turkey, which runs into the Danube: eight miles eaſt of Reni, in Beſſarabia.

GAHN'IA, *ſ.* [So named by Forſter in honour of Hen-

ry

ry Gahn, author of *Fundamenta Agroſtographiæ.*] In botany, a genus of the claſs hexandria, order monogynia. The generic characters are—Calyx: glume one-valved, ovate-lanceolate, convolute, two or five-flowered, *Forſt.*—two-valved, one-flowered; valves lanceolate, channelled, acuminate; the outer longer, broader, *Linn.* Corolla: glume two-valved, ſhorter than the calyx; valves ovate-lanceolate, acuminate, concave; the outer a little longer; nectary two-valved, hyaline, involving the filaments; outer valve larger, ovate, concave, three-toothed at the tip, *F.* (wedge-ſhaped with a point, *L.*) half the length of the corolline glume; inner ovate, entire, very ſmall. Stamina: filaments ſix, capillary, ſhort, after flowering elongated; antheræ linear, acuminate. Piſtillum: germ oblong; ſtyle filiform, erect, longer than the calyx, bifid; ſtigmas in each diviſion of the calyx two, capillary, curved back. Pericarpium: none. Seed ſingle, oblong, ſubangular, ſmooth, ſurrounded by the elongated filaments, ſo as to be double the length of the corolline glume, permanent.—*Eſſential Character.* Glume two-valved, irregular; nectary two-valved, involving the filaments; ſtigma dichotomous.

Species. 1. Gahnia procera: panicles ſpiked, ſeveral elongated, florets ſix-ſtamened. Culm half a fathom in height, round, ſmooth, upright, reclining at top, the thickneſs of a pigeon's quill; leaves ſword-ſhaped, longer than the culm, narrow, briſtle-ſhaped at the tip, reclining, concave at the baſe, ſheathing, rough at the edge with rows of minute ſpinules, alternate; panicles in ſpikes, ſtiff, ſeveral, from the ſheaths of the leaves, coming out in whorls at each joint of the culm, purple; flowers purple, in involucres half an inch in length; ſeeds brown; number of ſtamens in the lower flowers ſeven or eight, but the upper ones have always ſix; the lower panicles are often deſtitute of involucres, and therefore bear naked flowers. Native of New Zealand; found in Duſky bay, April 11, 1773.

2. Gahnia ſchoenoides: culms flexuoſe, panicles compound ſpiked rigid ſubſolitary. Native of Otaheite. It may probably be a Schoenus.

GA'IA, a town of Italy, in the Modeneſe: twenty miles ſouth of Modena.

GAICHI'ES (John), an eſteemed French writer, born in 1648. He became a prieſt of the Oratory, was made prebendary of Soiſſons, and choſen member of the academy in that city. For thirty years he officiated as a preacher in Soiſſons, and in his own life exhibited a commendable pattern of the piety and virtues which he enforced on his hearers. He ſhone in the character of a polite ſcholar; and after he became member of the academy at Soiſſons, was frequently employed to draw up the academic diſcourſes, which were annually preſented to the French academy. Some difference of opinion having ariſen between him and Langlet, biſhop of Soiſſons, which rendered his ſituation in that city leſs agreeable than formerly, he reſigned his prebend, and removed to Paris, where he died in 1731, at eighty-three years of age. The Academic Diſcourſes which he publiſhed, were ten in number; and are inſerted in the collections of the French academy. He was alſo the author of Maxims for the Uſe of Pulpit Orators. M. Gaichies' Diſcourſes, and the piece laſt mentioned, were publiſhed at Paris in 1739, with a preface by the abbé Lavarde.

GAIDAROTHY'MO, *ſ.* in botany. See STACHYS SPINOSA.

GAIDRONI'SA, a ſmall iſland in the Mediterranean, near the ſouth coaſt of Candia. Lat. 34. 48. N. lon. 43. 31. E. Ferro.

GAI'GNY, or GAGNY (John), in Latin GAGNÆUS, a learned French divine in the ſixteenth century, firſt-almoner to Francis I. and a native of Paris. He had taken the degree of bachelor in 1526, at which time he held the appointment of procureur, or attorney, for the French nation in the univerſity. In 1529 he delivered a courſe of lectures on ſcholaſtic theology in the college of Navarre, with great applauſe; was made rector of the univerſity in 1531; received the bonnet of doctor of divinity in the ſame year; and filled the poſt of chancellor of the univerſity from 1546 until his death, which took place towards the cloſe of the year 1549. He was intimately converſant with the learned languages, an able divine, and a reſpectable Latin poet. Francis I. entertained a great regard for him, and often conſulted him on ſubjects connected with the intereſts of literature. He publiſhed, in 1547, an edition of The Pſalms, in which the vulgar Latin tranſlation is accompanied with three ſorts of paraphraſtic lyric verſes; a French tranſlation of the Commentaries of Primaſius on St. Paul's Epiſtles, 1540; a French tranſlation of the Sermons of Guerricus, abbot of Igny; The Life of Alcimus Avitus; and the Hiſtory of the taking of Jeruſalem, by Apollonius Collatius, Prieſt of Novara, 1540. But his moſt important works conſiſt of ſhort Commentaries, upon the different books of the New Teſtament, in which he explains the literal ſenſe by a kind of paraphraſe, and moſt commonly follows the Greek text and the beſt Greek interpreters. He began with Scholia upon St. Paul's Epiſtles, printed in 1539. In 1543 he publiſhed a new edition of the preceding, conſiderably enlarged, and Scholia upon The general Epiſtles, and upon The Revelation. His Scholia upon The Goſpels, and The Acts of the Apoſtles, were not publiſhed till after his death in 1552. Theſe Scholia are inſerted in the *Biblia Magna* of father John de la Haye.

GAIL'DORF, or GAIL'ENDORF, a town of Germany, in the circle of Swabia, and lordſhip of Limburg: five miles ſouth of Hall, in Swabia, and thirty-eight weſt-ſouth-weſt of Anſpach.

GAILLAC', a town of France, and principal place of a diſtrict, in the department of the Tarn. It is a place of conſiderable trade, and the vine which grows on the hills in the environs is much eſteemed. It is ſituated on the Tarn, which is here navigable: nine leagues north-eaſt of Toulouſe, and eight north-north-weſt of Caſtres. Lat. 43. 53. N. lon. 19. 33. E. Ferro.

GAILLAC', a town of France, in the department of the Aveiron, and chief place of a canton, in the diſtrict of Sévérac-le-Chareau: ſeven miles north-weſt of Sévérac.

GAILLAC', *ſ.* A kind of French wine ſo called from the place where it is made. *Phillips.*

GAILLAC' TOUL'ZA, a town of France, in the department of the Upper Garonne, and chief place of a canton, in the diſtrict of Rieux: four leagues eaſt of Rieux, and ſeven ſouth of Toulouſe.

GAILLAR'DIA, *ſ.* in botany. See GALARDIA.

GAILLEFONTAI'NE, a town of France, in the department of the Lower Seine, and chief place of a canton, in the diſtrict of Neufchatel: three leagues ſouth-eaſt of Neufchatel, and three ſouth-weſt of Aumale.

GAILLON', a town of France, in the department of the Eure, and chief place of a canton, in the diſtrict of Louviers. Near it is a celebrated Carthuſian monaſtery, burnt down in 1764; and ſince rebuilt with ſuperior elegance. It has been the burial-place of numbers of the royal family of France: three leagues north-weſt of Vernon, and two and a half ſouth-eaſt of Louviers.

GAILOV'SKOI, a fortreſs of Ruſſia, in the government of Caucaſus, on the Ural: twelve miles north-eaſt of Uralſk.

GAI'LY, *adv.* Airily; cheerfully. Splendidly. See GAYLY.

GAI'MERSHEIM, a town of Germany, in Upper Bavaria: two miles north-weſt of Ingolſtadt, and nine eaſt-north-eaſt of Neuburg.

GAIN, *ſ.* [*gain*, Fr.] Profit; advantage; contrary to *loſs.*—It is in praiſe of men as in gettings and *gains*; light *gains* make heavy purſes; for light *gains* come thick, whereas great come but now and then. *Bacon.*—Intereſt; lucrative views:

That,

That, ſir, which ſerves for *gain*,
And follows but for form,
Will pack, when it begins to rain,
And leave thee in the ſtorm. *Shakeſpeare.*

Unlawful advantage.—Did I make a *gain* of you by any of them whom I ſent unto you? 2 *Cor.* xii. 17.

If pride, if envy, if the luſt of *gain*,
If mad ambition, in thy boſom reign,
Thou boaſt'ſt, alas! thy ſober ſenſe in vain. *Fitzgerald.*

Overplus in a comparative computation; any thing oppoſed to loſs:

Who knows the balance of our loſs and *gain?*
Who knows, how far a rattle may outweigh
The mace or ſceptre? *Davies.*

To GAIN, *v. a.* [*gagner*, Fr.] To obtain as profit or advantage.—What reinforcement we may *gain* from hope. *Milton.*—To win; not to loſe.—A leper once he loſt, and *gain'd* a king. *Milton.*—To have the overplus in comparative computation.—If you have two veſſels to fill, and you empty one to fill the other, you *gain* nothing by that. *Brown.*—To obtain; to procure; to receive:

For fame with toil we *gain*, but loſe with eaſe,
Sure ſome to vex, but never all to pleaſe. *Pope.*

To obtain increaſe of any thing allotted.—I know that ye would *gain* the time, becauſe ye ſee the thing is gone from me. *Dan.* ii. 8.—To obtain whatever, good or bad.—Ye ſhould not have looſed from Crete, and have *gained* this harm and loſs. *Acts*, xxvii. 21.—To win againſt oppoſition:

O love! for Sylvia let me *gain* the prize,
And make my tongue victorious as her eyes. *Pope.*

To draw into any intereſt or party:

Come, with preſents, laden from the port,
To gratify the queen and *gain* the court. *Dryden.*

To obtain as a wooer:

He never ſhall find out fit mate, but ſuch
As ſome misfortune brings him, or miſtake,
Or whom he wiſhes moſt ſhall ſeldom *gain*
Through her perverſeneſs, but ſhall ſee her *gain'd*
By a far worſe. *Milton.*

To reach; to attain.—Death was the poſt, which I almoſt did *gain*. *Waller.*

Sun! found his praiſe
In thy eternal courſe, both when thou climb'ſt,
And when high noon haſt *gain'd*, and when thou fall'ſt.
Milton.

To GAIN *over*. To draw to another party or intereſt.—The court of Hanover ſhould have endeavoured to *gain over* thoſe who were repreſented as their enemies. *Swift.*

To GAIN, *v. n.* To grow rich; to have advantage; to be advanced in intereſt or happineſs.—Thou haſt taken uſury and increaſe, and thou haſt greedily *gained* of thy neighbours by extortions. *Ezek.* xxii. 12.—To encroach; to come forward by degrees; with *on*:

When watchful herons leave their wat'ry ſtand,
And mounting upward with erected flight,
Gain on the ſkies, and ſoar above the fight. *Dryden.*

So *on* the land, while here the ocean *gains*,
In other parts it leaves wide ſandy plains. *Pope.*

To get round; to prevail againſt; with *on*.—The Engliſh have not only *gained upon* the Venetians in the Levant, but have their cloth in Venice itſelf. *Addiſon.*—To obtain influence with; with *on*.—My good behaviour had *gained* ſo far *on* the emperor, that I began to conceive hopes of liberty. *Swift.*

GAIN, *adj.* [An old word now out of uſe.] Handy; ready; dexterous.

GAIN'AGE, *ſ.* [*gainagium*, Lat.] In law, the gain or profit of tilled or planted land, raiſed by cultivating it; alſo the draught, plough, and furniture, for carrying on the work of tillage, by the baſer kind of ſoke-men or villeins. Gainage was only applied to arable land, when they that had it in occupation, had nothing thereof but the profit raiſed by it from their own labour, towards their ſuſtenance, nor any other title but at the lord's will: and gainer is uſed for a ſoke-man, that hath ſuch land in occupation. *Bract. lib.* 1. c. 9. The word *gain* is mentioned by Weſt. Symb. par. 2. ſect. 3. where he ſays, Land in demeſne, but not in gain, &c. And in the 51 Hen. III. ſt. 4, there are theſe words; "No man ſhall be diſtrained by his beaſts, that gain the land." In the ſtatute of Magna Charta, c. 14, by gainage is meant no more than the plough-tackle, or implements of huſbandry, without any reſpect to gain or profit: where it is ſaid of the knight and freeholder, he ſhall be amerced *ſalvo contenemento ſuo*; the merchant or trader, *ſalvo merchandiſa ſua*; and the villein or countryman, *ſalvo gainagio ſuo*, &c. In which caſes it was, that the merchant and huſbandman ſhould not be hindered, to the detriment of the public, or be undone by arbitrary fines; and the villein had his wainage, to the end that the plough might not ſtand ſtill; for which reaſon the huſbandmen at this day are allowed a like privilege by law, that their beaſts of the plough are not, in many caſes, liable to diſtreſs. See the article DISTRESS.

GAINBATE'SA, a town of Italy, in the kingdom of Naples, and county of Moliſe: eighteen miles eaſt-ſouth-eaſt of Moliſe.

GAIN'ER, *ſ.* One who receives profit or advantage.—He that loſes any thing, and gets wiſdom by it, is a *gainer* by the loſs. *L'Eſtrange.*

GAIN'FARHN, a town of Germany, in the archduchy of Auſtria: one mile ſouth-ſouth-weſt of Baden.

GAIN'FUL, *adj.* Advantageous; profitable.—He will dazzle his eyes, and bait him in with the luſcious propoſal of ſome *gainful* purchaſe, ſome rich match, or advantageous project. *South.*—Lucrative; productive of money.—Nor knows he merchants' *gainful* care. *Dryden.*

Maro's muſe commodious precepts gives,
Inſtructive to the ſwains, nor wholly bent
On what is *gainful*. *Philips.*

GAIN'FULLY, *adv.* Profitably; advantageouſly.

GAIN'FULNESS, *ſ.* Profit; advantage.

GAIN'GIVING, *ſ.* The ſame as miſgiving; a giving againſt; as gainſaying, which is ſtill in uſe, is ſaying againſt, or contradicting.—It is but foolery; but it is ſuch kind of *gaingiving*, as would, perhaps, trouble a woman. *Shakeſpeare.*

GAIN'LESS, *adj.* Unprofitable; producing no advantage.

GAIN'LESSNESS, *ſ.* Unprofitableneſs; want of advantage.—The parallel holds too in the *gainleſſneſs* as well as laborioufneſs of the work; miners, buried in earth and darkneſs, were never the richer for all the ore they digged; no more is the inſatiable miſer. *Decay of Piety.*

GAIN'LY, *adv.* Handily; readily; dexterouſly. *Out of uſe.*

To GAIN'SAY, *v. a.* To contradict; to oppoſe; to controvert with; to diſpute againſt.—Speeches which *gainſay* one another, muſt of neceſſity be applied both unto one and the ſame ſubject. *Hooker.*

Too facile then, thou didſt not much *gainſay*;
Nay, didſt permit, approve, and fair diſmiſs. *Milton.*

To deny any thing:

I never heard yet
That any of thoſe bolder vices wanted
Leſs impudence to *gainſay* what they did
Than to perform it firſt. *Shakeſpeare.*

GAIN'SAYER, *ſ.* Opponent; adverſary.—Such as

may ſatisfy *gainſayers*, when ſuddenly, and beſides expectation, they require the ſame at our hands. *Hooker.*

GAINS'BOROUGH, a large and populous commercial town of Lincolnſhire, ſituated on the eaſtern bank of the Trent, which river parts it from the county of Nottingham. It is a very ancient place, memorable in 868 for the marriage of Alfred the Great with Ethelrid the daughter of an alderman of the Ganii. Here Swein, the Daniſh king, was ſtabbed, of which wound he died three days after in great agony. His ſon Canute was by the Saxon king Ethelred driven from hence with great ſlaughter to his ſhips, which then lay in the Humber. About a mile from the town are ſeveral acres of ground near the caſtle-hill, ſuppoſed to have been Daniſh encampments; and ſouth-by-eaſt five miles are veſtiges of the ancient city of Sidnaceſter, the ſee of Eadulfus in the ſeventh century, before it was joined to Dorcheſter and Lincoln. King Stephen created William de Rommara firſt earl of Lincoln, and gave him the caſtle of Gainſborough. This place ſuffered greatly in the civil wars. In July 1643, the earl of Kingſton, governor of the caſtle, was taken by ſurpriſe by lord Willoughby of Parham, and, for his loyalty, hurried into a pinnace to be taken to Hull for ſafety; but lord Cavendiſh, in the warmth of zeal for the king's cauſe, ordered a drake to be fired at the veſſel, with a view to retake the noble priſoner, which fatal ſhot killed both the earl and his ſervant. After this the earl of Newcaſtle came up and cannonaded the caſtle, which obliged the Oliverians to capitulate. Lately in paving the ſtreets the bones of many bodies were found, apparently buried where ſlain, being mingled together promiſcuouſly. And near a place called the Chapel-Staith, human bones of a prodigious magnitude have been dug up; and alſo in preparing the foundation for the new bridge, at the depth of twenty-one feet, a curious dagger was found, thought to be Daniſh.

The town has been lately very much improved; the inhabitants have re-built the church at their own coſt, and they may be ſaid to have completed that buſineſs with elegant ſimplicity. Acts have likewiſe been obtained for paving, cleanſing, and lighting, the town, and for building a bridge at the ſouth end of the town, over the Trent, which abounds with fiſh. The commercial concerns of Gainſborough are very conſiderable, as the inland trade by ſmall craft from ſo many different counties, and indeed the whole navigation from the Severn, Merſey, &c. to the Trent, all unite here. The town contains about 5000 inhabitants, and has ſeveral good charity ſchools. The market is on Tueſday; and the fairs, commonly called marts, hold nine days; but at preſent Tueſday and Wedneſday in Eaſter-week, and the firſt Tueſday and Wedneſday next after the 20th of October, are the principal days for buſineſs. Gainſborough is ſituated in 53. 26. north latitude, and is diſtant from London 148 miles, from Lincoln eighteen, and Newark twenty-five. About this place are thoſe uncommon high tides, at the full and change, which are called the *eager*. The Trent brings up ſhips of large burthen with the tide, though it is near forty miles from the Humber by water, and it is reckoned the moſt flouriſhing town in the county. Gainſborough gives title of earl to the noble family of Noel.

GAINS'BOROUGH (Thomas), an eminent Engliſh painter, born at Sudbury in 1727. As his father was a perſon in reduced circumſtances, he received little advantage from education, and was in truth the pupil of his own genius. Drawing after nature was one of his earlieſt propenſities, and his imitative powers were formed in his boyiſh days. He was ſent when very young to London for improvement and employment. There he practiſed modelling figures of animals, in which he attained great excellence. He alſo drew ornaments for heads, under the inſtruction of Gravelot the engraver, and painted ſmall landſcapes for ſale. At length he undertook portrait, and by his induſtry ſupported himſelf without any aſſiſtance from his family. He married at nineteen, and took up his reſidence at Ipſwich for ſome years. Thence he removed to Bath, where he attained that high reputation which accompanied him to his death. He ſettled at London in 1774, and after a ſhort time engaged the notice of his majeſty, of whom, with moſt of the royal family, he made admired portraits. No other patronage was required to raiſe him to the firſt rank in his profeſſion in point of buſineſs and emolument; but his intrinſic merits have alſo rendered him an intereſting object among eminent artiſts. His liberal contemporary, ſir Joſhua Reynolds, introduced a particular critique of his talents, in his 14th Academical Diſcourſe, by ſaying, "If ever this nation ſhould produce genius ſufficient to acquire to us the honourable diſtinction of an Engliſh ſchool, the name of Gainſborough will be tranſmitted to poſterity, in the hiſtory of the art, among the very firſt of that riſing name." Gainſborough indeed poſſeſſed all the characters of original genius. His talents for muſic were extraordinary, though marked with a capricious love of change in the inſtruments on which he practiſed. With very little knowledge of books, he wrote letters in a ſtyle which might have been thought a cloſe imitation of the manner of Sterne. His converſation was ſprightly and humorous, though confined in its topics, and he always ſhewed an impatience of ordinary ſubjects, and interrupted them by ſome ſally of wit. He beſtowed his money with great liberality, and was alive to all the emotions of a friendly and generous heart.

As an artiſt, the merit of Gainſborough cannot be more ably or candidly appreciated than it has been by ſir Joſhua Reynolds. Improvement in his art was conſtantly in his view, and he purſued it with the enthuſiaſm of a true lover, not of a mercenary profeſſor. His ſtyle and manner were peculiarly his own, and he produced effects by means which no other painter employed. For many years he was in the habit of painting by night. This cuſtom (ſays ſir Joſhua) is very improving to an artiſt. By candle-light, objects not only appear more beautiful, but from there being in a greater breadth of light and ſhadow, as well as having a greater breadth and uniformity of colour, nature appears in a higher ſtyle; and even the fleſh ſeems to take a higher and richer tone of colour. Judgment is to direct us in the uſe to be made of this method of ſtudy; but the method itſelf is advantageous. I have often imagined, that the two great coloriſts, Titian and Corregio, formed their high ideas of colouring from the effects of objects by this artificial light: and whoever attentively ſtudies the firſt and beſt manner of Guercino, will be convinced that he either painted by this light, or formed his manner on this conception. Gainſborough was alſo worthy of imitation in his manner of forming all the parts of his picture together; the whole going on at the ſame time, in the ſame manner as nature creates her works. Though this method (obſerves ſir Joſhua) is not uncommon to thoſe who have been regularly educated; yet probably it was ſuggeſted to him by his own natural ſagacity. With reſpect to Mr. Gainſborough's love of his art, without which excellence cannot be attained, it was enthuſiaſtic. We certainly know, that his paſſion was not the acquirement of riches, but excellence in his art; and to enjoy that honourable fame, which is ſure to attend it. That he felt this ruling paſſion ſtrong in death (continues ſir Joſhua), I myſelf was a witneſs.

When ſuch a man as Gainſborough arrives to great fame, without the aſſiſtance even of an academical education, without travelling to Italy, or any of thoſe preparatory ſtudies which have been ſo often recommended, he affords an inſtance, how little ſuch ſtudies are neceſſary; ſince ſo great excellence may be acquired without them. This is an inference not warranted by the ſucceſs of any individual; and I truſt it will not be thought that I wiſh to make this uſe of it. It muſt be remembered that the ſtyle of art which Gainſborough choſe, and in which he

ſo

ſo much excelled, did not require that he ſhould go out of his own country for the objects of his ſtudy; they were every where about him; he found them in the ſtreets, and in the fields; and from the models thus accidentally thrown in his way, he ſelected with great judgment ſuch as ſuited his purpoſe. As his ſtudies were directed to the living world principally, he did not pay a general attention to the works of the various maſters, though they are always of great uſe, even when the character of our ſubject requires us to depart from ſome of their principles. It cannot be denied that the department of the art which he profeſſed, may exiſt with great effect without them; that in ſuch ſubjects, and in the manner that belongs to them, they are ſupplied, and more than ſupplied, by natural ſagacity, and a minute obſervation of particular nature. If Gainſborough did not look at nature with a poet's eye, it muſt be acknowledged that he ſaw her with the eye of a painter; and gave a faithful, if not a poetical, repreſentation of what he had before him.

Though he did not much attend to the works of the great hiſtorical painters of former ages, yet he was well aware, that the language of the art, the art of imitation, muſt be learned ſomewhere; and as he knew that he could not learn it in an equal degree from his contemporaries, he very judiciouſly applied himſelf to the Flemiſh ſchool, who are undoubtedly the greateſt maſters of one neceſſary branch of art; and he did not need to go out of his own country for examples of that ſchool: from that he learnt the harmony of colouring, the management and diſpoſition of light and ſhadow, and every means which the maſters of it practiſed to ornament and give ſplendor to their works. And to ſatisfy himſelf, as well as others, how well he knew the mechaniſm and artifice which they employed to bring out that tone of colour, which we ſo much admire in their works, he occaſionally made copies from Rubens, Teniers, and Vandyck, which it would be no diſgrace to the moſt accurate connoiſſeur to miſtake, at the firſt ſight, for the works of thoſe maſters. What he thus learned, he applied to the originals of nature, which he ſaw with his own eyes; and imitated, not in the manner of thoſe maſters, but in his own.

Whether he moſt excelled in portraits, landſcapes, or fancy pictures, it is difficult to determine: whether his portraits were moſt admirable for exact truth of reſemblance, or his landſcapes for the portrait-like repreſentation of nature, ſuch as we ſee in the works of Rubens, Ryſdale, and others of thoſe ſchools. In his fancy pictures, when he had fixed on his object of imitation, whether it was the mean and vulgar form of a wood-cutter, or a child of an intereſting character, as he did not attempt to raiſe the one, ſo neither did he loſe any of the natural grace and elegance of the other; ſuch a grace and ſuch an elegance, as are more frequently found in cottages than in courts. This excellence was his own, the reſult of his particular obſervation and taſte; for this he was certainly not indebted to the Flemiſh ſchool; nor indeed to any ſchool; for his grace was not academical or antique, but ſelected by himſelf from the great ſchool of nature; and there are yet a thouſand modes of grace, which are neither theirs nor his, but lie open in the multiplied ſcenes and figures of life, to be brought out by ſkilful and faithful obſervers.

Few Engliſh pictures have attained a higher value than ſome of thoſe produced by Gainſborough. He never attempted hiſtorical painting of the higher kind, conſcious that his education had not qualified him to excel in it. Correctneſs and preciſion were no parts of his excellence, nor had he learning enough for the circumſtance and coſtume of hiſtory or allegory. Facility and ſtrength of execution were qualities which Gainſborough poſſeſſed in an uncommon degree; but he often ſacrificed too much to them. While in the vigour of his powers and the height of his reputation, he was attacked with a tumour in the neck, of the conſequences of which he died in Auguſt 1788, at the age of ſixty-one. He was buried in Kew church-yard, whither his remains were attended by the firſt artiſts, and other reſpectable friends.

The Gainſboroughs were a family of genius. The elder brother, at Sudbury, was a proficient in the arts; and a brother, who was a diſſenting-miniſter at Henley-upon-Thames, was one of the moſt ingenious mechanics of his time, as well as a man of ſingular benevolence and ſimplicity.

'GAINST, *prep.* See AGAINST:

Tremble, ye nations! who, ſecure before,
Laugh'd at thoſe arms, that *'gainſt* ourſelves we bore.
Dryden.

To GAINSTA'ND, *v. a.* To withſtand: to oppoſe; to reſiſt. A proper word, but not in uſe.—Love proved himſelf valiant, that durſt with the ſword of reverent duty *gainſtand* the force of ſo many enraged deſires. *Sid.*

To GAINSTRI'VE, *v. n.* To reſiſt:

Whoſe bodies chaſt, whenever in his powre
He may them catch, unable to *gainſtrive*,
He with his ſhameful luſt doth firſt deflowre,
And afterwards themſelves doth cruelly devoure. *Spenſ.*

GAIR'ISH, *adj.* [ȝeyrnian, to dreſs fine, Sax.] Gaudy; ſhowy; ſplendid; fine.—Three or four will outrage in apparel, huge hoſe, monſtrous hats, and *gairiſh* colours. *Aſcham.*

There in cloſe covert by ſome brook,
Where no profaner eye may look,
Hide me from day's *gairiſh* eye. *Milton.*

Extravagantly gay; flighty.—Fame and glory tranſport a man out of himſelf: it makes the mind looſe and *gairiſh*, ſcatters the ſpirits, and leaves a kind of diſſolution upon all the faculties. *South.*

GAIR'ISHNESS, *ſ.* Finery; flaunting gaudineſs. Flighty or extravagant joy.—Let your hope be without vanity, or *gairiſhneſs* of ſpirit, but ſober, grave, and ſilent. *Taylor.*

GAIR'SA, one of the ſmaller Orkney iſlands, about half a league north-eaſt from Pomona iſland.

GAIS'SERN, a town of Germany, in the duchy of Stiria: twelve miles eaſt of Rottenmanns.

GAIT, *ſ.* [*gat*, Dut.] Away; as, Gang your *gait*:

Good youth, addreſs thy *gait* unto her;
Be not denied acceſs, ſtand at her door. *Shakeſpeare.*

March; walk:

Thou art ſo lean, and meagre waxen late,
That ſcarce thy legs uphold thy feeble *gait*. *Hubbard.*

The manner and air of walking.—Great Juno comes; I know her by her *gait*. *Shakeſpeare.*

Leviathans
Wallowing, unwieldy, enormous in their *gait*. *Milton.*

GA'LA, *ſ.* [from *cala*, or *caloat*, Arabic; a robe of honour.] A royal banquet; a diſplay of chivalry; a grand feſtival, attended with ſumptuous dreſs and pageantry.

GA'LA WATER, a river of Scotland, which runs into the Tweed, about two miles above Malcroſs, in Roxburgſhire.

GA'LAAD, or GALEAD. See GILEAD.

GALAC'TIA, *ſ.* in botany. See CLITORIA.

GALACTIRRHŒ'A, *ſ.* [γαλακτιῤῥοια, from γαλα, milk, and ῥεω, to flow.] The medical term for an exceſs or overflowing of the milk in women.

GALAC'TITES, *ſ.* A precious ſtone as white as milk, a kind of white clay.

GALACTOPH'AGI, *ſ.* In antiquity, perſons who lived wholly on milk, without the uſe of any other food. The words are compounded of γαλακτ-, milk, and φαγειν, to eat. Certain nations in Scythia Aſiatica, as the Getæ, Nomades, &c. are famous, in ancient hiſtory, in quality of *galactophagi*, or milk-eaters. Homer makes their eloge, Iliad, lib. iii. Ptolemy, in his geography, places the

Galactophagi

Galactophagi between the Riphæan mountains on one ſide, and the Hircanian ſea on the other.

GALACTOPH'AGIST, *ſ.* [*galactophagus*, Lat. of γαλακτοφαγος, of γαλα, milk, and φαγω, to eat.] A milk-eater, a milk-ſop.

GALACTOPH'ORA, *ſ.* [γαλακτοφορα, from γαλα, milk, and φερω, to carry.] Medicines which increaſe or purify the milk. The lacteal veſſels are alſo called *ductus galactophori*.

GALACTOPO'SIA, *ſ.* [γαλακτοποσια, from γαλα, milk, and πινω, to drink.] The practice of curing diſeaſes by a milk-diet.

GA'LACZ, or GALASI, or GALATZ, a town of European Turkey, in Bulgaria, near the Danube: one hundred and twenty miles ſouth-ſouth-weſt of Bender, and fifty-four weſt of Iſmael. Lat. 45. 24. N. lon. 46. 10. E. of Ferro.

GALA'GE, *ſ.* A ſhepherd's clog. *Not in uſe:*

My heart-blood is well nigh froſne, I feel;
And my *galage* grown faſt to my heel. *Spenſer.*

GALAM', a fort of Africa, built by the French on the river Senegal, ceded to the Engliſh by the peace of Verſailles, in 1763. During the American war it was taken by the French, in whoſe poſſeſſion it remained by the peace of 1783.

GALAM. See GALLAM.

GALAN', or GALLAN, a town of France, in the department of the Higher Pyrenées, and chief place of a canton, in the diſtrict of Tarbes: five leagues eaſt of Tarbes.

GALAN'GA, and GA'LANGALE, *ſ.* in botany. See KÆMPFERIA and MARANTA.

GALAN'THIS, in mythology, a ſervant of Alcmena, whoſe ſagacity eaſed the labours of her miſtreſs. When Juno reſolved to retard the birth of Hercules, and haſten the labours of the wife of Sthenelus, ſhe ſolicited the aid of Lucina; who immediately repaired to the houſe of Alcmena, and in the form of an old woman, ſat near the door with her legs croſſed, and her fingers joined. In this poſture ſhe uttered ſome magical words, which ſerved as a charm to prolong the labours of Alcmena, and render her ſtate the more miſerable. Alcmena had paſſed ſome days in the moſt excruciating torments, when Galanthis began to ſuſpect the jealouſy of Juno; and concluded that the old woman, who continued at the door always in the ſame unchanged poſture, was the inſtrument of the anger of the goddeſs. With ſuch ſuſpicions Galanthis ran out of the houſe, and with a countenance expreſſive of joy, ſhe informed the old woman that her miſtreſs had juſt brought forth. Lucina, at the words, roſe from her poſture, and that inſtant Alcmena was ſafely delivered. The loud laugh which Galanthis raiſed upon this, made Lucina ſuſpect that ſhe had been deceived. She ſeized Galanthis in a rage, and threw her on the ground; but while ſhe attempted to reſiſt, ſhe was changed into a weaſel, and condemned to bring forth her young, in the moſt agonizing pains, by the mouth, by which ſhe had uttered falſehood. This transformation alludes to a vulgar notion among the antients, who believed this of the weaſel, becauſe ſhe carries her young in her mouth, and continually ſhifts them from place to place. The Bœotians paid great veneration to the weaſel, which, as they ſuppoſed, facilitated the labours of Alcmena. *Ælian.*

GALAN'THUS, *ſ.* [from γαλα and ανθος, milk and flower: ſo called from the milky whiteneſs of the corolla.] In botany, a genus of the claſs hexandria, order monogynia, natural order of ſpathaceæ, (narciſſi, *Juſſ.*) The generic characters are—Calyx: ſpathe oblong, obtuſe, compreſſed, gaping on the flat ſide, withering. Corolla: petals three, oblong, obtuſe, concave, lax, patulous, equal: nectary cylindric, three-leaved, half the length of the petals; leaflets petal-ſhaped, parallel, emarginate, obtuſe. Stamina: filaments capillary, very ſhort: antheræ oblong, acuminate, ending in a briſtle, convergent. Piſtillum: germ globular, inferior: ſtyle filiform, longer than the ſtamens: ſtigma ſimple. Pericarpium: capſule oval-globular, obtuſely three-ſided, three-celled, three-valved. Seeds ſeveral, globular.—*Eſſential Character.* Petals: three concave; nectary of three ſmall emarginate petals; ſtigma ſimple.

Galanthus nivalis, or ſnow-drop, a ſingle ſpecies. The bulb of the ſnowdrop is coated and truncate. Leaves yelloviſh at the baſe, callous at the tips. Scape half a foot or a ſpan in height, ancipital, ſtriated, involved at the baſe in a pair of leaves: ſheath whitiſh, truncate, involving the leaves and ſcape. The peduncle uſually comes out from the left cell of the ſpathe, is weak, and wrinkled below the germ. Flowers ſolitary, pendulous: petals milk-white. Nectary (or inner ſmaller petals) having on the outſide above the middle a green heart-ſhaped ſpot, and on the inſide ſix yelloviſh green lines. Antheræ opening at the tip; filaments twice their length, and ſpringing each from a cavity which has a rim round it. Capſule half an inch long. Seeds oblong, four to twelve in one cell, each adhering to the receptacle by its proper hook. It varies with double flowers. Native of Swiſſerland, Auſtria, Sileſia, England, &c. in meadows. Common in orchards, where it is probably a relique of cultivation. At the foot of Malvern hills, where no traces of buildings or gardens are to be found. Near Cirenceſter, &c. but it is very doubtful whether this, and ſeveral other bulbous plants were originally indigenous. It flowers uſually in February, hence its name in ſome places of Fair Maids of February. In the Rev. Gilbert White's Naturaliſt's Calendar, the ſnowdrop is marked to blow from Jan. 10 to Feb. 5.

Theſe flowers are valued for their early appearance in the ſpring, for they uſually flower in February, when the ground is often covered with ſnow. The ſingle ſort comes out the firſt, and though the flowers are but ſmall, yet when they are in bunches, they make a very pretty appearance; therefore theſe roots ſhould not be planted ſingle, as is ſometimes practiſed by way of edging to borders; for when they are ſo diſpoſed, they make very little appearance. But when there are twenty or more roots growing in a cloſe bunch, the flowers have a very good effect; and as theſe flowers thrive well under trees or hedges, they are very proper to plant on the ſides of the wood-walks, and in wilderneſs quarters; where, if they are ſuffered to remain undiſturbed, the roots will multiply exceedingly. Theſe may be taken up at the end of June, when the leaves decay, and may be kept out of the ground till the end of Auguſt; but they muſt not be removed oftener than every third year. See LEUCOIUM.

GALA'NUS (Clement), an Italian who was ſent miſſionary into Armenia, where he continued for ſeveral years. After his return to Rome he publiſhed, in 1650, a laborious work in two volumes folio, conſiſting of treatiſes in the Armenian language, accompanied with Latin tranſlations, and a great variety of notes, argumentative, hiſtorical, and theological, entitled, *Conciliationes Eccleſiæ Armenæ cum Romana*, &c. and is intended to ſhew, that the Armenians differ very little from the Latins in their religious opinions. It was publiſhed in aid of a ſyſtem, according to which the miſſionaries were directed, by artful compliances, and explanations adapted to the prejudices of the Greeks, to ſoften their antipathy againſt the Latin church, and inſenſibly to bring them under the papal juriſdiction. Galanus was alſo the author of a Grammar of the Armenian Language, and a Syſtem of Logic, in the ſame, publiſhed at Rome in 1645.

GALAR'DIA, *ſ.* [named firſt *Gaillardia*, by Monſ. Fougeroux de Bondaroy, from Monſ. *Gaillard* of Charentonneau.] In botany, a genus of the claſs ſyngeneſia, order polygamia fruſtranea, natural order corymbiferæ. The generic characters are—Calyx: common of two rows of ſcales; ſcales linear, flat, acute, about twelve in each row; the outer longer, reflex: the inner erect. Corolla: compound radiate; corollets hermaphrodite, numerous

rous in the convex diſk; females about twelve, much longer, ſpreading, in the ray. Proper in the hermaphrodites tubular-funnel-form, with a five-toothed border: in the females ligulate, wider outwards, half-three-cleft. Stamina: to the hermaphrodites filaments five, capillary, very ſhort; antheræ cylindric, tubular. Piſtillum: to the hermaphrodites germ turbinate-angular; ſtyle filiform, the length of the corollet; ſtigmas two, ſpreading; females germ very ſmall; ſtyle none; ſtigma none. Pericarpium: none; calyx unchanged. Seeds in the hermaphrodites ſolitary, angular, crowned with the five-leaved calycle; leaflets lanceolate, erect, awned: in the females none. Receptacle: convex, (flat, *Juſſ.*) chaffy; chaffs briſtle-ſhaped.—*Eſſential Character.* Receptacle chaffy; ſeed crowned with the five-leaved calycle (eight-chaffed, *Juſſ.*) calyx of two rows of ſcales, almoſt equal.

Galardia alternifolia, a ſolitary ſpecies. Stem from a foot to eighteen inches high, ſtraight, branched, ſlightly hiſpid, tinged with purple; root-leaves oblong-ſpatulate, with large notches, a little rough to the touch, ſpread on the ground; ſtem-leaves alternate, embracing, oblong, having a few blunt indentures along the edge, bright green, and ſlightly villoſe; the upper ones are almoſt entire; peduncles ſimple, naked, long, terminating, bearing one handſome flower, purple and yellow, two inches in diameter; ſcales of the calyx ciliate or hiſpid at the baſe, the inner ones ſmalleſt; hermaphrodite florets hiſpid on the outſide; receptacle ſlightly convex; ſeeds turbinate, crowned with from five to eight ſharp ſcarioſe chaffs which form the egret. This fine plant has been cultivated a few years in the royal garden at Paris. M. Fougeroux informs us that the comte d'Eſſales brought the ſeeds from Louiſiana, and that the plants had produced ſeeds in the Paris garden in 1784 or thereabouts. It is an annual, and flowers in July and Auguſt, and continues to the end of October.

GALA'RED, a town of Sweden, in the province of Blekingen: twenty-eight miles north of Halmſtadt.

GAL'ARIPS, *ſ.* in botany. See ALLAMANDA.

GALAR'QUE, a town of France, in the department of the Gard: two leagues ſouth-eaſt of Sommieres.

GALA'RS, a town of Tranſilvania: ſixteen miles ſouth-eaſt of Hunvad.

GALASHI'ELS, a flouriſhing town of Scotland, in the county of Selkirk, on a ſmall river called the *Gala*, at its union with the Tweed, with a conſiderable woollen manufacture: five miles north of Selkirk.

GALA'SO, a river of Italy, in the kingdom of Naples, which runs into the ſea near Tarento.

GAL'ATA, the principal fauxburg or ſuburb of Conſtantinople; formerly an extenſive city, which roſe under the auſpices of the Genoeſe republic, from the connivance, rather than the encouragement, of the Greek emperors. In 1261 certain Genoeſe merchants obtained a right of ſettlement here, with the privilege of being governed by their own podeſta or chief magiſtrate, ſubject to the empire. As they increaſed in commercial conſequence, they became involved in a war with Cantacuzene; and from Michael Paleologus extorted a licence to ſurround Galata with a ſtrong wall and gates, which were completed in 1348. Four years after, they defeated the navy of the Greeks and their Venetian allies; and, had not petty conteſts for ſuperiority among themſelves waſted their power, they might have become maſters of the imperial territory. In the laſt ſiege of Conſtantinople, their unextinguiſhed jealouſy of the Greeks induced them to give a covert aſſiſtance to the ſultan Mohammed II. and it is obſerved by Gibbon, that the colony of Galata awed the capital, and navigated the Euxine, till it was involved in the final ſervitude of Conſtantinople itſelf. In 1446, the walls, with their twelve gates, were completely repaired, and the citadel, or tower of Chriſt, firſt built by Anaſtaſius, was raiſed to double its former height; which, beſide a very lofty conical roof, exceeds 140 feet. As it crowns a hill, the elevation is uncommonly grand. The Turks uſe it only for the purpoſe of ſounding the tocſin, or great drum, in caſe of fire; to the ravages of which it yielded in the conflagration of 1794, but has been ſince improved as a proſpect-room by the ſultan Selim III. The city of Galata is at preſent the reſidence of merchants of all nations and religions; the ſtreets are chiefly formed by ſhops and magazines for articles of European commerce. The circuit incloſes about four miles. Its juriſdiction has always been claimed by the Venetians, whoſe ambaſſadors are ſtyled *bailo*, and whoſe public entrance through the gates has been uſually attended with a ceremony of preſenting the keys. Imperfect remains are yet to be ſeen of the Genoeſe fort, from which the chain was drawn acroſs to the ſeraglio point, during the ſieges of Conſtantinople which happened in the reigns of Leo III. Michael II. and Conſtantine the laſt.

GAL'ATA, a ſmall iſland in the Mediterranean, near the coaſt of Tunis. Lat. 38. 15. N. lon. 9. 30. E. Greenwich.

GALATÆ'A, or GALATHÆA, in mythology, a ſea-nymph, daughter of Nereus and Doris. She was paſſionately loved by the cyclop Polyphemus, whom ſhe treated with diſdain; while Acis, a ſhepherd of Sicily, enjoyed her unbounded favours. The happineſs of the lovers was deſtroyed by the jealouſy of the cyclop, who cruſhed his rival with a piece of a broken rock, while repoſing on the boſom of Galatæa. The nymph was inconſolable for the loſs of Acis; and as ſhe could not reſtore him to life, ſhe changed him into a fountain. *Ovid.*

GALATE'O (Antony), an Italian philoſopher, who takes his name from his birth-place Galatona, in the Salentine. His family was named Ferrari, originally from Greece. He was born in 1444, and received his firſt education at Nardo. Thence he went for the ſtudy of medicine to Ferrara, and after taking his degree of doctor, he ſettled at Naples, where he was much eſteemed by Ferdinand I. and his ſucceſſors, and appointed their phyſician. The air not agreeing with him, he removed to Gallipoli, where he married. He alſo reſided long at Lecce, at which place he founded an academy, on the model of that of Naples, of which he was a member. He died at Lecce in 1516. As a philoſopher, he adhered to the opinions of the ancients, but with an elevation above vulgar prejudices. As a phyſician, he publiſhed ſome valuable obſervations on the cauſes of epidemic diſeaſes in the countries where he practiſed, and alſo on the gout, rheumatiſm, &c. His moſt celebrated work is an elegant and learned performance, *De ſitu Iapygiæ*, to which is annexed a deſcription of the city of Gallipoli; the whole containing much curious matter in geography and civil and natural hiſtory. His other principal works are, *De Situ Elementorum*; *De Situ Terrarum*; *De Mari & Aquis*; *Succeſſi dell' armata Turcheſca nella citta d'Otranto dell' anno* 1480.

GALATE'O, a town of Italy, in the kingdom of Naples, and province of Calabria Ultra: eight miles eaſt-ſouth-eaſt of Nicotera.

GALA'TI, a town of the iſland of Silily, in the valley of Demona: twelve miles ſouth-weſt of Patti.

GALA'TIA, in ancient geography, a province of Aſia Minor, now called *Amaſia*; bounded on the eaſt by Cappadocia, on the weſt by Bithynia, on the ſouth by Pamphylia, and on the north by the Euxine ſea. It was known as the north part of Phrygia Magna; but upon being occupied by the Gauls, was called *Galatia*; and becauſe ſituated in the midſt of Greek colonies, it obtained the name of *Gallogræcia*. Strabo calls it *Galatia*, and *Gallogræcia*: hence a twofold name of the people; *Galatæ* and *Gallogræci*. The Greeks called it *Gallia Parva*; to diſtinguiſh it from the *Tranſalpina*, both which they called *Galatia*. It was reduced under the ſubjection of the Romans in the time of Auguſtus, and is now in the hands of the Turks. Here St. Paul founded a church, to which he directed that epiſtle known by the name of the *Epiſtle to the Galatians*, written with a view to reclaim them from the obſervation of Jewiſh ordinances. *Acts* xvi. 6.

GAL'ATIN (Peter), a learned Franciſcan monk, who flouriſhed at the beginning of the ſixteenth century. He acquired conſiderable reputation by different theological and literary productions, particularly by *De Arcanis Catholicæ Veritatis, Libri XII. quibus pleraque Religionis Chriſtianæ Capita contra Judæos, tam ex Scripturis veteris Teſtamenti authenticis, quam ex Talmudicorum Commentariis, confirmare & illuſtrare conatus eſt.* The firſt edition of this work appeared in 1518, and met with ſo favourable a reception, that it afterwards underwent ſeveral impreſſions at Baſil, Frankfort, &c. The beſt editions are thoſe of Frankfort in 1612 and 1672, in folio, to which is added a treatiſe of the learned John Reuchlin, entitled *De Cabala, ſeu de ſymbolica Receptione, Dialogus tribus Libris abſolutus.*

GALATO'LA, a town of Italy, in the kingdom of Naples, and province of Otranto: four miles eaſt-ſouth-eaſt of Nardo.

GA'LATZ. See GALACZ.

GA'LAX, *ſ.* [γαλαξ, Gr. milk.] In botany, a genus of the claſs pentandria, order monogynia. The generic characters are—Calyx: perianth ten-leaved; outer leaflets alternate, ſhorter, lanceolate, reflex; inner longer, lanceolate, acute, upright. Corolla: one-petalled, ſalver-ſhaped; tube cylindric, length of the calyx; border flat, five-cleft, ſegments obtuſe. Stamina: filaments ſhort; antheræ roundiſh, converging within the throat of the corolla. Piſtillum: germ ovate, villoſe; ſtyle filiform, ſemibifid, length of the ſtamens; ſtigmas roundiſh. Pericarpium: capſule ovate, one-celled, two-valved, coloured, elaſtic. Seeds two, large, convex, ovate, callous, as it were ſingle two-lobed.—*Eſſential Character.* Calyx: ten-leaved; corolla ſalver-ſhaped; capſule one-celled, two-valved, elaſtic.

Galax aphylla, the only ſpecies. This plant is a native of Virginia, as yet very rare and little known in Europe; leaves all radical; ſtem naked, ſimple, probably woody; flowers in a looſe terminating ſpike.

GALAX'IA, *ſ.* [γαλαξιος, Gr. milky.] In botany, a genus of the claſs monadelphia, order triandria, natural order enſatæ, (irides, *Juſſ.*) The generic characters are—Calyx: ſpathe one-valved, membranaceous, converging. Corolla: one-petalled, ſuperior; tube filiform, long, erect, a little widened at top; border ſix-parted; parts obovate, obtuſe, ſpreading; the three outer ones having a nectareous pit. Stamina: filaments three, united in a cylinder; antheræ ovate. Piſtillum: germ inferior, obtuſely triangular, ſmooth; ſtyle filiform, a little longer than the ſtamens; ſtigmas three, filiform, many-parted, ſpreading. Pericarpium: capſule oblong-ſubcylindric, three-grooved, three-celled, three-valved. Seeds very many, globular, very ſmall.—*Eſſential Character.* Spathe one-valved; corolla one-petalled, ſix-cleft; tube capillary; ſtigma many-parted.

Species. 1. Galaxia ovata, or ovate galaxia: leaves ovate. Root filiform, fixed to an ovate netted comoſe bulb; there are uſually ſeveral of theſe conglomerate; ſtem none; root-leaves heaped, ſheathing, ovate, obtuſe, ſlightly veined longitudinally, flat, ſmooth, the edge ſomewhat cartilaginous: the calyx is a very thin ſheath; corolla variegated with yellow, purple, and violet; capſule ſmooth; it flowers from June to September.

2. Galaxia graminea, or graſſy galaxia: leaves linear-filiform. Root as in the preceding; leaves radical, in bundles, broader at the baſe, then linear, briſtle ſhaped at the tip, entire, channelled, ſmooth, very nearly an inch in length; flowers radical, among the ſheathing leaves, in bundles, ſeſſile, with a long capillary tube, the length of the leaves; corolla yellow, varying with a yellow tube and a violet-coloured border. Theſe are both natives of the Cape of Good Hope, where they were found by Thunberg.

Cavanilles adds a third ſpecies, found by Commerſon in the Straits of Magellan. Being doubtful whether it belongs to this genus, he names it *Galaxia obſcura.*

GALAXI'A, a feſtival, in which they boiled a mixture of barley, pulſe, and milk, called γαλαξια by the Greeks.

GAL'AXY, *ſ.* [γαλαξια, Gr. *galaxie*, Fr.] The MILKY-WAY, or VIA LACTEA, in aſtronomy, that whitiſh, luminous track, which ſeems to encompaſs the heavens like a ſwarth or girdle; and which is eaſily ſeen in a clear night, eſpecially when the moon is not up. It is of a conſiderable, though unequal, breadth; being alſo in ſome parts double, but in others ſingle:

A broad and ample road, whoſe duſt is gold,
And pavement ſtars, as ſtars to thee appear,
See in the *galaxy*, that milky way,
Which nightly, as a circling zone thou ſeeſt
Powder'd with ſtars. *Milton.*

The galaxy paſſes through many of the conſtellations in its circuit round the heavens, and keeps its exact place or poſition with reſpect to them.

Many fabulous ſtories concerning the milky-way have been invented by the ancient poets and philoſophers, ſome of whom ſpeak of it as the road by which the heroes went to heaven. The Egyptians called it the *way of ſtraw*, from the ſtory of its riſing from burning ſtraw thrown behind the goddeſs Iſis in her flight from the giant Typhon. The Greeks, who affected to derive every thing in the heavens from their fabled intercourſe with the gods, have two origins for it: the one, that Juno, without perceiving it, accidentally gave ſuck to Mercury when an infant; but that as ſoon as ſhe turned her eyes upon him, ſhe threw him from her; and, as the nipple was drawn from his mouth, the milk ran round the heavens, and effaced the ſplendour of the ſtars over which it paſſed; the other, that the infant Hercules being laid by the ſide of Juno when aſleep, on waking, ſhe gave him the breaſt; but ſoon perceiving who it was, ſhe threw him from her, and the heavens were marked by the flowing current of milk.

Philoſophers, however, gave it a different turn, and a different origin, from the poets; theſe deemed it to be a track of liquid fire, ſpread in this manner along the ſkies: and others again, ſuppoſing a celeſtial region beyond all that was viſible, and imagining that fire, at ſome time let looſe from thence, was to conſume the world, made this a part of that celeſtial fire, and appealed to it as preſage of what eventually would ſurely happen. This diffuſed brightneſs they conſidered as a crack in the vault or wall of heaven, and fancied they ſaw a glimmering of celeſtial flame through it; and that there required nothing more than the opening of this crack by ſome accident of nature, or by the fiat of the gods, to make the whole frame ſtart, and thus diſſolve the earth by liquid fire.

Ariſtotle makes the galaxy a kind of meteor, formed of a crowd of vapours, drawn into that part by certain large ſtars diſpoſed in the region of the heavens anſwering to it. Others, on a more rational hypotheſis, finding that the galaxy was ſeen all over the globe, that it always correſponded to the ſame fixed ſtars, and that it was far above the higheſt planets, ſet Ariſtotle's opinion aſide, and placed the galaxy in the firmament or region of the fixed ſtars; concluding it to be an aſſemblage of an infinite number of minute ſtars. And ſince the invention of teleſcopes, and the reſearches made by the indefatigable Dr. Herſchel, this opinion has been confirmed. See the article ASTRONOMY, vol. ii. p. 344–350.

GAL'BA (Servius Sulpicius), a Roman emperor, deſcended from the ancient family of Sulpicii, and ſucceeded to the throne on the death of Nero. See the article ROME.

GALBANE'TUM, *ſ.* [with phyſicians.] A medicinal compound in which the chief ingredient is *galbanum.*

GAL'BANUM, *ſ.* [χαλβανη, Gr. from חלבנה, *chalbanah*, Heb.] A concrete, gummy, reſinous, juice of an evergreen plant, with leaves like thoſe of aniſe, growing in Syria, the Eaſt Indies, and Ethiopia. It is the *bubon galbanum* of Linnæus. See BUBON, vol. iii. p. 471. This drug is brought to us in pale-coloured, ſemitranſparent, ſoft,

ſoft, tenacious, maſſes, of different ſhades, from white to brown; the better ſorts of which, on being opened, appear compoſed of clear whitiſh tears, often intermixed with little ſtalks or ſeeds of the plant. It partakes more of the reſinous than of the gummy quality, though it is nearly all ſoluble in water. It hath a ſtrong unpleaſant ſmell, and bitteriſh warm taſte, is unctuous to the touch, and ſoftens in the fingers. In medical virtue and ſenſible qualities it reſembles the gum ammoniacum, but is leſs efficacious in aſthmas, though more efficacious than it in hyſteric diſorders. Great part of the virtue of galbanum conſiſts in its eſſential oil, and is carried up in diſtillation, either with water or with ſpirit, whence great care is required in purifying it. For making of plaſters, and ſuch like inferior purpoſes, the beſt method is to expoſe it in winter to a ſharp froſt, and whilſt it is brittle to powder it; thus the impurities may in ſome meaſure be ſeparated in the ſearce; for internal uſes, it is beſt managed by including it in a bladder, and keeping it in hot water, until it is ſoft enough to be ſtrained by preſſure through an hempen cloth. Beſides the eſſential oil yielded by diſtillation with water, an empyreumatic oil is obtained, by diſtilling in a retort without mixture. This empyreumatic oil is of a fine blue colour, but changes in the air to a purple.

GALBE'UM, *ſ.* [from the emperor Galba, who is ſaid to have worn it.] A medical bracelet worn round the neck.

GAL'BULUS, *ſ.* [from *galbus*, Lat. yellow.] The cone or nut of the cypreſs-tree; ſo called from its colour. Alſo the medical term for a natural yellowneſs of the ſkin.

GAL'DER, a town of the iſland of Canary.

GALE, *ſ.* [*gahling*, Germ. haſty, ſudden.] A wind not tempeſtuous, yet ſtronger than a breeze.—Freſh *gales* and gentle air. *Milton.*

Umbria's green retreats,
Where weſtern *gales* eternally reſide. *Addiſon.*

GALE (Roger), a learned antiquarian, eldeſt ſon of dean Gale, born in 1672, and educated at Trinity college, Cambridge, of which he became fellow in 1697. He poſſeſſed a conſiderable eſtate at Scruton in Yorkſhire, and was repreſentative of North Allerton in that county, during three parliaments. He was a fellow of the royal and antiquarian ſocieties, of which laſt he was vice-preſident and treaſurer. He died at Scruton, in June, 1744. Mr. Gale publiſhed *Antonini Iter Britanniarum Commentariis illuſtratum Thomæ Gale, S. T. P. nuper Decani Ebor. Opus poſthumum reviſit, edidit R. G. Acceſſit Anonymi Ravennatis Britanniæ Chorographia*; Lond. 1709, 4to. Alſo, The Knowledge of Medals, &c. tranſlated from the French of Joubert; *Regiſtrum Honoris de Richmond*, 1722, folio; A Diſcourſe on the four Roman Ways in Britain, printed in Leland's Itinerary, vol. vi. and ſeveral papers in the Memoirs of the Royal and Antiquarian Societies, and other publications. He bequeathed his MSS. and a cabinet of Roman coins to Trinity college, Cambridge.—His brother, SAMUEL GALE, was alſo eminent for antiquarian learning, and was the author of ſome eſſays in the Archæologia.

GALE (Theophilus), a learned Engliſh nonconformiſt divine, born at King's-Teinton in Devonſhire, in 1628. In 1647 he was entered a commoner of Magdalen college, in the univerſity of Oxford, where his great diligence and exemplary behaviour recommended him to the eſteem of the preſident, Dr. John Wilkinſon. To the ſame recommendations he was probably indebted for his election to a fellowſhip of his college, in 1650, when ſeveral of his ſeniors proved unſucceſsful candidates. In 1652 he took his degree of M. A. and became an eminent tutor, and a diſtinguiſhed preacher. While he diligently diſcharged the duties of theſe functions, he applied himſelf cloſely to theological ſtudies, and collected materials for his grand work The Court of the Gentiles, the plan of which he had begun to form at an early period of his academic life. For ſeveral years a conſiderable part of his theological reſearches was directed in ſubſerviency to this deſign; while at the ſame time he ſedulouſly diſcharged the duties of the miniſterial office, and was juſtly admired for the happy mixture of ſolid reaſoning, learning, and piety, by which his pulpit diſcourſes were diſtinguiſhed. In 1657 he ſettled as a ſtated preacher at Wincheſter, where he acquired univerſal eſteem by his exemplary life and converſation. When, after the reſtoration of Charles II. the act of uniformity was paſſed in 1661, Mr. Gale not being able conſcientiouſly to ſubſcribe to the terms required under it, found himſelf compelled to embrace the hard lot of many other diſtinguiſhed clergymen, who were excluded from the public exerciſe of their function; and he was likewiſe deprived of his fellowſhip. In theſe circumſtances he was received into the family of Philip lord Wharton, in the capacity of tutor to his two ſons Thomas and Godwin. As lord Wharton was on principle a non-conformiſt, his views of things would not permit him to ſend his ſons to either of the Engliſh univerſities; on which account he determined to place them in ſome foreign public academy. In purſuance of this reſolution, he ſent them under the care of Mr. Gale, in 1662, to Caen in Normandy, where there was a celebrated ſeminary of learning, under the direction of the moſt diſtinguiſhed profeſſors of the reformed religion in France. In this ſituation Mr. Gale had an opportunity of forming an acquaintance with many of the foreign literati, among whom was the famous Bochart, and of improving himſelf by their converſation and literary communications. In 1665 he returned with his pupils to England, and ſoon after renewed his literary purſuits. When he had finiſhed his work, as a member of the univerſity he applied to Dr. Fell, the vice-chancellor of Oxford, for his licence to commit it to the preſs; which being granted with much readineſs, Mr. Gale printed the firſt part, with the view of trying what reception it was likely to meet with in the learned world. This was publiſhed in 1669, in 4to. and entitled The Court of the Gentiles; or, A Diſcourſe touching the Original of Human Literature, both Philology and Philoſophy, from the Scriptures and Jewiſh Church, &c. It was received with great applauſe, both at home and abroad; which it certainly merited on account of the profound erudition, ingenuity, and labour, which it diſplayed. The ſecond part was publiſhed in 1671, and the third and fourth in 1677. The whole was ſpeedily tranſlated into Latin, and ſpread the author's fame over every part of Europe. Before the appearance of the fourth part, Mr. Gale had publiſhed, in 1676, another learned work, intended to exhibit a compendious view of the ancient philoſophy in general, and entitled *Philoſophia Generalis, in duas partes diſterminata: Una, de Ortu & Progreſſu Philoſophiæ*, &c. The leading deſign of it is the ſame with that in The Court of the Gentiles; only it is written with more conciſeneſs, and particularly intended for the uſe of perſons engaged in a regular courſe of philoſophical ſtudies. In 1678 he printed propoſals for publiſhing by ſubſcription, *Lexicon Græci Teſtamenti Etymologicum, Synonymum ſive Gloſſarum & Homonymum*; which, as the title imports, was intended both for a lexicon and concordance. In this work, which was meant to form one large folio volume, Mr. Gale had made conſiderable progreſs; and it promiſed, according to Dr. Calamy, to be a much more complete and valuable performance than any then extant. The author, however, was prevented from finiſhing it by his death, which took place in 1678, when in the fiftieth year of his age. Beſides the works already mentioned, he was the author of Theophily; or, a Diſcourſe of the Saints' Amity with God in Chriſt, &c. 8vo. 1671; The True Idea of Janſeniſm, both Hiſtoric and Dogmatic, 8vo. 1669; The Anatomy of Infidelity, or an Explication of the Nature, Cauſes, Aggravations, and Puniſhment of Unbelief, 8vo. 1672; The Life of Mr. Thomas Tregoſſe, with his Character,

racter, 8vo. 1671; A Diſcourſe of Chriſt's Coming, &c. 8vo. 1673; *Idea Theologiæ tam contemplativæ quam activæ, ad Formam S. Scripturæ delineata*, 8vo. 1673.

GALE (Thomas), a learned Engliſh divine, claſſical ſcholar, critic, and antiquary, born at Scruton in Yorkſhire, in 1636. His claſſical education he received in Weſtminſter ſchool, where he was admitted king's-ſcholar, and elected thence to Trinity college, Cambridge, of which he afterwards became a fellow. In 1658 he took his degree of B. A. and that of M. A. in 1662. To the reputation which he had acquired in the Greek tongue, he was indebted for his appointment to the regius-profeſſorſhip of the Greek language in that univerſity, in 1666. At the opening of the Sheldonian theatre at Oxford, in 1669, he was incorporated M. A. in that univerſity. In 1671 his fame was conſiderably extended, by an accurate edition which he publiſhed of the ancient mythological writers, entitled *Opuſcula Mythologica, Ethica, & Phyſica, Græcè & Latinè*, 8vo. with notes, various readings, &c. In 1672, he was choſen head-maſter of St. Paul's ſchool, in London, over which he preſided for five-and-twenty years, diſcharging with great fidelity and reputation the duties of his laborious office, and affording evidence at the ſame time of his uncommon induſtry, as well as erudition, by new and accurate editions of ſeveral valuable Greek authors. In 1666, he was employed by the city of London to write the inſcriptions on the monument erected in memory of the dreadful fire; for which ſervice the corporation voted him a preſent of plate. In 1675 he took the degree of doctor in divinity at Cambridge; and in the following year was collated to a prebend in the cathedral church of St. Paul. In 1677 he was elected a fellow of the royal ſociety; and in 1685, when the ſociety reſolved to have honorary ſecretaries, who would undertake the office without expectation of reward, Dr. Gale was choſen to that ſituation, jointly with ſir John Hoſkins; and they had for their clerk-aſſiſtant, or under-ſecretary, the celebrated Halley, who had been one of Dr. Gale's moſt diſtinguiſhed ſcholars at St. Paul's ſchool. In 1697, Dr. Gale preſented to the library in Trinity college, Cambridge, a number of curious Arabic MSS. and in the ſame year he was rewarded for his exertions in the cauſe of literature, by being preferred to the deanery of York. The remainder of his life he ſpent in that city, attentive to the preſervation and beautifying of the noble cathedral, and commendable for his generous hoſpitality. To the great regret of his numerous friends, he did not ſurvive his exaltation to this dignity quite five years, but died at York, in 1702, in the ſixty-eighth year of his age. Beſides the Collection of Mythologiſts, already noticed, he publiſhed: 1. *Hiſtoriæ Poeticæ Antiqui Scriptores, Græcè & Latinè*, printed at Paris in 1675, 8vo. 2. *Rhetores Selecti, Græcè & Latinè*, 1676, 8vo. 3. *Jamblicus Chalcidenſis de Myſteriis, Epiſtola Porphyrii de eodem Argumento, Gr. & Lat.* 1678, folio. 4. *Pſalterium juxta Exemplar Alexandrinum, Gr. & Lat.* 1678, 8vo. 5. *Herodoti Halicarnaſſenſis Hiſtoriarum, Lib. X.* &c. 1679, folio: 6. An edition of Cicero's Works, reviſed by him, and printed in 1681 and 1684, in two volumes folio. 7. *Hiſtoriæ Anglicanæ Scriptores Quinque, ex vetuſtis Codicibus nunc primum in Lucem editi*, 1687, folio. 8. *Hiſtoriæ Britannicæ, Saxonicæ, Anglo-Danicæ, Scriptores XX. ex vetuſt. Cod. MSS. editi*, &c. 1691, folio. The two laſt-mentioned publications are a continuation of the *Rerum Anglicarum Scriptorum Veterum*, tom. i. publiſhed in 1684, under the direction of Dr. Fell, biſhop of Oxford. After the author's death, a volume of his Sermons was publiſhed in 1704, 8vo. and *Antonini Iter Britanniarum, Commentariis illuſtratum Thomæ Gale*, &c. with large additions, by his ſon Roger Gale, 1709, 4to.

GALE (John), a learned Engliſh non-conformiſt divine of the baptiſt perſuaſion, born in London in 1680. At ſeventeen years of age he was not only accompliſhed in the Latin and Greek languages, but alſo well acquainted with the Hebrew; and he was now ſent to the univerſity of Leyden, to complete that literary progreſs which he had ſo happily begun. In this ſeminary he applied to his ſtudies with uncommon ardour, and in leſs than two years had made ſuch rapid improvement, that he was honoured with the degrees of M. A. and doctor of philoſophy when only nineteen years of age. The theſis which he maintained upon this occaſion, *De Ente, ejuſque Conceptu*, he publiſhed, with a dedication to his father, and his two uncles, ſir John and ſir Joſeph Wolf; and it was alſo accompanied with a Latin panegyric, in teſtimony of the author's merit, by the famous Adrian Reland. From Leyden Dr. Gale went to Amſterdam, where he purſued his theological ſtudies under the celebrated Limborch. Upon his return to his native country, he carefully improved himſelf in the knowledge of the oriental languages; and then undertook a critical examination both of the Old and New Teſtament in their originals, comparing his own obſervations with the remarks of the beſt commentators, ancient and modern, and conſulting the different ancient verſions. About this time an occaſion offered for the exertion of his talents in a controverſy, which held him out to public notice in a very conſpicuous point of view. The Rev. Mr. Wall, vicar of Shoreham, having publiſhed The Hiſtory of Infant Baptiſm, he was honoured by the thanks of the houſe of convocation which ſat in 1705, as a teſtimony to the great merit of his performance. This treatiſe was handed to Dr. Gale by one of his friends, as perfectly convincing and unanſwerable; but the doctor, after peruſing it, drew up a ſeries of letters, in the years 1705 and 1706, which, after being long handed about in manuſcript, were at length publiſhed, under the title of Reflections on Mr. Wall's Hiſtory of Infant Baptiſm, in ſeveral Letters to a Friend, 8vo. The merit of this performance ſoon made the author generally known and reſpected. He was ſoon after choſen one of the miniſters of the baptiſt congregation in Paul's-alley, near Barbican, London; where, as his ſermons were chiefly practical, and his voice and manner extremely pleaſing, he was much followed and admired by perſons of all perſuaſions. Some time after the appearance of Dr. Gale's Reflections on Mr. Wall's Hiſtory, the two antagoniſts held a perſonal conference on the ſubject, which ended, as ſuch conferences generally do, in each perſon retaining his own opinion, and a perſuaſion of his advantage in the diſpute. Mr. Wall, however, was determined to appeal to the public againſt the Reflections, to which he drew up an anſwer that was committed to the preſs in 1719, under the title of A Defence of the Hiſtory of Infant Baptiſm, &c. 8vo. Dr. Gale was preparing an anſwer to this defence, when he was prevented by a premature death; being ſuddenly attacked by a fever, in 1721, which proved fatal to him, when only in the forty-ſecond year of his age. Soon after his death, four volumes of "Sermons upon ſeveral Subjects, by the late Reverend Dr. John Gale," were given to the public, and met with ſuch a reception as might be expected from the author's known reputation and learning.

GALE, a river of Ireland, in the county of Kerry, which, by its union with the Feal, forms the river Caſhin.

GALE, *ſ.* in botany. See LIQUIDAMBAR and MYRICA.

GA'LEA, *ſ.* in antiquity, a light caſque, or helmet, commonly made of braſs; but Camillus, according to Plutarch, ordered thoſe of his army to be made of iron, as the ſtronger metal. The lower part of it was called *buccula*, and on the top was a creſt. The Velites wore a light galea, made of the ſkins of wild beaſts, to make them appear more terrific to an enemy.

GALE'A, *ſ.* in anatomy, the amnios; ſo called becauſe it ſurrounds the fœtus like a helmet. In ſurgery, it means a bandage for the head. In botany, it is the upper lip of a labiated flower which reſembles a creſt or helmet. A ſpecies of head-ach is ſo termed by medical men, when it ſurrounds the head like a helmet.

GALEA'NO (Joſeph), a phyſician of Palermo, born

in 1605. He became eminent in his profeſſion throughout the iſland of Sicily, and was employed by the viceroys and nobility, who regarded him as the Hippocrates of his country. He taught medicine near fifty years at Palermo, and had a great number of diſciples, who carried his fame over Italy, and to other parts of Europe. He wrote ſeveral works on medical ſubjects, which, however, have probably been little read elſewhere; for Haller contents himſelf with giving a bare liſt of their titles. Galeano was a man of general knowledge, and diſtinguiſhed himſelf among his countrymen as a philoſopher, divine, and poet, as well as a phyſician. Of his poetical works ſeveral are dedicated to the celebration of Santa Roſalia, the patroneſs of Palermo. He likewiſe collected the fugitive pieces of Sicilian poetry by other writers, and publiſhed five volumes under the title of *Le Muſe Siciliane*. He has met with many panegyriſts, who have extolled him as one of the great men of his age. He died at Palermo in 1675.

GALEANTHRO'PIA, *ſ.* [γαλεανθρωπια, Gr. from γαλη, a cat, and ανθρωπος, a man.] A ſpecies of madneſs, in which the patient fancies himſelf to be like a cat.

GALEAS'SE, or GALLEASS, *ſ.* [*galeas*, Fr.] A Venetian low-built veſſel, uſing both ſails and oars, and is the largeſt of all veſſels that moves with oars. It will carry twenty guns, and has a ſtern capable of holding a great number of marines. It has three maſts, which are never lowered or taken down. It has alſo thirty-two benches of rowers; and to each bench ſix ſlaves, who ſit under cover.

GA'LEATED, *adj.* [*galeatus*, Lat.] Covered as with a helmet.—A *galeated* eſchinus, copped, and in ſhape ſomewhat more conic than any of the foregoing. *Woodward.*—[In botany.] Such plants as bear a flower reſembling an helmet, as the monk's-hood, &c.

GALE'ED, [i. e. the heap of witneſs.] A heap of ſtones reared by the patriarch Jacob, and his uncle Laban, in mount Gilead, as a witneſs of the ſolemn covenant made with each other in the ſight of heaven that neither ſhould paſs that heap to the injury of the other; Laban gave it the name of *jegarſabadutha*, and it was the ſpot on which the city of Mizpah was afterwards built. *Gen.* xxxi. 47, 48.

GAL'EGA, *ſ.* [Italian, q. *herba gallica*.] In botany, a genus of the claſs diadelphia, order decandria, natural order papilionaceæ or leguminoſæ. The generic characters are—Calyx: perianth one-leafed, tubular, ſhort, half-five-cleft; teeth ſubulate, nearly equal. Corolla: papilionaceous; banner large, ovate, reflex at the end and on the ſides; wings oblong, having an appendage, and being almoſt the length of the banner; keel oblong, compreſſed, ſtraight towards the end, gibbous below, ſharp above. Stamina: filaments diadelphous (ſimple and nine-cleft); antheræ oblong. Piſtillum: germ ſlender, oblong; ſtyle ſlender, ſhorter than the germ, aſcending; ſtigma a very ſmall dot at the end. Pericarpium: legume very long, compreſſed, acuminate, ſcored with oblong ſtreaks between the ſeeds. Seeds ſeveral, oblong-kidney-ſhaped.—*Eſſential Character.* Calyx: with ſubulate teeth, nearly equal; legume with oblique ſtreaks, between the ſeeds.

Species. 1. Galega officinalis, officinal galega, or goat's-rue: legumes ſtiff upright; leaflets lanceolate, ſtreaked, naked. Root perennial, compoſed of many ſtrong fibres, which are frequently jointed; ſtems channelled, hollow, from two to three, or even five, feet in height; leaves unequally pinnate, compoſed of five or ſeven (Haller ſays nine or ten) pairs of ſmooth entire leaflets; flowers terminating, in looſe ſpikes; they are of a pale blue colour, appear in June, and are ſucceeded by taper pods, about an inch and half in length, and ripening towards the end of Auguſt. There is a variety with white, and another with variegated, flowers. Goat's-rue is accounted cordial, ſudorific, and alexipharmic. Mr. Boyle celebrates its virtues in peſtilential and malignant diſeaſes. It is a native of Spain, Italy, Hungary, and Africa, it was cultivated by Gerarde in 1596. By ſome miſtake, this plant is ſet down by Parkinſon, as having been found wild near Linton in Cambridgeſhire, where it was certainly never ſeen growing wild by any perſon.

β. G. Africana has larger leaves, compoſed of eight or ten pairs of leaflets, broader and blunter; the flowers are larger, the ſpikes longer, and the ſeed-pods much thicker.

2. Galega cinerea, or cinereous galega: legumes ſtiff ſpreading, racemes oppoſite to the leaves, pedicels ſolitary; leaflets villoſe underneath, ſtipules lanceolate. This is a ſmall herbaceous plant, ſomewhat of an aſh colour, ſeldom growing above eleven or twelve inches in height; it is common among the buſhes in all the ſavannas about Kingſton in Jamaica.

3. Galega littoralis, or ſhore galega: legumes in racemes, the whole villoſe-tomentoſe. Stems round, branched, villoſe, procumbent unleſs it be ſupported by neighbouring ſhrubs; flowers fleſh-coloured, inodorous; ſeeds variegated. Native of Carthagena in America, on ſandy ſhores; and every where between the tropics.

4. Galega Virginiana, or Virginian galega: legumes back-ſickled compreſſed villoſe ſpiked, calyxes woolly, leaflets oval-oblong acuminate. Root perennial; ſtem annual, three feet high, erect. The whole plant is covered with a ſilvery down; flowers red, in ſpikes at the ends of the branches. Inhabits North America.

5. Galega villoſa, or hairy galega: legumes back-ſickled villoſe pendulous racemed lateral, leaflets ſmooth lanceolate. Procumbent. Native of the Eaſt Indies.

6. Galega ſpinoſa, or prickly galega: legumes ſolitary back-ſickled compreſſed, ſtipules ſpineſcent, leaflets wedge-ſhaped hoary, ſtem diffuſed. Found in Coromandel by Konig.

7. Galega maxima, or great galega: legumes ſtiff aſcending ſmooth, ſtipules lanceolate, leaflets oblong ſmooth ſtreaked. This is the largeſt of the genus; and a native of Ceylon.

8. Galega grandiflora, or roſe-coloured galega: legumes ſpreading, ſtipules ovate-lanceolate, leaflets oblong almoſt naked awned. Stem ſhrubby, round, branched, having very minute hairs ſcattered over it. Native of the Cape of Good Hope, whence it was introduced by Mr. Francis Maſſon in 1774.

9. Galega palleus, or pale-coloured galega: legumes ſtiff ſpreading ciliate, ſtipules awl-ſhaped, leaflets (nine to eleven) oblong ſharp pubeſcent underneath. Native of the Cape of Good Hope; flowers in July.

10. Galega piſcatoria, or woolly galega: legumes ſtiff aſcending ſubvilloſe, ſtipules awl-ſhaped, leaflets (eleven to thirteen) oblong blunt ſomewhat hairy underneath, peduncles ancipital. Native of India and the South Sea iſlands; introduced in 1778, by Patrick Ruſſel, M. D. It flowers in June and July.

11. Galega purpurea, or purple galega: legumes ſtiff aſcending ſmooth racemed terminating, ſtipules awl-ſhaped, leaflets oblong ſmooth. Perennial; ſtem leſs angular and ſtraighter than the ſeventh, reddiſh. Mr. Miller ſays, this plant was annual here; that it had an herbaceous ſtalk, two feet high; that the leaves had eight or nine pairs of leaflets; that the peduncles came out oppoſite to theſe; and that the flowers were ſmall, purple, in a looſe ſpike, and ſucceeded by ſlender erect pods. He received the ſeeds from Ceylon and many other parts of the Eaſt Indies. It was cultivated in 1768, by him; and flowers in July and Auguſt.

12. Galega Caribæa, or Caribbean galega: legumes ſtiff ſmooth pendulous racemed, leaflets ſmooth mucronate, ſtem ſhrubby. This is an upright branched ſlender ſhrub, two feet high; flowers inodorous, red and white variegated; the two upper ſegments of the calyx leſs deeply cut, and ſhorter than the others, and the loweſt ſegment longer than any; ſeeds black, ſhining. Native of the Caribbee iſlands.

13. Galega cœrulea, or blue galega: racemes terminating many-flowered contracted, leaflets (eight to ten pairs)

pairs) elliptic, ſtem ſcabrous. Flowers numerous, heaped, blue. Found in South America by Mutis.

14. Galega tinctoria, or dying galega: ſpikes lateral peduncled, legumes ſtiff pedulous, leaflets emarginate villoſe underneath. A very handſome plant; ſtems naked, flexuoſe, ſmooth, angular. From this plant the inhabitants of Ceylon prepare their indigo.

15. Galega ſenticoſa, or ſweet galega: legumes in pairs lateral ſmooth, leaflets emarginate ſilky underneath; ſtem ſhrubby. This is a woody ſhrub, with a roundiſh ſtem, and a brown bark. Native of Ceylon.

16. Galega pulchella, or fair galega: legumes ſtraight villoſe; pendulous, racemed; ſtipules awl-ſhaped; ſtandards above and leaves underneath villoſe. It differs from G. tinctoria in having the leaflets villoſe on both ſides, and not all emarginate; the flowers not in ſpikes, and the legumes by no means pendulous; nor can it be referred to G. ſenticoſa, as appears from the deſcription in Flora Zeylanica; it flowered at Pavia the 21ſt of July, 1783, and the ſeeds ripened on the 5th of September. Native of the Cape of Good Hope, whence it was introduced here in 1787.

17. Galega fruteſcens, or ſhrubby galega: leaflets ovate, flowers panicled axillary, ſtem ſhrubby. Mr. Miller has not deſcribed this; but informs us that it was diſcovered by Dr. Houſtoun at Campeachy, whence he ſent the ſeeds to Europe.

18. Galega tomentoſa, or rough galega: legumes ſtiff aſcending villoſe racemed oppoſite to the leaves, pedicels in threes, leaflets ſilky underneath, ſtipules awl-ſhaped. Differs from G. cinerea only in having narrower ſtipules, and the legumes in threes at each tooth of the peduncle.

19. Galega toxicaria, or poiſoning galega: ſpikes terminating peduncled, legumes cylindric pedicelled ſpreading, ſtem and leaflets hoary-tomentoſe. This is a ſpreading ſhrubby plant, riſing generally to the height of five or ſix feet; the leaves and branches, well pounded, and thrown into a river or pond, very ſoon affects the water, and intoxicates the fiſh, ſo as to make them float on the ſurface, as if dead; moſt of the large ones recover after a ſhort time, but the greateſt part of the ſmall fry periſh on theſe occaſions. It is a native of South America, whence it has been introduced to Jamaica, and cultivated there, on account of its intoxicating qualities.

Propagation and Culture. The firſt ſpecies is propagated by ſeeds, ſown either in ſpring or autumn in an open ſituation. When the plants come up, keep them clean from weeds till they are ſtrong enough to remove; then take them carefully up, and plant them in a ſpot well dug and cleared, in rows a foot and a half diſtant, and one foot aſunder in the rows; watering them till they have taken new root. Hoe the ground frequently between the plants; and dig it in the ſpring between the rows. If the ſtalks are cut down every year, before the ſeeds are formed, the roots will continue the longer, eſpecially on a light dry ſoil. Or, if the ſeeds be permitted to ſcatter, the plants will come up without any care. The fourth ſort, though tolerably hardy, is with difficulty preſerved in gardens; for the ſeeds rarely ripen in England, and the plants are often deſtroyed by froſts in winter. The other ſorts from the Eaſt and Weſt Indies may be propagated by ſeeds ſown on a hot-bed in the ſpring. When the plants are ſtrong enough, tranſplant each of them into a ſeparate ſmall pot, and plunge them into a hot-bed of tanner's bark, ſhading them till they have taken new root. Then treat them as other tender plants, preſerving them through the winter in the bark-ſtove. They will flower in July, and perfect their ſeeds in September. If the plants are brought forward early in the ſpring, and the ſummer proves warm, the ſeeds may ripen here. See ÆSCHYNOMENE, CASSIA, OROBUS, and SAPHORA.

GAL'EGOS, a town of Portugal, in the province of Entre Duero e Minho: four miles north-eaſt of Barcelos.

GA'LEN (Claudius), the moſt eminent of the ancient phyſicians next to Hippocrates, born at Pergamus in Aſia, in 131, during the reign of Adrian. His father, Nicon, was an architect, and converſant in the mathematical ſciences. The education of Galen was liberal, comprifing all the branches of ſcience then cultivated by the Greeks. He, at length, through the admonition of a dream (as he himſelf aſſerts), turned his ſtudies to medicine, in which his maſters were Satyrus and Pelops. In purſuit of knowledge he travelled to the principal cities of that part of the Roman empire, as Smyrna, Corinth, and Alexandria; and in his twenty-eighth year returned to his native place, where, for ſome time, he undertook the chirurgical care of gladiators. He firſt viſited Rome about his thirty-third year, and obtained great reputation from his anatomical and practical ſkill. After remaining there about four years, he quitted it on occaſion of a deſtructive peſtilence, and returned to his native country. He was, however, ſoon afterwards recalled by the preſſing letters of the joint emperors, Marcus Aurelius and Lucius Verus. The former, on leaving Rome for the German war, confided the medical care of his ſon Commodus to Galen. It is not known where he paſſed the remaining part of his life, or when he died, but it is conjectured that it was in the reign of Severus. Galen, as might be ſuppoſed of one ſo eminent in his profeſſion, had many rivals and enemies, whom he ſeems to have taken no care to conciliate, but, on the contrary, treated with contempt. He was, indeed, confident in his own powers; and in his writings ſpeaks much and boaſtingly of himſelf, and with little moderation of thoſe from whom he differed. No phyſician had ever a better right, from the vaſt extent of his knowledge, to arrogate ſuperiority over his contemporaries; and perhaps in the whole hiſtory of the ſcience, no example is to be found of one who took a wider range, or carried his reſearches and improvements into more branches. In fact, he ſet limits to medicine, which no one for a number of centuries ventured to paſs over; and the works of Galen were the received medical code down to the time of the revival of experimental enquiry. His writings were exceedingly numerous. In his own enumeration of them he reckons two hundred, which were burnt in the temple of Peace; but thoſe which are come down to our times are ſufficient to compoſe a very voluminous body of practical and theoretical medicine. Merely to recite the titles of theſe would occupy much room to little purpoſe; we ſhall therefore content ourſelves with a ſhort notice of ſome of the moſt important.

Though a diligent anatomiſt, it does not appear that he ever diſſected human bodies: and many errors in his deſcriptions may be traced to his transferring to men what he had obſerved in brutes. He, however, inſtituted a great many experiments upon living bodies, ſome of them of a very nice and delicate kind. He is the firſt writer who has any thing of conſequence on the blood-veſſels, and he diſcovered by experiment that the arteries always contain blood, and that their contraction propels it into the veins. One of the beſt and moſt capital of his works is his treatiſe *De Uſa Partium*, in ſeventeen books, in which he conſiders at large the action and uſes of all the principal parts of the body, with the philoſophical view of ſupporting the doctrine of final cauſes in oppoſition to the Epicureans. Many nice and curious obſervations in this piece prove the minute accuracy with which he had examined thoſe animals to which his diſſections were confined. Other valuable works upon anatomical and phyſiological topics are thoſe entitled *De Facultatibus Naturalibus*; *De Motu Muſculorum*; *De Fetuum Formatione*; and *De Pulſuum Differentiis*. In the practice of medicine it is doubtful whether his writings have done more good or harm. He added much to the fund of obſervation, and improved the art of pharmacy; but he eſtabliſhed as the baſis of his practice a theory, ſimple indeed, but founded upon falſe hypotheſes. This was the ſyſtem, ſo long famous in the ſchools, of plethora and cacochymy, and of the three humours and their four qualities, to which all his curative indications were accommodated. This was the

the parent of that abundance and ſubtility of diviſion and complication which ſo long obſcured the reaſonings of phyſicians, and made their whole art rather the reſult of logical inference from pre-conceived opinions, than of the inveſtigation of cauſes and effects as really exiſting in nature. His works, *De Temperamentis*; *De Differentiis & Cauſis Morborum*; and *Methodus Medendi*; are among the moſt conſiderable of this claſs; and that entitled *De Locis Affectis* is very valuable in a pathological view. His works on diet, and on the choice and compoſition of medicines, added much to the ſtock of knowledge then poſſeſſed on thoſe ſubjects. It would be almoſt endleſs to enumerate all the ſeparate pieces of this author, with their editions and the commentaries that have been made upon them. His whole works have been ſeveral times publiſhed in Latin tranſlations. The only complete edition in Greek and Latin is that of Chartier, together with the works of Hippocrates, in thirteen volumes folio, Paris, 1660, which, however, is reckoned not to owe much to the learning of the editor. The ſtyle of Galen is polite and eloquent, but prolix and diffuſe, and he frequently repeats himſelf in his works. He ſhows himſelf well acquainted with philoſophy and ſcience in general, and deſerves to be reckoned one of the moſt univerſal ſcholars of antiquity. Modern improvements have now in a great meaſure conſigned his writings to neglect; but his fame can only periſh with the ſcience itſelf.

GA'LEN (Bernard-Chriſtopher Van), biſhop of Munſter, in whom we find a ſingular inſtance of the union of the military with the epiſcopal character. He was born in 1604, of one of the principal families of Weſtphalia. In his youth he followed the profeſſion of arms, and for ſome time commanded a regiment in the ſervice of the elector of Cologne. At length he obtained a canonry in the cathedral of Munſter, and afterwards the provoſtſhip of the ſame. His uncle, who brought him up, expected to be choſen prince biſhop of that ſee, but the nephew ſupplanted him, and, in 1650, cauſed the election to fall upon himſelf. The pope refuſed to confirm it; but ſuch was the vigour of Bernard's character, that he eſtabliſhed his authority, and cauſed it to be reſpected by his neighbours. His attempt to introduce a garriſon of his own troops into Munſter, occaſioned a quarrel with that city, which he beſieged and furiouſly bombarded; but the interpoſition of the United Provinces obliged him to enter into a compromiſe. He built, however, a ſtrong citadel in order to bridle it for the future. In 1664 he was choſen one of the directors of the army of the empire againſt the Turks; but a peace ſoon following put an end to an employ ſo congenial to his diſpoſition. The ill-will he bore the United States for their interference between him and his ſubjects, together with a ſubſidy from Charles II. of England, induced him, in 1665, to take up arms againſt the republic, and he made an irruption into Overyſſel, and took ſeveral places; but the interpoſition of France obliged him to withdraw his forces and make peace. In 1672 he joined the league between France and England againſt the United States, and took ſeveral places from them and their ally the elector of Brandenburg; but the imperial arms turned the fortune of war againſt him, and he was obliged to ſign another peace in 1674. In the next year he entered into an alliance with the king of Denmark againſt Sweden, from which power he made ſome conqueſts in Bremen and Verden. At length he peaceably terminated a life which he had ſpent in quarrels with his neighbours, and in maintaining the character of a brave and able commander, and enterpriſing prince, but certainly not of an exemplary chriſtian biſhop. He died in 1678, at the age of ſeventy-four.

GA'LEN, or GALIEN (Matthew), a learned catholic divine in the ſixteenth century, born at Weſt Capelle, in the iſland of Walcheren, in the province of Zealand. He purſued his ſtudies at Douay, where he acquired much reputation as a preacher, and as a lecturer in theology. Afterwards he filled the chair of profeſſor in that faculty at the univerſity of Dillingen, during the ſpace of three years. At the expiration of that period he was recalled to Douay, where he received the bonnet of doctor, and contributed by his exertions to raiſe that univerſity to high credit in the catholic world. A ſenſe of the obligations which by theſe means he conferred on their city, induced the inhabitants to recommend him to the notice of the king of Spain, who nominated him to the provoſtſhip of St. Peter's; afterwards to that of St. Amatus; and finally appointed him chancellor of the univerſity. He died in 1573. He was the author of ſeveral works, which are much eſteemed for the erudition diſplayed in them. In this number are, *Commentarium de Chriſtiano & Catholico Sacerdote*, 4to. *De Originibus Monaſticis*; *De Miſſæ Sacrificio*; *De Sæculi noſtri Choreis*, &c.

GA'LEN, a military townſhip of America, in the ſtate of New-York, ſituated on Canadaque creek: twelve miles north-weſt of the north end of Cayuga lake, and thirteen ſouth by eaſt of Great Sodus. It is bounded ſouth by Junius.

GALE'NA, *ſ.* an ore of *plumbum*, or lead; for which ſee MINERALOGY.

GALEN'GARRIF HARBOUR, a bay at the northern part of Bantry Bay, in the county of Cork in Ireland.

GALE'NIA, *ſ.* [So named by Linnæus from the famous phyſician Claudius Galenus.] In botany, a genus of the claſs octandria, order digynia, natural order ſuculentæ, (atriplices, *Juſſ.*) The generic characters are —Calyx: perianth very ſmall, four-cleft, concave; diviſions oblong. Corolla: none. Stamina: filaments eight, capillary, ſcarcely the length of the calyx; antheræ twin. Piſtillum: germ roundiſh; ſtyles two, ſimple, reflex; ſtigmas ſimple. Pericarpium: capſule roundiſh, two-celled: ſeeds two, oblong, angular.—*Eſſential Character.* Calyx four-cleft; corolla none; capſule roundiſh, two-ſeeded.

Species. 1. Galenia Africana, upright or ſhrubby galenia: erect, ſhrubby; leaves linear, fleſhy. Stem four or five feet high, ſending out many weak branches; leaves very narrow, placed irregularly on every ſide, of a light green, with a furrow running longitudinally through the middle; flowers in looſe panicles from the ſides and at the ends of the branches, very ſmall, and making little appearance. It is a ruſtic ſhrub, with the air of Tetragonia, but all the parts minute, and the whole of it obſcurely papilloſe or bladdery; ſtem round, with a few reflex little briſtles; leaves oppoſite, ſeſſile, perennial; flowers ſeſſile, white, in a dichotomous panicle. Native of the Cape; flowering from June to Auguſt.

2. Galenia procumbens, or trailing galenia: procumbent; leaves ovate channelled, patulous and recurved at the tip. Found at the Cape of Good Hope, by Thunberg.

Propagation and Culture. Theſe plants will not live through the winter in the open air in England, but muſt be placed in the green-houſe, or under a frame, with other hardy exotic plants, where they may have a large ſhare of air in mild weather, for they only require to be protected from froſt. In the ſummer they may be expoſed in the open air, with other plants of the ſame country, and in dry weather they muſt be frequently watered. They may be propagated by cuttings, which if planted during any of the ſummer months and watered frequently, will take root in five or ſix weeks, and may then be treated as is directed for the old plants.

GALEN'IC, or GALENICAL, *adj.* In medicine, was a method of treating diſeaſes, founded on the principles f Galen. It is alſo uſed as contradiſtinguiſhed from *chemical*. The terms *galenical* and *chemical* were occaſioned by a diviſion of the practitioners of medicine into two ſects, which happened on the early introduction of chemiſtry into medicine.

GALEOB'DOLON, *ſ.* in botany. See GALEOPSIS.

GA'LENISTS, or GALENITES, in eccleſiaſtical hiſto-

ry, a branch of Mennonites, or Anabaptiſts, who adopt ſeveral of the opinions of the Socinians, or Arians, touching the divinity of our Saviour. In 1664 the Waterlandians were divided into two parties, of which the one were called *Galeniſts*, and the other *Apoſtolians*. They are thus called from their leader Abr. Galenus, a learned and eloquent phyſician of Amſterdam, who conſidered the Chriſtian religion as a ſyſtem that laid much leſs ſtreſs on faith than practice; and who was for taking into the communion of the Mennonites all thoſe who acknowledged the divine origin of the books of the Old and New Teſtament, and led holy and virtuous lives.

GAL'EON, or GALOO'N, *ſ.* See GALLEON.

GALEOP'SIS. *ſ.* [from γαλη, Gr. a cat, and οψις, aſpect; the flowers gaping like the open mouth of an animal.] In botany, a genus of the claſs didynamia, order gymnoſpermia, natural order verticillatæ or labiatæ. The generic characters are—Calyx: perianth one-leafed, tubular, five-toothed, ending in awns the length of the tube, permanent. Corolla: monopetalous, ringent; tube ſhort; border gaping; throat a little wider than the tube, at the length of the calyx above the baſe of the upper lip putting out on each ſide an acuminate toothlet, concave underneath; upper lip roundiſh, concave, ſerrate at the tip; lower trifid, the lateral diviſions roundiſh, the middle one larger, emarginate, notched. Stamina: filaments four, ſubulate, concealed beneath the upper lip, two of them ſhorter; antheræ roundiſh, bifid. Piſtillum: germ quadrifid; ſtyle filiform, length and ſituation of the ſtamens; ſtigma bifid, acute. Pericarpium: none; calyx ſtiff, ſtraight, containing the ſeeds in the bottom: ſeeds four, three-ſided, truncate.—*Eſſential Character.* Corolla upper lip notched a little, vaulted; lower has two teeth above.

Species. 1. Galeopſis ladanum, red dead-nettle, or nettle-hemp; narrow-leaved allheal, or ironwort: internodes of the ſtem equal, whorls remote, calyxes not pungent; leaves linear-lanceolate, almoſt naked. Theſe have in general the ſtem herbaceous, four-cornered; leaves oppoſite; flowers in whorls. The firſt ſpecies has an upright ſtem, a foot high, purpliſh, ſomewhat hairy or nearly ſmooth, brachiate, the knots ſcarcely ſwoln; leaves petioled, entire or ſlightly and diſtantly toothed, acuminate, naked or a little hairy, of a pale green colour; about eighteen flowers in a whorl. It is frequent in corn fields, in a calcareous ſoil, flowering from June to Auguſt.

Monſ. Villars has a ſpecies, which he calls *intermedia*, becauſe it ſeems to be a connecting link between this and G. tetrahit; the calyx has no awns like this, but the flowers are only half the ſize of thoſe of tetrahit, which are ſmaller than thoſe of ladanum; the whole plant is viſcid; it is not ladanum ſegetum of Rivinus, but it approaches to it a little; the ſtem is from eight to ten inches high; the branches leſs frequent than in ladanum; the leaves oval, blunt, villoſe and toothed; the flowers red, ſeldom white, extending little beyond the calyx.

2. Galeopſis villoſa, hairy dead-nettle or nettle-hemp, or yellow ironwort: internodes equal, whorls remote, leaves lanceolate ſerrate, villoſe. Root annual branched; ſtem thicker, higher, and more branched, than the foregoing, purpliſh, obſcurely quadrangular, grooved and villoſe; leaves much broader, the ſerratures more in number and more regular, thoſe next the root ovate, thoſe on the ſtem lanceolate, acuminate, villoſe or ſilky, with ſtraight veins; whorls more and nearer to each other. This has very much the air of the foregoing, of which Linnæus makes it only a variety; it differs however in breadth, ſerratures, veins, and hairineſs of the leaves, as well as in the colour of the flowers. Native of Germany, Swiſſerland, and England, as in ſandy corn-fields of Cambridgeſhire, Nottinghamſhire, Yorkſhire and Lancaſhire, and about Bangor in Wales; flowering in July and Auguſt.

3. Galeopſis tetrahit, common or hemp-leaved dead-nettle: internodes thickened at top; upper whorls almoſt contiguous; calyxes ſomewhat pungent. Every part of the plant is rough with very ſharp prickles, and has a ſtrong ſmell when bruiſed. Grows in corn fields, and on the borders of them, on waſte grounds, in coppice woods, &c. flowering in July and Auguſt.

There are ſeveral varieties, as, β. G. canabina: the flower large and elegant, above double the ſize of the foregoing, the corolla four times as long as the calyx, ſtraw-coloured, and the lower lip ſpotted with purple. Haller, Miller, Pollich, and Krocker, make it a ſeparate ſpecies; but the ſtructure of the whole plant being the ſame, Linnæus will not allow it to be any thing more than a variety; all the parts are much larger and ſofter. Inhabits Germany, Switzerland, Sweden, &c. in Great Britain, in the northern counties, as about Keighley, Settle, &c. alſo in Eſſex, at the bottom of Ribton lane, near Woodford.

γ. Corolla white ſlightly tinged with red, and the lip marked with yellow, riſing from a purple calyx; joints of the ſtem red; leaves narrower, of a deeper green, and the whole air different from the common ſort. Mr. Doody obſerved this many years near the Neat-houſes, and in the way from thence to Cheſſea.

δ. Corolla white and very large; obſerved by Merret along the ditches from Scrooby to Sherwood foreſt, and by Mr. Lawſon on the ſkirts of Croſs-Fell and other places of Weſtmoreland and Cumberland.

Villars has a new ſpecies, under the name of G. proſtrate. He refers to Merret, but ſays that the flowers are yellow; its low, ſimple, villoſe, ſtem, and its large flowers, ſeem to make it a diſtinct ſpecies, in the opinion of Villars; but it ſeems much diſpoſed to vary.

Dr. Smith obſerved a remarkable variety at Matlock in 1788, with the terminating flowers always regularly four-cleft and ſalver-ſhaped, with four equal ſtamens, whilſt all the reſt had their proper form.

4. Galeopſis galeobdolon, yellow dead-nettle, or nettle-hemp: ſix flowers in a whorl; involucre of four leaves; (flowers ſix to twelve, with an involucre of as many leaves as flowers.) With reſpect to this ſpecies there has been a great diverſity of opinion. Haller makes it a *cardiaca*, Scopoli a *leonurus*, and Crantz, a *lamium*. Mr. Hudſon has created a new genus for it under the name of *galeobdolon*, in which he has been followed by Mr. Curtis and Mr. Relhan. Native of Sweden, Germany, Swiſſerland, Auſtria, Carniola, Italy, Britain, &c. In ſome parts of the iſland frequent, as in Charlton, Hampſtead, and ſome other woods near London; in Kent, Eſſex, Cambridgeſhire, Suffolk, Norfolk, Worceſterſhire, Staffordſhire, Warwickſhire. It flowers in May and June. It is found with variegated leaves.

Propagation and Culture. All the ſpecies, except the laſt, being annual, muſt be propagated from ſeeds, but being common weeds, are ſeldom cultivated in gardens; though the firſt variety of the third ſpecies makes no bad appearance, and was therefore not unaptly named *ſpecioſa* by Mr. Miller. As weeds among corn they are not very injurious, nor difficult of extirpation. The fourth ſort is perennial, and may be propagated plentifully by the runners, which it throws out too abundantly. When the foliage is variegated, it makes a beautiful appearance in a garden. This being a wood plant, ſhould not be too much expoſed to the ſun. See LAMIUM, NEPETA, PHLOMIS, SPERMACOCE, and STACHYS.

GALE'OTI (Nicholas), an Italian Jeſuit, who died in 1748. He is celebrated for a collection of "Lives of the Generals of the Society of Jeſus, with their Portraits," folio, in Latin and Italian, publiſhed at Rome in 1748. He was alſo the author of learned notes on the Muſæum Odeſcalcum, in 2 vols. folio, which were publiſhed at Rome after the author's death, in 1751.

GAL'ERA, a town of Spain, in the province of Grenada: five miles ſouth-ſouth-eaſt of Hueſca.

GAL'ERA, a town of Spain, in the province of Catalonia: five miles ſouth-ſouth-weſt of Tortoſa.

GAL'ERA,

GAL'ERA, a town of Italy, in the patrimony of St. Peter, between Bracciano and Rome.

GALE'RIA (Gulf of), on the north-weſt coaſt of the iſland of Corſica. Lat. 42. 27. N. lon. 26. 30. E. Ferro.

GALERI'CULATE, *adj.* [from *galerus*, Lat.] Covered as with a hat.

GALERI'CULUM, *ſ.* in antiquity, a cap worn both by men and women amongſt the Romans. It conſiſted of ſkin, which was ſo neatly dreſſed with human hair, that the artificial covering could with difficulty be diſtinguiſhed from the natural. It was uſed by thoſe whoſe hair was thin; and by wreſtlers, to prevent their antagoniſts from pulling their hair. This appears to have been the origin of wigs.

GALE'RIUS (C. Valerius Maximianus), a Roman emperor, native of Dacia; for whoſe exploits ſee the article ROME.

GAL'ERON, a town of the iſland of Celebes, celebrated for its fiſhery: five leagues from Macaſſar.

GALESI'NI, in Latin GALESINIUS (Peter), a native of Milan, where he exerciſed the office of apoſtolical prothonotary under popes Gregory XIII. and Sixtus V. He underſtood the learned languages, and was converſant in eccleſiaſtical antiquities. He beſtowed much labour on illuſtrating and correcting the Roman Martyrology, giving it a new dreſs, and adding to it a great number of hiſtorical facts. It was firſt publiſhed at Milan, in 1577, under the patronage of St. Charles Borromeo, with the title of A Martyrology adapted to the Uſe of the Church of Rome, for all the Days in the Year; and the next year it was reprinted at Venice. Beſides that work, Galeſini publiſhed: 1. The Lives of the Saints that are mentioned in the Church of Milan, 1582. 2. Notes upon the Greek Text of the LXX, 1567. 3. A Commentary upon the Pentateuch, 1587. 4. A Treatiſe concerning the Obeliſk which Sixtus V. raiſed in 1586. 5. A Diſcourſe concerning the Tomb which Sixtus V. erected to the Memory of Pius V. 6. A hiſtory of the popes, entitled, *Theatrum Pontificale*. 7. Tranſlations from the Greek into Latin of ſome Diſcourſes of St. Gregory Nyſſen, and Theodoret. 8. The hiſtories of Sulpitius Severus, and of Aimon of Halberſtadt; and ſome other pieces of ancient authors.

GALE'SUS, in ancient geography, a river of Calabria, flowing into the bay of Tarentum; now *Galeſo*. The poets have celebrated it for the ſhady groves in its neighbourhood, and the fine ſheep which feed on its fertile banks, and whoſe fleeces were ſaid to be rendered ſoft when they bathed in the ſtream. *Martial.*—The name alſo of a diſtinguiſhed perſon of Latium, killed as he attempted to make a reconciliation between the Trojans and Rutulians, when Aſcanius had killed the favourite ſtag of Tyrrheus: which was the prelude of all the enmities between the hoſtile nations. *Virgil.*

GA'LETS, an iſland at the eaſt end of lake Ontario, and in the ſtate of New-York: five miles ſouth-weſtward of Roebuck iſland, five northerly of Point Gaverſe, and thirty one ſouth-eaſt of Point au Goelans.

GALET'TE (La), a neck of land in the river of St. Lawrence, in Canada. From the point oppoſite to l'Iſle de Montreal, a road is projected to Galette, ſo as to ſave forty leagues of navigation, which the falls render almoſt impracticable, and always very tedious. The land about la Galette is very good; and in two days time a barque may ſail thence to Niagara, with a good wind. La Galette is a league and a half above the fall called *les Galots*.

GAL'GALA, or GALILEA. See GALILEE.

GAL'GON, a town of France, in the department of the Gironde, and chief place of a canton, in the diſtrict of Libourne: five miles north of Libourne.

GALHA'RA, a town of Portugal, in the province of Beira: four leagues north-eaſt of Coimbra.

GA'LI POU'RI, an iſland of the Indian Sea. See ELEPHANTA.

GALIAN'CON, *adj.* [from γαλεος, Gr. a weaſel, and αγκων, the elbow.] Having one arm ſhorter than the other, or ſhaped like the weaſel.

GALIA'NI (Ferdinand), an Italian abbé, born in 1728, at Chieti, a town of Abruzzo, where his father was aſſeſſor of the royal court of juſtice. In his eighth year he was taken under the protection of his uncle, Cæleſtin Galiani archbiſhop of Tarento, and after receiving the neceſſary education, he applied to the ſtudy of the law along with his eldeſt brother Bernardo. A ſatirical piece, which he wrote at the age of eighteen againſt the academy *Degli Emuli*, who refuſed to admit him into their ſociety, made him firſt known as a writer; and this was ſoon followed by his principal work, in five books, On Money and Specie, which was publiſhed in 1750. There are few works of this kind which diſplay ſo much order, preciſion, and boldneſs of thought, and where the ſubject is treated in ſo clear and elegant language. The work was printed without the author's name, and it remained for a conſiderable time unknown. It was received with the greateſt approbation; and when its fame was fully eſtabliſhed, he diſcovered himſelf as the author, to the great joy of his friends. He now obtained ſome preferment in the church; and made a tour through Italy, which procured him an acquaintance with the moſt eminent men of letters in that country. About the year 1755 he began to form a collection of all the kinds of ſtones found in the neighbourhood of Veſuvius. The ſpecimens he collected amounted to 141, and in 1772 he publiſhed a treatiſe in which he gave an explanation of them, entitled *Catalogo delle Materie appartenenti al Veſuvio, contenute nel Muſeo, con alcune brevi Oſſervazioni*, &c. *Londra*, 1772. This collection he ſent to Pope Benedict XIV. together with the printed deſcription; and on one of the boxes he inſcribed the following words: "*Beatiſſime Pater, fac ut lapides iſti panes fiant.*" The holy father received the preſent with great ſatisfaction, and in return gave Galiani the living of Canonica, at Amalphi, worth 400 ducats per annum. As a member of the academy of Herculaneum, the object of which was to make known and illuſtrate the antiquities of Herculaneum, Pompei, and Stabia, he had a ſhare in the well-known works on the antiquities of theſe and other deſtroyed cities, and explained a great many antique paintings which had been aſſigned to him for that purpoſe. On the death of his patron, pope Benedict XIV. in 1758, out of gratitude for the kindneſs received from him, he wrote his eulogy, in which he exerted the whole power of his eloquence. In 1759 he was appointed ſecretary to the French embaſſy; and it was at this period that his public career commenced. During his reſidence in France, he did not neglect the ſtudy of the belles-lettres. He began in Paris to write annotations on Horace, in which he examined the occaſion and ſubject of each poem, in order to enable the claſſical reader to comprehend the allegories and obſcure alluſions. Beſides explaining many dark paſſages, he arranged the poems in a new order according to time and place, and exhibited the progreſs which Horace himſelf made in poetry, till he attained to a perfection, which has never ſince been imitated. He amended alſo many errors, which in the courſe of time had crept into the text; and in his labour he was greatly aſſiſted by the manuſcripts in the king's library. He next wrote in the French language a work on the corn trade, conſiſting of eight dialogues. He undertook it in conſequence of the great ſcarcity of corn which had prevailed in France for many years, and which often occaſioned not only a famine in the kingdom, but commotions and inſurrections. With a view to encourage agriculture, the king, in 1764, permitted by an edict, the free exportation of corn from all the provinces of the kingdom. Galiani, in his work, endeavoured to ſhew that this edict, and other regulations eſtabliſhed by the court, were the cauſes of the ſcarcity, and of the numerous diſorders which attended it. While he remained

at Paris he kept the work a ſecret, for fear of incurring the reſentment of the nation; but after his departure it appeared under the title of *Dialogues ſur le Commerce des Bleds*; *Londres*, 1770–8; and excited a great deal of attention in France. The means propoſed by Galiani againſt the abuſe of free exportation and monopoly found a great many partiſans among thoſe who aſcribed all the diſorders which had taken place to the government. The economiſts, on the other hand, adhered to their favourite opinions, and wiſhed that the old ſyſtem might be continued. The abbé Morellet, who had obtained great conſideration among them, took up his pen to refute the Dialogues; and all the gazettes, journals, and other periodical works of the day, teemed with articles which related to this literary diſpute. But the court ſeemed inclined to favour the ſyſtem of Galiani; for it moderated the prohibitions before impoſed, and forbade the abbé Morellet, or any other perſon, to write againſt him. Soon after his return to Naples, the greateſt men whom France at that time poſſeſſed entered into an epiſtolary correſpondence with him: their letters form nine thick volumes in quarto. He died loaded with honours and offices on the 30th of October, 1787, in the fifty-ninth year of his age. Beſides the above-mentioned commentary, he wrote alſo, in three books, A Treatiſe on the innate Propenſities or Inclinations of Men, or the Principles of the Law of Nature and Nations, deduced from the Poems of Horace. In 1779 he publiſhed a book on the Neapolitan dialect, in which he explains the grammatical rules of it, and aſſerts that the pronunciation of none of the other Italian dialects is ſo harmonious, ſo expreſſive, and ſo agreeable to the muſes. Beſides his labours in conjunction with Zannoni, in conſtructing a Map of the kingdom of Naples on a large and improved ſcale; Galiani was employed alſo on an important work On the natural Duties of Princes to other belligerent Powers, which made its appearance in 1782, and was tranſlated into German, with ſome additions, by C. A. Cæſar. A life of Galiani, written by Louis Diodati, was publiſhed at Naples in 1788.

GAL'IBIS, or CHARAIBES, a nation of Indians, inhabiting near New-Andaluſia, in South America; from which the Charaibes of the Weſt Indies are thought to be deſcended.

GALICA'NA, a town of Italy, in the republic of Lucca: thirteen miles north of Lucca.

GALI'CIA, a province of Spain, bounded on the north and weſt by the ſea, on the eaſt by Auſtria and Leon, and on the ſouth by Portugal, from which it is ſeparated by the river Minho. The ſoil in general is unequal and mountainous, with ſome ſmall plains on the ſea coaſt. There are ſome excellent ports, nevertheleſs it has but little commerce. Induſtry is not excited, and the Galician is rather laborious than active. The air in general is moiſt; temperate on the coaſts; colder inland. The inhabitants ſow but little wheat, plant many vineyards and fruit trees, and cultivate rye and flax. The ſea coaſts abound with fiſh, particularly ſardines, anchovies, ſalmon, and a peculiar ſpecies which the fiſhermen call *bezugos*. The foreſts ſupply good ſhip timber. In the mountains are found mines of gold, copper, iron, lead, and vermilion. It has likewiſe ſome excellent paſtures. It contains ſixty-four cities and towns, but few conſiderable ones, 3242 pariſhes, 242,264 families, 12,637 religious, eleven cathedrals, thirty-four hoſpitals, fourteen colleges, ſeventy-nine convents of men, and twenty-four of women. The inhabitants are conſtant and courageous: poverty compels great numbers of them to ſeek a living in the neighbouring provinces, where they hire themſelves to the moſt ſervile and laborious employments, for which they are deſpiſed by the other Spaniards. Galicia was anciently a kingdom, under the Suevi, the Viſigoths, and Moors. In 1037, it was united to the kingdom of Caſtile. The principal towns are Corunna, and Compoſtella, or St. Jaques de Compoſtella. The principal rivers are the Ulla, Tambra, Mandeo, and Lours.

GALI'CIA (New). See GUADALAJARA.

GALI'CIA, a name given to a part of Poland, ſeized on by the houſe of Auſtria, heretofore a part of Red Ruſſia, and palatinate of Lemberg, ſeparated from Hungary by the Carpathian mountains, about 280 miles in length, and from ſixty to one hundred in breadth. Lemberg, or Leopol, is the capital. It is watered by the Dnieſter, the San, and ſeveral other rivers.

GALIGNA'NA, a town of Venetian Iſtria: fourteen miles north-eaſt of Rovigno.

GAL'ILEE (Land of), one of the principal diviſions of Paleſtine, ſituated in the north of that country; bounded on the north by Syria; on the eaſt by Baſhan, the river Jordan, and the Sea of Galilee; on the ſouth by Samaria; and on the weſt by the Mediterranean: containing, within theſe limits, the provinces of the tribes of Aſher, Naphtali, part of Dan, Zebulon, and Iſſachar; the three former were denominated Upper, and the two latter Lower, Galilee.

It was known by this name even in the days of Joſhua the ſucceſſor of Moſes. *Joſh.* xx. 7. xxi. 32. We read of Solomon's giving Hiram twenty cities thereof in return for his ſervice in building the temple, &c. but as they did not give ſatisfaction to Hiram, they were probably the ſame cities he reſtored to Solomon; 1 *Kings*, ix. 11, 12. 2 *Chron.* viii. 2. After the defection of the ten tribes from the houſe of David, it formed a part of the kingdom of Iſrael, and continued ſuch until the total conqueſt of that kingdom by Tiglath-pileſer, king of Aſſyria, in conſequence of their idolatry. 2 *Kings*, xv. 29. xvii. 6. xviii. 11. 1 *Chron.* v. 26. In the Maccabean wars Galilee is frequently introduced, (not only by its general name, but alſo by that of Galgala or Galilea, 1 *Macc.* ix. 2.) many of their battles being fought in various parts of it. 1 *Macc.* v. 21. In the time of our Saviour it was governed by Herod the tetrarch, and it is on account of the Saviour's reſidence here, that Galilee principally claims our attention; the particular circumſtances of which are fully detailed in the writings of the four evangeliſts, to which we refer the reader.

GAL'ILEE (Sea of, or Lake of GENNESARETH), a lake of Paleſtine, ſituated between the land of Galilee and that of Genneſareth, from which circumſtance it derived both thoſe names: it was alſo called the Sea of Tiberias, probably in honour of that prince, and is the Sea of Chinnereth of the Old Teſtament; alſo Genneſſar Water, 1 *Macc.* xi. 67. The river Jordan paſſes through it in its courſe towards the Dead Sea; it is memorable for the miracles wrought upon it by the Saviour. *Numb.* xxxiv. 11. *Matth.* viii. 26. *Luke*, v. 1–6, 7. *John*, vi. 1–19. xxi. 6.

GALILE'I (Galileo), a moſt eminent philoſopher, mathematician, and aſtronomer, the ſon of a Florentine nobleman, born at Piſa in 1564. The earlieſt ſubjects of his ſtudies were poetry, muſic, and drawing; but his genius ſoon led him to the cultivation of ſublimer ſciences, by his proficiency in which he has immortaliſed his name. His father was deſirous of educating him as a phyſician; and with this view he entered him as a ſtudent in philoſophy and medicine at the univerſity of Piſa; but Galileo became ſoon diſſatisfied with the obſcurity of the Ariſtotelian ſyſtem, then taught in the ſchools, and conceived an unconquerable diſlike to medical purſuits. He therefore betook himſelf to the ſtudy of the mathematics, and, without the aſſiſtance of a tutor, made a rapid progreſs in thoſe ſciences, commencing with Euclid, and afterwards making himſelf maſter of the works of Archimedes, and of other ancient mathematicians. When his father perceived that his improvement indicated uncommon talents for mathematical diſquiſitions, he prudently ſuffered him to follow the natural bias of his mind without reſtraint. So great was the reputation that he acquired as a mathematician, that in 1589 the duke of Tuſcany appointed

pointed him to the mathematical chair in the univerſity of Piſa. He diſcharged the duties of this appointment for about three years, with the applauſe and admiration of the liberal and more enlightened; but not without exciting the jealouſy and oppoſition of the violent Ariſtotelians, who, becauſe he ventured to queſtion ſome of the hypothetical maxims of their maſter, held him out in the odious light of a viſionary and dangerous innovator. Becoming diſguſted with the obſtructions which their bigotry threw in the way of his promoting juſt principles of ſcience, in 1592 he reſigned his profeſſorſhip at Piſa, and accepted an invitation that was ſent him to fill the mathematical chair in the univerſity of Padua. In this ſeminary he continued for eighteen years, raiſing the credit of the univerſity as a ſchool of ſound philoſophy. By degrees Tuſcany felt an increaſing ardour for improvement; and no ſooner was it known that Galileo's patriotiſm inclined him to devote his ſervices to his native country, than Coſmo II. grand-duke, ſent for him to Piſa in 1611, where he made him profeſſor of mathematics, with a very conſiderable penſion. With the ſtudy of mathematics Galileo united that of phyſics, particularly the doctrines of mechanics and optics. Before he had ſettled at Padua, he had written his Mechanics, or treatiſe on the benefits derived from that ſcience and its inſtruments; and alſo his Balance, for finding the proportion of alloy or mixed metals. Theſe he had introduced into his lectures at that univerſity. Being informed at Venice, in 1609, that Janſen, a Dutchman, had invented a glaſs by means of which diſtant objects appeared as if they were near, he turned his attention to this ſubject, and from the imperfect accounts which he had received, and his own reflections on the nature of refraction, diſcovered the conſtruction of that inſtrument. The next day, after he had ſolved the problem of its conſtruction, he made ſuch an inſtrument, and by the attention which he paid to its perfection and improvement, may juſtly be conſidered as the ſecond inventor of the teleſcope. He now turned his inſtrument towards the heavens, and then firſt diſcovered the ſurface of the moon not to be ſmooth, but rough, and full of prominences and cavities. The milky-way he found to be an aſſemblage of fixed ſtars, inviſible to the naked eye. Venus he found to vary in its phaſes like the moon. The figure of Saturn he obſerved to be oblong, and imagined that it conſiſted of three diſtinct parts, one ſpherical in the midſt, and two leſſer ones on the ſides, which afterwards appeared to be only the *anſæ*, or extreme parts of Saturn's ring. Jupiter he ſaw ſurrounded with four moons, which in honour of the duke de Medici he called *Medicean ſtars*, and ſoon perceived that by means of their frequent eclipſes geographical longitudes might be found. On the ſun's diſk he perceived ſpots, from the motion of which he inferred that the ſun revolved on its axis. It was while he was purſuing theſe diſcoveries, that he was invited to Florence, where he had leiſure afforded him to devote himſelf to his mathematical and philoſophical ſtudies, without being obliged to attend to the duties of his profeſſorſhip. In a very few years, however, his tranquillity was diſturbed by the ignorant and bigotted clergy, on account of the zeal which he diſcovered for illuſtrating and confirming the truth of the Copernican ſyſtem. That ſyſtem they maintained to be falſe and heretical, as being contrary to the plain and expreſs language of the ſcriptures; and by their complaints againſt him to the inquiſition at Rome, rendered it neceſſary for him, in 1615, to appear in that city to juſtify himſelf. According to letters written from Rome by the learned Anthony Querenghi, Galileo did not loſe his courage on this occaſion, but in numerous companies of men of letters and others, defended the Copernican doctrine with a force of argument which perſuaded many of its truth and reaſonableneſs, and ſilenced the objections of others who would not be convinced. When he attended the inquiſition, however, he was not ſuffered to enter into any explanations, but was directly accuſed of hereſy for maintaining the two propoſitions, that the ſun is the centre of the world, and immoveable by a local motion; and that the earth is not the centre of the world, nor immoveable, but moves with a diurnal motion. Theſe propoſitions he was by a decree of the inquiſitors ordered to renounce, and not to defend them either in converſation or writing, or even to inſinuate them into the minds of any perſons whomſoever. Moſt accounts concur in ſtating, that on this occaſion he was committed to the priſon of the holy office, where he was confined for about five months; but according to other accounts he was treated with greater mildneſs, and only threatened with impriſonment if he ſhould prove refractory. Be that as it may, he was not permitted to quit Rome until he had promiſed to conform himſelf to the decree of the inquiſition; and it is probable that his ſentence would have been more ſevere, had not the grand-duke of Tuſcany warmly intereſted himſelf on his behalf, as well as ſome perſons of high rank and influence at the papal court. Galileo now returned to his ſtudies, in which his aſtronomical obſervations and other diſcoveries ſerved to eſtabliſh moſt completely and ſatisfactorily the truth of his opinions. At length, in 1632, he ventured to publiſh at Florence his Dialogues on the two greateſt Syſtems of the World, the Ptolemaic and Copernican; in which he produced the ſtrongeſt arguments in favour of both ſyſtems; without expreſſing a decided opinion which of them was the true one, but not without ſuch inſinuations in favour of the Copernican as ſufficiently indicated its ſuperior reaſonableneſs, and his own belief in it. Scarcely had this work made its appearance, before the cry of hereſy was raiſed more loudly than ever againſt Galileo, and he was again cited to appear before the tribunal of the inquiſition, in 1633. Though now ſeventy years of age, he was obliged to ſubmit to the perſecuting mandate, and on his arrival at Rome was at firſt committed priſoner to the apartments of the fiſcal of the holy office. Afterwards, through the interceſſion of the grand-duke, he was permitted to reſide in the houſe of his ambaſſador while the proceſs was carrying on againſt him. After his trial had laſted about two months, he was brought up to receive ſentence in full congregation; when he was ordered, in the moſt ſolemn manner, to abjure and condemn the Copernican ſyſtem, as contrary to the ſcriptures, and to bind himſelf by oath no longer to teach or ſupport it, either directly or indirectly. As a puniſhment for having diſobeyed the former decree of the court, he was condemned to be detained in the priſons of the holy office, during the pleaſure of the cardinal inquiſitors; and enjoined as a ſaving penance, for three years to come, to repeat once a-week the ſeven penitential pſalms, the court reſerving to themſelves the power of moderating, changing, and taking away, altogether, or in part, the above-mentioned puniſhment and penance. His Dialogues were alſo ordered to be burnt at Rome. Pope Urban VIII. who at that time ſat on the pontifical throne, leſſened the rigour of his ſentence, by confining him for a time to the palace and garden de Medici at Rome; after which he was ſent to the archiepiſcopal palace at Sienna, where the air was more favourable to his ſtate of health; and in 1634 he was permitted to reſide at his country-houſe at Arcetri, in the vicinity of Florence. In this place he ſpent the remainder of his days, diligently applying himſelf to his celeſtial obſervations. By his continual uſe of the teleſcope, however, and the injuries which his eyes had received from the nocturnal air, his ſight was gradually impaired, till he became entirely blind about three years before his death. This calamity he bore with a truly chriſtian reſignation, employing himſelf in conſtant meditation and enquiry, the reſult of which he intended to communicate to the world. He had digeſted much matter, and had begun to dictate his conceptions, when he was attacked by a diſtemper which terminated in his death, in 1642, when in the ſeventy-eighth year of his age. Galileo unqueſtionably rendered the higheſt ſervice to ſci-

ence, by treating, in a clear and geometrical manner, the doctrine of motion, which has been juſtly called the Key of Nature. The rational part of mechanics had been ſo much neglected, that ſcarcely any improvement was made in it for almoſt two thouſand years; but Galileo has given us fully the theory of equable motions, and of ſuch as are uniformly accelerated or retarded, and of theſe two compounded together. He, firſt, demonſtrated, that the ſpaces deſcribed by heavy bodies from the beginning of their deſcent are as the ſquares of the times; and that a body, projected in any direction that is not perpendicular to the horizon, deſcribes a parabola. Theſe were the beginnings of the doctrine of the motion of heavy bodies, which has been ſince carried to ſo great a height by ſir Iſaac Newton. In geometry, he invented the cycloid, or trochoid; though the properties of it were afterwards chiefly demonſtrated by his pupil Torricelli. He invented the ſimple pendulum, and made uſe of it in his aſtronomical experiments: he had alſo thoughts of applying it to clocks; but did not execute that deſign. The glory of that invention was reſerved for his ſon Vincenzo, who made the experiment at Venice in 1649; and Huygens afterwards carried the invention to perfection. Of Galileo's invention alſo was the machine with which the Venetians render their Laguna fluid and navigable. He alſo diſcovered the gravity of the air, and endeavoured to compare it with that of water; and opened ſeveral other enquiries in natural philoſophy. He was not eſteemed and followed by philoſophers only, but was honoured by perſons of the greateſt diſtinction of all nations. Galileo had ſcholars worthy of ſo great a maſter, by whom the gravitation of the atmoſphere was eſtabliſhed fully, and its varying preſſure accurately and conveniently meaſured, by the column of quickſilver of equal weight ſuſtained by it in the barometrical tube. The elaſticity of the air, by which it perpetually endeavours to expand itſelf, and, while it admits of condenſation, reſiſts in proportion to its denſity, was a phenomenon of a new kind, (the common fluids having no ſuch property,) and of the utmoſt importance to philoſophy. Theſe principles opened a vaſt field of new and uſeful knowledge, and explained a great variety of phenomena, which had been accounted for in an abſurd manner before that time. It ſeemed as if the air, the fluid in which men lived from the beginning, had been then firſt diſcovered. Philoſophers were every where buſily enquiring into the various properties and their effects; and valuable diſcoveries rewarded their induſtry. Of the great number who diſtinguiſhed themſelves on this occaſion, we cannot but mention Torricelli and Viviani in Italy, Paſcal in France, Otto Guerick in Germany, and Boyle in England. Galileo wrote a number of treatiſes, of which the principal, publiſhed during his life-time, beſides his Mechanics, Balance, and Dialogues, already mentioned, were: 1. The Operations of the Compaſs, geometrical and military, 1606. 2. A Diſcourſe addreſſed to the moſt ſerene Coſmo II. Grand-duke of Tuſcany, concerning the Swimming of Bodies upon, and their Submerſion in, Water, 1612. 3. *Nuncius Sidereus*, 1610, of which, 4. A Continuation, or An Eſſay on the Hiſtory of Galileo's laſt Obſervations on Saturn, Mars, Venus, and the Sun, &c. was afterwards collected from letters between Galileo and his correſpondents. 5. A Letter concerning the Trepidation of the Moon, inſcribed to Alphonſo Antonini, with Antonini's Anſwer, 1638. 6. A Diſcourſe of the ſolar Spots, &c. with Predictions and Ephemerides of the Mediœan Planets, 1613. 7. The famous Italian piece entitled, *Il Saggiatore*, written in defence of Guiducci's Diſcourſe on Comets, 1623. 8. A Letter to Prince Leopold of Tuſcany, examining the fiftieth Chapter of Licetus's *Lethoſphoros*. 9. A Letter to Chriſtopher Greinbergius, concerning the Montuoſity of the Moon, 1611. 10. Mathematical Diſcourſes and Demonſtrations concerning two new Sciences, relating to Mechanics and local Motions, together with an Appendix concerning the Centre of Gravity in ſome Solids, 1638, &c. The preceding articles, together with ſome other treatiſes written either by Galileo, or by ſome of his diſciples in defence of his doctrines and obſervations, were collected and publiſhed by Menoleſſi, in 1656, under the title of *L'Opere de Galileo Galilei Lynceo, nobile Fiorentino*, &c. in 2 vols. quarto. Several of theſe pieces were tranſlated into Engliſh, and publiſhed by Thomas Saliſbury, in his Mathematical Collections, in 2 vols. folio. A volume alſo of his Letters to ſeveral learned men, and ſolutions of a variety of problems, was publiſhed at Bologna, in quarto. His laſt diſciple, Vincenzo Viviani, who proved a very eminent mathematician, methodiſed a piece of his maſter's, and publiſhed it under the title of *Quinto Libro de gli Elementi d'Euclide*, &c. 1674, quarto; and he alſo publiſhed ſome other pieces of Galileo, including extracts from his Letters to a learned Frenchman, in which the author gives an account of the works which he intended to have publiſhed, and an extract of a letter to John Camillo, a mathematician of Naples, concerning the angle of contact. Many other of Galileo's writings were unfortunately loſt to the world, owing to the ſuperſtition of one of his ignorant nephews; who, conſidering that his uncle died a priſoner of the holy office, though permitted to reſide in his own houſe, ſuſpected that his papers might contain dangerous hereſies, and therefore committed them to the flames. Sir John Finch, in a letter to Thomas Saliſbury, attributes the deſtruction of Galileo's MSS. to his widow's devotion, and the fanaticiſm of her confeſſor; but the beſt authorities maintain that Galileo was never married. His ſon *Vincenzo Galilei*, who honourably ſupported his father's reputation, by firſt applying his invention of the pendulum to clock-work, was of illegitimate birth.

VINCENZO GALILEI, the father of Galileo, was a man of letters, not unſkilled in the mathematics, and particularly converſant in the ſcience of muſic. He wrote ſome elaborate works, of which the moſt eſteemed conſiſt of five dialogues concerning harmony, and its meaſures and tones, with rules for compoſing, and other practical parts of ancient and modern muſic. The firſt book is entitled, *Foromino, o Dialogo, nel quale ſi contengono le vere & neceſſarie Regole di intavolare la Muſica nel Lutto*, 1569, folio. He likewiſe wrote a defence of it, entitled, *Dialogo della Muſica antica & moderna in ſuo Diſeſo contra Joſeffo Zarlino*, 1602, folio.

GALI'NA POINT, a cape of the iſland of Jamaica, on the north coaſt. Lat. 18. 26. N. lon. 76. 41. W. Greenwich.

GALINA'GO, *ſ.* [dim. of *gallus*, a cock.] The woodcock. An eminence within the proſtrate gland is called *caput gallinaginis*, from its fancied reſemblance to a woodcock's head.

GAL'INGEN, a town of Pruſſia, in the province of Natangen: four miles ſouth of Bartenſtein.

GAL'INHAS, a river of Africa, which riſes in the country of Hondo, and runs into the Atlantic: eleven leagues from Scherbro. The Portugueſe call it *Magualbari*.

GALINSO'GEA, *ſ.* in botany, a genus of the claſs ſyngeneſia, order polygemia ſuperflua. The generic characters are—Receptacle chaffy; down many-leaved, chaffy; calyx imbricate.

Species. 1. Galinſogea parviflora: leaves ovate, triply nerved, ſerrate; peduncles one or two flowered. Inhabits Peru.

2. Galinſogea trilobata: leaves oblong-lanceolate, toothed, triply nerved; lower-ones halbert-ſhaped and three-lobed; flowers ſomewhat corymbed. Inhabits Peru.

GALINTHIA'DIA, a feſtival at Thebes, in honour of Galinthias, a daughter of Prœtus. It was celebrated before the feſtival of Hercules, by whoſe orders it was firſt inſtituted.

GALIPA'GOS, a cluſter of uninhabited iſlands in the South Sea, on both ſides the equator, not far from the coaſt

coaſt of Terra Firma; belonging to Spain. They lie between 3° N. and 4° S. lat. and between 83° 40′ and 89° 30′ W. lon. There are only nine of them of any conſiderable ſize; ſome of which are ſeven or eight leagues long, and three or four broad. Dampier ſaw fourteen or fifteen of them. The chief of theſe are, Norfolk neareſt the continent, Wenmore among the north weſternmoſt, and Albemarle the weſternmoſt of all. A number of ſmall iſlands lie weſt from theſe, on both ſides the equator; one of which, Gallego I. lies in the 1ſt degree of N. lat. and 102° of W. lon. Many of theſe iſles are well wooded, and ſome have a deep black mould. Vaſt quantities of the fineſt turtle are to be found among theſe iſlands, where they live the greateſt part of the year; yet they are ſaid to go from thence over to the main to lay their eggs, which is at leaſt one hundred leagues diſtant.

GALIPE'A, *ſ.* in botany, a genus of the claſs diandria, order monogynia. The generic characters are—Calyx: four or five-ſided, four or five-toothed. Corolla: ſalver-ſhaped, deeply four or five-parted. Stamina: four, two of them barren.

Galipea trifoliata, a ſingle ſpecies; it is a ſhrub ſix feet high; leaves alternate, in threes; leaflets ſeſſile, lanceolate, entire; flowers ſmall, in a terminal, few-flowered, cyme. Inhabits Guiana, on the banks of rivers.

GALISTE'O, a town of Spain, in Eſtremadura: ten miles eaſt of Coria.

GA'LITSCH, a town of Ruſſia, in the government of Koſtrom, on the ſouth ſide of a lake to which it gives name: fifty-ſix miles eaſt-north-eaſt of Koſtrom. Lat. 57. 56. N. lon. 60. 40. E. Ferro.

GA'LITSCH, a lake of Ruſſia, about fifty miles in circumference, in the government of Koſtrom: fifty miles from St. Koſtrom.

GA'LIUM, *ſ.* [from γαλα, Gr. milk, ſome ſpecies having the property of curdling milk.] LADIES BEDSTRAW; in botany, a genus of the claſs tetrandria, order monogynia, natural order ſtellatæ, (rubiaceæ, *Juſſ.*) The generic characters are—Calyx: perianth very ſmall, four-toothed, ſuperior; in ſome ſpecies none. Corolla: one-petalled, wheel-ſhaped, four-parted, ſharp, without any tube. Stamina: filaments four, ſubulate, ſhorter than the corolla; antheræ ſimple. Piſtillum: germ twin, inferior; ſtyle filiform, half-two-cleft, length of the ſtamens; ſtigmas globular. Pericarpium: berries two, dry, globular, united: ſeeds ſolitary, kidney-form, large. —*Eſſential Character.* Corolla one-petalled, flat, ſeeds two, roundiſh.

Species. I. *With a ſmooth fruit.* 1. Galium rubioides, or madder-leaved ladies bedſtraw: leaves in fours, lanceolate-ovate, equal, ſcabrous underneath; ſtem erect. This has the appearance of G. boreale, but the leaves are double the breadth, with the nerves three in number, and ſcabrous underneath; the ſtem firm and upright, a foot high and more, ſlender, ſwelling at the joints, purpliſh brown, rough when rubbed from the bottom upwards. Native of the Palatinate, Sileſia, Idria, &c. flowering in July; perennial.

2. Galium paluſtre, or white ladies bedſtraw: leaves in fours, obovate, unequal; ſtems diffuſed. Root ſlender, creeping, perennial; ſtem flaccid, branched from the joints, a foot or more in length, the corners ſet with ſharp hooked prickles, pointing downwards; flowers numerous, white, on lateral and terminating peduncles, which are uſually trifid, and ſubdivided. Common on the banks of rivers and ditches, and in moiſt meadows; flowering in July.

Dr. Withering has obſerved a dwarf variety, ſimilar to the foregoing, but ſcarcely a foot in length; reſembling the figure of G. trifidum in the Hora Danica, but readily diſtinguiſhable by the corolla of four diviſions, and the divided peduncles.

Dr. Withering has alſo obſerved another variety, reſembling the paluſtre, except that the leaves grow in ſixes. It is not unlikely but it may turn out to be a diſtinct ſpecies.

3. Galium trifidum, or trifid galium: leaves in fours, linear; ſtem procumbent, ſcabrous; corollas trifid. Root annual, very ſmall and ſlender; ſtem ſlender, bent back, ſtiffiſh, hairy, very much branched from the bottom almoſt to the top; the branches three or four together, divaricate. Native of Denmark, Sileſia, Canada; flowers in July.

4. Galium montanum, or mountain ladies bedſtraw: leaves in fours, or thereabouts, linear, ſmooth, and even; ſtem weak, ſcabrous. Stature between G. mollugo and glaucum; ſtem weak, rough; leaves in fives on the ſtem, reflex ſublinear; on the branches in fours; flowers in trifid corymbs, white, purpliſh on the outſide before they expand. According to Haller, the leaves are in eights; Pollich makes them eight on the ſtem, and ſix on the branches; Krocker, five to eight on the ſtem, and four to ſix on the branches. Haller deſcribes the ſtem to be three feet high, round, firm, upright, ſwelling under the leaves, not much branched; leaves narrow, hollow and glaucous underneath, ending in a ſhort awn, ſharper towards the top of the ſtem; ovate-lanceolate, and ſmaller under the flowers. Pollich adds, that the ſtem is very ſmooth, glaucous-green, and ſays that it is divided into many branches; that the leaves are hardiſh, a little rolled back on the edge, ſmooth and glaucous above, ſcabrous, whitiſh, and grooved, beneath. The root, according to Krocker, is reddiſh; the ſtem eighteen inches high, ſcabrous, branched very ſmooth, glaucous, upright, obſcurely four-cornered. Theſe deſcriptions do not perfectly agree; and after all, Gouan is of opinion that this and the glaucum are but one ſpecies. Native of Germany and Swiſſerland.

5. Galium procumbens, or trailing ladies bedſtraw: leaves on the flowering ſtem in ſixes, lanceolate and ſlightly hairy; the reſt generally in fours, obovate; ſtem proſtrate, ſmooth. Diſtinguiſhable from G. paluſtre (ſays Ray) by its ſmallneſs, ſmoothneſs of its ſtems and leaves, and place of growth, namely on hills; perennial; ſtems and branches matted together, and ſpreading on the ground; flowering ſtem from two to ſix inches high, twiſted, appearing cylindrical to the naked eye, but when magnified to have four rounded corners; leaves often in fours at the bottom of the ſtem, five about the middle, and ſix at the top, unequal in ſize in the ſame whorl, ſometimes obovate-lanceolate, the edges beſet with minute prickly hairs pointing towards the end, the keel ſmooth; thoſe of the branches ſometimes in fives. Lightfoot takes this to be only a variety of G. uliginoſum, growing in dry and mountainous paſtures; but Dr. Stokes has found it to be the ſame in marſhes as on hills. Found on heaths and mountains, alſo in marſhy places; in Dudley wood; it flowers from June to Auguſt.

6. Galium lucidum, or tranſparent ladies bedſtraw: leaves four to ſix, rigid, ſubulate, bowed upwards: flowers panicled terminating; larger than the fruit, which is wrinkled. Perennial; ſtem very much branched next the root; the whole plant ſhining; leaves in ſixes, then fives or fours, half round, ſubulate, ſomewhat ſcabrous about the edge, but hardly to be known by the touch, bowed upwards; flowers in a terminating panicle; corolla white, larger than the fruit, which is oblong-ovate, bowed in, black and wrinkled. Native of the county of Nice, &c. in dry places; alſo probably in Dauphiné.

7. Galium tinctorium, or dyeing ladies bedſtraw; leaves on the ſtem in ſixes and linear, on the branches in fours; ſtem flaccid, one or two flowers on a peduncle. This abounds in the woods of Canada; the roots are employed by the Indians in dying the quills of the American porcupines red. The French women there ſometimes dye their clothes with theſe roots, which are but ſmall, like thoſe of G. luteum. Neither air, ſun, nor water, change the colour.

8. Galium uliginoſum, or marſh ladies bedſtraw: leaves in ſixes, lanceolate, ſerrate-prickly backward, mucronate ſtiff: corollas larger than the fruit. Root perennial, creeping, ſlender; ſtems from procumbent erect, often putting out roots at the baſe, from a finger's length to a foot or eighteen inches, the corners rough, with very minute prickles; two or more branches ſpringing from each joint; leaves ſix, ſometimes ſeven or eight, or even nine, in a whorl; five lines long, and one broad, lanceolate, not much bent back at the edge, which is ſet with very minute prickles; in other parts they are ſmooth, of a bright green above, but glaucous underneath; flowers in panicles at the ends of the ſtem and branches, in trifid diviſions, the peduncles very ſhort; at the baſe of theſe a pair of leaflets or bractes; corolla white, larger than the fruit; Haller ſays it has a tinge of roſe colour; antheræ very ſmall, purpliſh; fruits rough, according to Tournefort. Native of Sweden, France, Germany, Swiſſerland, Great Britain; on wet heaths, in bogs, low meadows, by river ſides, and other watery places; it flowers in July and Auguſt.

9. Galium ſpurium, or corn ladies bedſtraw: leaves in ſixes, lanceolate keeled, ſcabrous, prickly backwards; joints ſimple. Stem quadrangular, proſtrate, hardly branched, prickly downwards at the corners; leaves uſually in ſixes, ovate-lanceolate, prickly backwards, keeled; peduncles axillary and terminating, bowed in, three-flowered, all the flowers hermaphrodite: ſeeds globular, ſmoothiſh. It is very common in the corn in Cambridgeſhire, eſpecially where the ſoil is calcareous, as about Gogmagog hills, Linton, &c. alſo in various parts of Oxfordſhire. According to Hudſon, in the iſle of Thanet; about Leatherhead and elſewhere in Surrey; and near Stamford. In the Iſle of Wight, as Dr. Withering ſays; it is an annual plant, and flowers in June and July, and even later in the ſtubble after the corn is off.

10. Galium tricorne, or three-horned ladies bedſtraw: leaves from ſix to eight; peduncles lateral, almoſt naked, trifid, pedicels bowed back; fruit tubercled. Leaves from ſix to eight, the upper ſurface ſmooth, the rib underneath rough.

11. Galium Anglicum, or Engliſh ladies bedſtraw: leaves about ſix, lanceolate, acuminate, reflex, ciliate prickly; ſtems ſpreading, rough with prickles, pointing backwards; corollas ſmaller than the fruit. Root annual, branched; ſtems from a foot to eighteen inches in height, the corners rough with prickles pointing backwards, jointed, branched, branches alternate, flowering branches oppoſite. Found by Sherard on a wall at Hackney, and at Eltham; by Hudſon, in ſandy ground between Dartford and Northfleet, and on a wall at Farningham in Kent; by Mr. Crowe, on the walls of Binham church in Norfolk.

12. Galium ſaxatile, or rock ladies bedſtraw: leaves in ſixes, obovate, obtuſe; ſtem very much branched, procumbent. Scarcely a hand high; root large, producing a prodigious number of ſtems, which are angular; leaves in great abundance, without any prickle at the end: ſeeds very large, wrinkled. This is Haller's deſcription, who doubts very much whether his plant be the ſame with that of Linnæus; Krocker ſays that it has a ſmall, ſlender, creeping, root; a ſmooth ſtem, a hand or a foot in height; five or ſix leaves, oblanceolate or obovate, ſmooth, ending in a ſlender tip; the flowers axillary, the peduncles ſuſtaining one to four flowers in a corymb, the corymbs four to ſix-flowered, ſhort; corollas white: ſeeds large; it is an annual. Native of Spain and Swiſſerland, on mountain rocks.

13. Galium Pyrenaicum, or Pyrenean ladies bedſtraw: leaves in ſixes, flowers lateral, oppoſite, ſubſeſſile, ſolitary. Stems weak, of a finger's length, and branched; the internodes ſcarcely the length of the leaves, which are ſmooth, ſomewhat convex, and mucronate. Native of the Pyrenees.

14. Galium minutum, or ſmall ladies bedſtraw: leaves in eights, lanceolate, mucronate, ſerrate-prickly, ſmooth, incurved, fruits reflex. This very much reſembles G. verum, but it is leſs than a hand in height, and is decumbent; ſtem quite ſmooth, not ſcabrous even about the edge; leaves a little convex, not bent back on the edge; fruit fleſhy, large, with the peduncles reflex, whence they are conglomerate; perennial. Native of Ruſſia.

15. Galium puſillum, or dwarf ladies bedſtraw: leaves in eights, hiſpid, linear, acuminate; fruit ſmooth; peduncles dichotomous. Root branched, perennial; ſtems numerous, from three to ten inches high, branched, the corners commonly rough with prickles; they form large tufts, covered with innumerable milk-white flowers, very conſpicuous at a diſtance. Not only the corners of the ſtem, but the edges and midribs of the leaves, are rough, with ſhort ſpreading hairs; leaves rarely up to eight; in the Engliſh Botany it is ſaid from ſix to eight, or even nine, in a whorl, equally ſpreading. Native of Provence; on the limeſtone hills near Kendal in Weſtmoreland; Matlock-bath, Derbyſhire; flowers in July and Auguſt.

16. Galium verum, yellow ladies bedſtraw, or cheeſe-rening: leaves in eights, linear grooved; flowering branches ſhort. Root perennial, creeping, ſlender, ſomewhat woody, of a yellow colour; ſtem from one to two feet high; leaves about an inch in length, bluntiſh with a ſlight point, narrowed at the baſe, the edges rolled back, and rough with minute prickles turned upwards, viſible only with a magnifier, above ſlightly wrinkled, dark green and gloſſy, underneath hollowed and paler; the lowermoſt uſually eight in a whorl, but not unfrequently ten, the upper ones decreaſing to ſeven, and ſo down to two, and even one at the extremities of the branches; flowers in a panicle, numerous, ſmall, fragrant with a peculiar odour. It is common in moſt parts of Europe, in paſtures, and by the ſides of fields and roads, in a dry ſoil; flowering from June to Auguſt and September; it will flouriſh in the moſt unremitting drought, when not a blade of graſs is to be ſeen. Beſides the names ſet down in the title, Gerarde ſays it is called *maid's-hair*, and *petty mugwet*, which laſt is from the French *petit muguet*. I muſt obſerve that the common name *bedſtraw*, (which we have from the German) is from the verb *to ſtrew* or *ſtrow*, anciently written ſtraw; thus the multitude *ſtrawed* branches in the way before Chriſt. Before the invention of feather-beds, a variety of herbs were uſed to ſtrew beds with; among theſe doubtleſs this was one.

It is an inveterate notion that the flowers and herb of this plant will curdle milk. Dioſcorides names it γαλιον, from this property; the ſame property is attributed to it by Galen; Matthiolus informs us that in Tuſcany they uſe it for this purpoſe, in order that their goat and ſheep's milk cheeſe may eat the ſweeter: Gerarde, who was a Cheſhire man, ſays, that in his country, eſpecially about Namptwich, they uſe it in their rennet, eſteeming that the beſt cheeſe which is made with it; and in ſome of the Weſtern Iſles they curdle milk with a ſtrong decoction of this herb. But Bergius and Krocker could not ſucceed in coagulating milk with this herb alone. The Galium has probably been put into milk deſtined to make cheeſe, not ſo much for the purpoſe of curdling it, as of giving it a flavour, or, as Matthiolus expreſſes it, to make it eat the ſweeter. The French preſcribe the flowers in hyſteric and epileptic caſes; both theſe and the leaves diſcover a ſenſible acidity to the taſte; and the flowery tops committed to the ſtill as ſoon as gathered, give over (ſays Lewis) a pretty ſtrong acid liquor in a moderate heat. The reſtringent and refrigerating virtues therefore aſcribed to this plant appear to have ſome foundation. Boiled in alum-water, the flowering ſtems dye of a good yellow colour; the roots dye a very fine red, not inferior to madder, but they are ſmall. An ingenious gentleman, however, converſant in dying, aſſured Mr. Curtis, that the roots produced a brighter colour than madder; and

on

on that account they may be worth trying, eſpecially as the reſt of the plant may be ſucceſsfully uſed in dying yellow. They were cultivated a few years ſince under the direction of the committee of privy council for trade; the roots were ſuppoſed on an average to weigh ſeven ounces; and the produce, when dry, to be twelve hundreds and an half on an acre; the roots of moſt of the plants belonging to the natural order of ſtellatæ yield more or leſs of a red dye. Not only this ſpecies, but G. ſylvaticum, mollugo, and aparine, are recommended for this purpoſe. So alſo are aſperula arvenſis, tinctoria, and cynanchica.

17. Galium erectum, or upright ladies bedſtraw: leaves moſtly in eights, lanceolate, with fine prickly ſerratures; panicles, trichotomous; ſtem flaccid. Root perennial, branched; ſtems ſeveral, rather upright, ſwelled at the joints, roughiſh at the corners, a little hairy, branched; flowering branches oppoſite; leaves eight, ſometimes ſix only, in a whorl, lanceolate or linear-lanceolate, naked; flowers white; ſeeds ſmall. Dr. Stokes adds, that the whorls of leaves are from four to five inches diſtant, and bent back; that the ſerratures are directed towards the point of the leaf, and not bowed back as in the other rough-leaved ſpecies; and that his ſpecimen agrees with Mr. Hudſon's deſcription in every reſpect, except that the ſtem is ſmooth. Inhabits meadows and moiſt paſtures; found in Heydon common, Norfolk, by Mr. Bryant; it flowers in June and July.

18. Galium mollugo, or great ladies bedſtraw: leaves in eights, ovate-linear, ſubſerrate, ſpreading very much, mucronate; ſtem flaccid, branches ſpreading. The whole plant is ſmooth to the touch; root perennial, creeping; ſtem two, three, and four, feet high, and even more, generally depreſſed, unleſs ſupported by the weight of the branches, quadrangular, (by which it is diſtinguiſhed from the next ſpecies,) thickeſt juſt above the joints; one ſeed is generally much larger than the other. Common in hedges and buſhy places; flowering from June to Auguſt; it is called *wild madder*, and *great baſtard madder*; the roots yield a red dye, like the true madder, and of a brighter colour; like that alſo, they dye the bones of animals, that feed on them, red.

Scopoli enumerates four varieties: 1. With the bottom leaves emarginate. 2. With the leaves rounded at the end, the nerve ending in a point or prickle. 3. With the leaves toothletted or ſerrulate, each indentation ending in a prickle, which correſponds with our common plant. 4. With the leaves quite entire and reflex, a ſmall alpine plant, only a finger's length. This Dr. Stokes has obſerved on Malvern hills.

19. Galium ſylvaticum, or wood ladies bedſtraw: leaves in eights, ſmooth and even, but ſcabrous underneath; a pair of floral leaves on capillary peduncles; ſtem ſmooth and even. Stems lofty, weak, ſmooth and even, very obſcurely cornered or roundiſh; leaves in a whorl from eight to ten, ſometimes only ſix, mucronate; the keel not always ſcabrous; ſeed round, black, wrinkled; uſually only one in a pair comes to maturity; the whole plant is ſomewhat glaucous; the root is perennial, yelloviſh on the outſide; and affords a very fine red dye like the laſt. Native of Germany, Swiſſerland, and the South of Europe, in woods; flowering from June to Auguſt.

20. Galium linifolium, or flax-leaved ladies bedſtraw: leaves in ſevens or thereabouts; linear-lanceolate, ſmooth and even; peduncles capillary; ſtem upright, four-cornered. Native of the South of Europe; it flowers in June and July; and is perennial.

21. Galium rigidum, or rigid ladies bedſtraw: leaves whorled, linear, ſcabrous above; panicles divaricate; ſtem upright, round, hairy and roughiſh. Perennial; flowering in June.

22. Galium ariſtatum, or bearded ladies bedſtraw: leaves in eights, lanceolate, ſmooth and even; panicle capillary, petals awned. Perennial; the whole plant ſmooth and even; ſtem a foot high; leaves eight or nine in a whorl, nicely lanceolate, by no means ſtiff. Native of Italy, on Monte Baldo, and Cenſio; it flowers in July.

23. Galium ſcabrum, or rough ladies bedſtraw: leaves about eight, ſcabrous, mucronate; flowering, branches ſubtrichotomous. Perennial; ſtems upright, cloſely beſet with very ſhort ſoft hair. Found by Dr. Stokes in a hedge-row, in a marly ſoil, on the ſide of Red Houſe Lane, near Worceſter; flowering in Auguſt. In Auſtria, by profeſſor Jacquin.

24. Galium ſylveſtre, or field ladies bedſtraw: leaves ſix to nine; linear-lanceolate, quite entire, awned; ſtems angular, decumbent. Root ſmall, very ſlender, creeping; ſtems from a ſpan to a foot in length, and more, brittle, ſlender, proſtrate, a little hairy at bottom; leaves quite entire, ending in a fine long prickle; the lower ones ſomewhat rough, with hairs about the edge, the upper ones ſmooth, but ſometimes they are all hairy. Native of France, Germany, and Swiſſerland, where Haller informs us it is frequent by way-ſides in corn-fields and ſtony places; it is alſo found in the Alps, and there becomes a more humble creeping plant. He mentions ſeveral varieties.

25. Galium Hieroſolymitanum, or Jeruſalem ladies bedſtraw: leaves in tens, lanceolate-linear, umbels faſtigate. In ſtature this approaches very near to G. rubrum. Native of Paleſtine.

26. Galium glaucum, or glaucous ladies bedſtraw: leaves linear; peduncles dichotomous; ſtem ſmooth and even. Root perennial, ſomewhat creeping, branched; ſtems ſlender, weak, proſtrate, gloſſy; leaves gloſſy, glaucous underneath, hardly ſcabrous on the edge, the lower ones turned back. According to Haller and Jacquin, there are eight leaves in a whorl; according to Allioni, ſix or ſeven, ſerrate on the edge; according to Krocker, eight or even nine in the lower ones, but five or ſix in the upper ones; Scopoli aſſigns only ſix to the lower whorls, four to the upper ones, and two only to thoſe on the branches. It is a native of the South of Europe, Tartary, and Siberia, in mountain woods and fiſſures of rocks; it flowers in our gardens from June to September.

27. Galium cinereum, or cinereous ladies bedſtraw: leaves in ſixes, linear, rigid, ſerrate-prickly; ſtems ſmooth, flexuoſe, filiform, ſomewhat woody at bottom; branchlets upright, leafleſs, with abont three flowers. Perennial; this is an elegant ſpecies covered with a glaucous bloom; when this bloom is wiped off, the plant is of a ſhining, not a dark, green; ſtems obſcurely quadrangular; leaves of a long elliptic form, wider at the end, and terminating in a remarkable white prickle. Native of Piedmont and Dauphiné.

28. Galium tenuifolium, or thin leaved ladies bedſtraw: leaves ſix to eight, linear, grooved, rigid, ſlightly and finely ſerrate, with a ſmall prickle at the end; ſtems diffuſely branched, each branch terminated by a panicle; peduncles two or three-flowered. Perennial; ſtems eighteen inches high, ſmooth, ſharply quadrangular; branches oppoſite, one longer than the other; leaves eight at bottom, diminiſhing till they come to two, or even one; truly rigid, not ſoft and flexible, ſmooth; but not ſhining; ſeeds ſlightly wrinkled, but neither hairy nor rough; colour of them black. Native of Nice, Provence, and Dauphiné.

29. Galium purpureum, or purple ladies bedſtraw: leaves linear-briſtle-ſhaped, peduncles, capillary, longer than the leaves. Stem upright, very much branched, and ſo leafy that the leaves can hardly be numbered; they are uſually in eights, ſmooth, and keeled underneath. The roots dye red. Found by Lago Lugano; near Ripa and Chiavenna; Nice, Montferrat, &c. perennial.

30. Galium rubrum, or red ladies bedſtraw: leaves linear, patulous; peduncles very ſhort. Root perennial, ſlender; the whole plant pale green; ſtems ſlender, proſtrate, near a foot in length, rough with ſmall prickles;

leaves on the ſtem ſix or ſeven in a whorl, on the branches four or five, bent down, lanceolate, quite entire, duſky green, ſmooth, but the edge very rough with prickles, and a little prickle at the end; they are three lines in length, and half a line in breadth; the upper leaves are in pairs; the flowers are very ſmall, of a pale purple colour (fuſco-rubri, *Scop.*) or white, diſpoſed in panicles at the end of the ſtem and branches; this differs from the foregoing ſpecies, with which it ſeems to have been confounded by ſeveral authors, by the leaves not being elliptic, nor ſpreading out; alſo by the ſhortneſs of the peduncles, and its manner of flowering; for in G. purpureum the flowers are terminating, rather panicled; purple, not reddiſh brown. Native of the Palatinate, Sileſia, Carniola, and Italy; flowers in July and Auguſt.

II. *With a hiſpid fruit.* 31. Galium boreale, or croſs-leaved ladies bedſtraw: leaves in fours, lanceolate, three-nerved, ſmooth; ſtem upright. Root perennial, long, ſlender, dark purple; ſtems a foot or eighteen inches in height, obſcurely quadrangular, ſtout, much branching at top; the lower part ſmooth, the upper ſlightly hairy. Native of Lapland, Sweden, Sileſia, Swiſſerland, Carniola, Britain; as in the mountains of Weſtmoreland and Wales; near Pooley bridge by Ulſwater, in Cumberland; near the ferry at Winander-meer; in the county of Durham; in Scotland not unfrequent on rocks by the ſides of rivers and lakes; it flowers in July and Auguſt. This is one of the ſpecies whoſe roots afford a beautiful red dye. The proceſs is thus deſcribed by Haller: the roots are gathered in ſpring, they are ground with malt duſt, and infuſed in ſmall beer, the woollen yarn is macerated, and then boiled in this liquor. Gunner adds that the yarn is firſt dyed yellow in a decoction of birch leaves.

32. Galium piloſum, or hairy ladies bedſtraw: leaves in fours, nearly oval, hairy, nerveleſs; ſeeds hairy. Perennial. Native of North America; flowers in June and July.

33. Galium rotundifolium, or round-leaved ladies bedſtraw: leaves in fours, ovate, obtuſe, terminating in a very ſhort prickle, ciliate about the edge, three-nerved; ſtem procumbent. Root perennial, ſlender, creeping, cinnamon-coloured; ſtem weak, a foot long, ſlightly grooved; branches alternate, green at the bottom, pubeſcent, with very ſhort hairs, and leafy, frequently purpliſh above, naked, and jointed; leaves ſubpetioled, four or very ſeldom five in a whorl, ſpreading, broad, with very ſhort hairs on the nerves and at the edges; towards the top of the ſtem, where it terminates in two or three almoſt dichotomous peduncles, is placed a pair of lanceolate leaves. Native of Sileſia, Swiſſerland, Savoy, Auſtria, &c. It flowers in July and Auguſt.

34. Galium maritimum, or ſea ladies bedſtraw: leaves in fours, hiſpid; peduncles one-flowered; fruits villoſe. Root perennial; leaves in fours, rarely fives. Obſerved in the Levant, by Schreber: if it be Gouan's plant, it is alſo native of Montpellier, the Pyrenées, and Nice: but according to Gouan, the leaves are eight in a whorl.

35. Galium Bermudianum, or Bermuda ladies bedſtraw: leaves in fours, linear, obtuſe; branches very much ſub-divided. Native of Virginia and Maryland.

36. Galium Græcum, or Candia ladies bedſtraw: leaves about ſix, linear-lanceolate; ſtems woody; the whole plant rough with hairs. Native of the iſlands of the Archipelago.

37. Galium aparine, or common rough ladies bedſtraw, cleavers, or gooſegraſs: leaves in eights, lanceolate; keels ſcabrous, with prickles pointing backwards; joints villoſe. Root annual; ſtem four feet high or more, weak, and ſupporting itſelf on other plants, brittle, jointed, the joints villoſe at the baſe; the angles are ſet with pellucid prickles pointing downwards; it is very much branched, and the branches are oppoſite; leaves ſix or eight in a whorl, (eight or ten, *Linn.* four to ſeven or more, *With.* ſix to eight, *Hall. Poll. Krock.* ſeven, *Bauh.* Ray ſays, eight on the lower, ſix on the upper, whorls of the ſtem; on the branches fewer, from ſix to three, two, and even one.) Common in hedges, and cultivated grounds; flowering from May and June through the ſummer and part of the autumn. Its well-known property of adhering to whatever it comes in contact with, acquired it the names of *cleavers, clevers, clivers*, and *catchweed* or *ſcratchweed*; from the ſame idea it had the more elegant appellation of *philanthropon* among the Greeks and Romans; from its roughneſs it has been called *hariff*, or rather *hairrough*; and from being a favourite food or medicine of geeſe, *gooſe-graſs, gooſe-ſhare*, and *goſling-weed.*

Linnæus informs us that they uſe the ſtalks in Sweden as a filtre to ſtrain their milk through. Dioſcorides relates that the ſhepherds made the ſame uſe of it in his time; and certainly it is no bad thing to take out hairs from the milk, where a ſieve is not at hand. It is reckoned to purify the blood, and for that purpoſe the tops are an ingredient in ſpring broth. The expreſſed juice of the herb, taken to the amount of four ounces or a quarter of a pint, night and morning, during ſeveral weeks, is very efficacious in removing many of thoſe cutaneous eruptions, which are called, although improperly, ſcorbutic. It has been much celebrated in ſcrophulous and cancerous ſores, but experiments made in our hoſpitals have not turned out in its favour. The ſeeds have been ſubſtituted for coffee; the roots, like moſt of the genus, will dye red, and eaten by birds, have tinged their bones of that colour. It is a troubleſome weed, particularly in young quick-ſet hedges, which it will entirely overgrow and choke. Linnæus ſays it is very apt to infeſt their crops of peaſe. Being an annual weed, it is eaſily deſtroyed, if it be cut or plucked up early, for it begins to ſeed in June.

38. Galium Pariſienſe, or Parva ladies bedſtraw: leaves linear; peduncles two-flowered. Root annual; ſtems a foot high, weak, ſcabrous backward; leaves in ſevens, lanceolate, mucronate, ſcabrous eſpecially on the edge.

39. Galium megaloſpermum, or large-ſeeded ladies bedſtraw: leaves in fives, elliptic, acuminate, finely ſerrate; peduncles two-flowered; fruits large wrinkled. This forms a tuft; the ſtems are not more than a finger's length; flowers pale yellow; fruits dirty white. Native of Monte Cenifio.

40. Galium ſaccharatum, or ſweet ladies bedſtraw. Suppoſed to be a variety of G. aparine. Parkinſon ſays it differs from aparine lævis only in having the ſeed rough like unto a coriander comfit. Ray, that the leaves are ſmooth, and the fruits warted, but not lappaceous or tenacious.

41. Galium umbroſum, or ſhady ladies bedſtraw. Native of New Zealand.

42. Galium viſcoſum, or clammy ladies bedſtraw: lower leaves in fours, obovate; upper ones in ſixes, linear-lanceolate, ſerrate, keel and ſtem ſmooth. Root annual; ſtems ſeveral, aſcending, a finger or a hand in height, ſmooth, even, made four-cornered by a pale decurrent line, branched from all the lower axils, ending at length towards the top in oppoſite peduncles, an inch long. In a rich ſoil the ſtems are frequently a ſpan high, and ſpreading. Native of Tunis, in the mountains.

43. Galium paſchal: leaves in nines or thereabouts, linear-lanceolate, rugged backwards, peduncles axillary, elongated, trichotomous. Stems weak, a foot and half high or more, ſimple, ſmooth, even; perhaps not different from G. hieroſolymitanum.

44. Galium aparinoides: leaves in ſixes, oblong, on the edge and along the keel, prickly backwards, joints ſmooth. Stem herbaceous, weak, half a foot high, prickly backwards at the corners, with equal joints; ſeeds as in G. aparine, from which it differs in the ſize, number, and form, of the leaves.

45. Galium album, or white ladies bedſtraw: leaves in eights, or thereabouts, oblong, unarmed, rugged on the edge; ſtem pubeſcent, even. Stem the thickneſs of a pigeon's quill, erect, branched, a cubit in height, pubeſcent,

ſcent, unarmed, purpliſh brown at the joints, the internodes a ſpan in length; leaves ſeſſile, commonly in ſevens, mucronate, ſcarcely ſerrulate at the edge, ſmooth above, villoſe underneath, eſpecially on the keel; fruit hiſpid. Native of Smyrna.

46. Galium microcarpum, or ſmall-fruited ladies bedſtraw: leaves in ſixes or thereabouts, lower ones oblong, upper ones briſtle-ſhaped; peduncles trifid. Stems ſeveral, filiform, a hand and ſometimes a finger high, erect, rugged at the corners below, but even above, branched at the baſe, dichotomous or trichotomous at top; lower leaves in fours, petioled, obovate, ſmall; the middle ones in ſixes, a little longer, marked with two lines, oblong, ſharp at both ends; flowers purple; fruit minute, whitiſh-hiſpid. Native of the dry mountains of Tunis; and of Spain, but not ſo common there.

47. Galium tuberoſum, or tuberous ladies bedſtraw: leaves in fives, lanceolate; peduncles heaped, axillary. The root is a ſmall, oblong, irregularly-ſhaped, white, farinaceous, tuber; ſtem herbaceous, a foot and a half high, rufous, procumbent, ſimple; flowers white; fruit roundiſh, rough. It is cultivated in China and Cochinchina for the roots, which are eaten boiled, either whole or in meal.

48. Galium cruciatum, or croſs-wort: leaves in fours, ovate hairy; ſtem ſimple above, hairy, bunches of flowers, lateral with two leaves; flowers polygamous; fruit ſmooth. Root perennial, creeping, ſlender; ſtems branched only at the baſe, weak and ſupporting themſelves on buſhes, quadrangular, very hairy, jointed; having at every joint four ovate, entire, ſoft, hairy, leaves, from the axils of theſe all the way up the ſtem ariſe ſeveral ſlender, forked, many-flowered, peduncles, each furniſhed with two ſmall leaves at the firſt diviſion. The flowers are yellow, formed exactly like the galiums, except that ſome are only male, and ſome of the hermaphrodites are five-cleft. Croſſwort is not uncommon about hedges and in thickets, flowering early in ſummer.

Propagation and Culture. Moſt of theſe plants, being deſtitute of beauty, and being ſubject to ſpread, and overrun whatever plants grow near them, are ſeldom cultivated except in botanic gardens. The perennial ſorts may eaſily be propagated, by parting their roots either in ſpring or autumn; and they will grow in almoſt any ſoil and ſituation. If the annual ſorts are permitted to ſcatter their ſeeds, they will maintain themſelves in a garden without any culture, except that of preventing other weeds from overgrowing them. The common gooſegraſs propagates itſelf prodigiouſly, by the adheſion of its fruits to the hairy coats of cattle, &c. If it ſhould be thought adviſeable to propagate the galium verum for the uſe of the roots in dyeing, the beſt ſoil is a ſandy loam; heavy ſoils will not anſwer. Prepare the land as for flax; ſow four pounds of ſeed on an acre. In April hoe out the plants to ſix inches ſquare; the crop will require three or four hoeings more the firſt ſeaſon. In May or June take up as many plants as will leave the reſt at the diſtance of one foot ſquare; in March following take up again as many as will leave the reſt ſtanding at two feet ſquare; and in the fourth take up the whole crop in March; keeping it all the while clean from weeds. See ASPERULA, RUBIA, SHERARDIA, and VALANTIA.

GALL, *ſ.* [ȝealа, Sax. *galle*, Dut.] The bile, an animal juice remarkable for its ſuppoſed bitterneſs.—*Gall* is the greateſt reſolvent of curdled milk: Boerhaave has given at a time one drop of the *gall* of an eel with ſucceſs. *Arbuthnot.*

A honey tongue, a heart of *gall*,
Is fancy's ſpring, but ſorrow's fall. *Shakeſpeare.*

The part which contains the bile.—The married couple, as a teſtimony of future concord, did caſt the *gall* of the ſacrifice behind the altar. *Brown.*—Any thing extremely bitter:

Poiſon be their drink!
Gall, worſe than *gall*, the daintieſt meat they taſte. *Shakeſ.*

Rancour; malignity.—They did great hurt unto his title, and have left a perpetual *gall* in the mind of the people. *Spenſer on Ireland.*—Anger; bitterneſs of mind:

Suppoſe your hero were a lover,
Though he before had *gall* and rage;
He grows diſpirited and low,
He hates the fight, and ſhuns the blow. *Prior.*

A ſlight hurt by fretting off the ſkin.—This is the fataleſt wound; as much ſuperior to the former, as a gangrene is to a *gall* or ſcratch. *Government of the Tongue.*—The *gall* or bile of animals, being of a ſaponaceous quality, is found particularly uſeful in cleanſing or waſhing coloured ſtuffs, the dye of which is apt to fade. It was alſo employed by the ancients for removing diſcolourations or ſpots of the ſkin. For its mode of ſecretion, and chemical properties, ſee CHEMISTRY, vol. iv. p. 361; and ANATOMY, vol. i. p. 616.

The juice of animal gall was generally given amongſt the Jews, to perſons ſuffering death under the execution of the law, to aſſuage thirſt, and alleviate pain; but gall and myrrh, in thoſe caſes, are ſuppoſed to have been the ſame thing; becauſe at our Saviour's crucifixion, St. Matthew ſays, they gave him vinegar to drink mingled with gall; whereas St. Mark calls it wine mingled with myrrh: the truth is, that they diſtinguiſhed every thing *bitter* by the name of *gall*. The Greeks and Romans alſo gave ſuch a mixture to perſons ſuffering death by torture.

GALL, in natural hiſtory, a protuberance or nut, produced on plants and trees of different kinds, by the puncture of inſects. They are of various forms and ſizes, and no leſs different with regard to their internal ſtructure. Some have only one cavity, and others a number of ſmall cells communicating with each other. Some of them are as hard as the wood of the tree they grow on, whilſt others are ſoft and ſpongy; the firſt being termed *gall-nuts*, and the latter *berry-galls*, or *apple-galls*. The *gall-nut* is nothing more than the nidus of the cynipides, in which the eggs of theſe inſects are depoſited. See the article CYNIPS, vol. v. p. 519. They afford a ſecure lodgment for the larvæ of the fly, until they are capable of eating a paſſage through, in order to aſſume the winged ſtate. The tear which iſſues from the punctured leaf wounded for this purpoſe by the parent inſect, gradually increaſing by acceſſions of freſh matter, forms a covering to the egg and ſucceeding larva. Thoſe *galls* which have no hole, are found to have the dead worm remaining in them. Two ſorts are diſtinguiſhed in the ſhops, one brought from Aleppo, called Oriental, or Aleppo nut, or *galla* ſpinoſa; the other from the ſouthern parts of Europe, called European galls. The former are generally of a bluiſh colour, or greyiſh or blackiſh, verging to a blue; unequal in their ſurface, hard to break, and of a cloſe texture: the others are of a pale browniſh or whitiſh colour, ſmooth, round, eaſily broken, leſs compact, and of a much larger ſize. The two ſorts differ in ſtrength, but in other reſpects are of the ſame quality. The beſt are the ſmall, protuberant, bluiſh, and heavy ones.

Galls are a powerful aſtringent, ſuppoſed to be one of the ſtrongeſt in the vegetable kingdom. They have no peculiar ſmell or taſte; their medical character is ſimple aſtringency. Both water and ſpirit take up nearly all their virtue. The ſpirituous extract is the ſtrongeſt medical preparation; but the ſimple powder is as good as any other mode of adminiſtering them. The doſe of the powder is from a few grains to a dram. They are not, however, much uſed in medicine, though they have been ſaid to be beneficial in intermittents, and one of the moſt powerful of the vegetable aſtringents. Dr. Cullen has cured intermittents, by giving half a dram of the powder of galls every two or three hours, during the intermiſſion; and both by itſelf, and joined with camomile flowers, has

prevented the return of the paroxyſms. The following fomentation is recommended for the piles, &c. Take of bruiſed galls ʒ ſs. boiling water, ℔ ii. macerate them for an hour, and then ſtrain off the liquor. This is alſo ſerviceable in the prolapſus ani, and the fluor albus, applied cold. An injection merely aſtringent is made, by adding two ounces of diſtilled water to the ſame quantity of the fomentation above, and uſed in gleets and leucorrhœa. Againſt the piles alſo, the ointment called camphorated ointment of galls has been found ſerviceable after the uſe of leeches, and is thus made: Incorporate half a dram of camphor with one ounce of hog's lard, and then add two drams of galls in very fine powder. Galls are of extenſive uſe in preparing the black dye; for which ſee the article DYING, vol. vi. p. 162, 163.—And alſo for making the beſt and moſt durable writing ink; for the preparation of which ſee the article INK.

To GALL, *v. a.* [*galer*, Fr.] To hurt by fretting the ſkin.—Tyrant, I well deſerv'd thy *galling* chain. *Pope.*

I'll touch my point
With this contagion, that, if I *gall* him ſlightly,
It may be death. *Shakeſpeare.*

To impair; to wear away.—If the rain ſhould fall down in a continual ſtream like a river, it would *gall* the ground, waſh away plants by the roots, and overthrow houſes. *Ray.*—To teaze: to fret; to vex.—No man commits any ſin but his conſcience ſmites him, and his guilty mind is frequently *galled* with the remembrance of it. *Tillotſon.*—To haraſs; to miſchief; to keep in a ſtate of uneaſineſs.—In our wars againſt the French of old, we uſed to *gall* them with our long bows, at a greater diſtance than they could ſhoot their arrows. *Addiſon.*

Light demi-lances from afar they throw,
Faſten'd with leathern thongs, to *gall* the foe. *Dryden.*

To GALL, *v. n.* To fret.—I have ſeen you glecking and *galling* at this gentleman twice or thrice. *Shakeſpeare.*

"Touch a GALL'D horſe and he'll winch:"—That is, accuſe a perſon of what his conſcience ſmites him with being guilty of, and he will be ſenſibly touched to the quick. This proverb is generally applied to thoſe moroſe and touchy creatures, who conſider every thing that is ſaid as if deſignedly levelled at them, when perhaps the perſon who is ſpeaking has no ſuch thing in view.

GALL-FLY. See CYNIPS, vol. v. p. 519.

GAL'LA, an Ethiopian nation, originally dwelling, as Mr. Bruce ſuppoſes, under the line, and exerciſing the profeſſion of ſhepherds, which they ſtill follow. For a number of years they have been conſtantly migrating northwards. At firſt they had no horſes; the reaſon of which was, that the country they came from did not allow thoſe animals to breed: but as they proceeded northward, and conquered ſome of the Abyſſinian provinces, they ſoon furniſhed themſelves with ſuch numbers, that they are now almoſt entirely a nation of cavalry. On advancing to the frontiers of Abyſſinia, the multitude divided, and part directed their courſe towards the Indian Ocean; after which, having made a ſettlement in the eaſtern part of the continent, they turned ſouthward into the countries of Bali and Dawaw, which they conquered, and ſettled there in 1537. Another diviſion having taken a weſterly courſe, ſpread themſelves along the banks of the Nile; ſurrounding the country of Gojam, and paſſing eaſtward behind the country of the Agows, extended their poſſeſſions as far as the territories of the Gongas and Gafats. Since that time the Nile has been the boundary of their poſſeſſions; though they have frequently plundered, and ſometimes conquered, the Abyſſinian provinces on the other ſide of the river, but have never made any permanent ſettlement in thoſe parts. A third diviſion ſettled to the ſouthward of the low country of Shoa, which the governor of that province permitted, in order to form a barrier betwixt him and the territories of the emperor of Abyſſinia, on whom he ſcarcely acknowledges any dependence.

The Galla on the hills are of a brown complexion; but thoſe who live in the valleys are entirely black. Each of the three diviſions above-mentioned has a king of its own; and they have alſo a kind of nobility, from among whom the ſovereign can only be choſen: however, the commonalty are not excluded from riſing to the rank of nobles if they diſtinguiſh themſelves in battle. Theſe nations have all a great veneration for a tree that grows plentifully in their country, called *wanzey*, which the people are ſaid to adore as a god. Their aſſemblies for the choice of a king are all held under one of theſe trees; and when the ſovereign is choſen, they put a bludgeon of this wood in his hand by way of ſceptre, and a garland of its bloſſoms on his head. Their principal arms are lances made of wood ſharpened at the end and hardened in the fire; and their ſhields are compoſed only of one ſingle fold of bull's hide, which are extremely apt to warp by heat, or become too ſoft in wet weather. They are exceedingly cruel; and make a horrid yell on going into battle. According to Mr. Bruce's account, the women are fruitful; and ſuffer ſo little in child-bearing, that they do not even confine themſelves for a ſingle day after delivery. They plough, ſow, and reap the corn, which is trodden out by the cattle; but the men have all the charge of the cattle in the fields. Beſides the wanzey, they worſhip the moon and ſtars at particular ſeaſons of the year. They all believe in a reſurrection; and have ſome faint notions of a ſtate of happineſs, but no idea of future puniſhment. Some of them, to the ſouthward, profeſs the Mahometan religion, but thoſe to the eaſt and weſt are pagans. Polygamy is allowed among them; and it is ſingular, that among theſe people the women ſolicit their huſbands to take others to their embraces. The reaſon of this cuſtom is, that the men may have numerous families of children, who may be capable of defending them againſt their enemies; as the Galla, according to Bruce, always fight in families, whether againſt foreign enemies, or with one another.

GAL'LA, a town of Arabia Felix: twenty-four miles ſouth-eaſt of Taas.

GAL'LAM, a town of Africa, the capital of a kingdom of the ſame name, on the river Senegal. Lat. 14. 25. N. lon. 9. 55. W. Greenwich.

GAL'LAN, a ſmall iſland on the coaſt of Peru, in lat. 14, ſouth five miles north of the high land *Morro Veijo*, or Old Man's Head; between which iſland and the high land, is a moſt eligible ſtation to cruize for veſſels bound for Callao, north or ſouth.

GAL'LAND (Antony), eminent for oriental knowledge, born at Rollo in Picardy, in 1646. He received his early education at the college of Noyon, whence he was taken to be put to ſome trade. But his inclination for literature carried him to Paris, where he purſued his ſtudies under M. Petitpied, a doctor of the Sorbonne, and afterwards at the college of Mazarin. Becoming particularly converſant with the oriental languages, he was engaged as a companion by M. de Nointel in his embaſſy to Conſtantinople and the Levant, where he collected a rich treaſure of antiquities. Returning to Paris in 1675, he made acquaintance with Vaillant and other medaliſts, with whom he made a ſecond voyage to the Levant. He went thither a third time in 1679, partly at the expence of the French Eaſt-India company, and partly at that of Colbert. On his return, he was employed by Thevenot, the king's librarian; and after the death of d'Herbelot he continued the publication of his *Biblioth. Orientale*, and wrote the preface of it. He was appointed royal profeſſor of Arabic in 1709. He died in 1715, at the age of ſixty-nine. Of his works, none is ſo well known as his verſion of the Arabian tales, called the Thouſand and One Nights, which became a popular book throughout Europe. He publiſhed various other pieces tranſlated from

from the eaſtern languages, and ſeveral explanations of medals and other matters of antiquity in the Mem. of the Academy of Inſcriptions, Mem. de Trevoux, and other collections.

GAL'LAND (Auguſtus), a French lawyer and hiſtorian of the ſeventeenth century. He was extremely well verſed in legal and hiſtorical antiquities, as he proved by ſeveral learned writings. One of the moſt celebrated of his works was that which he compoſed againſt the allodial rights pretended by ſome of the provinces of written law, to which he added the laws given to the Albigenſes by Simon de Montfort. This was firſt publiſhed at Paris in 1629, and he gave a much augmented edition in 1637. He likewiſe publiſhed in 1637, ſeveral treatiſes relative to the ancient banners of France. He is ſuppoſed to have died about 1644. His ſon, in 1648, publiſhed his Memoirs for the hiſtory of Navarre and Flanders. A *Diſcours au Roi*, concerning the origin, progreſs, &c. of the city of Rochelle, publiſhed anonymouſly in 1628 and 1629, is aſcribed to this author. Many genealogies of noble families, drawn up by his hand, are preſerved in different libraries.

GAL'LANT, *adj.* [*galant*, Fr. from *gala*, fine dreſs, Span.] Gay; well dreſſed; ſhowy; ſplendid; magnificent. —A place of broad rivers, wherein ſhall go no galley with oars, neither ſhall *gallant* ſhips paſs thereby. *If.* xxxiii. 21.

The gay, the wiſe, the *gallant*, and the grave,
Subdu'd alike, all but one paſſion have. *Waller.*

Brave; high ſpirited; daring; magnanimous.—Fare thee well, thou art a *gallant* youth. *Shakeſpeare.*—A *gallant* man, whoſe thoughts fly at the higheſt game, requires no further inſight. *Digby.*—Fine; noble; ſpacious:

There are no tricks in plain and ſimple faith;
But hollow men, like horſes hot at hand,
Make *gallant* ſhew and promiſe of their mettle. *Shakeſ.*

Courtly with reſpect to ladies:

When firſt the ſoul of love is ſent abroad,
The gay troops begin
In *gallant* thought to plume their painted wings. *Tillotſ.*

GAL'LANT, *ſ.* A gay, ſprightly, airy, ſplendid, man. —The *gallants* and luſty youths of Naples came and offered themſelves unto Vaſtius. *Knolles.*

The *gallants*, to protect the lady's right,
Their faulchions brandiſh'd at the griſly ſpright. *Dryden.*

One who careſſes women to debauch them.—Though worn to pieces with age, he ſhews himſelf a young *gallant*. *Shakeſpeare.*—She left the good man at home, and brought away her *gallant*. *Addiſon.*—A wooer; one who courts a woman for marriage. In the two latter ſenſes it has commonly the accent on the laſt ſyllable, as in the French.

GAL'LANT, a town of Hungary, three miles ſouth-ſouth-weſt of Serat.

To GAL'LANTISE, *v. a.* [*galantiſer*, Fr.] To court, to play the gallant.

GAL'LANTLY, *adv.* Gaily; ſplendidly. Bravely; nobly; generouſly.—You have not dealt ſo *gallantly* with us as we did with you in a parallel caſe: laſt year a paper was brought here from England, which we ordered to be burnt by the common hangman. *Swift.*

GAL'LANTRY, *ſ.* [*galanterie*, Fr.] Splendour of appearance; ſhow; magnificence; glittering grandeur; oſtentatious finery:

Make the ſea ſhine with *gallantry*, and all
The Engliſh youth flock to their admiral. *Waller.*

Bravery; nobleneſs; generoſity.—The eminence of your condition, and the *gallantry* of your principles, will invite gentlemen to the uſeful and ennobling ſtudy of nature. *Glanville.*—A number of gallants.—Hector, Deiphobus, and all the *gallantry* of Troy, I would have arm'd to-day. *Shakeſpeare.*—Courtſhip; refined addreſs to women:

The martial Moors, in *gallantry* refin'd,
Invent new arts to make their charmers kind. *Granville.*

Vicious love; lewdneſs; debauchery.—It looks like a ſort of compounding between virtue and vice, as if a woman were allowed to be vicious, provided ſhe be not a profligate; as if there were a certain point where *gallantry* ends, and infamy begins. *Swift.*

GALLARA'TO, a town of Italy, in the duchy of Milan: twenty miles weſt-north-weſt of Milan.

GAL'LARDON, a town of France, in the department of the Eure and Loire, and chief place of a canton, in the diſtrict of Chartres: four leagues weſt of Dourdan, and three north-eaſt of Chartres.

GALL'BRUNN, a town of Germany, in the archduchy of Auſtria: ſeven miles north-weſt of Brugg.

GALLE', in Latin *Gallæus* (Servatius), a learned Dutch divine, paſtor of the Walloon church at Haarlem, died at Campen in 1709. He was the editor of a beautiful and excellent edition of *Lactantius, cum notis variorum*, printed by Hackius, 1660, 8vo. and the author of *Diſſertationes de Sybillis, earumque Oraculis*, 1688, 4to. and of a new impreſſion, with enlargements and corrections, of Opſopæus's edition of the Sybilline oracles, entitled *Sybillina Oracula, ex veteribus Codicibus emendata & reſtituta, &c. accedunt Oracula Magica Zoroaſtris, Jovis, Apollinis, &c. Gr. & Lat. cum notis variorum, &c.* 1689, 4to.

GAL'LE, or PONTE GALLE, a ſeaport town and fort of the iſland of Ceylon, ſituated on the ſouth-weſt coaſt, about half a league in circumference within the walls; defended by baſtions towards the land; on the ſide towards the ſea are banks and rocks; the fortreſs is on a tongue of land: the bay is expoſed only to the weſterly winds; but is ſaid not to be large, nor convenient, and the entrance dangerous on account of the rocks. The Dutch took it from the Portugueſe in 1640. The air is healthy, and the heat of the climate moderated by the land and ſea breezes: ninety-eight miles ſouth of Candy. Lat. 6. N. lon. 80. 20. E. Greenwich.

GAL'LEASS. See GALEASSE.

GALLE'GO, a town of Spain, in the province of Leon: eighteen miles ſouth-ſouth-eaſt of Salamanca.

GAL'LEGO, a river of Spain, which riſes in the Pyrenees, and runs into the Ebro, oppoſite Saragoſſa.

GAL'LEGOS, a town of Spain, in the province of Leon: twenty-four miles ſouth of Salamanca.

GAL'LEMBERG, a town of Germany, in the duchy of Carniola: thirty miles eaſt of Laubach.

GAL'LENBU'LON, a town of the iſland of Madagaſcar. Lat. 17. 20. S. lon. 71. 50. E. of Ferro.

GAL'LENEK, a town of Germany, in the duchy of Carniola: fourteen miles ſouth-eaſt of Stein.

GAL'LENSTAIN, a town of Germany, in the duchy of Stiria: three miles weſt of Reiffling.

GAL'LEON, *ſ.* [*galeon*, Fr.] A lofty or high built ſhip of great capacity, peculiar to Spain, and employed in the commerce of the Indies. The Spaniards ſend annually two fleets; the one for Mexico, which they call the *flota*; and the other for Peru, which they call the *galleons*. They are appointed to ſail from Cadiz in January, and arrive at Porto Bello about the middle of April; where, the fair being over, they take on board the plate, and reach Havannah about the middle of June; where they are joined by the flota, in order to return to Spain with the greater ſafety.

GALL'EOT. See GALIOT.

GAL'LERY, *ſ.* [*galerie*, Fr. derived by Du Cange from *galeria*, low Latin, a fine room.] A kind of walk along the floor of a houſe, into which the doors of the apartments open; in general, any building of which the length much exceeds the breadth.—Nor is the ſhape of our cathedrals proper for our preaching auditories, but rather the figure of an amphitheatre, with *galleries* gradually overlooking

overlooking each other; for into this condition the pariſh churches in London are driving apace, as appears by the many *galleries* every day built in them. *Graunt.*

High lifted up were many lofty towers,
And goodly *galleries* fair overlaid. *Spenſer.*

A private *gallery* 'twixt th' apartments led,
Not to the toe yet known. *Denham.*

The ſeats in the playhouſe above the pit, in which the meaner people ſit:

While all its throats the *gallery* extends,
And all the thunder of the pit aſcends. *Pope.*

GAL'LESE, a town of Italy, in the ſtate of the church, and province of Patrimonio: twenty-five miles north of Rome.

GAL'LEY, *ſ.* [*galea*, Ital. *galere*, Fr. derived, as ſome think, from *galea*, Lat. a helmet, pictured anciently on th prow; as others from γαλεωτης, the ſword-fiſh; as others from *galleon*, expreſſing in Syriac men expoſed to the ſea. From *galley* come *galleaſs*, *galleon*, *galliot*, &c.] A veſſel driven with oars, much uſed in the Mediterranean, but found unable to endure the agitation of the main ocean:

Great Neptune grieved underneath the load,
Of ſhips, hulks, *gallies*, barks, and brigandines. *Fairfax.*

It is proverbially conſidered as a place of toilſome miſery, becauſe criminals are condemned to row in them.—The moſt voluptuous perſon, were he tied to follow his hawks and his hounds, his dice and his courtſhips, every day, would find it the greateſt torment that could befal him: he would fly to the mines and the *gallies* for his recreation, and to the ſpade and the mattock for a diverſion from the miſery of a continued uninterrupted pleaſure. *South.*

GAL'LEY-FOIST, *ſ.* The London city barge, which conveys the new lord mayor to Weſtminſter.—When the *gally foiſt* is afloat to Weſtminſter. *B. Jonſon.*

GAL'LEY-SLAVE, *ſ.* A man condemned for ſome crime to row in the gallies.—Hardened *galley ſlaves* deſpiſe manumiſſion. *Decay of Piety.*

The ſurges gently daſh againſt the ſhore,
Flocks quit the plains, and *galley-ſlaves* their oar. *Garth.*

GAL'LI, in ancient geography, a nation of Europe, naturally fierce, and inclined to war. They were very ſuperſtitious; and in their ſacrifices often immolated human victims. In ſome places, they had large ſtatues made with twigs, which they filled with men, and reduced to aſhes. They believed themſelves deſcended from Pluto; and from that circumſtance they always reckoned their time, not by the days, as other nations, but by the nights. Their obſequies were ſplendid; and not only the moſt precious things, but even ſlaves and oxen, were burnt on the funeral pile. Children, among them, never appeared in the preſence of their fathers, before they were able to bear arms in the defence of their country. *Strabo.*—The name of Galli was alſo applied to the prieſts of Cybele, from the river Gallus, in Phrygia, where they celebrated their feſtivals. They mutilated themſelves before they were admitted to the prieſthood, in imitation of Atys, the favorite of Cybele. The chief among them was called Archigallus. *Lucian.*

GAL'LI, five ſmall deſolate iſlands on the coaſt of the Principato Citra of Naples. They are ſuppoſed to be the Syrenuſæ, or iſlands once inhabited by the Sirens, which Ulyſſes is ſaid to have paſſed with ſo much caution and hazard. Great revolutions, however, have been occaſioned in their ſhape, ſize, and number, by the effects of ſubterranean fire; and ſome writers aſſert, that theſe rocks have riſen from the bottom of the ſea ſince the time of Homer. The tradition of Sirens having reſided here, is very ancient; but what they really were, diveſted of their fabulous and poetical diſguiſe, it is not eaſy to diſcover. See the article SIREN.

GALLI-HALFPENCE, an ancient coin, which, with ſuſkins and doitkins, were forbidden by the ſtatute of Hen. III. c. 5. It is ſaid they were brought into England by the Genoeſe merchants, who trading hither in galleys, lived commonly in a lane near Tower-ſtreet, and were called galley-men, landing their goods at galley-key, and traded with their own ſmall ſilver coin termed *galli-halfpence*. *Stow's Survey*, 137.

GAL'LIA, in ancient geography, a large country of Europe, called *Galatia* by the Greeks. The inhabitants were called *Galli*, *Celtæ*, *Celtiberi*, and *Celtoſcythæ*. Ancient Gaul was divided into four different parts by the Romans, called *Gallia Belgica*, *Narbonenſis*, *Aquitania*, and *Celtica*. Gallia Belgica was the largeſt province, bounded by Germany, Gallia Narbonenſis, and the German ocean; and contained the modern diſtricts of Alſace, Lorraine, Picardy, part of the low countries, and of Champagne, and of the Iſle of France. Gallia Narbonenſis, which contained the provinces afterwards called Languedoc, Provence, Dauphiné, and Savoy, was bounded by the Alps and Pyrenean mountains, by Aquitania, Belgicum, and the Mediterranean. Aquitania Gallica, which afterwards formed the provinces of Poitou, Santonge, Guienne, Berry, Limoſin, Gaſcogny, Auvergne, &c. was ſituated between the Garumna, the Pyrenean mountains, and the ocean. Gallia Celtica, or Lugdunenſis, was bounded by Belgium, afterwards Gallia Narbonenſis, the Alps, and the ocean. It contained the country afterwards known by the name of Lyonnois, Touraine, Franche Comté, Senenois, Swiſſerland, and part of Normandy. Beſides theſe grand diviſions, there is often mention made of Gallia Ciſalpina or Citerior, Tranſalpina or Ulterior, which refers to that part of Italy which was conquered by the Gauls who croſſed the Alps. By Gallia Ciſalpina, the Romans underſtood that part of Gaul which lies in Italy, and by Tranſalpina, that which lies beyond the Alps, in regard only to the ſituation of Rome. Gallia Ciſpadana, and Tranſpadana, is applied to a part of Italy conquered by the Gauls; and then it means the country on this ſide of the Po, or beyond the Po, with reſpect to Rome. By Gallia Togata, the Romans underſtood Ciſalpine Gaul, where the Roman gowns, *togæ*, were uſually worn. Gallia Narbonenſis was called *Braccata*, on account of the peculiar covering of the inhabitants for their thighs. The epithet of Comata is applied to Gallia Celtica, becauſe the people ſuffered their hair to grow to an uncommon length. The inhabitants were great warriors, and their valour overcame the Roman armies, took the city of Rome, and invaded Greece in different ages. They ſpread themſelves over the greateſt part of the world. They were very ſuperſtitious in their religious ceremonies, and revered the ſacerdotal order as if they had been gods. They long maintained a bloody war againſt the Romans, and Cæſar reſided ten years in their country before he could totally ſubdue them. See GAUL.

GALLIA'NO, a town of Italy, in the duchy of Milan: ſix miles ſouth-ſouth-eaſt of Como.

GAL'LIARD, *ſ.* [*gaillard*, Fr. ſuppoſed to be derived from the Gauliſh *ard*, genius; and *gay*.] A gay, briſk, lively, man; a fine fellow.—Selden is a *galliard* by himſelf. *Cleaveland.*—An active, nimble, ſpritely, dance. It is now in both ſenſes obſolete.—The tripla's and changing of times have an agreement with the changes of motion; as when *galliard* time and meaſure time are in the medley of one dance. *Bacon.*

There's nought in France
That can be with a nimble *galliard* won:
You cannot revel into dukedoms there. *Shakeſpeare.*

GAL'LIARDISE, *ſ.* [French.] Merriment; exuberant gaiety. *Not in uſe.*—I am no way facetious, nor diſpoſed for the mirth and *galliardiſe* of company. *Browne.*

GAL'LICAN, *ſ.* & *adj.* [*Gallicanus*, Lat.] Belonging to France or the French nation.

GAL'LICISM,

GAL'LICISM, *f.* [*gallicifme*, Fr. from *gallicus*, Lat.] A mode of ſpeech peculiar to the French language: ſuch as, he *figured* in controverſy; he *held* this conduct; he *held* the ſame language that another had *held* before: with many other expreſſions to be found in the pages of Bolingbroke.—In Engliſh I would have *Galliciſms* avoided, that we may keep to our own language, and not follow the French mode in our ſpeech. *Felton on the Claſſics.*

GAL'LICO, a town of Italy, in the kingdom of Naples, and province of Calabria Ultra; five miles north of Reggio.

GALLIE'NUS (P. Licinius), Roman emperor, ſon of Valerian, raiſed to the purple in 253, at only twenty years of age. See the article ROME.

GALLIGAS'KINS, *f.* [*Caligæ Gallo-Vaſconum. Skinner.*] Large open hoſe. Uſed in ludicrous language:

My *galligaſkins*, that have long withſtood
The winter's fury, and encroaching froſts,
By time ſubdu'd, (what will not time ſubdue?)
An horrid chaſm diſcloſe. *Philips.*

GAL'LIM, [Heb. one who heaps up.] A town of Paleſtine, ſuppoſed to be ſituated near the land of Moab. 1 *Sam.* xxv. 44. *Iſaiah* x. 30.

GALLIMA'TIA, *f.* [*galimathias*, Fr.] Nonſenſe; talk without meaning.

GALLIMAU'FRY, *f.* [*galimafrée*, Fr.] A hoch-poch, or haſh of ſeveral ſorts of broken meat; a medley. *Hanmer.*—They have made of our Engliſh tongue a *gallimaufry*, or hodgepodge of all other ſpeeches. *Spenſer.*—Any inconſiſtent or ridiculous medley.—The painter who, under pretence of diverting the eyes, would fill his picture with ſuch varieties as alter the truth of hiſtory, would make a ridiculous piece of painting, and a mere *gallimaufry* of his work. *Dryden.*—It is uſed by *Shakeſpeare* ludicrouſly of a woman:

Sir John affects thy wife.
—Why, ſir, my wife is not young.
—He wooes both high and low, both rich and poor;
He loves thy *gallimaufry*, friend. *Shakeſpeare.*

GALLI'NÆ, in ornithology, an order of birds. See ORNITHOLOGY.

GALLINA'CEOUS, *adj.* [from *gallus*, Lat. a cock.] Partaking of the nature of poultry. An appellation given to the birds of the order of the gallinæ.

GALLINA'RA, a ſmall iſland in the Mediterranean, near the coaſt of Genoa: ten miles ſouth of Finale. Lat. 44. 2. N. lon. 25. 50. E. Ferro.

GALLINA'RIA, in ancient geography, an extenſive wood near Cumæ in Italy, famous as being the retreat of robbers. *Juvenal.*

GALLINA'RIA, *f.* in botany. See CASSIA.

GALLI'NAS (Las). See BISSAGOTS.

GALLINA'ZO, *f.* in mineralogy, a vitrified lava, the ſame with the *lapis obſidianus* of the ancients. It is of a moſt beautiful jet black, capable of receiving a very high poliſh; and of this ſubſtance the native Americans and Incas of Peru made their plane, concave, and convex, mirrors.

GAL'LINULE. See FULICA.

GAL'LIO, a man's name. *Acts* xviii. 12, 17.

GALLIOP'OLIS, a poſt town of the American States, in the north-weſt territory, ſituated on a bend of the Ohio, and nearly oppoſite to the mouth of the great Kanhaway. It contains about one hundred houſes, nearly all inhabited by French people. It is one hundred and forty miles eaſtward of Columbia, three hundred ſouth-weſt of Pittſburg, and five hundred and fifty ſouth-weſt of Philadelphia. Lat. 39. 2. N. lon. 83. 9. W.

GAL'LIOT. See GALIOT.

GALLIP'OLI, a ſeaport town of European Turkey, in the province of Romania, on the ſea of Marmora, with a good harbour; the reſidence of a pacha, and the ſee of a Greek biſhop, ſuffragan of Heraclea. It was taken from the Chriſtians in 1357 by Soliman: eighty miles ſouth of Adrianople, and one hundred and eight weſt-ſouth-weſt of Conſtantinople. Lat. 40. 24. N. lon. 44. 28. E. Ferro.

GALLIP'OLI, a ſeaport town of Italy, in the kingdom of Naples, and province of Otranto, ſituated on a rock ſurrounded by the ſea, and attached to the land only by a bridge; the ſee of a biſhop, ſuffragan of Otranto. The environs are planted with olive and cotton-trees, which produce the chief articles of its commerce; but the inhabitants are not well acquainted with the method of making the beſt oil, their's being principally purchaſed for manufactures: twenty-one miles weſt of Otranto. Lat. 40. 18. N. lon. 35. 37. E. Ferro.

GAL'LIPOT, *f.* [*gleye*, Dut. ſhining earth. *Skinner.*—The true derivation is from *gala*, Spaniſh, finery. *Gala*, or gallipot, is a fine painted pot.] A pot painted and glazed, commonly uſed for medicines.—Plato ſaid his maſter Socrates was like the apothecary's *gallipots*, that had on the outſide apes, owls, and ſatyrs; but within, precious drugs. *Bacon.*

Here phials in nice diſcipline are ſet;
There *gallipots* are rang'd in alphabet. *Garth.*

GALLIVAT', *f.* a large row boat, of about ſeventy tons burden, much uſed in the ſhallows on the coaſt of Hindooſtan from Bombay to Goa; as they are frequently uſed by pirates, they are conſtructed ſo as to carry ſix or eight large cannon, beſide petteraroes; and are furniſhed with forty or fifty ſtout oars, by which means they are rowed at the rate of four miles an hour. They will carry from two to three hundred men in each, who fight and row by turns.

GAL'LIUM, in botany. See GALIUM.

GAL'LO, an iſland in the province of Popayan, South America, in N. lat. 2. 40. Captain Dampier ſays it is ſituated in a deep bay, and that off this iſland there is not above four or five fathom water; but at Segnetta, which is on the north ſide, a veſſel may ride in deep water, free from any danger. The iſland is high, provided with wood and good water, and having good ſandy bays, where a ſhip may be cleaned.—Alſo, the name of an iſland of the South Sea, near the coaſt of Peru, which was the firſt place poſſeſſed by the Spaniards, when they attempted the conqueſt of Peru.

GALLOGRÆ'CIA, a country of Aſia Minor, near Bithynia and Cappadocia. It was inhabited by a colony of Gauls, who aſſumed the name of *Gallogræci*, becauſe a number of Greeks had accompanied them in their emigration. *Strabo.*

GAL'LON, *f.* [from *gelo*, low Lat.] An Engliſh meaſure of capacity, for things both liquid and dry, containing two pottles, or four quarts, or eight pints. But thoſe pints and quarts, and conſequently the gallon itſelf, are different, according to the quality of the things meaſured: the wine gallon, for inſtance, contains two hundred and thirty-one cubic inches, and holds eight pounds five ounces and two thirds, avoirdupois, of pure water; the beer and ale gallon contains two hundred and eighty-two cubic inches, and holds ten pounds three ounces and one fifth of water; and the gallon dry meaſure, for grain, meal, &c. contains two hundred and ſixty-eight cubic inches and four fifths, and holds nine pounds eleven ounces and a half of water.

GALLO'NIUS (Anthony), a prieſt of the congregation of the oratory at Rome, who flouriſhed in the ſixteenth century, was a native of that city, and died there in 1605. He was the author of a Hiſtory of Virgins, 1591, 4to. The Lives of certain Martyrs, 1597, 4to. The Life of St. Philip Neri, founder of the congregation of the oratory, in 8vo. and, *Apologeticus Liber pro Aſſertis in Annalibus Eccleſiaſticis Baronianis de Monachatu Sancti Gregoriæ Papæ, &c.* 1604, 4to. But the moſt celebrated of his works, is a treatiſe on the different kinds of cruelties inflicted by the pagans on the martyrs of the primi-

tive church; illuſtrated by engravings of the inſtruments of torture made uſe of by them. The firſt edition was in Italian, entitled *Trattato de gli Inſtrumenti di Martirio, &c.* 1591, 4to. with copper-plates executed by the celebrated Anthony Tempeſta. This work the author tranſlated into Latin, and publiſhed at Rome in 1594, 4to. with the title, *De Sanctorum Martyrum Cruciatibus, &c.* illuſtrated with wooden prints. Afterwards it underwent different impreſſions at Paris, Antwerp, &c.

GALLOO'N, *ſ.* [*galon*, Fr.] A kind of cloſe lace made of gold or ſilver, or of ſilk alone.

To GAL'LOP, *v. n.* [*galoper*, Fr. derived by all the etymologiſts, after *Budæus*, from καλπαζειν; but perhaps it comes from *gant*, all, and *loopen*, to run, Dut. that is, to go on full ſpeed.] To move forward by leaps, ſo that all the feet are off the ground at once.—*Gallop* lively down the weſtern hill. *Donne.*

In ſuch a ſhape grim Saturn did reſtrain
His heav'nly limbs, and flow'd with ſuch a mane,
When half ſurpriz'd, and fearing to be ſeen,
The leacher *gallop'd* from his jealous queen. *Dryden.*

To ride at the pace which is performed by leaps.—He who fair and ſoftly goes ſteadily forward, in a courſe that points right, will ſooner be at his journey's end than he that runs after every one he meets, though he *gallop* all day full ſpeed. *Locke.*—To move very faſt:

The golden ſun
Gallops the zodiac in his gliſt'ring coach. *Shakeſpeare.*

GAL'LOP, *ſ.* The motion of a horſe when he runs at full ſpeed; in which, making a kind of a leap forwards, he lifts both his forelegs very near at the ſame time; and while theſe are in the air, and juſt upon the point of touching the ground, he lifts both his hind legs almoſt at once.

GALLOPA'DE, *ſ.* in the manege, the ſhort gallop.

GALLOPA'VO, *ſ.* A name for the peacock. See PAVO.

GAL'LOPER, *ſ.* A horſe that gallops.—Mules bred in cold countries are much better to ride than horſes for their walk and trot; but they are commonly rough *gallopers*, though ſome of them are very fleet. *Mortimer.*—A man that rides faſt, or makes great haſte. [In artillery,] the name of a carriage ſerving for the ſmalleſt guns, and having ſhafts ſo as to be drawn without a limber.

To GAL'LOW, *v. a.* [aȝælþan, to fright, Sax.] To terrify; to fright:

The wrathful ſkies
Gallow the very wand'rers of the dark,
And make them keep their caves. *Shakeſpeare.*

GAL'LOWAY, *ſ.* A horſe not more than fourteen hands high, much uſed in the north; probably as coming originally from Galloway, a ſhire in Scotland.

GALLOWAY, a townſhip of the American States, in Glouceſter county, New Jerſey.

GAL'LOWAY (New), a town of Scotland, in the county of Kircudbright, near the Ken: fifteen miles north of Kircudbright.

GAL'LOWAY (Upper, or Weſt), a name ſometimes given to the county of Wigton, in Scotland. See WIGTONSHIRE.

GAL'LOWAY (Mull of), a cape of Scotland, on the ſouth coaſt of the county of Wigton, at the eaſt of the entrance into Glenluce-bay. Lat. 54. 44. N. lon. 1. 43. W. Edinburgh.

GAL'LOWGLASSES, *ſ.* Foot-ſoldiers—It is worn of footmen under their ſhirts of mail, which footmen the Iriſh call *gallowglaſſes*: the which name doth diſcover them alſo to be ancient Engliſh; for *gallogla* ſignifies an Engliſh ſervitor or yeoman. And he being ſo armed in a long ſhirt of mail, down to the calf of his leg, with a long broad ax in his hand, was then *pedes gravis armaturæ*; and was inſtead of the footman that now weareth the corſlet, before the corſlet was uſed, or almoſt invented. *Spenſer.* [*Hanmer*, otherwiſe than *Spenſer.*] Soldiers among the wild Iriſh, who ſerve on horſeback:

A puiſſant and mighty pow'r
Of *gallowglaſſes* and ſtout kernes,
Is marching hitherward in proud array. *Shakeſpeare.*

GAL'LOWS, *ſ.* [It is uſed by ſome in the ſingular; but by more only in the plural, or ſometimes it has another plural, *gallowſes*. *Golgo*, Gothic; ȝealȝa, Sax. *galge*, Dut. which ſome derive from *gabalus furca*, Lat. others from גבה, Heb. high; others from *gallu*, Welſh, power: but it is probably perived, like *gallow*, to fright, from aȝælpan, Sax. the gallows being the great object of legal terror.] A beam laid over two poſts, on which malefactors are hanged.—I would that we were all of one mind, and one mind good; O, there were deſolation of gaolers and *gallowſes*. *Cymbeline.*

I propheſied if a *gallows* were on land,
This fellow could not drown. *Shakeſpeare.*

A wretch that deſerves the gallows:

Cupid hath been five thouſand years a boy.
—Ay, and a ſhrewd unhappy *gallows* too. *Shakeſpeare.*

GAL'LOWS-FREE, *adj.* Exempt by deſtiny from being hanged:

Let him be *gallows-free* by my conſent,
And nothing ſuffer, ſince he nothing meant. *Dryden.*

GAL'LOWS-MAKER, *ſ.* One that makes a gallows.—What is he that builds ſtronger than the maſon, the ſhipwright and the carpenter? The *gallows-maker*. *Shakeſp.*

GAL'LOWTREE, *ſ.* The tree of terror; the tree of execution:

He hung their conquer'd arms, for more defame,
On *gallowtrees*, in honour of his deareſt dame. *Spenſer.*

GALL'STAD, a town of Sweden, in the province of Weſt Gothland: fifty miles eaſt of Gothenburg.

GALLUC'CI (John-Paul), a learned Italian aſtronomer, fellow of the academy at Venice, who contrived an inſtrument which was found ſerviceable in obſerving the celeſtial phenomena before the invention of the teleſcope. He was the author of ſeveral aſtronomical works, and ſome on phyſic, which diſplay a conſiderable acquaintance with the ſtate of ſcience as it exiſted in his time, and a commendable ardour for its improvement; but not unmixed with the fanciful notions which then prevailed concerning the influence of the heavenly bodies, in their different poſitions, on the human frame and conſtitution. The principal of them are: 1. *Theatrum Mundi & Temporis*, 1589, folio. 2. *De Themate Erigendo, Parte Fortunæ, Diviſione Zodiaci, Dignitatibus Planetarum & Temporibus ad Medicandum accommodatis*, &c. 1584, folio. 3. *Speculum Uranicum*, 1593, folio. 4. *Cæleſtium Corporum, & Rerum ab ipſis pendentium, Explicatio*, 1605, folio. 5. *Della Fabrica del nuovo Orologio univerſale, e Uſo di nuovo Stromento per fare gli Orologi ſolari*, 1590, 4to. 6. *Della Fabrica & Uſo di diverſi Strometi di Aſtronomia & Coſmographia*, 1597, 4to.

GAL'LUS, [from γαλλος, Gr. caſtrated, becauſe this bird was dedicated to Cybele, whoſe prieſts were all eunuchs; or from *galea*, a helmet, which its comb in ſome manner repreſents.] A cock. It is alſo a term for an eunuch.

GAL'LUS (Cornelius), a Roman poet, born in the year before Chriſt 69, at Forum Julii, which may be either Frejus in Provence, or Friuli in Italy. Of his life few incidents are known. One of the moſt intereſting circumſtances in it was his intimacy with Virgil, whom he was probably the means of introducing to Mæcenas. That poet has inſcribed his tenth eclogue with the name of Gallus, whoſe deſertion by his miſtreſs Lycoris is the ſubject of the compoſition. Gallus himſelf wrote four books of elegies to the honour of this miſtreſs, which raiſed him to a high rank among the poets of this claſs, and appear

to

to have been extremely popular. Propertius, Martial, and other ancients, mention him with applauſe. His Lycoris is ſuppoſed to have been the Cytheris who captivated Mark Antony, and was carried about by him in ſuch indecent triumph. Gallus was intimately connected with Aſinius Pollio; and he was employed by Auguſtus in his war againſt Antony and Cleopatra, and ſo well approved his valour and conduct that he was afterwards appointed to the government of Egypt. But this elevation proved his ruin; for, being charged with peculation, and, as ſome aſſert, with conſpiracy, he was deprived of all his property, and condemned to exile. Unable to bear this diſgrace, he put an end to his life in his forty-third year. None of his writings have reached modern times; but Servius affirms that there are ſeveral of his lines inſerted in the eclogue of Virgil above-mentioned. Some elegies, which were publiſhed under his name in the beginning of the ſixteenth century, are undoubtedly ſuppoſititious. Beſides his pieces on Lycoris, it is known that he tranſlated into Latin verſe ſome books of the Greek poet Euphorion.

GAL'LUS (C. Vibius Trebonianus), one of the Roman emperors. See ROME.

GAL'LUS (Cæſar), ſon of Julius-Conſtantius, the brother of Conſtantine the Great, born in 326. His true name was Flavius Claudius Conſtantius, nor is it known why hiſtorians have called him Gallus. He, with his brother Julian (afterwards emperor), were the only princes of the collateral Flavian race who were ſpared in the maſſacre which took place after the death of Conſtantine. See the article ROME.

GAL'LY (Henry), a learned Engliſh divine, born at Beckenham in Kent, in 1696, and admitted a penſioner of Bene't college, Cambridge, in 1714. He took his degree of M. A. in 1721; and was in the ſame year choſen lecturer of St. Paul's, Covent-garden, London, and inſtituted to the rectory of Wavenden in Buckinghamſhire. In 1725 he was appointed chaplain to the lord-chancellor King, who preferred him to a prebend in the cathedral church of Glouceſter, in 1728. In the ſame year he was admitted to the degree of doctor of divinity at Cambridge, when George II. honoured that univerſity with his preſence. In 1730 the lord-chancellor preſented him to the rectory of Aſhton in Northamptonſhire, and not long afterwards promoted him to a prebend in the cathedral church of Norwich. Dr. Gally's next preferment was the rectory of St. Giles's in the Fields, in 1732; and in 1735 he was nominated chaplain in ordinary to his majeſty. He died in 1769. Beſides Two Sermons on the Miſery of Man, publiſhed in 1723, and A Sermon preached before the Houſe of Commons upon the Acceſſion, in 1739, he was the author of a tranſlation from the Greek of The Morals of Theophraſtus, with Notes, and a Critical Eſſay on Characteriſtic Writing, 1728, 8vo. The Reaſonableneſs of Church and College Fines aſſerted, and the Right which Churches and Colleges have in their Eſtates defended, 1731, 8vo. Conſiderations on Clandeſtine Marriages, 1750, 8vo. A Diſſertation againſt pronouncing the Greek Language according to Accents, 1754, 8vo. and A Second Diſſertation on the ſame Subject, in Anſwer to Mr. Forſter's Eſſay on the different Nature of Accent and Quantity, 1763, 8vo.

GAL'LY, *ſ.* with chemiſts, an oblong reverberatory furnace, in which a row of retorts is placed beſide each other, with their necks protruding through lateral openings.

GAL'LY, *ſ.* with printers, a frame into which the compoſitor empties the lines out of his compoſing-ſtick, and in which he ties up the page when it is completed. The gally is formed of an oblong ſquare board, with a ledge on three ſides, and a groove to admit a falſe bottom, called a *gally-ſlice*; or of braſs, without a ſlice.

GALLYHEAD', a cape on the ſouthern coaſt of Ireland, in the county of Cork: eighteen miles ſouth-ſouth-weſt of Bandonbridge. Lat. 51. 31. N. lon. 8. 54. W. Greenwich.

GALNEIKIR'CHEN, a town of Germany, in the archduchy of Auſtria: five miles north of Steyregg.

GALO'CHE, *ſ.* [French.] A man's ſhoe (without ſtraps or other faſtening) made to wear over another ſhoe.

GAL'OMBATZ, a town of Servia: twenty miles weſt-ſouth-weſt of Orſova.

GALOPI'NA, *ſ.* in botany, a genus of the claſs tetrandria, order digynia, natural order rubiaceæ. The generic characters are—Calyx: none. Corolla: monopetalous, quadrifid, ſuperior, revolute. Stamina: filaments four, capillary, long, inſerted into the receptacle, deciduous. Piſtillum: germ inferior; ſtyles two, a little ſhorter than the ſtamens, growing out; ſtigmas ſimple. Pericarpium: none: ſeeds in pairs, naked, ſubglobular, muricate.—*Eſſential Character.* Calyx none; corolla four-cleft; ſeeds two, naked.

Galopina circæoides, a ſingle ſpecies. The root is annual; ſtem herbaceous, round, red, ſmooth, ſeldom branched, erect but weak, about two feet high; branches alternate, ſpreading, reſembling the ſtem; leaves oppoſite, petioled, oblong, acute, entire, ſmooth, pale underneath, an inch or a little more in length. In the axiis of the leaves are others, ſimilar, but ſmaller; flowers terminating in a looſe diffuſed panicle; peduncles and pedicels oppoſite, capillary, ſmooth, with two oppoſite briſtle-ſhaped bractes. Native of the Cape of Good Hope. In the ſyſtematic arrangement it has its place before aphanes; from which it differs in having the filaments inſerted into the receptacle, and a ſuperior corolla. It differs from galium in having no calyx, and two ſtyles. Thunberg, who conſtituted this genus, has thought fit, in his Prodromus Plantarum Capenſium, to ſink it, and make this plant a ſpecies of anthoſpermum.

GALO'TS, the loweſt of the falls on the river St. Lawrence in Canada. Between the neck of land la Galette and les Galots is an excellent country, and no where can there exiſt finer foreſts.

GALO'TS (l'Iſle aux), an iſland in the river St. Lawrence, in Canada: three leagues beyond l'Iſle aux Chevres, in N. lat. 43. 33.

GAL'OVSKOI, a fortreſs of Ruſſian Siberia, in the government of Kolivan: eighty ſix miles ſouth-weſt of Büſk.

GALOU'WAH, or GHALVAH, a town of Africa, in the country of Nubia, ſituated on the Nile.

GAL'STA, a town of Sweden, in the province of Weſt Gothland: twenty-three miles eaſt-north-eaſt of Uddevalla.

GAL'TEES, mountains of Ireland, between the counties of Limerick, Tipperary, and Cork: twenty-five miles north of Cork.

GALTEL'LA, a town of the iſland of Sardinia: fourteen miles ſouth of Lode.

GALVA'NI (Louis), an eminent modern phyſiologiſt, born in 1737 at Bologna, where ſeveral of his relations had diſtinguiſhed themſelves in juriſprudence and theology. He early devoted himſelf to the ſtudy of medicine, under Beccari, Tacconi, Galli, and profeſſor Galeazzi, who received him into his houſe, and gave him his daughter in marriage. In 1762 he ſuſtained with reputation an inaugural theſis, *De Oſſibus*, and was then created public lecturer in the univerſity of Bologna, and appointed reader in anatomy to the inſtitute in that city. His excellent method of lecturing drew a crowd of auditors; and he employed his leiſure in experiments and in the ſtudy of comparative anatomy. He made a number of curious obſervations on the urinary organs, and on the organ of hearing in birds, which were publiſhed in the Memoirs of the Inſtitute. His reputation as an anatomiſt and phyſiologiſt was eſtabliſhed in the ſchools of Italy, when accident gave birth to the diſcovery which after him has

has been named GALVANISM. His concluſion from the whole of his experiments was, that all animals are endued with an electricity of a peculiar nature, and inherent in their economy, to which he gives the name of *animal electricity*. See the particulars of the Galvanic theory, under ELECTRICITY, vol. vi. p. 434–448. The firſt publication of Galvani on this ſubject was, *Aloyſii Galvani de Viribus Electricitatis in Motu Muſculari Commentarius*, 1791, 4to. printed for the inſtitute of Bologna. It immediately excited the notice of philoſophers both in Italy and other countries, and was followed by numerous publications, in which new experiments were related, and different opinions maintained, particularly by the celebrated M. Volta. Galvani, however, proceeded in his enquiries, and made many new experiments upon the innate electricity in the torpedo, as a ſubject intimately connected with his diſcovery. He alſo examined with minuteneſs into the different effects of the homogeneity and heterogeneity of the metals employed in forming the arch of communication by which the galvanic phenomena are excited; a circumſtance which has been ſince particularly purſued by M. Volta. A peculiar kind of inflexible attachment to political opinions had long influenced the mind of Galvani, which cauſed him ſteadily to refuſe taking the civic oath exacted by the new conſtitution of the Ciſalpine republic, and in conſequence he incurred the deprivation of his poſts and dignities. A prey to melancholy, and reduced in conſequence almoſt to indigence, he retired to the houſe of his brother James, a man of very reſpectable character, and there fell into a ſtate of debility and extenuation. The republican governors, probably aſhamed of their conduct towards ſuch a man, paſſed a decree for his reſtoration to his profeſſorial chair and its emoluments; but it was now too late. He expired on November 5, 1798, at the age of ſixty.

GAL'VANISM, *ſ.* [from *Galvani*.] The doctrine of animal electricity; for which ſee the article ELECTRICITY, vol. vi. p. 433–448.

GAL'VEAS, a town of Portugal, in the province of Alentejo: eight leagues weſt-north-weſt of Eſtremoz.

GAL'WAY, a county of Ireland, in the province of Connaught, next to Cork the moſt conſiderable in point of ſize in the kingdom, but the leaſt populous; bounded on the north by Mayo and Roſcommon; on the eaſt by Roſcommon, King's County, and Tipperary; on the ſouth by the county of Clare, and an arm of the ſea called *Galway Bay*, and on the weſt by the Atlantic ocean, about ſeventy-ſix miles from eaſt to weſt, and forty from north to ſouth, containing one hundred and ſixteen pariſhes, and twenty-eight churches. The number of houſes is twenty-eight thouſand two hundred and twelve, and about one hundred and forty-two thouſand ſouls. The ſoil is warm and fertile, with a lime-ſtone bottom. This lime-ſtone riſes ſometimes ſo near the ſurface as to render it unfit for tillage, but yielding excellent paſture. Some parts are mountainous, with quarries of black and white marble. Great quantities of kelp are made along the coaſt, and ſea-weed gathered for manure, of great advantage to the families that dwell there, who are little farmers, and hardy fiſhermen. See the article FUCUS, vol. viii. p. 89. On the ſea coaſt is a large bay, ſheltered by the three ſouthern iſlands of Arran. The ſound between theſe iſlands is a ſafe road, and a number of creeks, as well as the harbour of Galway, are deep enough to admit merchant ſhips, but are more frequented by coaſters and fiſhing boats than by veſſels in the foreign trade. There are ſeveral other well ſheltered harbours on the coaſt of Galway. The principal towns are Galway, Tuam, Ballinaſloe, and Loughrea.

GAL'WAY, a town of Ireland, and capital of the county to which it gives name, ſituated on a river, which runs from Lough Corrib into the ſea. It is ſurrounded with ancient walls, which are haſtening to decay. The houſes are generally well built, in number nine hundred and fifty, and containing about twelve thouſand inhabitants. It was formerly the moſt commercial town in Ireland, and has now a conſiderable trade. The port is very commodious and ſafe, but ſo diſtant from the city that lighters are neceſſary to carry goods into the town. Galway is governed by a mayor, recorder, and ſheriff. In the civil war of 1641, it refuſed to admit either Engliſh or Iriſh, till the rebels became maſters of the adjoining country, when they were joined by the citizens. At the cloſe of the rebellion it ſubmitted to the duke of Ormond, but, in 1651, it ſurrendered to major-general Ireton. In 1690, it declared for king James, but next year ſurrendered to general Ginkle: ninety-ſix miles weſt of Dublin. Lat. 53. 15. N. lon. 8. 58. W. Greenwich.

GAL'WAY, a townſhip of the American States, in the county of Saratoga, ſtate of New York. By the cenſus of 1796, it appears that 491 of its inhabitants were qualified to be electors.

GALWAY BA'Y, a large bay in the Atlantic, on the weſt coaſt of Ireland, ſheltered at the entrance by the South Arran iſlands, about twenty miles long, and ſeven broad.

GA'MA (Vaſco or Vaſques de), a celebrated navigator and naval commander, born of a noble family at Sines, in the Portugueſe province of Alentejo. When king Emanuel reſolved to puſh the diſcoveries already made of the ſouthern parts of Africa and the interjacent ſeas to the Eaſt Indies, de Gama's reputation for courage and prudence cauſed him to be fixed upon to conduct the enterpriſe. He ſet ſail from Liſbon with a ſquadron of three ſmall armed veſſels and a ſtore-ſhip, in July, 1497, and was four months contending with contrary winds before he reached the Cape of Good Hope. He doubled that promontory, and coaſted along the ſouth-eaſtern ſide of Africa, touching at various ports, till he reached Melinda. There he procured a mahometan pilot, who conducted him to the Malabar coaſt, and in May he arrived at Calicut. He was at firſt received in a friendly manner by the zamorin or prince; but the intrigues of the mahometan merchants at length cauſed a plot to be laid for his deſtruction, upon the diſcovery of which he ſet ſail upon his return to Europe. He entered the port of Liſbon in September, 1499, after having loſt the greater part of his crew by diſeaſe and fatigue. He was received with great favour by the king, who rewarded him liberally with pecuniary advantages, and the title of count of Videgueria. This expedition completely eſtabliſhed the practicability of a new road to the Indies; and he was employed in a ſecond voyage, in which he commanded a fleet of twenty ſhips, and bore the title of admiral of the Indian, Perſian, and Arabian, ſeas. He ſailed in February, 1502; and after compelling tribute from ſome of the petty princes in his route, he arrived at Cochin, where he received a deputation from the Chriſtians of St. Thomas, to whom he promiſed protection. The zamorin, whoſe ſuſpicions of theſe new viſitors were thoroughly awakened, fitted out a fleet to intercept the Portugueſe; but de Gama, boldly beginning the attack, boarded and took two of the largeſt ſhips, which proved to be prizes of immenſe value. After this ſucceſs, leaving a ſquadron at Cananor, he himſelf ſailed homewards, and arrived at Liſbon in September, 1503. The ſucceſs of this voyage occaſioned great triumph in Portugal, and the policy of the nation was directed towards ſecuring the eſtabliſhments it had made in the Indies, and extending them by conqueſt. After the acceſſion of John III. de Gama, though in a very advanced age, was prevailed upon, in 1524, to undertake a third voyage, with the high rank of viceroy of the Indies. He defeated the people of Calicut by ſea, and again proceeded to Cochin, where he died in 1525.

GAMA'CHES, a town of France, in the department of the Somme, and chief place of a canton, in the diſtrict of Abbeville: four leagues ſouth-weſt of Abbeville, and two and a half ſouth-eaſt of Eu.

GAMA'CHES (Philip de), a learned French divine and profeſſor, born in 1568. He received the degree of doctor from the faculty of the Sorbonne, in 1598, and was appointed profeſſor of theology in the univerſity of Paris during the following year. After having diſcharged the duties of his office for twenty-five years, with the reputation of being one of the moſt able divines of his time, he died in 1625, at fifty-ſeven years of age. He was a zealous and able ſupporter of Edmund Richer, in the oppoſition which he made to the encroachments of the papal power on the liberties of the Gallican church. His Commentaries on the *Summa Theologiæ* of Aquinas, printed at Paris in 1625, in two volumes folio, are held in much eſtimation.

GAMA'CHES (Stephen-Simon), a French eccleſiaſtic, born at Meulan about the year 1672. He became one of the canons of the holy croſs *de la Bretonniere*, and acquired ſuch reputation by his proficiency in ſcience and literature, that he was choſen an early member of the French academy of ſciences. He died in 1756, in the eighty-fourth year of his age. He was the author of Phyſical Aſtronomy, &c. 1740, in two volumes 4to. Literary and Philoſophical Diſſertations, 1755, 8vo. the Syſtem of a Chriſtian Philoſopher, 1721, 8vo. the Syſtem of the Heart, 1708, 12mo. publiſhed under the aſſumed name of Clarigny; and the Elegancies of Language reduced to their Principles, 1757, 12mo. This work has obtained conſiderable reputation, and has been denominated, "a dictionary of fine thoughts." It is recommended as worthy of the peruſal of every perſon who wiſhes to write well.

GAMA'LIEL, [of גמול a reward, and אל Heb. God, i. e. God's reward.] A Jewiſh rabbi, tutor to St. Paul.

GAMA'ZE, a town of Egypt: twelve miles north of Atfieh.

GAM'BACH, a town of Germany, in the circle of the Upper Rhine, and principality of Solms Braunfels: two miles weſt of Munzenberg.

GAMBAI'S, a town of France, in the department of the Seine and Oiſe: one league eaſt of Houdan.

GAMBA'LA, or GAMBOULO, a town of Italy, in the Milaneſe: two miles from Vigevano.

GAMBALOO'K, *ſ.* A riding gown worn in the eaſtern parts.

GAMBA'RA, a town of Italy, in the Breſſan: eighteen miles ſouth of Breſcia.

GAMBA'RA (Lorenzo), a Latin poet, born at Breſcia in 1496. He acquired conſiderable reputation, and is mentioned with honour by Manutius, Lipſius, Gyraldus, and others. His works, of which ſeveral editions have been given, conſiſt of ſmaller and larger pieces. Of the latter the moſt known is his Columbus, written at the inſtigation of cardinal Granvelle. It is a poem in four cantos, the ſubject of which is the diſcovery of America by Columbus. Others of his pieces are deſcriptive, as his Venetiæ, and Caprarola. He died at the age of ninety, in 1586.

GAMBA'RA (Veronica), an Italian lady of poetical fame, daughter of count Gianfranceſco Gambara, born at Breſcia in 1485. She received a liberal education, and was particularly aided in her literary purſuits by cardinal Bembo, who formed her taſte, and directed her in the rules of Italian verſe. In 1509 ſhe married Giberto the lord of Corregio, with whom ſhe lived nine years. After his death ſhe devoted herſelf to the education of her two ſons, and to the compoſition of thoſe works which have perpetuated her memory. When her brother Uberto was made governor of Bologna in 1528, ſhe fixed her reſidence in that city; and at the time of the coronation of the emperor Charles V. her houſe was the reſort of a number of the moſt diſtinguiſhed geniuſes in Europe who followed his court. She afterwards returned to Corregio, where ſhe died in 1550. Her poems were firſt publiſhed in various collections; but a complete edition of them, with her letters, was printed at Breſcia in 1759. They certainly rank with the moſt elegant and poliſhed productions of the time.

GAMBA'RE, a village, near Venice, with a parochial church, ſituated nearly four miles and a half from it, to the pariſh of which the whole diſtrict belongs. It has a fine market-place ſituated on the Brenta, and is ſurrounded with elegant country-ſeats. A chapel ſtands now on the ruins of the formerly celebrated abbey of Benedictine monks, called St. Ellero or Ilario, which was deſtroyed in the thirteenth century by Ezzelin.

GAMBA'RO, a town of Italy, in the duchy of Piacenza: twenty-four miles ſouth of Piacenza.

GAMBAS'CA, a town of Piedmont, in the marquiſate of Saluzzo, on a ſmall river which runs into the Po: ſix miles weſt of Saluzzo.

GAMBE'RIA, or GAM'BRIA, *ſ.* A military boot or defence for the legs.

GAM'BEYSON, *ſ.* [*gambezonum*, Lat.] A horſeman's coat uſed anciently in war, which covered the legs: or rather a quilted coat, *cento*, *veſtimentum ex coactili lana confectum*, to put under the armour, to make it ſit eaſy. *Fleta*, lib. i. c. 24.

GAM'BIA, a country of Africa, which takes its name from the river which paſſes through it; ceded to the Engliſh by the peace of 1783.

GAM'BIA, GAMBRA, or GAMBA, a celebrated river of Africa, which takes its riſe from a vaſt chain of mountains, in N. lat. 11° (which were obſerved by Mr. Park to paſs acroſs that continent,) and empties itſelf into the ſouth Atlantic ocean; being navigable for ſloops and ſmall craft, for more than two hundred leagues up the country. The earlieſt European eſtabliſhment known to have been formed on this celebrated river, was a factory of the Portugueſe; and to this muſt be aſcribed the introduction of the numerous words of that language which are now in uſe among the Foulahs and Mandingoes, who chiefly inhabit the towns and villages on its banks. The Dutch, French, and Engliſh, afterwards ſucceſſively poſſeſſed themſelves of ſettlements on the coaſt; though the trade of the Gambia became, and continued for many years, a ſort of monoply in the hands of the Engliſh. In the travels of Francis Moore, is preſerved an account of the Royal African company's eſtabliſhments on this river, as early as 1730, at which time James's factory alone conſiſted of a governor, deputy governor, and two other principal officers; eight factors, thirteen writers, twenty inferior attendants and tradeſmen; a company of ſoldiers, and thirty-two negro ſervants, beſides ſloops, ſhallops, and boats, with their crews; and there were no leſs than eight ſubordinate factories in other parts of the river. But its trade with Europe, by being afterwards laid open, was almoſt annihilated; inſomuch that the ſhare which the ſubjects of England at this time hold in it, ſupports not more than two or three annual ſhips; and the groſs value of Britiſh exports is ſaid to be under twenty thouſand pounds. The French and Danes ſtill maintain a ſmall ſhare, and the Americans have lately ſent ſome veſſels to the Gambia by way of experiment. The commodities exported to the Gambia from Europe conſiſt chiefly of fire-arms and ammunition, iron-ware, ſpirituous liquors, tobacco, cotton caps, a ſmall quantity of broad cloth, and a few articles of the manufacture of Mancheſter; a ſmall aſſortment of India goods, with ſome glaſs beads, amber, and other trifles: for which has been uſually taken in exchange ſlaves, gold-duſt, ivory, bees-wax, and hides. Slaves for a long time conſtituted the chief article of traffic on the Gambia, for which reaſon the Moors and Arabs call it *Neel Abeed*, the River of Slaves, but the aboriginal negroes call it *Neel Kibbeer*, the Great River.

Mr. Park croſſed in his way ſix different ſtreams that fall into the Gambia from the north-eaſt. Among theſe the principal one is the Nerico, which flows from the quarter of Bondou; and is reckoned the eaſtern boundary of a tract which the Africans of this region ſtyle the Country of the Weſt, expreſſed by that of the ſetting ſun. This tract is on a lower level than that to the eaſt; is flat, and the ſoil compoſed of clay and ſand. The Gambia has a

ſmall impediment to its navigation at Baraconda, in the country of Woolli; but although this is uſually termed a fall, Mr. Park was informed that it did not impede the paſſage of canoes: ſo that it ought more properly to be termed a *rapide*, according to the American phraſe; that is to ſay, a ſlope, down which the water runs with more ordinary rapidity, but which does not, however, totally impede the paſſage of canoes, or ſmall boats. The Gambia abounds with numerous varieties of fiſh, ſome of which are excellent food. At the entrance from the ſea, ſharks are found in great abundance; and, higher up, alligators and the hippopotamus or river horſe are very numerous.

GAM'BLER, *ſ.* [A cant word for *game* or *gameſter*.] He whoſe practice it is to invite the unwary to game, in order to cheat them.

GAMBO'GE, *ſ.* A concrete vegetable juice, the produce of an Eaſt-Indian tree, called by the natives *caracapulli*, the *cambogia gutta* of Linnæus; and is partly of a gummy and partly of a reſinous nature. It is brought to us either in form of orbicular maſſes, or of cylindrical rolls of various ſizes; and is of a denſe, compact, and firm, texture, and of a beautiful yellow. For many years it was uſed in medicine as a draſtic purge; but being found to injure the ſtomach, it has been abandoned in modern practice. It gives a beautiful and durable citron yellow ſtain to marble, whether rubbed in ſubſtance on the hot ſtone, or applied as dragon's blood; or in form of a ſpirituous tincture. When it is applied on cold marble, the ſtone muſt afterwards be heated to make the colour penetrate. It is now chiefly uſed as a pigment.—See the article CAMBOGIA, vol. iii. 640.

To GAM'BOL, *v. n.* [*gambiler*, Fr.] To dance; to ſkip; to friſk; to jump for joy; to play merry frolics:

The king of elfs, and little fairy queen,
Gambol'd on heaths, and danc'd on ev'ry green. *Dryden.*

To leap; to ſtart:

'Tis not madneſs
That I have utter'd; bring me to the teſt,
And I the matter will record, which madneſs
Would *gambol* from. *Shakeſpeare.*

GAM'BOL, *ſ.* A ſkip; a hop; a leap for joy:

Bacchus through the conquer'd Indies rode,
And beaſts in *gambols* friſk'd before their honeſt god.
Dryden.

A frolic; a wild prank:

For who did ever play his *gambols*,
With ſuch unſufferable rambles? *Hudibras.*

GAM'BOLD (John), a pious Engliſh divine among the Moravian brethren, or ſect known by the name of *Unitas Fratrum*. He was born near Haverfordweſt in Pembrokeſhire, and became a member of Chriſt-church college, in the univerſity of Oxford. Of that inſtitution he was made one of the chaplains, and took his degree of M. A. in 1734. About the year 1739, he was preſented by Dr. Secker, then biſhop of Oxford, to the vicarage of Stanton Harcourt, in Oxfordſhire. When Peter Boehler, a diſciple of count Zinzendorf, viſited Oxford in 1738, and held frequent conferences with John and Charles Weſley, who were then laying the foundations of what was afterwards called *methodiſm*, Mr. Gambold interpreted his diſcourſes, which were delivered in the Latin language in certain meetings of learned and unlearned perſons, who aſſumed to themſelves the title of *awakened people*. From this time his mind appears to have been influenced by an inclination towards the tenets of the Moravian ſchool; and in 1742 he became ſo thoroughly a convert and enthuſiaſt, that, without giving any notice to his dioceſan and patron, he deſerted his flock, and joined himſelf to the new ſect, which, by an act of the legiſlature in 1749, was permitted to erect its eſtabliſhments in this country. For many years he was the regular miniſter of the congregation ſettled in London, and preached at the chapel of the brethren in Fetter-lane. In 1754 he was conſecrated a biſhop at an Engliſh provincial ſynod held at Lindſay-houſe, Chelſea, and was greatly eſteemed for his piety and learning by ſeveral Engliſh biſhops, who were his contemporaries in the univerſity of Oxford. In 1768 he retired to his native country, where he died, at Haverfordweſt, in 1771. As he was a good ſcholar, the celebrated Mr. Bowyer frequently employed him in correcting the preſs; in which capacity he ſuperintended the beautiful and very accurate edition of Lord Chancellor Bacon's works in 1765; and in 1767 he was profeſſedly the editor of David Crantz's Hiſtory of Greenland, containing a deſcription of the country and its inhabitants, and particularly of the miſſion carried on for above thirty years by the *Unitas Fratrum*, &c. in two volumes 8vo. He was alſo the author of the following pieces: a neat edition of the Greek Teſtament, but without his name, *Textu per omnia Milliano, cum Diviſione Pericoparum & Interpunctura A. Bengelii*, 1742, in two volumes 12mo. A ſhort Summary of Chriſtian Doctrine in the way of Queſtion and Anſwer, &c. intended to ſhew the conſiſtency of his connection with, and miniſtry in, the church of the brethren, with a ſteady attachment to the church of England; Maxims and Theological Ideas, collected out of the ſeveral Diſſertations and Diſcourſes of count Zinzendorf, from 1738 till 1747; Sixteen Diſcourſes on the ſecond article of the Creed, preached at Berlin, by the Ordinary of the Brethren, 1752, 12mo. Twenty-one Diſcourſes, or Diſſertations upon the Augſburg Confeſſion, tranſlated from the high Dutch, 1753; The Martyrdom of Ignatius, a Tragedy, publiſhed after his death by the Rev. Benjamin La Trobe, in 1773, with the Life of Ignatius, &c. with ſome ſingle Sermons, and other devotional pieces.

GAM'BON, a river of France, which runs into the Seine, near Andely.

GAM'BREL, *ſ.* [from *gamba*, *gambarella*, Ital.] The leg of a horſe.—What can be more admirable than for the principles of the fibres of a tendon to be ſo mixed as to make it a ſoft body, and yet to have the ſtrength of iron? as appears by the weight which the tendon, lying on a horſe's *gambrel*, doth then command, when he rears up with a man upon his back. *Grew.*

GAM'BRIA, *ſ.* [In old writings.] A kind of military boot.

GAMBRO'N, or GOMBRON, or GOMRON, a ſeaport town of Perſia, in the province of Lariſtan, called alſo *Beuder Abbas*, famous throughout many ages, as the port of Schiras, and of all the ſouth of Perſia. Its trade was formerly very extenſive; but at preſent it is very trifling, nor is there a ſingle European factory in the city. This decline has been occaſioned by the domeſtic diſturbances in Perſia, and the wars and diſputes between the French and the Engliſh. The Dutch, for a while, continued to carry on a conſiderable trade here; but ſince they formed a ſettlement in the iſland of Karek, they have entirely deſerted Gambron. Lat. 27. 20. N. lon. 57. E. Greenwich.

GAMBROVIS'SA, a town of Venetian Iſtria: nine miles eaſt of Capo d'Iſtria.

GAME, *ſ.* [*gaman*, a jeſt, Iſlandic.] Sport of any kind.—We have had paſtimes here, and pleaſing *game*. *Shakeſp.*—Jeſt; oppoſed to earneſt or ſerioufneſs:

Then on her head they ſet a garland green,
And crowned her 'twixt earneſt and 'twixt *game*. *Spenſer.*

Inſolent merriment; ſportive inſult:

Do they not ſeek occaſion of new quarrels,
On my refuſal, to diſtreſs me more;
Or make a *game* of my calamities? *Milton.*

A ſingle match at play. Advantage in play:

Mutual vouchers for our fame we ſtand,
And play the *game* into each other's hand. *Dryden.*

Scheme

Scheme purſued; meaſures planned.—This ſeems to be the preſent *game* of that crown, and that they will begin no other 'till they ſee an end of this. *Temple.*—Solemn conteſts, exhibited as ſpectacles to the people.—The *games* are done, and Cæſar is returning. *Shakeſpeare.*

Milo, when ent'ring the Olympic *game*,
With a huge ox upon his ſhoulders came. *Denham.*

To GAME, *v. n.* [gaman, Sax.] To play at any ſport. To play wantonly and extravagantly for money.

The invention of *games*, for the double purpoſe of recreation and of health, and of thus giving vigour both to body and mind, ranks among the moſt ancient, as well as moſt laudable, of the innocent exerciſes and amuſements of mankind. The firſt games would be naturally of the athletic kind, and of the moſt inoffenſive and harmleſs nature; but as ſuperior ſkill in the ſports and paſtimes thus early adopted, would quickly beget jealouſy and envy between competitors, the trial of ſtrength, by wreſtling and boxing, would in conſequence follow, and muſt have exiſted at a very early period of the world. Hence Mr. Bryant, in his Analyſis of Ancient Mythology, mentions Cercyon of Megara, Hercules, and Pollux, as famous wreſtlers, verſed in all the exerciſes and feats of the athletæ, from whoſe cuſtoms were derived the Iſthmian, Nemean, Pythic, Olympic, and Delian, games, which were ſolemniſed by the ancient Greeks with infinite pomp and magnificence. In theſe games were exhibited running, leaping, wreſtling, boxing, and throwing the quoit, which all together were termed πενταθλον. Beſides theſe, there were horſe and chariot races; and contentions alſo in oratory, poetry, and muſic: for particulars of which, ſee under each of the above-mentioned titles in this work.

From theſe feſtivals of the Greeks, the Romans unqueſtionably derived their ſecular games, and all the exerciſes performed by the Roman youth in the Campus Martius. Theſe conſiſted, like thoſe of the Greeks, in throwing the diſcus or quoit, hurling the javelin, wreſtling, boxing, riding a fiery horſe, driving a military car, &c. After their inſtitution by Auguſtus, they were celebrated by Claudius, Domitian, and Severus; and were ſolemniſed a fifth time, A. D. 248, on the completion of the full period of a thouſand years from the foundation of Rome. The ſecular games, like the ſacred Olympics, were calculated to inſpire the ſuperſtitious mind with deep and ſolemn reverence. The myſtic ſacrifices were performed during three ſucceſſive nights on the banks of the Tiber; and the Campus Martius reſounded with muſic and dances, and was illuminated with innumerable lamps and torches.

But as the Romans advanced in military fame and univerſal conqueſt, ſo their games and paſtimes partook more of a warlike and ferocious character, until they were diſgraced by the brutal and ſavage combats of the Arena. Here wild beaſts of the moſt untamable kind were exhibited in ſolemn ſhows, and encountered by convicts and ſlaves, whoſe life or liberty was decreed as the reward of their victory; and here the gladiators were expoſed to public view, and engaged in thoſe cruel and inhuman conflicts, which were decreed on purpoſe for them to deſtroy each other; while ſand or ſaw-duſt was ſtrewed under foot, as the word *arena* imports, in order to conceal the effuſion of human gore, which would otherwiſe have offended the eyes and ſhocked the feelings of the deluded ſpectators. See the article GLADIATOR, in this volume.

Though the firſt Chriſtian emperors of Rome, at the commencement of the fifth century, had ſucceeded in aboliſhing the inhuman combats of gladiators, yet the idle multitude ſtill depended for their amuſements on the frequent exhibition of public games and ſpectacles; and theſe were now celebrated in the circus and amphitheatre with redoubled magnificence and ſplendour. The taſte was turned from the unnatural and cruel extirpation of fellow men in cold blood by rules of tactical ſcience, to the taming of wild beaſts, horſe and chariot races, and the various modes of theatrical repreſentation; and ſo faſcinated were the Roman people with theſe ſplendid ſhows, that they conſidered the circus as their ſacred temple, and the only ſeat of pleaſure and delight. The impatient crowd ruſhed at the dawn of day to ſecure their places; and there were many who paſſed a ſleepleſs and anxious night in the porticoes of the building. From the morning to the evening, careleſs of the ſun or of the rain, theſe giddy votaries of pleaſure, who ſometimes amounted to the number of four hundred thouſand, would remain with ſtedfaſt attention, their eyes rivetted on the horſes and charioteers, and their minds agitated between hope and fear, as if the fate of Rome had depended on the event of a ſingle race. Theſe games were exhibited at the expence of the republic, or of the emperors. The race in its firſt inſtitution, was a ſimple conteſt of two chariots, whoſe drivers were diſtinguiſhed by white and red liveries; but two additional colours, a light green, and a cærulean blue, were afterwards introduced; and as the races were repeated twenty-five times, one hundred chariots contributed in the ſame day to the pompous amuſements of the circus. Theſe colours ſoon became the foundation of four different parties or factions, whoſe fortunes and beſt intereſts were laviſhed upon theſe games, and in ſupporting and abetting the colour which they had eſpouſed. So prevalent and ſo ſumptuous did theſe equeſtrian ſports become, that Conſtantinople at length endeavoured to emulate the pageantry of Rome, and the colours and factions of the hippodrome became as violent and tumultuous as thoſe which agitated the circus. Other great cities caught in time the flame and folly of ſumptuous races and ſplendid ſhows; and theſe, as it is ſuppoſed, gave life, and ſpring, and action, to the juſts and tournaments of more modern times; as did the pantomimical exhibitions of the amphitheatre, the baiting of wild beaſts, and the muſic and the military dances which accompanied them, give birth to the various amuſements at country wakes and revels, which were afterwards inſtituted and ſupported by the nobility and gentry in almoſt every part of Europe.

The games and paſtimes which early diſtinguiſhed the character and manners of the Engliſh people, have recently appeared under the title of ÐLIÐ-ÐAMENA ÆNÐEL-ÐEOÐ, by the ingenious Mr. Strutt; a work which highly merits the regard of the curious reader. When the Romans invaded Britain, they found her inhabitants bold, active, and warlike, and engaged in thoſe games or amuſements which beſt accorded with their nature, ſuch as running, leaping, wreſtling, ſwimming, &c. Perhaps the ſkill which the natives of Devonſhire and Cornwall retain to the preſent day in hurling and wreſtling, may properly be conſidered as an early veſtige of the games which manifeſted Britiſh ſtrength and activity. Under the Saxon heptarchy, when the times were extremely turbulent, we might naturally expect that ſuch exerciſes as enured the body to fatigue, and biaſſed the mind to military purſuits, ſhould have conſtituted the chief part of a young nobleman's education: accordingly, we find that leaping, wreſtling, caſting of darts, and other paſtimes which required great exertions of bodily ſtrength, were taught them in their adoleſcence. Theſe amuſements engroſſed the whole of their attention, every one ſtriving to excel his fellow; for, hardineſs, ſtrength, and valour, out-balanced, in the public eſtimation, the accompliſhments of the mind; and therefore literature, which flouriſhes beſt in tranquillity and retirement, was conſidered as a purſuit unworthy the notice of a ſoldier, and only requiſite in the gloomy receſſes of the cloiſter. But here, poſſibly, might be traced the early propenſity to the more vicious ſedentary games of the Anglo-Saxons, and eſpecially with the dice; which they appear to have derived from their anceſtors; for, Tacitus aſſures us that the ancient Germans would not only hazard all their wealth, but even ſtake their liberty, upon the turn of the dice; "and he who loſes, (ſays the author,) ſubmits to ſervitude, though younger and ſtronger than his antagoniſt, and patiently permits himſelf to be bound, and ſold

in the market; and this madneſs they dignify by the name of *honour*." Cheſs was alſo a favourite game with the Saxons; as was likewiſe backgammon. It appears that amongſt them a large portion of the night was appropriated to the purſuit of theſe unprofitable amuſements. In the reign of Canute, this practice was ſanctioned by the example of royalty, and followed by the nobility: the clergy, however, were prohibited from playing at games of chance, by the eccleſiaſtical canons eſtabliſhed in the reign of Edgar.

Among the paſtimes introduced by the Norman nobility, none engaged the general attention ſo much as the tournaments and the juſts. Theſe amuſements, in the middle ages, which may be denominated the ages of chivalry, were in high repute among the nobility of Europe, and produced in reality much of the pomp and gallantry that we find recorded with poetical exaggeration in the legends of knight-errantry. We are not, however, to conceive, that martial exerciſes were confined entirely to the education of young noblemen: the ſons of citizens and yeomen had alſo their games and ſports reſembling military combats. Thoſe practiſed at an early period by the young Londoners ſeem to have been derived from the Romans: they conſiſted of various attacks and evolutions performed on horſeback, the youth being armed with ſhields and pointleſs lances, and was denominated *ludus Trojæ*, or Troy game. Theſe amuſements, according to Fitz Stephen, were appropriated to the ſeaſon of Lent; but at other times they exerciſed themſelves in archery, fighting with clubs and bucklers, and running at the quintain; and in winter, when the froſt ſet in, they aſſembled on the ice, and run againſt each other with poles, in imitation of lances, in a juſt; and frequently one or both were beaten down, "not always without hurt; for, ſome break their arms, and ſome their legs; but youth, (ſays this author,) emulous of glory, ſeeks theſe exerciſes preparatory againſt the time that war ſhall demand their preſence." Henry VIII. not only countenanced the practice of military paſtimes by permitting them to be exerciſed without reſtraint, but alſo endeavoured to make them faſhionable by his own example. Hall aſſures us, that, even after his acceſſion to the throne, he continued daily to amuſe himſelf in archery, caſting of the bar, wreſtling, or dancing, and frequently in tilting, tournaying, fighting at the barriers with ſwords and battle-axes, and ſuch like martial recreations, in moſt of which there were few that could excel him. The purſuits and amuſements of a nobleman are, however, placed in a different view by an author of the ſucceeding century; who, deſcribing the perſon and manners of Charles lord Mountjoy, regent of Ireland, ſays, "He delighted in ſtudy, in gardens, in riding on a pad to take the aire, in playing at ſhovelboard, at cardes, and in reading of play-books for recreation, and eſpecially in fiſhing and fiſh-ponds, ſeldome uſeing any other exerciſes, and uſeing theſe rightly as paſtimes, only for a ſhort and convenient time, and with great variety of change from one to the other." Thus, by degrees, the diſcontinuation of bodily exerciſes afforded a proportionable quantity of leiſure time for the cultivation of the mind; ſo that the manners of the people were ſoftened by degrees, and learning, which had been ſo long neglected, became faſhionable, and was eſteemed an indiſpenſable mark of a polite education. Many of the paſtimes that had been countenanced by the nobility, and ſanctioned by their example, in the middle ages, grew into diſrepute in more modern times, and were condemned as vulgar and unbecoming the notice of a gentleman. "Throwing the hammer and wreſtling, (ſays an author of the ſeventeenth century,) I hold them exerciſes not ſo well beſeeming nobility, but rather the ſoldiers in the camp and the prince's guard."

Burton, in his Anatomy of Melancholy, gives us a general view of the ſports moſt prevalent in the ſeventeenth century. "Cards and dice (ſays he) are rocks upon which men loſe themſelves, when they are imprudently handled, and beyond their fortunes. Ringing, bowling, ſhooting, playing with keel-pins, tronks, quoits, pitching of bars, hurling, wreſtling, leaping, running, fencing, muſtering, ſwimming, playing with waſters, foils, football, balowns, running at the quintain, and the like, are common recreations of country folks; riding of great horſes, running at rings, tilts and tournaments, horſe-races, and wild gooſe chaſes, which are diſports of greater men, and good in themſelves, though many gentlemen by ſuch means gallop quite out of their fortunes." Speaking of the Londoners, he ſays, "They take pleaſure to ſee ſome pageant or fight go by, as at a coronation, wedding, and ſuch like ſolemn niceties; to ſee an ambaſſador or a prince received and entertained with maſks, ſhows, and fireworks. The country hath alſo his recreations, as may-games, feaſts, fairs, and wakes." The following paſtimes he conſiders as common both in town and country, namely, "bull-baitings and bear-baitings, in which our countrymen and citizens greatly delight, and frequently uſe, dancers on ropes, jugglers, comedies, tragedies, artillery gardens, and cock-fighting." He then goes on: "Ordinary recreations we have in winter, as cards, tables, dice, ſhovelboard, cheſs-play the philoſopher's game, ſmall trunks, ſhuttlecock, billiards, muſic, maſks, ſinging, dancing, ule-games, frolics, jeſts, riddles, catches, croſs purpoſes, queſtions and commands, merry tales of errant knights, queens, lovers, lords, ladies, giants, dwarfs, thieves, cheaters, witches, fairies, goblins, and friars." To this catalogue he adds: "Dancing, ſinging, maſking, mumming, and ſtage-plays, are reaſonable recreations, if in ſeaſon; as are may-games, wakes, and whitſonales, if not at unſeaſonable hours, are juſtly permitted. Let them, (that is, the common people,) freely feaſt, ſing, dance, have puppet-plays, hobby-horſes, tabers, crowds, (fiddles,) and bagpipes;" let them "play at ball and barley-brakes;" and afterwards, "plays, maſks, jeſters, gladiators, tumblers, and jugglers, are to be winked at, leſt the people ſhould do worſe than attend them." In addition to the may-games, morris-dancings, pageants, and proceſſions, which were commonly exhibited throughout the kingdom in all great towns and cities, the Londoners had peculiar and extenſive privileges: they had large portions of ground allotted to them in the vicinity of the city for the practice of ſuch paſtimes as were not prohibited by the government, and for thoſe eſpecially that were beſt calculated to render them ſtrong and healthy. In the holidays during the ſummer ſeaſon, the young men of London exerciſed themſelves in the fields with "leaping, ſhooting with the bow, wreſtling, caſting the ſtone, playing with the ball, and fighting with their ſhields." The laſt ſpecies of paſtime is the ſame that Stow calls "*practiſing with their waſters and bucklers*;" which in his day was exerciſed by the apprentices before the doors of their maſters. The city damſels had alſo their recreations on the celebration of theſe feſtivals, according to the teſtimony of both the authors above-mentioned. The firſt tells us that they played upon citherns, and danced to the muſic; and, as this amuſement did not take place before the cloſe of the day, they were occaſionally permitted to continue it by moonlight. We learn from the other, who wrote at the diſtance of more than four centuries ago, that it was then cuſtomary for the maidens, after evening prayers, to dance in the preſence of their maſters and miſtreſſes, while one of their companions played the meaſure upon a timbrel; and, in order to ſtimulate them to purſue this exerciſe with alacrity, the beſt dancers were rewarded with garlands, the prizes being expoſed to public during the whole of the performance.

A general view of the games and paſtimes practiſed by the Londoners ſoon after the commencement of the ſeventeenth century, occurs in Strype's edition of Stow's Survey. The modern ſports of the citizens, ſays the editor, beſides drinking, are cock-fighting, bowling upon greens, playing at tables, or backgammon, cards, dice, and billiards

liards; alſo muſical entertainments, dancing, maſks, balls, ſtage-plays, and club-meetings, in the evening. The lower claſſes divert themſelves at foot-ball, wreſtling, cudgels, ninepins, ſhovelboard, cricket, ſtowball, ringing of bells, quoits, pitching the bar, bull and bear baitings, throwing at cocks, and, what is worſt of all, lying at alehouſes. To theſe are added, by an author of later date, ſailing, rowing, ſwimming and fiſhing, in the river Thames, horſe and foot races, leaping, archery, bowling in allies, and ſkittles, tennis, cheſs, and draughts. The paſtimes here enumerated were by no means confined to the city of London, or its environs: the larger part of them were in general practice throughout the kingdom.

The courts of princes, and the caſtles of noblemen, formerly vied with each other in ſumptuous games and entertainments; eſpecially on days of public feſtivity, when, in every one of the apartments opened for the reception of the gueſts, were exhibited variety of entertainments, which accorded to the taſte of the times, but in which propriety had very little ſhare; the whole forming a ſcene of pompous confuſion, where feaſting, drinking, muſic, dancing, tumbling, ſinging, and buffoonery, were often exhibited at the expence of common decency. If we turn to the third book of Fame, written by Chaucer, we ſhall find a curious picture of theſe tumultuous court entertainments, drawn from reality, and perhaps without any great exaggeration. It may be thus expreſſed in modern language: Minſtrels of every kind were ſtationed in the receptacles for the gueſts; among them were jeſters, that related tales of mirth and of ſorrow; excellent players upon the harp, with others of inferior merit ſeated on various ſeats below them, who mimicked their performances like apes to excite laughter; behind them, at a great diſtance, was a prodigious number of other minſtrels, making a great ſound with cornets, ſhaulms, flutes, horns, pipes of various kinds, and ſome of them made with green corn, ſuch as are uſed by ſhepherds' boys; there were alſo Dutch pipers to aſſiſt thoſe who choſe to dance either love-dances, ſprings, or rayes, or any other new-deviſed meaſures. Apart from theſe were ſtationed the trumpeters and players on the clarion; and other ſeats were occupied by different muſicians playing variety of mirthful tunes. There were alſo preſent large companies of jugglers, magicians, and tregetors, who exhibited ſurpriſing tricks by the aſſiſtance of natural magic.

The pageantry of courts and caſtles was ſoon emulated in all great towns and cities, on occaſions of rejoicing, or of ſolemnity. In London, where they were moſt frequently required, a conſiderable number of different artificers were kept, at the city's expence, to furniſh the machinery for the pageants, and to decorate them. The elegance diſplayed at juſts and tournaments was imitated in theſe temporary exhibitions, by men riding in armour, and ſome adorned with ribbons, flags, banners, and other reſemblances of ſplendour. The fronts of the houſes in the ſtreets were covered with rich adornments of tapeſtry, arras, and cloth of gold; the chief magiſtrates and opulent citizens appeared on horſeback in ſumptuous habits, and joined the cavalcade; while the ringing of bells, the ſound of muſic from various quarters, and the ſhouts of the populace, nearly ſtunned the ears of the ſpectators. At certain diſtances, in places appointed for the purpoſe, pageants were erected, which were temporary buildings repreſenting caſtles, palaces, gardens, rocks, or foreſts, as occaſion required, where nymphs, fawns, ſatyrs, gods, and goddeſſes, appeared in company with giants, ſavages, dragons, ſaints, knights, buffoons, and dwarfs, ſurrounded by minſtrels and choriſters; the heathen mythology, the legends of chivalry, and chriſtian divinity, were abſurdly jumbled together, and the exhibitions uſually concluded with pedantic harangues, replete with the groſſeſt adulation. Some faint traces of the proceſſional parts of theſe exhibitions were retained at London about thirty years ago, in the lord-mayor's ſhow; but the pageants and orations have been long diſcontinued, and the ſhow itſelf is now ſo much contracted, that it is in reality altogether unworthy of ſuch an appellation.

The people of this country, in all ages, delighted in ſecular muſic, ſongs, and theatrical performances; which is abundantly evident from the great rewards they gave to the bards, the ſcalds, the gleemen, and the minſtrels, who were ſucceſſively the favourites of the opulent, and the idols of the vulgar. The continual encouragement given to theſe profeſſors of muſic, poetry, and pantomime, in proceſs of time, ſwelled their numbers beyond all reaſonable proportion, inflamed their pride, increaſed their avarice, and corrupted their manners; ſo that at length they loſt the favour they had ſo long enjoyed among the higher claſſes of ſociety; and, the donations of the populace not being ſufficient for their ſupport, they fell away from affluence to poverty, and wandered about the country in a contemptible condition, dependent upon the caſual rewards they might occaſionally pick up at church-ales, wakes, and fairs. Hence the origin of ſtrolling players, rope-dancers, ſhowmen, &c.

Hentzner, who wrote at the concluſion of the ſixteenth century, ſays, "the Engliſh excell in dancing and muſic, for they are active and lively." He alſo adds, "they are vaſtly fond of great noiſes that fill the ear, ſuch as the firing of cannon, beating of drums, and the ringing of bells, ſo that it is common for a number of them to get up into ſome belfry and ring the bells for hours together for the ſake of exerciſe." Polydore Virgil, lib. v. cap. 2, mentions another remarkable ſingularity belonging to the Engliſh, who celebrated the feſtival of Chriſtmas with plays, maſques, and magnificent ſpectacles, together with games at dice and dancing, which, he tells us, *was not cuſtomary with other nations*; and with reſpect to the Chriſtmas prince, or lord of the miſrule, he was, as the ſame author informs us, a perſonage almoſt peculiar to this country.

It were well if theſe ſingularities were the only vulnerable parts of the national character of our anceſtors; but it muſt be confeſſed that there are other paſtimes which equally attracted their attention, and manifeſted a great degree of barbariſm, which will admit of no defence. A modern author, reprobating the inhumanity of throwing at cocks, makes theſe pertinent obſervations: "Some French writers have repreſented this diverſion of the common people much to our diſadvantage, and imputed it to a natural fierceneſs and cruelty of temper, as they do ſome other entertainments peculiar to our nation; I mean thoſe elegant diverſions of bull-baiting, and prize-fighting, with the like ingenious recreations of the bear-garden. I wiſh I knew how to anſwer this reproach which is caſt upon us, and excuſe the death of ſo many innocent cocks, bulls, dogs, and bears, as have been ſet together by the ears, or died an untimely death, only to make us ſport." The ladies of the preſent day will probably be ſurpriſed to hear, that all, or the greater part, of theſe barbarous recreations, were much frequented by the fair ſex, and countenanced by thoſe among them of the higheſt rank and moſt finiſhed education, being brought by degrees, no doubt, to ſacrifice their feelings to the prevalency of a vicious and vulgar faſhion, which even the ſanction of royalty, joined with that of ancient cuſtom, cannot reconcile with decency or propriety."

The celebration of the *May-games* in England, on account of their ſimplicity and antiquity, are not unworthy of notice in this place. "On the calands or firſt of May, (ſays Bourne,) commonly called *May-day*, the juvenile part of both ſexes were wont to riſe a little after midnight, and walk to ſome neighbouring wood, accompanied with muſic and blowing of horns, where they break down branches from the trees and adorn them with noſegays and crowns of flowers; when this is done, they return with their booty homewards about the riſing of the ſun, and make their doors and windows to triumph with their flowery ſpoils; and the after-part of the day is chiefly ſpent in

dancing round a tall poll, which is called a *may-poll*; and being placed in a convenient part of the village, ſtands there, as it were, conſecrated to the goddeſs of flowers, without the leaſt violation being offered to it in the whole circle of the year." This cuſtom, no doubt, is a relic of one more ancient, practiſed by the heathens, who obſerved the laſt four days in April, and the firſt of May, in honour of the goddeſs Flora. To this we may add the following extract from Stow. "In the month of May the citizens of London of all eſtates, generally in every pariſh, and in ſome inſtances two or three pariſhes joining together, had their ſeveral mayings, and did fetch their may-poles with divers warlike ſhews; with good archers, morrice-dancers, and other devices for paſtime, all day long; and towards evening they had ſtage-plays and bonfires in the ſtreets. Theſe great mayings and may-games were made by the governors and maſters of the city, together with the triumphant ſetting up of the great ſhaft or principal may-pole in Cornhill before the pariſh church of Saint Andrew;" thence called *St. Andrew Under-ſhaft*. No doubt the May-games are of longer ſtanding, though the time of their inſtitution cannot be traced. Mention is made of the may-pole at Cornhill, in a poem called the *Chaunce of the Dice*, attributed to Chaucer. Stow has paſſed over unnoticed the manner in which the may-poles were uſually decorated; but this deficiency is ſupplied by a contemporary writer, who ſaw theſe paſtimes in a different point of view; he writes thus: "Againſt Maie-day, every pariſh, towne, or village, aſſemble themſelves, both men, women, and children; and either all together, or dividing themſelves into companies, they goe ſome to the woods and groves, ſome to the hills and mountaines, ſome to one place, ſome to another, where they ſpend all the night in pleaſant paſtimes, and in the morning they return bringing with them birch boughes and branches of trees to deck their aſſemblies withal. But their chiefeſt jewel they bring from thence is the maie-pole, which they bring home with great veneration, as thus; they have twentie or fourtie yoake of oxen, every oxe having a ſweete noſegaie of flowers tied up to the tip of his hornes, and theſe oxen drawe home the may-poale, which they covered all over with flowers and hearbes, bound round with ſtrings from the top to the bottome, and ſometimes it was painted with variable colours, having two or three hundred men, women, and children, following it with great devotion. And thus equipped it was reared with handkerchiefes and flagges ſtreaming on the top, they ſtrawe the ground round about it, they bind green boughs about it, they ſet up ſummer halles, bowers, and arbours, hard by it, and then fall they to banquetting and feaſting, to leaping and dauncing about it, as the heathen people did at the dedication of their idols. I have heard it credeblie reported, by men of great gravity, credite, and reputation, that of fourtie, threeſcore, or an hundred, maides going to the wood, there have ſcarcely the third part of them returned home againe as they went!" *P. Stubbs's Anatomie of Abuſes*, 1595.

It ſeems to have been the conſtant cuſtom, at the celebration of the may-games, to elect a lord and lady of the may, who probably preſided over the ſports. "On the thirtieth of May, in the fourth year of queen Mary, A. D. 1557, (ſays Strype,) was a goodly may-game in Fenchurch-ſtreet, with drums, and guns, and pikes; and with the nine worthies, who rode, and each of them made his ſpeech, there was alſo a morrice dance, and an elephant and caſtle, and the lord and lady of the may appearing to make up the ſhow." We alſo read that the lord of the may, and no doubt his lady alſo, was decorated with ſcarfs, ribbands, and other fineries. Hence a citizen, in the old comedy called *the Knight of the Burning Peſtle*, addreſſing himſelf to the other actors, ſays, "Let Ralph come out on may-day in the morning, and ſpeak upon a conduit, with all his ſcarfs about him, and his feathers, and his rings, and his knacks, as lord of the may." His requeſt is complied with, and Ralph appears upon the ſtage in the aſſumed character, where he makes his ſpeech, beginning in this manner: "With gilded ſtaff and croſſed ſcarf the may-lord here I ſtand."

At the commencement of the ſixteenth century, or perhaps ſtill earlier, the ancient ſtories of Robin Hood and his merry companions ſeem to have been new-modelled, and divided into ſeparate ballads, which much increaſed their popularity; for this reaſon it was cuſtomary to perſonify this famous outlaw, with ſeveral of his moſt noted aſſociates, and add them to the pageantry of the may-games. He preſided as lord of the may, and a female, or rather, perhaps, a man habited like a female, called the *Maid Marian*, his faithful miſtreſs, was the lady of the may. His companions were alſo equipped in appropriate dreſſes, and diſtinguiſhed by the title of *Robin Hood's Men*. Biſhop Latimer, in a ſermon which he preached before Edward VI. relates the following anecdote, which proves the great popularity of theſe pageants: "Coming (ſays he) to a certain town on a holiday to preach, I found the church door faſt locked. I taryed there half an houre and more, and at laſt the key was found, and one of the pariſh comes to me and ſayes, Syr, this is a buſy day with us, we cannot hear you; it is *Robin Hoode's day*; the pariſh are gone abroad to gather for Robin Hood; I pray you let [hinder] them not. I was fayne, therefore, to give place to Robin Hood. I thought my rochet would have been regarded; but it would not ſerve, it was faine to give place to *Robin Hoode's men*."

It has been obſerved, that the May-games were not confined to the firſt day of the month, neither were they always concluded in one day; on the contrary, there is an ancient manuſcript, written apparently in the reign of Henry VII. wherein a number of gentlemen, profeſſing themſelves to be the ſervants of the lady May, promiſe to be in the royal park at Greenwich, day after day, from two o'clock in the afternoon till five, in order to perform the various ſports and exerciſes ſpecified in the agreement, that is to ſay,—On the fourteenth of May they engage to meet at a place appointed by the king, armed with the *harneis* thereunto accuſtomed, to kepe the fielde, and to run with every commer eight courſes. Four additional courſes were to be granted to any one who deſired it, if the time would permit, or the queen was pleaſed to give them leave.—On the fifteenth the archers took the field to ſhoot at the ſtandard with flight arrows.—On the ſixteenth they held a tournament with ſwords rebated to ſtrike with every commer eight ſtrokes, according to the accuſtomed uſage.—On the eighteenth, (for Sunday intervened,) they were to be ready to "wreſtle with all commers all manner of ways," according to their pleaſure.—On the nineteenth they were to enter the field, to fight on foot at the barriers, with ſpears in their hands and ſwords rebated by their ſides, and with ſpear and ſword to defend their barriers.—On the twentieth they were to give additional proof of their ſtrength by caſting "the barre on foote, and with the arme, bothe heavit and hight."—On the twenty-firſt they recommenced the exerciſes, which were to be continued daily, Sundays excepted, through the remaining part of May, and a fortnight in the month of June.

Henry VIII. when young, delighted much in pageantry, and the early part of his reign abounded with gaudy ſhows; moſt of them were his own deviſing, and others contrived for his amuſement; among the latter we may reckon a May-game at Shooter's-hill, which was exhibited by the officers of his guards: they in a body amounting to two hundred, all of them clothed in green, and headed by their captain, who perſonated Robin Hood, met the king one morning as he was riding to take the air, accompanied by the queen and a large ſuite of the nobility of both ſexes. The fictitious foreſters firſt amuſed them with a double diſcharge of their arrows; and then, their chief approaching the king, invited him to ſee the manner

manner in which he and his companions lived. The king complied with the requeſt, and the archers, blowing their horns, conducted him and his train into the wood under the hill, where an arbour was made with green boughs, having a hall, a great chamber, and an inner chamber, and the whole was covered with flowers and ſweet herbs. When the company had entered the arbour, Robin Hood excuſed the want of more abundant refreſhment, ſaying to the king, "Sir, we outlaws uſually breakfaſt upon veniſon, and have no other food to offer you." The king and queen then ſat down, and were ſerved with veniſon and wine; and, after the entertainment, with which it ſeems they were well pleaſed, they departed, and on their return were met by two ladies riding in a rich open chariot, drawn by five horſes. Both of theſe ladies were ſplendidly apparelled, one of them perſonifying lady May, and the other lady Flora; "who," we are told, "ſaluted the king with divers goodly ſongs, and ſo brought him to Greenwich."—We may, however, juſt obſerve, that the May-games had attracted the notice of the nobility long before the time of Henry; and, agreeable to the cuſtom of the times, no doubt, was the following curious paſſage in the old romance called the Death of Arthur: "Now it befell in the moneth of luſty May, that queene Guenever called unto her the knyghtes of the round table, and gave them warning that, early in the morning, ſhe ſhould ride *on maying* into the woods and fields beſide Weſtminſter." The knights were all of them to be clothed in green, to be well horſed, and every one of them to have a lady behind him, followed by an eſquire and two yeomen, &c.

"It is at this time" (that is, in May), ſays the author of one of the papers in the Spectator, "we ſee the briſk young wenches, in the country pariſhes, dancing round the maypole. It is likewiſe on the firſt day of this month that we ſee the ruddy *milkmaid* exerting herſelf in a moſt ſprightly manner under a pyramid of ſilver tankards, and, like the virgin Tarpeia, oppreſſed by the coſtly ornaments which her benefactors lay upon her." Theſe decorations of ſilver cups, tankards, and ſalvers, were borrowed for the purpoſe, and hung round the milkpails, with the addition of flowers and ribands, which the maidens carried upon their heads when they went to the houſes of their cuſtomers, and danced in order to obtain a ſmall gratuity from each of them. Of late years the plate, with the other decorations, were placed in a pyramidical form, and carried by two chairmen upon a wooden horſe. The maidens walked before it, and performed the dance without any incumbrance. In other places, inſtead of theſe weighty ornaments, they ſubſtituted a cow. The animal had her horns gilt, and was nearly covered with ribands of various colours, formed into bows and roſes, and interſperſed with green oaken leaves and bunches of flowers.

The *chimney-ſweepers* of London, it muſt alſo be remembered, have fingled out the firſt of May for their feſtival; at which time they parade the ſtreets in companies, diſguiſed in various manners. Their dreſſes are uſually decorated with gilt paper, and other mock fineries; they have their ſhovels and bruſhes in their hands, which they rattle one upon the other; and to this rough muſic they jump about in imitation of dancing. Some of the larger companies have a fiddler with them, and a jack in the green, as well as a lord and lady of the may, who follow the minſtrel with great ſtatelineſs, and dance as occaſion requires.

On the vigil of Saint John the Baptiſt, commonly called *Midſummer Eve*, it was uſual in moſt country places, and alſo in towns and cities, for the inhabitants, both old and young, and of both ſexes, to meet together, and make merry by the ſide of a large fire made in the middle of the ſtreet, or in ſome open and convenient place, over which the young men frequently leaped by way of frolic, and alſo exerciſed themſelves with various ſports and paſtimes, more eſpecially with running, wreſtling, and dancing. Theſe diverſions they continued till midnight, and ſometimes till cock-crowing. At London, in addition to the bonfires, "on the eve of this ſaint, as well as upon that of Saint Peter and Saint Paul, every man's door was ſhaded with green birch, long fennel, Saint John's wort, orpin, white lilies, and the like, ornamented with garlands of beautiful flowers. They (the citizens) had alſo lamps of glaſs with oil burning in them all night; and ſome of them hung out branches of iron, curiouſly wrought, containing hundreds of lamps lighted at once, which made a very ſplendid appearance." This information we receive from Stow, who tells us that, in his time, New Fiſh-ſtreet and Thames-ſtreet were peculiarly brilliant upon theſe occaſions.

The reaſons aſſigned for making bonfires upon the vigil of Saint John in particular are various, for many writers have attempted the inveſtigation of their origin; but unfortunately all their arguments, owing to the want of proper information, are merely hypothetical, and of courſe cannot be much depended upon. Thoſe who ſuppoſe theſe fires to be a relique of ſome ancient heatheniſh ſuperſtition engrafted upon the variegated ſtock of ceremonies belonging to the Romiſh church, are not, perhaps, far diſtant from the truth.

The Anglo-Saxons, and the Danes, as we have obſerved already, were much addicted to ſedentary games; and the ſame deſtructive propenſity was equally prevalent among the Normans. The evil conſequences ariſing from the indulgence of this pernicious pleaſure have in all ages called loudly for reprehenſion, and demanded at laſt the ſerious interference of the legiſlature. The vice of gambling, however, is by no means peculiar to the people of England; its influence is univerſally diffuſed among mankind; and in moſt nations the ſame ſtrong meaſures that have been adopted here, are found neceſſary to prevent its extenſion beyond the limits of reaſon and propriety. Dice, and thoſe games of chance dependent upon them, have been moſt generally decried; and cards, in later times, are added to them as proper companions. Cards, when compared with dice, are indeed of modern invention, and originally, we doubt not, productive only of innocent amuſement: they were, however, ſoon converted into inſtruments of gambling equally dangerous as the dice themſelves, and more enticing from the variety of changements they admit of, and the pleaſing mixture of chance with ſkill, which often gives the learner an advantage over the more experienced player. Towards the cloſe of the twelfth century, we meet with a very curious edict relative to gaming, which ſhews how generally it prevailed even among the lower claſſes at that period. This edict was eſtabliſhed for the regulation of the Chriſtian army under the command of Richard I. of England, and Philip of France, during the cruſade: it prohibits any perſon in the army beneath the degree of a knight from playing at any ſort of game for money; knights and clergymen might play for money, but no one of them was permitted to loſe more than twenty ſhillings in one whole day and night, under the penalty of one hundred ſhillings, to be paid to the archbiſhops in the army; the two monarchs had the privilege of playing for what they pleaſed; but their attendants were reſtricted to the ſum of twenty ſhillings, and, if they exceeded, they were to be whipped naked through the army for three days. The decrees eſtabliſhed by the council held at Worceſter, in the twenty-fourth year of Henry III. prohibited the clergy from playing at dice, or at cheſs: but neither the one nor the other of theſe games are mentioned in the ſucceeding penal ſtatutes, before the twelfth year of Richard II. when diceing is particulariſed, and expreſsly forbidden; though perhaps they were both of them included under the general title of "games of chance, and diſhoneſt games," mentioned in the proclamation of Edward III.

In the eleventh year of Henry VII. cards are firſt mentioned among the games prohibited by law; and at that time they ſeem to have been very generally uſed; for, the edict expreſsly forbids the practice of card-playing to apprentices,

prentices, excepting the duration of the Chriſtmas holidays, and then only in their maſters houſes. We learn from Stow, that theſe holidays extended "from All-Hollows evening to the day after Candlemas-day, when, (ſays the hiſtorian,) there was, among other ſports, playing at cards for counters, nailes, and points, in every houſe, more for paſtime than for gain." The recreations prohibited by proclamation in the reign of Edward III. excluſive of the games of chance, are thus ſpecified: throwing of ſtones, wood, or iron, playing at hand-ball, foot-ball, club-ball, and *cambucam*, which is ſuppoſed to have been a ſpecies of goff, and probably received its name from the crooked bat with which it was played. Theſe games were not forbidden from any particular evil tendency in themſelves, but becauſe they engroſſed too much of the leiſure and attention of the populace, and diverted their minds from the purſuits of a more martial nature. We ſhould add, that "bull-baiting and cock-fighting" are included with "other diſhoneſt games, as trivial and uſeleſs." In the reign of Edward IV. we find quoits, cloſh or claiſh, kayles or nine-pins, half-bowl, hand-in and hand-out, with quick-borde, claſſed among the unlawful amuſements; which liſt was conſiderably augmented in the ſucceeding reigns, and eſpecially in the eighteenth year of Henry VIII. when bowling, loggating, playing at tennis, dice, cards and tables, or back-gammon, were included.

In modern times, the penal laws have been multiplied, and much invigorated, in order to reſtrain the licentious ſpirit of gambling; and in ſome meaſure they have had a ſalutary effect; but the evil is ſo faſcinating and ſo general, that in all probability it will never be totally eradicated from the minds of the people. The frequent repetition and enforcement of the ſtatutes in former times, proves that they were then, as they are now, inadequate to the ſuppreſſion of gaming for a long continuance; and, when one paſtime was prohibited, another was preſently invented to ſupply its place, and perhaps of an equally deſtructive tendency. The general decay of thoſe manly and ſpirited exerciſes, which formerly were practiſed in the vicinity of the metropolis, has not ariſen from any want of inclination in the people, but from the want of places proper for the purpoſe: ſuch as in times paſt had been allotted to them are now covered with buildings, or ſhut up by encloſures, ſo that, if it were not for ſkittles, dutch-pins, four-corners, and the like paſtimes, they would have no amuſements for the exerciſe of the body; and theſe amuſements are only to be met with in places belonging to common drinking-houſes, for which reaſon their play is ſeldom productive of much benefit, but more frequently becomes the prelude to idleneſs and debauchery. This evil has been increaſing for a long ſeries of years; and honeſt Stow laments the retrenchments of the grounds appropriated for martial paſtimes which had begun to take place in his day: "Why (ſays he) ſhould I ſpeak of the ancient exerciſes of the long bow, by the citizens of this city, now almoſt clean left off and forſaken? I over-paſs it; for, by the means of cloſeing in of common grounds, our archers, for want of room to ſhoot abroad, creep into bowling-alleys and ordinarie dicing-houſes near home, where they have room enough to hazard their money at unlawful games." He then exclaims, "Oh, what a wonderful change has taken place! our wreaſtling at armes is turned to wallowing in ladies' laps, our courage to cowardice, our running to royot, our bowes into bowls, and our darts into diſhes."

The evils complained of in former times, were then only in their infancy: they have in the preſent day attained to a gigantic ſtature; and we may add to them E. O. tables, alſo other tables for gambling, diſtinguiſhed by the appellation of *noir et rouge*; pharo-banks, and many more faſhionable novelties, are equally as detrimental to morality, and as deſtructive to the fortunes of thoſe who purſue them, as any of the games of former ages. Even horſe-racing, which anciently was conſidered as a liberal ſport, and proper for the amuſement of a gentleman, as well as to encourage that uſeful and noble breed of animals, has been of late years degraded into a dangerous ſpecies of gambling, by no means the leſs deſerving of cenſure, becauſe it is faſhionable, and countenanced by perſons of the higheſt rank and fortune.—See all theſe games and tables explained under their reſpective titles in this Encyclopædia.

The laws now in force for prohibiting unlawful games, and for puniſhing gamblers, are as follows: By ſtatute 33 Hen. VIII. c. 9. juſtices of peace, and head officers in corporations, are impowered to enter houſes ſuſpected of unlawful games; and to arreſt and impriſon the gameſters, till they give ſecurity not to play for the future: alſo the perſons keeping unlawful gaming-houſes, may be committed by a juſtice, until they find ſureties not to keep ſuch houſes; who ſhall forfeit forty ſhillings, and the gameſters ſix ſhillings and eight-pence a time: and if the king licenſe the keeping of gaming-houſes, it is againſt law, and void.—The ſame ſtatute alſo provides that, no artificer, apprentice, labourer, or ſervant, ſhall play at any tables, tennis, dice, cards, bowls, &c. out of Chriſtmas time, on pain of twenty ſhillings for every offence; and at Chriſtmas, they are to play in their maſter's houſe, or preſence: but any nobleman, or gentleman, having one hundred pounds per annum eſtate, may licenſe his ſervants or family to play within the precincts of his houſe, or garden, at cards, dice, tables, or other games, as well among themſelves, as others repairing thither. This act is to be proclaimed once a quarter, in every market-town, by the reſpective mayors, &c. and at every aſſizes and ſeſſions.—A perſon was convicted of keeping a cock-pit; and the court reſolved it to be an unlawful game, within the ſtatute 33 Hen. VIII. c. 9. and fined him forty ſhillings a day. *Keb.* 510. But if the gueſts in an inn or tavern, call for a pair of dice, or tables, and for their recreation play with them, or if any neighbours play at bowls, for their recreation, or the like, theſe are not within the ſtatute; if the houſe be not kept for gaming, nor the gaming be for lucre or gain. *Dalt. c.* 46.

By the ſtatute 16 Car. II. c. 7. if any perſon, of what degree ſoever, ſhall by fraud, deceit, or unlawful device, in playing at cards, dice, tables, bowls, cock-fighting, horſe-races, foot-races, or other games or paſtimes, or bearing a ſhare in the ſtakes, betting, &c. win any money or valuable thing, he ſhall forfeit treble the value, one moiety to the crown, and the other to the party grieved, proſecution being in *ſix months*; in default whereof, the laſt mentioned moiety is to go to ſuch other perſon as will proſecute within one year, &c. And by the ſaid ſtatute, if any perſon ſhall play at cards, &c. other than for ready money; or bet, and ſhall loſe above one hundred pounds at one time or meeting, upon tick (i. e. ticket), he ſhall not be bound to make it good, but the contract or tick and ſecurity ſhall be void, and the winner ſhall forfeit treble the value.

By the ſtatute 9 Ann. cap. 14. all notes, bills, bonds, judgments, mortgages, or other ſecurities, given for money won by playing at cards, dice, tables, tennis, bowls, or other games; or by betting on the ſides of ſuch as play at any of thoſe games, or for repayment of any money knowingly lent for ſuch gaming or betting, ſhall be void. And where lands are granted by ſuch mortgages or ſecurities, they ſhall go to the next perſon who ought to have the ſame, as if the grantor were actually dead, and the grants had been made to the perſon ſo intitled after the death of the perſon ſo incumbering the ſame. If any perſon playing at cards, dice, or other game, or betting, ſhall loſe the value of ten pounds at one time, to one or more perſons, and ſhall pay the money, he may recover the money loſt by action of debt, within *three months* afterwards; and if the loſer do not ſue, any other perſon may do it, and recover the ſame, and treble the value with coſts, one moiety to the proſecutor, and the other to the poor: and the perſon proſecuted ſhall anſwer upon oath,

on

on preferring a bill to diſcover what ſums he hath won. —Perſons by fraud or ill practice, in playing at cards, dice, or by bearing a ſhare in the ſtakes, &c. or by betting, winning any ſum above ten pounds, ſhall forfeit five times the value of the thing won, and ſuffer ſuch infamy and corporal puniſhment, as in caſes of wilful perjury, being convicted thereof on indictment or information; and the penalty ſhall be recovered by action, by ſuch perſon as will ſue for the ſame. And if any one ſhall aſſault and beat, or challenge to fight, any other perſon, on account of money won by gaming, upon conviction thereof, he ſhall forfeit all his goods and ſuffer impriſonment for two years. Alſo by this ſtatute, any two or more juſtices of peace may cauſe ſuch perſons to be brought before them as they ſuſpect to have no viſible eſtates, &c. to maintain them; and if they do not make it appear that the principal part of their expences is got by other means than *gaming*, the juſtices ſhall require ſecurities for their good behaviour for twelve months; and in default of ſuch ſecurity, commit them to priſon until they find it: and playing or betting during the time, to the value of twenty ſhillings, ſhall be deemed a breach of good behaviour, and a forfeiture of their recognizances.

Where it ſhall be proved before any juſtice of peace, that any perſon hath uſed unlawful games contrary to ſtatute 33 Hen. VIII. c. 9. the juſtice may commit ſuch offender to priſon, till he enter into a recognizance that he ſhall not from thenceforth, at any time to come, play at any unlawful game. *Stat.* 2 *Geo.* II. *c.* 28.—For better preventing exceſſive and deceitful gaming; the ace of hearts, faro, faron, baſſet, or hazard, are declared to be lotteries by cards or dice; and perſons ſetting up theſe games are liable to the penalty of two hundred pounds. And every perſon who ſhall be an adventurer, or play or ſtake therein, forfeits fifty pounds. Likewiſe the ſale of any houſe, plate, &c. in the way of lottery by cards, &c. is adjudged void, and the things to be forfeited to any perſon that will ſue for the ſame. 12 *Geo.* II. *c.* 28.—The game of paſſage, and all other games with one or more dice, or any thing in that nature, having figures or numbers thereon, back-gammon and games now played with thoſe tables only excepted, ſhall be deemed games or lotteries by dice, within the ſtatute 12 Geo. II. c. 28: and ſuch as keep any office or table for the ſaid game, &c. or play thereat, are ſubject to the penalties in that act. *Stat.* 13 *Geo.* II. *c.* 19.—Playing at, or keeping any houſe or place for playing at, the game of roulet, otherwiſe roly-poly, or any other game with cards or dice already prohibited, incurs the penalties in ſtat. 12 Geo. II. cap. 28. Perſons loſing ten pounds, and paying the ſame, may ſue the winner, and recover the money with coſts: and on a bill in equity the court may decree the ſame to be paid. The perſons who have juriſdiction to determine informations on the ſtatutes againſt gaming, may ſummon witneſſes, who, on refuſing to appear and give evidence, ſhall forfeit fifty pounds. No privilege of parliament ſhall be allowed on proſecutions for keeping a gaming-houſe. Perſons loſing or winning ten pounds at one time, or twenty pounds in twenty-four hours, may be indicted and fined five times the value, to be paid to the poor. 18 *Geo.* II. *c.* 34.

By ſtatute 30 Geo. I. c. 24. If any perſon licenſed to ſell liquors ſhall knowingly ſuffer any *gaming* in their houſe or grounds, with cards, dice, draughts, ſhuffle boards, miſſiſſippi, or billiard-tables, ſkittles, or ninepins, by any journeymen, labourers, ſervants, or apprentices, he ſhall forfeit forty ſhillings for the firſt, and ten pounds for every ſubſequent offence; three-fourths to the poor, and one-fourth to the informer.—Any journeyman, &c. ſo gaming, ſhall forfeit from twenty ſhillings to five ſhillings.—No *certiorari* to be granted; but appeal given to the next ſeſſions; and perſons puniſhed by this act, not to be puniſhed by any other law. See the ſtatute 25 Geo. II. c. 36. againſt unlicenſed houſes for muſic, dancing, &c. the keeper of which, ſhall forfeit 100l.

From the above ſtatutes and the ſeveral determinations in the books, it may be obſerved, that at common law, the playing at cards, dice, &c. when practiſed innocently, and as a recreation, was not unlawful. 2 *Vent.* 175. But common *gaming-houſes* were always conſidered as nuiſances in the eye of the law. 1 *Hawk.* P. C. c. 75. and as the practice was found to encourage idleneſs and debauchery, the ſtat. 33 Hen. VIII. c. 9. was paſſed to reſtrain it among the inferior ſort of people. And on this ſtatute Noy had a writ to remove bowling-allies as common nuiſances. 3 *Keb.* 465. Gentlemen were however ſtill left free to purſue their pleaſure in this way, until the ſtatute 16 Car. II. c. 7. the preamble of which ſtates the inconveniences to be remedied as ariſing from the immoderate uſe of gaming. The proviſions of this ſtatute however were ſoon found to be inſufficient; and the ſtatute 9 Ann. c. 14. was made for the more effectually ſuppreſſing this pernicious vice. The ſubſequent ſtatutes, already enumerated above, ſuperadded further penalties to reſtrain this faſhionable crime: which may ſhew, ſays Blackſtone, that our laws againſt *gaming* are not ſo deficient, as our magiſtrates in putting thoſe laws in execution. 4 *Comm.* 173.

Betting on horſe-races is within the general words of the ſtatute 9 Ann. c. 14. 2 *Stra.* 1159: *Black. Rep.* 706. So is cricket. 1 *Wilſ.* part 1. p. 220. So is a foot-race: and a footman running againſt time is a foot-race: but to bring it within the ſtatute, it muſt appear that a perſon was engaged in ſuch game, and a wager was laid on his ſide. 2 *Wilſ.* 36.—But on a wager between two perſons on the lives of their two fathers, the winner has been allowed to maintain an action. *Burr.* 2802.—Where two perſons played at all-fours for two guineas a game, from Monday evening to Tueſday evening, without any interruption, except for an hour or two at dinner, the plaintiff loſt fourteen guineas, for which he brought his action on ſtatute 9 Ann. c. 14. and this was held to be one ſitting. —One time in the act means one ſtake or bet; and is diſtinguiſhed from one ſitting, which means a courſe of play where the company never parts, though the party may not be actually gaming the whole time. 2 *Black. Rep.* 1226.

On a conviction for gaming under ſtatute 9 Ann. c. 14. the judgment is only that the defendant is convicted: and the court cannot ſet a fine of five times the value, but a new action muſt be brought upon that judgment for the forfeiture. 2 *Stra.* 1048. But the ſtatutes againſt gaming have rendered it now leſs frequently neceſſary to reſort to courts of equity, which appear to have often interpoſed, prior to the ſtatute 16 Car. II. for the purpoſe of reſtraining the winner from proceeding at law againſt the loſer upon the ſecurity which he had obtained for the money won. See 14 *Vin. Ab.* 8. *pl.* 1. 3. *Chan. Rep.* 47.

It is obſervable that the ſtatute 16 Car. II. declares that the contract for money loſt at play, and all ſecurities given for it ſhall be utterly void; but the ſtatute 9 Ann. confines itſelf to the ſecurities for money won or lent at play. Upon which it has been determined, that though both the ſecurity and the contract are void as to money won at play, only the ſecurity is void as to money lent at play: and that the contract remains, and the lender may maintain his action for it. 2 *Burr.* 1077. 2 *Stra.* 1249.—The ſtatutes having declared the ſecurity void, a bill of exchange given for money won at play cannot be recovered upon, even by an indorſee for valuable conſideration, and without notice; the original vice of the conſideration affecting the ſecurity, even in the hands of an innocent and *bonâ fide* holder. 2 *Stra.* 1155. *Dougl.* 636. And it ſeems that if money be paid on ſuch ſecurity, it may be recovered back: for payment under a void ſecurity cannot be ſupported: nor does the limitation of three months, within which time the loſer of money actually paid at the time it is loſt muſt bring his action to recover it back, extend to payments on account of ſuch void ſecurities. *Ambl.* 269. —For further information relative to the laws for the puniſhment of *gaming*, ſee the articles LOTTERY, NUISANCE, and WAGER.

GAME, *ſ.* [*Aucupia*, Lat. from *auceps*, *aucupis*, i. e. *avium captio.*] Birds, or prey, got by fowling and hunting. From the commencement of time, the taking of *veniſon*, or *game*, formed one of the moſt favourite purſuits of man. In the early ſtate of things, this muſt naturally have been the caſe in every country upon the ſurface of the globe, becauſe it was one of the moſt obvious and ready means of procuring food. In all thoſe remote and uncultivated regions where the inhabitants yet remain in a ſtate of nature, we find this practice is ſtill in full force; and that every wild animal is conſidered as the abſolute property of the individual who can take it, let his ſituation in rank or life be what it may. We might even look up to the books of the ſacred ſcriptures,—to the command of Jacob to his ſon Eſau,—for this primeval right of individuals to take and ſeize *game* wherever they can find it at large, allowing game to conſiſt of, what it certainly does, both in the ancient and modern acceptation, all beaſts, *feræ naturæ*, "that are fit for food,"—for ſuch "*are given to man, and ſhall be food for him.*"—*Geneſis.*

Upon this principle of reaſoning, the early judicature of this country with reſpect to game, appears to have been founded. Tame animals, which fly not the dominion of man, but are domeſticated and reared in his fields or incloſures, are not *feræ naturæ*, but his own proper goods and chattels, which no man can take or drive away, without committing felony. Wild animals, on the contrary, which by flight or ſwiftneſs of foot, avoid the dominion of man, and lurk and hide in uncultivated waſtes and foreſts, are thoſe over which, by the common law of the land, no individual could claim an excluſive right, until he had firſt taken, ſeized, or reclaimed them, and had them in his poſſeſſion. For as property in a thing means the power which a man hath over it for his own uſe, and the ability he hath of applying it to the ſuſtentation of his exiſtence; ſo when that power ceaſeth, his property in it ceaſeth alſo; and hence if an animal of this kind, after ſeizure, eſcapes again into the wild common of nature, and aſſerts its freedom or liberty by its ſwiftneſs and ſubtilty, it remains no longer his, any more than a wild creature in the deſert; becauſe he has it not within his power, nor at his diſpoſal.

When Cæſar invaded Britain, he obſerved the hardy natives were fond of the chace, and found that *veniſon* conſtituted a great portion of their food. Yet he aſſerts, *Bel. Gal.* lib. 6, that "the Britons did not eat the fleſh of hares, notwithſtanding the iſland abounded with them." This, he adds, proceeded from a principle of religion, which, as among the Jews, prohibited the uſe of that animal as food. The Saxons and Danes, who afterwards ſubjugated the country, were alike prone to the purſuits of game, "*with ſharp-ſcented dogs and coſtly hawks*;" yet it no where appears that even the commoneſt among the people were then reſtrained from killing the game in wilds and foreſts, and converting it to their own uſe as food. It ſeems to have been reſerved for king Canute, about the year 1025, to be the firſt *general preſerver* of the game in England: he impoſed ſeveral reſtrictions, not only upon the common people, but upon the nobles likewiſe, forbidding them to hunt or kill the game, except upon their own eſtates; and he inflicted various fines and puniſhments, which, as they were novel and unprecedented, were deemed the more unjuſt and tyrannical. But it was to William ſurnamed the Conqueror, about the year 1070, upon the introduction of the feudal law, that we are to date the commencement of the moſt arbitrary reſtrictions and prohibitions reſpecting the game in this country. From that era the ſubject has been taken up, and moſt ably diſcuſſed, by ſir William Blackſtone, in his "Commentaries on the Laws of England;" and which for greater correctneſs and preciſion, we ſhall ſtate in the learned commentator's own words:

"In the Saxon times, though no man was allowed to kill or chaſe the *king's* deer, yet he might ſtart any game, purſue, and kill it, in the wilds, and on his own eſtate. But ſoon after the Norman conqueſt, a new doctrine took place; and the right of purſuing and taking all beaſts of chaſe or *venary*, and ſuch other animals as were accounted *game*, was then held to belong to the king, or to ſuch *only* as were authoriſed under him. And this, as well upon the principles of the feodal law, that the king is the ultimate proprietor of all the lands in the kingdom, they being all held of him as the chief lord, or *lord paramount of the fee*; and that therefore he has the right of the univerſal ſoil, to enter thereon, and to chaſe and take ſuch creatures at his pleaſure: as alſo upon another maxim of the common law, viz. that theſe animals are *bona vacantia*, and, having no other owner, belong to the king *by his prerogative*. As therefore the former reaſon was held to veſt in the king a *right* to purſue and take them any where; the latter was ſuppoſed to give the king, and ſuch as he ſhould authorize, a *ſole* and *excluſive* right.

"This right, thus newly veſted in the crown, was exerted with the utmoſt rigor, at and after the time of the Norman eſtabliſhment; not only in the ancient foreſts, but in the new ones which the conqueror made, by laying together vaſt tracts of country, depopulated for that purpoſe, and reſerved ſolely for the king's royal diverſion; in which were exerciſed the moſt horrid tyrannies and oppreſſions, under colour of *foreſt law*, for the ſake of preſerving the beaſts of chaſe; to kill any of which, within the limits of the foreſt, was as penal *as the death of a man.* And, in purſuance of the ſame principle, king John laid a total interdict upon the *winged* as well as the *fourfooted* creation: "*capturam avium per totam Angliam interdixit.*" The cruel and inſupportable hardſhips, which theſe foreſt laws created to the ſubject, occaſioned our anceſtors to be as zealous for their reformation, as for the relaxation of the feodal rigors, and the other exactions introduced by the Norman family; and accordingly we find the immunities of *Charta de Foreſta* as warmly contended for, and extorted from the king with as much difficulty, as thoſe of Magna Charta itſelf. By this charter, confirmed in parliament, many foreſts were diſafforeſted, or ſtripped of their oppreſſive privileges, and regulations were made in the regimen of ſuch as remained; particularly killing the king's deer was made no longer a capital offence, but only puniſhed by a fine, impriſonment, or abjuration of the realm. And by a variety of ſubſequent ſtatutes, together with a long acquieſcence of the crown without exerting the foreſt laws, this prerogative is now become no longer a grievance to the ſubject.—See the article FOREST, vol. vii. p. 565.

"As the king reſerved to himſelf the *foreſts* for his own excluſive diverſion, ſo he granted out from time to time other tracts of land to his ſubjects, under the names of *chaſes* or *parks*, or gave them licence to make ſuch in their own grounds; which indeed are ſmaller foreſts, in the hands of a ſubject, but not governed by the foreſt laws; and by the common law no perſon is at liberty to take or kill any beaſts of chaſe, but ſuch as hath an ancient chaſe or park; unleſs they be alſo beaſts of prey. As to all inferior ſpecies of game, called beaſts and fowls of warren, the liberty of taking or killing them is another franchiſe or royalty, derived likewiſe from the crown, and called *free warren*; a word, which ſignifies preſervation or cuſtody: as the excluſive liberty of taking and killing fiſh in a public ſtream or river is called a *free fiſhery*; of which however no new franchiſe can at preſent be granted, by the expreſs proviſion of Magna Charta, c. 16. See the article FISHERY, vol. vii. p. 406. The principal intention of granting to any one theſe franchiſes or liberties, was in order to protect the game, by giving the grantee a ſole and excluſive power of killing it himſelf, provided he prevented other perſons. And no man, but he who has a chaſe or free warren, by grant from the crown, or preſcription which ſuppoſes one, can juſtify hunting or ſporting upon another

other man's ſoil; nor indeed, in thorough ſtrictneſs of common law, *either hunting or ſporting at all.*

"However novel this doctrine may ſeem to ſuch as call themſelves *qualified* ſportſmen, it is a regular conſequence from what has been before delivered; that the ſole right of taking and deſtroying game belongs exclusively to the king. This appears, as well from the hiſtorical deduction here made, as becauſe he may grant to his ſubjects an excluſive right of taking them; which he could not do, unleſs ſuch a right was firſt inherent in himſelf. And hence it will follow, that no perſon whatever, but he who has ſuch derivative right from the crown, is by common law entitled to take or kill any beaſts of chaſe, or other game whatſoever. It is true, that, by the acquieſcence of the crown, the frequent grants of free warren in ancient times, and the introduction of new penalties of late by certain ſtatutes for preſerving the game, this excluſive prerogative of the king is little known or conſidered; every man, that is *exempted* from theſe modern penalties, looking upon himſelf as at liberty to do what he pleaſes with the game: whereas the contrary is ſtrictly true, that no man, however *well qualified* he may vulgarly be eſteemed, has a right to encroach on the royal prerogative by the killing of game, unleſs he can ſhew a particular grant of free warren; or a preſcription, which preſumes a grant; or ſome authority under an act of parliament. As for the latter, (ſays ſir William Blackſtone,) I recollect but two inſtances wherein an expreſs permiſſion to kill game was ever given by ſtatute; the one by 1 Jac. I. cap. 27. altered by 7 Jac. I. cap. 11. and virtually repealed by 22 & 23 Car. II. c. 25. which gave authority, ſo long as they remained in force, to the owners of free warren, to lords of manors, and to all freeholders having 40l. per annum in lands of inheritance, or 80l. for life or lives, or 400l. perſonal eſtate, (and their ſervants,) to take partridges and pheaſants upon their own, or their maſter's, free warren, inheritance, or freehold: the other by 5 Ann. c. 14. which empowers lords and ladies of manors to appoint gamekeepers to kill game for the uſe of ſuch lord or lady; which with ſome alteration ſtill ſubſiſts, and plainly ſuppoſes ſuch power not to have been in them before. The truth of the matter is, that theſe game laws do indeed *qualify* nobody, except in the inſtance of a gamekeeper, to kill game: but only, to ſave the trouble and formal proceſs of an action by the perſon injured, who perhaps too might remit the offence, theſe ſtatutes inflict *additional* penalties, to be recovered either in a regular or ſummary way, by any of the king's ſubjects, from certain perſons of inferior rank who may be found offending in this particular. But it does not follow that perſons, excuſed from theſe additional penalties, are therefore *authoriſed* to kill game. The circumſtance of having 100l. per annum, and the reſt, are not properly *qualifications*, but *exemptions*. And theſe perſons, ſo exempted from the penalties of the game ſtatutes, are not only liable to actions of treſpaſs by the owners of the land; but alſo, if they kill game within the limits of any royal franchiſe, they are liable to the actions of ſuch who may have the right of chaſe or free warren therein.

"Upon the whole it appears, that the king, by his prerogative, and ſuch perſons as have, under his authority, the royal franchiſes of chaſe, park, free warren, or free fiſhery, are the *only* perſons who may acquire any property, however fugitive and tranſitory, in theſe animals *feræ naturæ*, while living; which is ſaid to be veſted in them, *propter privilegium*. And it muſt alſo be remembered, that ſuch perſons as may thus lawfully hunt, fiſh, or fowl, *ratione privilegii*, have only a qualified property in theſe animals: it not being abſolute or permanent, but laſting only ſo long as the creatures remain within the limits of ſuch reſpective franchiſe or liberty, and ceaſing the inſtant they voluntarily paſs out of it."

Thus far we have ſtated the authority of ſir William Blackſtone. But E. Chriſtian, eſq. profeſſor of the laws of England in the univerſity of Cambridge, in his "Notes on the Commentaries," has with great judgment and candour pointed out the inſufficiency of ſeveral parts of that authority. He obſerves, that "the learned judge has frequently, and even zealouſly, inculcated the poſition, that the common law has *veſted the ſole property of all the game in England in the king alone*; and of conſequence that no man, let his rank and fortune be what they may, is qualified to kill game, or is exempt from the *original* penalties, unleſs he poſſeſſes ſome peculiar privilege *derived from the king*. This doctrine, enforced by ſo celebrated an author, apparently the reſult of mature deliberation, and which has been ſo long acquieſced in, he (Mr. Chriſtian) would have queſtioned with diffidence, if he had not been fully perſuaded that it was unſupported by any prior authority, and that the authorities to the contrary were numerous and irreſiſtible.

"The learned judge himſelf admits, that this is a *novel* doctrine to ſuch as call themſelves *qualified* ſportſmen; yet he has referred to no preceding authority whatever in any part of the Commentaries; but in p. 415. vol. ii. he has deduced this doctrine from two general principles, viz. *that the king is the ultimate proprietor of* ALL *the lands in the kingdom, and therefore he has the right of the univerſal ſoil to enter thereon, and to chaſe and take ſuch creatures at his pleaſure.* From the king's right to the univerſal ſoil, it is not evident why he ſhould have a better right to take ſuch creatures, than to take any other production of that ſoil. And even, if the king's majeſty ſhould have a right to enter all the lands of the kingdom in purſuit of game, this affords no inference that the land-owner may not enjoy this right concurrently with the king. But although no complaint can perhaps be made againſt the king for entering the lands of his ſubjects, it has been determined that this power cannot be given to his foreſters and ſervants.

"The other general principle relied upon by the learned commentator is, *another maxim of the common law, which he ſays he has frequently cited and illuſtrated, that theſe animals are* bona vacantia, *and having no other owner, belong to the king by his prerogative.* It has been determined, that fiſh, if not confined as in a trunk, cannot be called *bona et catalla*; and ſo game, till it is taken, is every where ſaid to be *nullius in bonis*. But I am inclined to think that the very reverſe of the maxim is true, and that *bona vacantia* belong to the *firſt* occupant or finder, except in thoſe inſtances particularly ſpecified by the law, and in which they are expreſsly given to the king. A perſon might have acquired by occupancy, even in the laſt century, an eſtate in real property. If a pearl ſhould be found in an oyſter, no lawyer would ſay, that it was the property of the king. If all wild animals had belonged to the crown, it would have been ſuperfluous to have ſpecified whales, ſturgeons, and ſwans. Lord Coke tells us, that "a "ſwan is a royal fowl; and all thoſe the property "whereof *is not known*, do belong to the king by his pre-"rogative: and ſo whales and ſturgeons are royal fiſh, "and belong to the king by his prerogative." Caſe of ſwans, 7 *Co.* 16. And the king may grant wild ſwans unmarked, *ib.* 18. But theſe are the only animals which our law has conferred this honour upon.

"It is true that our kings, prior to the *carta de foreſta*, claimed and exerciſed the prerogative of making foreſts wherever they pleaſed over the grounds of their ſubjects: within the limits of theſe foreſts certain wild animals were preſerved, by ſevere laws, for the recreation of the ſovereign. A diſtrict thus bounded at the king's pleaſure, might have been granted by the king to any of his ſubjects, who enjoyed the excluſive privilege either of a foreſt, chaſe, park, or free warren, according to the extent of the juriſdiction and powers conferred by the royal grant; but beyond the boundaries of theſe privileged places neither the king, nor any of his grantees, claimed a property in the game: for, according to the

law

law of king Canute, *quilibet homo dignus venatione sua in sylva, et in agris sibi propriis, et in dominio suo*; which law Manwood declares was confirmed by many succeeding kings. *Tit. For. pl.* 3. If this were so, it cannot be correct what the learned commentator has advanced, that *upon the Norman conquest a new doctrine took place.* By the *carta de foresta* all the new-made forests were disafforested and thrown open again; but besides the creation of new forests by the Norman kings, they had also made great additions and encroachments to the ancient Saxon forests; these encroachments were called *purlieus*, and as these were the same grievance to the owners of the land as the new forests, they also were disafforested, but with this distinction, that as the grievance extended only to the landowner, he was allowed to enjoy his lands in as full a manner as he had done before the encroachment; but they still continued with respect to the rest of the world under the forest law jurisdiction. Hence it followed as a consequence, that the owner of a purlieu might hunt and kill game within the limits of the purlieu, as any other man might have done in his own grounds: and the authorities of lord Coke and Manwood concur, if deer come out of the forest into the purlieu, the purlieu-man may hunt and kill them, provided he does it fairly and without *forestalling*. And this distinction is made; if a stag can recover the *filum forestæ*, the border of the forest, before the purlieu-man's dogs fasten upon him, he then belongs to the king, or to the owner of the forest, and the purlieu-man must call his dogs back; but if they fasten upon him before he gains the forest, and he drags them into it, he belongs to the owner of the purlieu, who may enter the forest and carry him away. 4 *Inst.* 303. *Manw. Purlieu.* This alone is decisive; but there are various authorities to the same effect. In the Year-book, 12 Hen. VIII. fo. 10. it is held, if a man drive a stag out of a forest and kill him, he shall gain no property in him, because he shall derive no advantage from his own wrongful act; yet if the stag comes of himself beyond the limits of the forest, then any one (if qualified) may kill and take him, for they are animals *feræ naturæ, et nullius in bonis*; and the maxim is *capiat qui capere potest*, i. e. catch that catch can.

"That the king has no property in deer or other game, when they are out of a forest, was determined also in a case reported by Keilway, 30, and copied by Manwood, 202. In that case an action of trespass was brought for entering the plaintiff's close; the defendant pleaded, that the place in which the trespass was supposed to be committed was adjoining to the king's forest, and that the plaintiff was bound to impale the said forest, and that for want of paling four deer escaped out of the forest into the plaintiff's land, and that he the defendant entered by the command of the forester to drive them back to the forest. The court held that this plea was not good; "for though the plaintiff was in fault for not paling, yet "it was not lawful for the forester, or any person, to "drive the deer out of the ground, or to take them; "and the reason was, *because the king had no property in them*; "and this was different from the case of *tame* cattle, "where the property still remains in the owner though "they are out of his ground, for which reason he may "retake them wherever he finds them; but it is not so "when the beasts are wild."

"The learned judge frequently intimates that no person is exempt from the *original* penalties; but I am inclined to think that no authority whatever can be found that any penalties were ever inflicted for killing game *out of* privileged grounds, except those which have been introduced by modern game laws, or the qualification acts. Lord Coke reports that the court held in the case of monopolies, 11 *Co.* 87, that "it is true that none can "make a park, chase, or warren, without the king's "licence, for that is *quodam modo* to appropriate those "creatures, which are *feræ naturæ et nullius in bonis*, to "himself, and to restrain them of their natural liberty, "which he cannot do without the king's licence; but "for hunting, hawking, &c. which are matters of pas- "time, pleasure, and recreation, there needs no licence, "but every one may in his own land use them at his "pleasure, *without any restraint to be made unless by parliament*, "as appears by the statutes of 11 Hen. VII. c. 17. 23 "Eliz. c. 10. and 3 Jac. I. c. 13." These authorities are also recognized and confirmed in *Bro. Abr. tit. Propertie*, and in Hales's Commentary to *F. N. B.* 197. And the following may serve as a specimen of the authorities collected by Brooke: *quant beasties savages le roye aler hors del forrest, le property est hors del roy*; and again, *filz sount hors del parke capient conceditur.*

"In a great case which was brought in 1791 from the courts of Scotland before the house of lords, the question was, whether by the law of Scotland the proprietor of an estate has a right to monopolize the game upon that estate, for the use of himself and particular friends, authorized by his licence, and to exclude all gentlemen, legally qualified, from following that amusement over his waste and other grounds, not specially protected by any particular statute? The printed cases of the appellant and respondent contain much curious learning upon the Scotch game-laws: but no idea was suggested that the game in Scotland belonged to the king. For the appellant, who insisted that he had a right to enter as a sportsman upon the respondent's estate, the authority of president Balfour in his Practics, was chiefly relied upon; *viz.* "it is leisome and permitted to all men to "chase hares, foxes, and all other beistis, beand with- "out forestis, warrenis, parkis, or wardis." But the judgment of the lords being for the respondent, this permission of course must be confined to a man's own estate. *Livingstone, appellant*, v. *Lord Breadalbane, respondent.*"

To these remarks we might add, that the learned commentator appears to have overlooked entirely the rights of allodial estates in England, and to have confined his observations chiefly to the feodal tenure established by the conqueror, and to *the right of the king as lord paramount of the fee.* But over allodial property, and the ancient ecclesiastical tenures, *where there is no fee*, this claim could not exist; and therefore, upon those lands, no superior lord, or owner of free warren, or purlieu, have claimed to exercise the right of pursuing or killing the game; nor can it be done without incurring the penalties of the law in an action of trespass. Allodial estates are those pure freeholds, which during the feodal government, were holden by the possessors, without being subjected to military service, fine, or fee; and, according to Dr. Stuart, in his "View of Society," 4to. edit. p. 211, "allodial proprietors, to avoid military service or fee, devised the fraud of assigning their lands to the church, and of holding them under its exemptions and immunities. Those who held possessions purely allodial, could only be called out in foreign wars; and as they held of no superior, or lord of a manor, so they had no part in the feodal associations, were subject to no homage, nor liable to any suit or service at the manerial courts." Over such land, therefore, no person can claim to pursue the game, but by licence of the owner.

Of what constitutes GAME in ENGLAND.

The animals which constitute *game*, in England, or such at least as are under the protection of the *game-laws*, are as follow: viz. the four-footed, include red or fallow deer, hares, and conies: the winged are, swans, partridges, pheasants, pigeons, wild-ducks, wild-geese, and other water-fowl, grouse (commonly called *red-game*), moor-birds or heath-fowl (commonly called *black game*), bustards, and herons. Fish, in ponds, and in private or manerial fisheries, are also protected by the game-laws, as hath been already noticed under the article

FISHERY, vol. vii. p. 419, to which we beg to refer the reader.

OF DEER.

For the general preſervation of the deer in parks, foreſts, and chaſes, ſeveral ancient ſtatutes were put in force, ſuch as ſtat. 3 Edward I. c. 20, by which thoſe treſpaſſers who had been convicted, and could not find ſurety, were compelled to abjure the realm. Alſo, 21 Ed. I. ſt. 2, intitled *De male factoribus in parcis*; by which it was made juſtifiable homicide to kill deer-ſtealers who ſhould defend themſelves by force of arms, or flee their purſuers to avoid the law. Alſo, 1 Hen. VII. c. 7, by which it was made felony in any perſon *wilfully to conceal* the hunting or killing of deer in the royal foreſts and parks. This was followed by ſtat. 1 J. c. 27. which made it penal in thoſe who ſhould *buy* or *ſell* any veniſon or deer. And by 5 G. c. 28, thoſe who ſhould be convicted of killing or wounding any red or fallow deer, were ſubjected to tranſportation for ſeven years.

By the 16 Geo. III. c. 30, (which repeals in whole or in part, the preceding ſtatutes,) and by the 42 Geo. III. c. 107, (which repeals the 1ſt act of the 16 Geo. III.) the law now in force for the preſervation of deer, is as follows:—If any perſon ſhall courſe or hunt, or ſhall take in any ſlip, nooſe, toyle, or ſnare, or ſhall kill, wound, or deſtroy, or ſhall ſhoot at, or otherwiſe attempt to kill, wound, or deſtroy, or ſhall carry away, any red or fallow deer, in the *incloſed* part of any foreſt, chaſe, purlieu, or ancient walk, or in any incloſed park, paddock, wood, or other incloſed ground, where deer are, have been, or ſhall be, uſually kept; without the conſent of the owner, or without being otherwiſe duly authoriſed; or ſhall be aiding, abetting, or aſſiſting therein or thereunto: every perſon ſo offending ſhall be guilty of felony, and adjudged to be tranſported for ſeven years. 42 *Geo.* III. *c.* 107. And every perſon who ſhall commit any of the ſaid offences in the *uninclofed* part of any ſuch foreſt or other ground, or ſhall be abetting therein as aforeſaid, ſhall for every ſuch offence forfeit 5ol. And if the offender ſhall be a keeper of or intruſted with the cuſtody or care of ſuch deer, he ſhall forfeit double.

It ſhall be lawful for one juſtice, on complaint to him made on oath by any credible perſon, that there is reaſon to ſuſpect any perſon of having in his cuſtody or poſſeſſion, or in any dwelling-houſe, out-houſe, yard, garden, or place, any red or fallow-deer which ſhall have been unlawfully killed, or the head, ſkin, or other part thereof, or any ſlip, nooſe, toyle, ſnare, or other engine, for the unlawfully taking of deer, by his warrant to cauſe ſuch perſon, and ſuch dwelling-houſe, out-houſe, garden, or place, to be ſearched; and if any ſuch ſhall be found, to cauſe the ſame, and ſuch perſon ſo having poſſeſſion, or in whoſe dwelling-houſe, out-houſe, garden, or other place, the ſame ſhall be found, to be brought before any juſtice having juriſdiction: and if ſuch perſon ſhall not produce before ſuch juſtice the party of whom he received the ſame, or ſatisfy ſuch juſtice that he came lawfully by ſuch deer, or the head, ſkin, or other part thereof, or had a lawful occaſion for ſuch ſlip, nooſe, toyle, ſnare, or other engine, or did not keep the ſame for any unlawful purpoſe; he ſhall forfeit not exceeding 3ol. nor leſs than 10l. at the diſcretion of ſuch juſtice. 16 *Geo.* III. *c.* 30.

And if any red or fallow deer ſuſpected to have been unlawfully killed, or the head, ſkin, or other part of ſuch deer, ſhall, on ſearch under a warrant from a juſtice, be found in the poſſeſſion or cuſtody of any perſon, or in any dwelling-houſe, out-houſe, garden, or other place, or ſhall be proved to have been in the poſſeſſion, houſe, out-houſe, garden, or place, of any perſon who may be juſtly ſuſpected to have come diſhoneſtly or unlawfully by the ſame as aforeſaid; and ſuch perſon ſo in poſſeſſion, or the owner or occupier of ſuch dwelling-houſe, out-houſe, garden, or other place, ſhall not, under the proviſions aforeſaid, be liable to conviction; in ſuch caſe, for the diſcovery of the party who actually killed or ſtole ſuch deer, it ſhall be lawful for any juſtice having juriſdiction, as the evidence given and the circumſtance of the caſe ſhall require, to ſummon before him every perſon through whoſe hands ſuch deer, or the head, ſkin, or other part thereof, ſhall appear to have paſſed; and if the perſon from whom ſuch deer, or the head, ſkin, or other part thereof ſhall appear to have been firſt received, or who having had poſſeſſion thereof, ſhall not give proof to the ſatisfaction of ſuch juſtice, that he came lawfully by the ſame, ſuch perſon ſhall, on every conviction, forfeit not exceeding 3ol. nor leſs than 10l.

And if it ſhall appear on the oath of one witneſs, that any perſon hath, or hath had, in his poſſeſſion, houſe, out-houſe, garden, or place, any red or fallow deer, or the ſkin, head, or other part thereof, and ſhall be reaſonably ſuſpected to have come diſhoneſtly or unlawfully thereby; every ſuch perſon, and all others through whoſe hands the ſame ſhall appear to have paſſed under the like ſuſpicion, may be proceeded againſt in like manner and form, and on conviction ſhall be ſubject and liable to the ſame penalty, as if ſuch deer, or the head, ſkin, or other part thereof, had been found in the poſſeſſion, houſe, out-houſe, garden, or place, of ſuch perſon, on ſearch made by warrant as aforeſaid.

If any perſon ſhall ſet, lay, or uſe, any net, wire, ſlip, nooſe, toyle, or other engine, for the purpoſe of taking or killing deer, within or upon any foreſt, chaſe, purlieu, or ancient walk, or in the ring or outer fence or bank dividing the ſame from the adjoining lands; or in any incloſed park, paddock, wood, or ground, where deer are, have been, or ſhall be, uſually kept, and ſhall be convicted of any ſuch offence; he ſhall forfeit for the firſt offence not exceeding 10l. nor leſs than 5l. and for every other offence any ſum not exceeding 20l. nor leſs than 10l.

If any perſon, carrying any gun or other fire arms, or any ſword, ſtaff, or other offenſive weapon, ſhall come into any foreſt, chaſe, purlieu, or ancient walk, or into any incloſed park, paddock, wood, or into any other ground where deer are uſually kept, be the ſame incloſed or not incloſed, with an intent unlawfully to ſhoot at, courſe, or hunt, or to take in any ſlip, nooſe, toyle, ſnare, or other engine, or to kill, wound, deſtroy, or to take away, any red or fallow deer; it ſhall be lawful for the ranger or keeper or perſon intruſted with the care of ſuch deer, to ſeize and take from ſuch perſon, in and upon ſuch foreſt, chaſe, purlieu, ancient walk, park, paddock, wood, or other ground, for the uſe of the owner thereof reſpectively, all ſuch guns, fire arms, ſlips, nooſes, toyles, ſnares, or other engines, and all dogs there brought for courſing deer, in like manner as the gamekeepers of manors are impowered by law within their reſpective manors, to ſeize and take dogs, nets, or other engines, in the cuſtody of perſons not qualified by law to keep the ſame. And if any ſuch perſon ſhall there unlawfully beat or wound any ranger or keeper, or his ſervants or aſſiſtants, in the execution of their office, or ſhall attempt to reſcue any perſon in the lawful cuſtody of any ſuch ranger, keeper, ſervant, or aſſiſtant; he ſhall be guilty of felony, and being convicted on indictment, ſhall be tranſported to one of his majeſty's plantations in America for ſeven years.

And it ſhall be lawful for any keeper or under-keeper, and their ſervants or aſſiſtants, to ſeize and apprehend upon the ſpot any perſon whom they ſhall diſcover in the actual fact of hunting, courſing, killing, wounding, ſhooting at, taking, deſtroying, or carrying away, any red or fallow deer, from any foreſt, chaſe, purlieu, or ancient walk, whether incloſed or not, or in any incloſed park, paddock, wood, or in any other incloſed ground, or attempting ſo to do; or in ſetting or laying any net, wire, ſlip, nooſe, toyle, ſnare, or other engine therein,

for the taking, killing, or deſtroying, of deer; and to carry ſuch offender before ſome neighbouring juſtice, to be dealt with according to law.

The pecuniary penalties on this act may be recovered before one juſtice, on the oath of one witneſs or confeſſion; half to the king, to be paid for his uſe into the hands of ſuch perſon as the juſtice ſhall direct, and half to the informer. And in caſe of non-payment thereof, with the charges incident to the conviction, immediately upon the conviction, the ſame ſhall be levied by warrant of ſuch juſtice by diſtreſs; and for want of ſufficient diſtreſs, the offender, except in ſuch caſes where it is otherwiſe provided by this act, ſhall be committed to the common gaol for ſix months, 42 Geo. III. c. 107. unleſs the ſaid penalty and charges ſhall be ſooner paid. And if upon conviction he doth not immediately pay the penalty, the juſtice may order him into cuſtody during ſuch time, not exceeding three days, as ſuch juſtice ſhall think proper to allow for return of the warrant of diſtreſs.

Provided, that if it ſhall appear to the ſatisfaction of ſuch juſtice, either by confeſſion of the party or otherwiſe, that he hath not goods or chattels ſufficient whereon to levy the penalty; the juſtice may, without iſſuing any warrant of diſtreſs, commit the party convicted, as if a warrant of diſtreſs had been iſſued, and a *nulla bona* returned thereon.

Provided alſo, that if any perſon committed for any firſt offence againſt this act ſhall, before his commitment to priſon, procure ſecurity to be given by two ſufficient ſureties, to the ſatisfaction of ſuch juſtice, for payment of the penalty with the charges incident, within ſix days, incluſive of the day of conviction; the juſtice may accept of ſuch ſecurity, and on non-payment thereof at the time, may cauſe the party and his ſaid ſureties to be apprehended by warrant, and commit them to the common gaol, for ſuch time as the party convicted was liable to have been impriſoned if no ſuch ſecurity had been given, unleſs the penalty [*or*] charges ſhall be ſooner paid.

Finally; if an offender for his firſt offence be committed for want of ſufficient diſtreſs, and ſhall, whilſt in gaol, obtain the conſent in writing of the proſecutor, and alſo of the owner, ranger, foreſter, keeper, or other perſon chiefly intruſted with the care of the deer in the foreſt or other place, for his enlargement; the juſtices in ſeſſions may cauſe him to be brought before them, and by their order may direct the gaoler to ſet him at liberty. If any offender ſhall make diſcovery of any other offender, ſo as he be convicted; he ſhall be diſcharged of all the penalties of this act by him incurred previous to ſuch diſcovery.

No certiorari ſhall be allowed to remove any conviction or other proceedings on this act, unleſs the party convicted ſhall before the allowance of ſuch certiorari, become bound to the proſecutor in 100l. with ſufficient ſureties as the juſtice before whom the offender was convicted [*ſhall approve of*], with condition to pay to the proſecutor within thirty days after ſuch conviction confirmed, [*on*] a procedendo granted, his full coſts and damages to be aſcertained upon his oath;—and ſhall alſo become bound to the juſtice before whom the conviction was made, with ſuch ſufficient ſureties as the juſtice ſhall approve of, in the penalty of 60l. with condition to proſecute ſuch writ of certiorari with effect, and to pay the juſtice the forfeiture to be diſtributed as by this act is directed, or to render to the juſtice ſuch perſon convicted, within thirty days after the conviction ſhall be confirmed, or a procedendo granted: and in default thereof, it ſhall be lawful to proceed to levy the penalty, as if no certiorari had been awarded. And after confirmation of the conviction by any of the ſuperior courts at Weſtminſter, and delivering to the juſtice the rule whereby the conviction hath been confirmed, he may proceed againſt the party in the ſame manner as if a procedendo had been granted.

But by a ſubſequent clauſe in the ſaid act, it is enacted, that no conviction ſhall be removed or removeable by certiorari, or any other writ or proceſs whatſoever, into any of his majeſty's courts of record at Weſtminſter; any law or ſtatute to the contrary notwithſtanding.

[How far theſe ſeemingly contradictory clauſes are reconcileable, or whether either, or which of them is in force, may afford matter of ſerious conſideration. Indeed, there ſeems to be a fatality attending theſe game laws; ſeveral of the moſt conſiderable of them not having been digeſted with that care and preciſion which may be deemed requiſite, eſpecially in caſes penal. And in the preſent caſe, the rolls have been conſulted; and every one of the miſtakes or omiſſions here ſpecified and placed between [ ], are to be found in the original roll; otherwiſe ſome of them might have been ſuppoſed to be only errors of the preſs.]

If any perſon ſhall think himſelf aggrieved by the determination of the juſtice, and ſhall not have ſought his remedy by removing the matter by certiorari as aforeſaid, he may appeal to the general quarter ſeſſions next after the expiration of twenty days from the time of the conviction; giving to the proſecutor ſix days' notice in writing, of his intention of bringing and proſecuting ſuch appeal, and of the matter thereof; and entering into recognizance before a juſtice, with two ſufficient ſureties to be approved by the ſaid juſtice on [*conviction,*] to appear and try the appeal at ſuch ſeſſions, and to abide by the order or determination of ſuch court, and for payment of ſuch coſts and charges as ſhall be awarded at the ſaid court. And if the conviction ſhall be there affirmed, the appellant ſhall pay to the proſecutor his full coſts, to be aſcertained by order of the ſaid court.

In the caſe of the K. *v.* Chandler, *T.* 12 Will. *Holt*, Ch. J. in delivering the opinion of the court, upon a conviction for deer ſtealing, ſaid, that in theſe convictions by juſtices of the peace in a ſummary way, where the ancient courſe of proceeding by indictment and trial by jury is diſpenſed with, the court may more eaſily diſpenſe with forms; and it is ſufficient for the juſtices, in the deſcription of the offence, to purſue the words of the ſtatute, and they are not confined to the legal forms requiſite in indictments for offences by the common law. 1 *L. Raym.* 581.

In the caſe of the K. *v.* Eaton, it was determined, that a certiorari to remove a conviction by a juſtice on the above act, a return that "the record is returned to the ſeſſions, and that a copy is annexed to the writ," is ſufficient. *D. & E.* 2 *V.* 285.

Provided, that if any perſon, thinking himſelf aggrieved as aforeſaid, ſhall have paid the penalty, or ſhall be then impriſoned; he may appeal againſt ſuch conviction as aforeſaid on entering into recognizance by himſelf only, without ſurety, conditioned as before-mentioned; the ſaid penalty remaining in the hands of ſuch juſtice, or ſuch perſon continuing in priſon in the mean time, and until the merits of the appeal ſhall be determined. 16 *Geo.* III. *f.* 30.

Provided alſo, that no conviction ſhall be ſet aſide by the ſaid ſeſſions for want of form, or for want of ſtating, or through the mis-ſtating, of any facts, circumſtances, or matter whatſoever, in caſe the facts alleged in the conviction, or on which the ſame ſhall be grounded, ſhall be proved to the ſatisfaction of the court; but the appeal ſhall be decided on the merits of the caſe only. *f.* 23.—Proſecutions on this act ſhall be commenced within *twelve calendar months* from the time of the offence committed, and not afterwards. *f.* 25.—Though the ſtatute mentions only red or fallow deer, yet the croſs breeds, ſuch as what is called a baſtard menald, bred from a menald buck and a fallow doe, are within the act, 2 *Eaſt's P. C.* c. 16.

The

The provisions of the 16 Geo. III. c. 30, respecting the seizing and conviction of offenders, and the recovery and application of penalties, and the appeal, &c. are extended to the 42 Geo. III. c. 107, by *s.* 3.—And if any person who hath been duly convicted of any offence for which a pecuniary penalty is imposed either by the 16 Geo. III. or by this act, shall offend a second time by committing any offence against this act for which a pecuniary forfeiture is imposed, such second offence, whether it be the same offence as the first, or be any other of the said offences, be deemed a felon [a felony], and the person guilty thereof shall be transported for seven years. And for the more ready conviction of persons for a second offence, the justice before whom he shall be convicted for the first offence, (if any offence against this act for which a pecuniary penalty is imposed,) shall transmit the conviction to the next sessions, to be there filed amongst the records; and such conviction so filed, or a true copy thereof certified and subscribed by the clerk of the peace, shall be sufficient evidence to prove the conviction of such first offence.

By the 9 Geo. I. c. 22, (commonly called the Black act,) if any person or persons, being armed with swords, fire arms, or other offensive weapons, and having his or their faces blacked, or being otherwise disguised, shall appear in any forest, chase, park, paddock, or grounds inclosed with any wall, pale, or other fence, wherein any deer have been or shall be usually kept, or shall unlawfully and wilfully hunt, wound, kill, destroy, or steal, any red or fallow deer: or if any person or persons (whether armed and disguised or not) shall unlawfully and wilfully hunt, wound, kill, destroy, or steal, any red or fallow deer, fed or kept in any places in any of the king's forests or chases which are or shall be inclosed with pales, rails, or other fences; or in any park, paddock, or grounds inclosed, where deer have been or shall be usually kept; or shall forcibly rescue any person, being lawfully in custody of any officer or other person, for any of the said offences; or shall by gift or promise of money, or other reward, procure any to join him or them in any such unlawful act: every person so offending, being thereof lawfully convicted, (in any county in England,) shall be guilty of felony without benefit of clergy; but not to work corruption of blood, nor forfeiture of lands or goods.—See the article BLACK ACT, vol. iii. p. 76.

By the 28 Geo. II. c. 19.—Whereas the burning and destroying of gofs, furze, and fern, in forests and chases, doth destroy the cover necessary for the preservation of the deer and game there; therefore if any person not having a right or legal licence to do the same, shall set fire to, burn, or destroy, (or be aiding therein,) any gofs, furze, or fern, in any forest or chase, without the consent of the owner or person chiefly intrusted with the custody of such forest or chase, or of some part thereof, and being brought before a justice shall be thereof convicted by confession, or oath of one witness, or on view of the justice, he shall forfeit not exceeding 5l. nor less than 40s. half to the informer, and half to the poor; if not forthwith paid, to be levied by distress; and if no sufficient distress can be found, the justice shall commit him to the common gaol, for any time not exceeding three months, nor less than one month. See the article CERVUS, vol. iv. p. 51, &c.

OF HARES.

No person, of what estate, degree, or condition, he be, shall trace, destroy, and kill, any hare *in the snow*, with any dog, birch, bow, nor otherwise. And the sessions or leet may inquire thereof; and after inquisition found, they shall for every hare so killed, cess upon every offender 6s. 8d. to be forfeited to the king, if in the sessions; and to the lord of the leet, if in the leet. 14 & 15 *Hen.* VIII. c. 10.

And by the 1 Jac. c. 27.—Every person who shall trace or course any hares in the snow, shall on conviction before two justices, by confession, or oath of two witnesses, be committed to gaol for three months, unless he pay to the churchwardens for the use of the poor, 20s. for every hare; or after one month after his commitment become bound by recognizance with two sureties in 20l. a-piece, before two justices, not to offend again in like manner.—And by the said last-mentioned act, every person who shall at any time take or destroy any hares, with hare-pipes, cords, or any such instruments or other engines, shall forfeit for every hare 20s. in like manner.

And by the 22 & 23 Car. II. c. 25.—If any person shall be found or apprehended setting or using any snares, hare-pipes, or other like engines, and shall be thereof convicted, by confession, or oath of one witness, before one justice, in *one month* after the offence; he shall give to the party injured such damages, and in such time, as the justice shall appoint, and shall pay down presently to the overseers for the use of the poor, such sum, not exceeding 10s. as the justice shall appoint; which, if he shall not do, the justice shall commit him to the house of correction not exceeding one month.

By the 9 Anne, c. 25.—If any person whatsoever shall take or kill any hare *in the night time*; he shall on conviction before one justice, on the oath of one witness, forfeit 5l. half to the informer, and half to the poor, by distress; for want of distress, to be sent to the house of correction for three months for the first offence, and for every other offence four months.

And by the 13 Geo. III. c. 80.—If any person shall knowingly and wilfully kill, take, or destroy, or use any gun, dog, snare, net, or other engine, with intent to kill, take, or destroy, any hare *in the night*, that is to say, between the hours of seven at night and six in the morning from the 12th day of October to the 12th day of February, and between the hours of nine at night and four in the morning from the 12th day of February to the 12th day of October; or in the *day time*, upon a *Sunday*, or *Christmas-day*; he shall on conviction on oath of one witness before one justice, forfeit for the first offence not exceeding 20l. nor less than 10l. and for the second offence not exceeding 30l. nor less than 20l.

But in case any information shall be made upon oath as aforesaid before a justice against an offender, and it shall appear that such offender hath already been convicted of a *first* and *second* offence; in such case the justice shall commit him to the common gaol or house of correction till the next general quarter sessions, unless he shall have entered into recognizance with two sufficient sureties to appear at such sessions, then and there to be tried by indictment for the said offence; and such justice shall also bind over the informer to prosecute the said offender by indictment as aforesaid; and if upon such indictment, the offender shall be convicted; he shall forfeit and pay in court the sum of 50l. and if he shall neglect or refuse to pay the same, he shall be committed to the common gaol or house of correction for not less than six nor more than twelve calendar months, unless such penalty shall be sooner paid; and the said offender shall, if the justices think proper, be once publicly whipped at the expiration of such commitment, in the town or place where such gaol or house of correction shall be, between the hours of twelve and one in the day.—Provided that no proceeding shall be upon this act, unless information on oath be made before a justice, within *one calendar month* after the offence committed.

The said forfeitures for the first and second offence, and also for the third offence on conviction at the sessions, together with the costs and charges previous to and attending such conviction (to be ascertained by the justice or justices before whom the offender shall be convicted), shall be forthwith paid, half to the informer, and

and half to the poor. And if ſuch perſon ſhall refuſe or neglect to pay the ſame, or to give ſecurity for the payment thereof, ſuch juſtice ſhall by his warrant cauſe the ſame to be levied by diſtreſs: and the ſaid juſtice may order ſuch offender to be detained in cuſtody, until return may conveniently be had to the warrant of diſtreſs, unleſs the party give ſufficient ſecurity, by recognizance or otherwiſe, to the ſatisfaction of ſuch juſtice, for his appearance before the ſaid juſtice on the day appointed for the return of the ſaid warrant, not exceeding ſeven days from the taking ſuch ſecurity: and if upon ſuch return, no ſufficient diſtreſs can be had, the ſaid juſtice ſhall commit the offender to the common gaol or houſe of correction for three calendar months, unleſs the forfeiture ſhall be ſooner paid; or until ſuch offender, thinking himſelf aggrieved by ſuch conviction, ſhall give notice to the informer that he intends to appeal to the next ſeſſions, and ſhall enter into a recognizance before a juſtice with two ſufficient ſureties conditioned to try ſuch appeal, and to abide the order of, and pay ſuch coſts as ſhall be awarded by the juſtices at ſuch ſeſſions; which notice ſhall not be leſs than fourteen days before the trial of the appeal. And the juſtices at ſuch ſeſſions, on proof of ſuch notice and recognizance, ſhall determine the appeal in a ſummary way, and award coſts to either party, as they ſhall judge proper.

And if the offender dwells in another county, the juſtice before whom the information or indictment was made, may direct his warrant of apprehenſion and diſtreſs to any conſtable where the offence was committed, to be by him carried to a juſtice near reſiding where the offender dwells, to be ſigned by him on the back of the ſaid warrant, on proof on oath of the hand-writing of the juſtice who firſt granted the warrant; which indorſement ſhall be ſufficient authority for the conſtable of the place where he dwells, or where his goods and chattels are, or for the conſtable who brings the warrant to be indorſed, to apprehend and convey the offender before the juſtice who firſt granted the warrant, or any other juſtice of that county where the offence was committed, or for ſuch conſtable to levy the penalty by diſtreſs; and alſo, in caſe where no ſufficient diſtreſs can be had, to convey the offender before the juſtice who firſt granted the warrant of diſtreſs, or any other juſtice of that county where the offence was committed, to be dealt with according to law. And the juſtice who indorſed the warrant ſhall direct the conſtable or other perſon making the diſtreſs, to deliver over the money levied to the juſtice who firſt granted the warrant; and if ſuch conſtable or other perſon ſhall neglect or refuſe to pay ſuch ſum, or deliver over all proceedings upon ſuch diſtreſs or warrant of apprehenſion, the juſtice who firſt granted the warrant, or the juſtice who indorſed it, may commit him to the common gaol or houſe of correction for ſix months, or till the money ſhall be paid, and the proceedings delivered over. And no order made, or any other proceedings upon this act, ſhall be quaſhed for want of form, or removed by certiorari or other writ into any of the courts of record at Weſtminſter.

[In reſpect to the third offence, here ſeems to be an inconſiſtency. The former part of the act ſays, if the offender ſhall not, upon conviction by indictment at the ſeſſions, pay into court the penalty of 5ol. he ſhall be committed to the gaol or houſe of correction for not leſs than ſix months nor more than twelve.—The latter part of the act ſays, the ſaid penalty ſhall be levied by diſtreſs; and if no diſtreſs can be had, the offender ſhall be committed to the gaol or houſe of correction for *three* months; with power of appealing to the ſeſſions then next following; with other circumſtances ſeemingly abſurd.]

And moreover by the 39 & 40 Geo. II. c. 50, after reciting that idle and diſorderly perſons frequently aſſemble and aſſiſt each other in the deſtruction of game in the night, and if interrupted are guilty of violence, to the terror of the people: It is enacted, that if any perſons to the number of two or more, ſhall enter into, or be found in, any foreſt, chaſe, park, wood, plantation, paddock, field, meadow, or other open or incloſed ground, in the night, namely, between eight at night and ſix in the morning from the 1ſt of October to the 1ſt of February, or between ten at night and four in the morning from the 1ſt of February to the 1ſt of October, having any gun, net, engine, or other inſtrument, for the purpoſe and with the intent to deſtroy, or ſhall wilfully deſtroy, take, or kill any hare, pheaſant, partridge, heath-fowl, commonly called *black game*, or grouſe, commonly called *red game*, or any other game: or if any perſon ſhall be found with any gun, fire-arms, bludgeon, or other offenſive weapon, protecting, aiding, abetting, or aſſiſting, any ſuch perſons as aforeſaid, the ranger, owner, or occupier thereof, or their keepers or ſervants, or any other perſon, may apprehend any ſuch offender, and deliver him into the cuſtody of a peace officer, who ſhall convey him before a juſtice: or in caſe any ſuch offender ſhall not be ſo apprehended, any juſtice, on information on oath of one witneſs, may iſſue his warrant to apprehend ſuch offender; and if it ſhall appear to ſuch juſtice on the oath of one witneſs that ſuch perſon is guilty of any of the offences aforeſaid, he ſhall be deemed to be a rogue and a vagabond within the meaning of the 17 Geo. II. c. 5, and ſhall ſuffer as therein directed; and in caſe any perſon ſo convicted, ſhall offend again, he ſhall be deemed an incorrigible rogue, and ſhall ſuffer accordingly.

Every perſon who ſhall ſell, or buy to ſell again, any hare, ſhall, on conviction at the aſſizes or ſeſſions, or before two juſtices out of ſeſſions, forfeit for every hare 10s. half to the poor, and half to him that will ſue. 1 *Jac.* c. 27. ſ. 4.

By the Black Act before mentioned, if any perſon, armed and diſguiſed, ſhall appear in any warren or place where hares are uſually kept, or unlawfully rob any ſuch warren; or (whether armed and diſguiſed or not) ſhall reſcue any perſon in cuſtody for either of the ſaid offences, or procure any to join with him in any ſuch unlawful act; he ſhall be guilty of felony without benefit of clergy.

It may here be proper to remark, that the law above recited for the preſervation and encouragement of the breed of *hare*, applies as well to perſons *qualified*, as to thoſe who are not qualified. It has been inſiſted upon that qualified perſons, inaſmuch as they have a right to *buy*, may likewiſe *ſell*, game; but it is not ſo. This traffic, of buying game to ſell again *in the large way* for the London market, has been carried on in ſeveral parts of England with impunity, by perſons who have thought it worth their while to purchaſe land for a qualification, with this ſole view, and for the privilege of *freeing* or guaranteeing it ſafe into London; but let it be remembered that they are amenable to every penal ſtatute now in force which prohibits the *ſale* of game.—It is alſo to be noticed here, that though there are ſtated periods or ſeaſons in which alone the *winged* game is allowed to be purſued and killed; yet it is not ſo with the *hare:* this timid unoffending creature is allowed no reſpite by law, not even for a breeding time; but may be hunted, courſed, and killed, except on Sundays and Chriſtmas-day, by qualified perſons, *all the year round.* Shame, however, in ſome, and the hope of greater plenty for ſport, in others, have, by a ſort of remorſeleſs conſent, influenced the bulk both of ſportſmen and of poachers to deſiſt from killing hares after Eaſter Monday; but they are eager to begin again as early as July or Auguſt, the inſtant the clover is carried, and the corn begins to fall, whereby the leverets are diſturbed, and become an eaſy prey to the voracity of man!—Why ſhould the legiſlature refuſe to hare the temporary repoſe it has granted to partridge, pheaſant, grouſe, &c.?

If

Of CONIES.

If any warrener ſhall find any treſpaſſers wandering within his liberty, intending to do damage therein, and that will not yield themſelves after hue and cry made to ſtand unto the peace, but do flee, or defend themſelves; although the warrener or his aſſiſtant do *kill* ſuch offenders, they ſhall not be troubled upon the ſame. 21 *Edw.* I. ſt. 2.

When information ſhall be made of unlawful hunting in a warren by night, or with painted faces, to any of the king's counſel, or to a juſtice of the peace, of any perſon ſuſpected, he may make a warrant to bring ſuch perſon before himſelf, or any other of the ſaid counſel or juſtices; and if ſuch perſon ſhall conceal the ſaid hunting, or any of his accomplices, it ſhall be felony; but if he confeſſeth, it ſhall be but treſpaſs finable at the ſeſſions. 1 *Hen.* c. 7.

If any perſon ſhall in the night time enter into any grounds incloſed, and uſed for keeping of conies, and hunt, drive out, take, or kill, any conies; he ſhall, on conviction at the ſuit of the king or of the party, at the aſſizes or ſeſſions, on indictment, bill, or information, or otherwiſe, be impriſoned three months, and pay to the party grieved treble damages and coſts, and find ſureties for his good abearing for ſeven years, or continue in priſon till he does: but this ſhall not extend to any grounds to be incloſed and uſed for conies *after* the making of this act, *without the king's licence.* 3 *Jac.* c. 13.

If any perſon ſhall at any time enter wrongfully into any warren or ground lawfully uſed or kept for the breeding or keeping of conies, whether it be incloſed or not; and there ſhall chaſe, take, or kill, any conies; and ſhall be thereof convicted in one month after the offence, before one juſtice, by confeſſion, or oath of one witneſs; he ſhall yield to the party grieved treble damages and coſts, and be impriſoned three months, and after till he find ſureties for his good abearing. 22 & 23 *Car.* II. *c.* 25. *ſ.* 4.

If any perſon ſhall wilfully and wrongfully, *in the night time,* enter into any warren or grounds lawfully uſed or kept for the breeding or keeping of conies, although the ſame be not incloſed, and ſhall then and there wilfully and wrongfully take or kill, in the night time, any coney againſt the will of the owner or occupier thereof; or ſhall be aiding and aſſiſting therein, and ſhall be convicted thereof at the aſſizes; he ſhall be tranſported for ſeven years, or ſuffer ſuch other leſſer puniſhment, by whipping, fine, or impriſonment, as the court ſhall award. Provided that conies may be taken, *in the day time,* on the ſea or river banks in the county of Lincoln, ſo far as the tide ſhall extend, or within one furlong of the ſaid banks; and the perſon taking them ſhall not be obliged to make ſatisfaction for damage, unleſs the ſame ſhall exceed the ſum of 1s. 5 *Geo.* III. *c.* 14.

By the Black Act above-mentioned, If any perſon, being armed and diſguiſed, ſhall appear in any warren or place where conies are uſually kept, or unlawfully rob any ſuch warren; or (whether armed and diſguiſed or not) ſhall reſcue any perſon in cuſtody for ſuch offence, or procure any perſon to join him therein; he ſhall be guilty of felony without benefit of clergy.

No perſon ſhall kill or take in the night any conies upon the *borders* of warrens, or other grounds lawfully uſed for the breeding or keeping of conies (except the owner or poſſeſſor of the ground, or perſons employed by them); on pain that the offender, on conviction in *one month* after the offence, before one juſtice, by confeſſion, or oath of one witneſs, ſhall give to the party injured ſuch damages and in ſuch time as ſhall be appointed by the juſtice, and over and above pay down preſently to the overſeers for the uſe of the poor ſuch ſum, not exceeding 10s. as the juſtice ſhall appoint; which if he ſhall not do, the juſtice ſhall commit him to the houſe of correction for ſuch time as he ſhall think fit, not exceeding one month. 22 & 23 *Car.* II. *c.* 25, *ſ.* 5.

The ſtatute ſaith, *upon the borders of warrens:* but if they are *out of* the warren, no perſon hath any property in them, and a man may juſtify killing them if they eat up his corn; but no action lies againſt the owner of the warren. 5 *Co.* 104.—So a perſon that hath a right of common may kill them, when they are out of the warren, and deſtroy the common; but he cannot have an action on the caſe *againſt the lord,* for that would be to create a multiplicity of actions. *Cro. El.* 548. *Cro. Ja.* 195. *Cro. Car.* 388.—For a man cannot have an action for another man's conies breaking into his ground, becauſe they are no longer the other's than while they are in the warren or place where he hath a right to keep them; ſo that no violation hereby ariſes to the property of one man by the beaſts of another; but the conies, being in their natural liberty, may be lawfully killed by the owner of the ſoil. 3 *Bac. Abr.* 326.

But if the lord hath a right to put conies upon the common, and by an exceſs in the number ſurcharges the common, and by the number of burrows made by the conies prevents the commoners' cattle from depaſturing the common; an action in ſuch caſe is the proper remedy, and the tenant may not of his own accord fill up the burrows and remove the nuiſance. As in the caſe of Cooper *v.* Marſhall, *E.* 30 Geo. II. By *L. Mansfield,* Ch. J. The queſtion in this caſe is not, whether the act of the lord be or be not hurtful, or how far it may be ſo: but the queſtion turns upon the remedy, whether it is abateable, whether the commoner can do himſelf juſtice? It may be prejudicial to the commoner, yet not injurious; it may be both prejudicial and injurious, yet not abateable. The lord by his grant of common, gives every thing incident to the enjoyment of it, as ingreſs, egreſs, and the like: and thereby authoriſes the commoner to remove every obſtruction to his cattle's grazing the graſs which grows upon ſuch a ſpot of ground: becauſe every ſuch obſtruction is directly contrary to the terms of the grant. A hedge, a gate, or a wall, to keep the commoner's cattle out, is inconſiſtent with a grant which gives them a right to come in. But the lord ſtill remains owner of the ſoil; and is not debarred from exerciſing any act of ownerſhip. The commoner has no right to meddle with the ſoil. In the preſent caſe, the lord has done nothing contrary to the grant. He hath not obſtructed the commoner from entering and putting in his cattle. The lord has a right to put conies upon the common. The conies themſelves naturally make the burrows. So that they are incident to the right of putting on the conies. If the lord ſurcharges, the commoner is injured in his right of common, it is true: But what is the commoner's remedy? Not to abate; not to be his own judge, in a complicated queſtion, which may admit of nicety to determine. There is a certain line to be drawn. The lord has a right ſo far, but no farther. Yet the commoner cannot deſtroy or drive off the conies; nor, conſequently, can he deſtroy the burrows, which is in effect deſtroying the conies.—By Mr. J. Denniſon: Upon the record of this caſe, it muſt be taken that the plaintiff was owner of the ſoil, and had a free warren; and that there is not ſufficient common left by the increaſe of the conies for the uſe of the commoner. The queſtion then is, Whether the commoner ſhall be intruſted to deſtroy the eſtate of the lord, in order to preſerve his own right of common. This would be to conſtitute himſelf judge in his own cauſe: No, let him take his proper remedy. A coney burrow is not of its own nature a nuiſance: on the contrary, it is eſſential to a free warren, therefore the nuiſance depends upon the number of them: and you can at the utmoſt, only abate ſo much of the thing as is a nuiſance. You cannot deſtroy the whole (which is the right here claimed); but only ſo much of the thing as

makes it a nuiſance.—By Mr. J. Foſter: This juſtification is clearly bad. It is founded on a claim of right, which cannot be maintained. It is admitted, that a commoner cannot in this caſe deſtroy the conies. Conſequently he cannot deſtroy the burrows; for the effect is, deſtroying the conies. If the lord has exceeded the bounds of his right, the law is to determine the *quantum* of ſuch exceſs; and to the law the commoner muſt reſort for his remedy, if he is aggrieved. 1 *Bur.* 252.

If any perſon ſhall be found or apprehended ſetting or uſing any ſnares or other like engines, for taking of conies, and ſhall be thereof in like manner convicted, he ſhall give to the party grieved ſuch damages and in ſuch time as the juſtice ſhall appoint, and pay down preſently to the overſeer for the uſe of the poor ſuch ſum not exceeding 10s. as the juſtice ſhall appoint; which, if he ſhall not do, the juſtice ſhall commit him to the houſe of correction not exceeding one month. 22 & 23 *Car.* II. *c.* 25.—Perſons aggrieved by any judgment given by virtue of this act, may appeal to the next ſeſſions, whoſe order therein ſhall be final, *if no title to any land or royalty be therein concerned.*

If any perſons not having lands or hereditaments of 40l. a-year, or not worth in goods 200l. ſhall uſe any gun or bow to kill conies, or ſhall keep any ferrets or coney dogs (except he have grounds incloſed for keeping of conies, the increaſing of which ſhall amount to 40s. a-year to be let, and except warreners in their warrens); in ſuch caſe, any perſon having 100l. a-year, may ſeize the ſame to his own uſe. 3 *Jac. c.* 13.

Of SWANS.

No perſon (other than the king's ſon), unleſs he have lands of freehold to the value of five marks a-year, ſhall have any mark or game of ſwans; on pain of forfeiting the ſwans, half to the king, and half to any perſon (ſo qualified) who ſhall ſeize the ſame. 22 *Edw.* IV. *c.* 6.—It is felony to take any ſwans that be lawfully marked, though they be at large. *Dalt. c.* 156.—And as to ſwans unmarked; if they be domeſtical or tame, that is, kept in a moat, or in a pond near to a dwelling houſe, to ſteal ſuch is alſo felony. So it ſeemeth of ſwans unmarked, ſo long as they keep within a man's manor, or within his private rivers; or if they happen to eſcape from thence, and be purſued and taken, and brought in again. But if ſwans that are *unmarked* ſhall be abroad, and ſhall attain to their natural liberty, then the property of them is loſt; and ſo long felony cannot be committed by taking them. And yet ſuch unmarked and wild ſwans the king's officers may ſeize (being abroad) for the king's uſe by his prerogative. Alſo the king may grant them, and by conſequence another may preſcribe to have them, within a certain precinct or place.

Every perſon who ſhall take the eggs of any ſwan out of the neſt, or willingly ſpoil them in the neſt; and ſhall be convicted thereof before two juſtices, by confeſſion, or oath of two witneſſes; ſhall be committed to gaol three months, unleſs he pay to the churchwardens, for the uſe of the poor, 20s. for every egg; or after one month of his commitment, become bound by his recognizance with two ſureties in 20l. a-piece, before two juſtices, never to offend again in like manner; which recognizance ſhall be returned to the next ſeſſions. 1 *Jac. c.* 27.

But by a more ancient ſtatute, no perſon ſhall take or cauſe to be taken, on his own ground or any other man's, the eggs of any ſwan; on pain (on conviction before the juſtices of the peace) of impriſonment for a year and a day, and fine at the king's will, half to the king, and half to the owner of the ſwans. 11 *Hen.* VII. *c.* 17.—See the article Anas, vol. i. p. 515.

Of PARTRIDGE and PHEASANT.

By the 11 Hen. VII. c. 17.—It is enacted, that no perſon, of what condition he be, ſhall take or cauſe to be taken, any pheaſants or partridges by nets, ſnares, or other engines, out of his own warren, upon the *freehold* of any other perſon, without the ſpecial licence of the owner or poſſeſſioner of the ſame; on pain of 10l. half to him that ſhall ſue, and half to the owner or poſſeſſioner of the ground where they ſhall be taken.

Every perſon who ſhall ſhoot at, kill, or deſtroy, any pheaſant, or partridge, with any gun or bow; or ſhall take, kill, or deſtroy them with ſetting dogs or nets, or with any manner of nets, ſnares, engines, or inſtruments whatſoever; or ſhall take their eggs out of the neſt or ſpoil them in the neſt; ſhall on conviction before two juſtices, by confeſſion or oath of two witneſſes, be committed to gaol three months, unleſs he pay upon conviction to the church-wardens for the uſe of the poor 20s. for every pheaſant, partridge, or egg; or after one month after his commitment, become bound by recognizance with two ſureties, before two juſtices in 20l. each, not to offend again in like manner. The recognizances to be returned to the next ſeſſions. 1 *Jac. c.* 27.

And by the 7 Jac. c. 11.—Every perſon who ſhall take, kill, or deſtroy, any pheaſant or partridge, with ſetting dogs and nets, or otherwiſe with any manner of nets, ſnares, or engines, ſhall on conviction before two juſtices, by confeſſion, or oath of one witneſs, be committed to gaol for three months, unleſs he forthwith pay to the churchwardens or overſeers 20s. for every pheaſant or partridge; and further to become bound by recognizance of 20l. before one juſtice, that he ſhall not thereafter kill or deſtroy any pheaſant or partridge. The recognizance to be filed at the next ſeſſions.—And every perſon who ſhall ſell, or buy to ſell again, any partridge or pheaſant (except they be reared and brought up in houſes, or brought from beyond ſea); ſhall on conviction at the aſſizes or ſeſſions, or before two juſtices out of ſeſſions, forfeit for every partridge 10s. and for every pheaſant 20s. half to him that will ſue, and half to the poor. 1 *Jac. c.* 27.

By the 33 Eliz. c. 10.—If any perſon of what eſtate, degree, or condition ſoever, ſhall take, kill, or deſtroy, any pheaſants or partridges *in the night time*; and be thereof convicted at the aſſizes, ſeſſions, or leet; he ſhall forfeit for every pheaſant 20s. and for every partridge 10s. half to him that ſhall ſue, and half to the lord of the manor, unleſs ſuch lord ſhall licence or procure the ſaid taking or killing, in which caſe the ſaid half ſhall go to the poor, to be recovered by any one of the churchwardens; and if not paid in ten days after conviction, he ſhall be impriſoned for one month: and moreover, beſides ſuch forfeiture and impriſonment, he ſhall give bond to ſome juſtice of the peace, with good ſureties, not to offend again in like manner for the ſpace of two years.

By the 9 Anne, c. 25.—If any perſon whatſoever ſhall take, or kill any pheaſant or partridge *in the night time*; he ſhall on conviction before one juſtice, on oath of one witneſs, forfeit 5l. half to the informer, and half to the poor, by diſtreſs; for want of diſtreſs to be ſent to the houſe of correction for three months for the firſt offence, and for every other offence four months.

And by the 13 Geo. III. c. 80.—If any perſon ſhall knowingly and wilfully kill, take, or deſtroy, or uſe any gun, dog, ſnare, net, or other engine, with intent to kill, take, or deſtroy, any pheaſant or partridge *in the night*, that is between the hours of ſeven at night and ſix in the morning from the 12th day of October to the 12th day of February, and between the hours of nine at night and four in the morning from the twelfth day of February to the twelfth day of October; or, *in the day time*, on a Sunday, or Chriſtmas-day; he ſhall forfeit for the firſt offence not exceeding 20l. nor leſs than 10l. for the ſecond offence not exceeding 30l. nor leſs than 20l. for the third and every other ſubſequent offence, 50l. To be levied and recovered as the like penalties for killing

ing any hare in the night or on a Sunday and Chriſtmas-day, as is above ſet forth.

And moreover, by 39 & 40 Geo. III. c. 50.—Idle and diſorderly perſons, to the number of two or more, who ſhall deſtroy any pheaſant or partridge in the night ſhall be deemed rogues and vagabonds, and dealt with accordingly.

Every perſon whatſoever, who ſhall hawk at, deſtroy, or kill, any pheaſant or partridge, with any kind of hawk, or dog, by colour of hawking, between the firſt of July and the laſt of Auguſt, ſhall on conviction before two juſtices, by confeſſion, or oath of two witneſſes, in *ſix months* after the offence, be committed to gaol for one month, unleſs he pay upon conviction to the churchwardens or overſeers for the uſe of the poor 40s. for every ſuch hawking at any pheaſant or partridge, and 20s. for every ſuch pheaſant or partridge which he, his hawk, or dog, ſhall take or kill. 7 *Jac. c.* 11.

By the 2 Geo. III. c. 19.—No perſon ſhall, upon any pretence whatſoever, take, kill, carry, ſell, buy, or have in his poſſeſſion or uſe, any *partridge*, (ſee the article TETRAO,) between [1ſt of February and 1ſt of September, 39 Geo. III. c. 34.] or any *pheaſant* (ſee the article PHASIANUS,) between February 1, and October 1, yearly, on pain of forfeiting, on conviction by one witneſs, in any of the courts of record at Weſtminſter, 5l. for every ſuch fowl, with full coſts. But this not to extend to any pheaſant taken in the ſeaſon allowed by this act, and kept in any mew or breeding place. All theſe fines and penalties extend alike to qualified and unqualified perſons.

Of PIGEONS.

A lord of a manor may build a dove-cote upon his own land, parcel of the manor; but a tenant of a manor cannot do it without the lord's licence. 3 *Salk.* 248. But any *freeholder* may build a dove-cote on his own ground. *Cro. El.* 548. *Cro. Ja.* 382.—And it hath been adjudged that erecting of a dove-houſe is not a common nuiſance, nor preſentable in the leet. *Cro. Jac.* 490, 1.

By the 1 James, c. 17.—Every perſon who ſhall ſhoot at, kill, or deſtroy, any houſe-dove or pigeon with any gun or bow; or ſhall take, kill, or deſtroy the ſame with ſetting dogs and nets, or with any manner of nets, ſnares, engines, or inſtruments whatſoever; ſhall, on conviction before two juſtices where the offence ſhall be committed, or the offender apprehended, by confeſſion or oath of two witneſſes, be committed to gaol three months, unleſs he pay to the churchwardens, for the uſe of the poor of the pariſh where the offence was committed or the offender apprehended reſpectively, 20s. for every pigeon, or after one month after his commitment become bound by recognizance with two ſureties, before two juſtices in 20l. apiece, not to offend again in like manner. The recognizance to be returned to the next ſeſſions.

And by the 2 Geo. III. c. 29.—If any perſon ſhall ſhoot at with an intent to kill, or by any means kill, or take, with a wilful intent to deſtroy, any houſe-dove or pigeon, and ſhall be thereof convicted, by confeſſion or oath of one witneſs, before one juſtice where the offence was committed, or the party apprehended, he ſhall forfeit 20s. to the proſecutor; and if not forthwith paid, ſuch juſtice may commit him to the gaol or houſe of correction, not exceeding three calendar months nor leſs than one, unleſs the forfeiture ſhall be ſooner paid.

But this not to extend to the ſhooting at or killing *wild* pigeons, unleſs they are ſhut up in a dove-houſe for the purpoſe of being tamed or taken. 1 *Hawk. P. C. c.* 33. —Perſons convicted on this act, ſhall not be convicted on any former act: and proſecutions on this act ſhall be commenced and carried on with effect within *two months* after the offence committed; and perſons impriſoned for default of payment of the penalty, ſhall not be liable afterwards to pay ſuch penalty.

But if the pigeons come upon my land, and I kill them; the owner hath no remedy againſt me; though I may be liable to the ſtatutes which make it penal to deſtroy them. *Cro. Ja.* 492.—Doves in a dove-houſe, young and old, ſhall go to the heir, and not the executor. 1 *Inſt.* 8.—See the article COLUMBA, vol. iv. p. 815–832.

Of WILD DUCKS, WILD GEESE, AND OTHER WATER FOWL.

Every perſon who ſhall ſhoot at, kill, or deſtroy, with any gun or bow, any mallard, duck, teal, or widgeon; and the ſame be proved by confeſſion, or oath of two witneſſes, before two juſtices; ſhall be committed to gaol for three months, unleſs he pay to the churchwardens for the uſe of the poor, 20s. for each fowl, or after one month after the commitment become bound by recognizance with two ſureties, before two juſtices, in 20l. each, not to offend again in like manner: which recognizance ſhall be returned to the next ſeſſions. 1 *J. c.* 27.

No perſon, between the laſt day of May and the laſt day of Auguſt yearly, ſhall take, or cauſe to be taken, any wild ducks, mallards, widgeons, teals, or wild geeſe, with nets or other engines; on pain of a year's impriſonment, and to forfeit for every fowl ſo taken 4d. half to the king, and half to him that will ſue by action of debt: alſo the juſtices of the peace may inquire of, hear and determine the ſame, as in caſes of treſpaſs. 25 *H.* VIII. *c.* 11.—Nevertheleſs, any gentleman, or any other that may diſpend 40s. a-year of freehold, may hunt and take ſuch wild fowl with their ſpaniels only, without uſing a net or other engine except the long bow.

But by a ſubſequent ſtatute, *if any perſon whatſoever* (between June 1, and Oct. 1, yearly, 10 Geo. II. c. 32.) ſhall by hays, tunnels, or other nets, drive and take any wild duck, teal, widgeon, or any other water fowl, in any place or reſort for wild fowl in the moulting ſeaſon; and ſhall be convicted thereof before one juſtice by the oath of one witneſs; he ſhall for every ſuch fowl forfeit 5s. half to the informer, and half to the poor, by diſtreſs, rendering the overplus above the penalty and charges of diſtreſs; for want of diſtreſs, to be committed to the houſe of correction not exceeding one month, nor leſs than fourteen days, to be whipt and kept to hard labour. And the nets to be ſeized and deſtroyed in the preſence of the juſtice. 9 *An. c.* 25.

No perſon, from March 31 to June 30, yearly, ſhall take or deſtroy the eggs of any mallard, teal, or other water fowl; on pain of a year's impriſonment, and of forfeiting for every egg one penny, half to the king, and half to him that will ſue by action of debt; or the juſtices of the peace may determine the ſame as in caſes of treſpaſs. 25 *H.* VIII. *c.* 11.—See the article DECOY, vol. v. p. 648.

Of HEATH-FOWL, GROUSE, AND BUSTARDS.

Every perſon who ſhall ſhoot at, kill, or deſtroy, with any gun or bow, any grouſe, heath-cock, or moor-game, (during the ſeaſon prohibited,) ſhall on conviction before two juſtices, by confeſſion, or oath of two witneſſes, be committed to gaol for three months, unleſs upon conviction he pay to the churchwardens for the uſe of the poor, 20s. for each fowl, or after one month after his commitment become bound by recognizance, with two ſureties in 20l. each, before two juſtices, not to offend again in like manner: the recognizance to be returned to the next ſeſſions. 1 *J. c.* 27.

No perſon ſhall, upon any pretence whatſoever, wilfully take, kill, deſtroy, carry, ſell, buy, or have in his poſſeſſion or uſe, any heath-fowl commonly called *black game*, between Dec. 10, and Aug. 20; nor any grouſe commonly called *red game*, between Dec. 10, and Aug. 12; nor any *buſtard*, between Mar. 1, and Sept. 1, in any year; on pain of forfeiting for the firſt offence any ſum not exceeding 20l. nor leſs than 10l. and for the ſecond and every ſubſequent offence, not exceeding 30l. nor

leſs

leſs than 20l. half to the informer, and half to the poor. 13 *Geo.* III. *c.* 55.—And perſons taking or killing in the New Foreſt, Hants, any *black game*, between Dec. 10 and Sept. 1, ſhall be liable to the forfeiture of the 13 *Geo.* III. *c.* 55. 43 *Geo.* III. *c.* 112.

To be recovered in any of his majeſty's courts of record at Weſtminſter, on proſecution within *ſix calendar months* after the offence committed.—Or the ſame may be recovered before one juſtice, information on oath being made before him within *three calendar months* after the offence committed; which ſaid juſtice may convict the offender by confeſſion, or oath of one witneſs: and on neglect or refuſal to pay, ſhall levy the ſame by diſtreſs, together with all coſts and charges attending the ſame. And ſuch juſtice may order the offender to be detained in ſafe cuſtody, until return may conveniently be had to the warrant of diſtreſs, unleſs the ſaid offender ſhall give ſecurity, by recognizance or otherwiſe, to the ſatisfaction of ſuch juſtice, for his appearance before him on the day appointed for the return of the warrant of diſtreſs, ſuch day not exceeding five days from the time of taking ſuch ſecurity. And if no ſufficient diſtreſs can be had, ſuch juſtice ſhall commit the offender to the common gaol or houſe of correction, there to be kept to hard labour for any time not exceeding ſix nor leſs than three calendar months, unleſs the forfeiture, and all coſts and charges attending the proſecution, be ſooner paid.

And if any perſon ſhall think himſelf aggrieved, he may appeal to any general quarter ſeſſions to be holden within four calendar months after the cauſe of complaint ſhall ariſe, giving fourteen days' notice in writing to the juſtice and to every other perſon againſt whom complaint ſhall be made; and in four days after ſuch notice, entering into recognizance before a juſtice with one ſufficient ſurety, conditioned to try the appeal at, and abide the order of, and pay ſuch coſts as ſhall be awarded by the juſtices at ſuch ſeſſions. And the juſtice having received notice of appeal, ſhall return all proceedings had before him, touching the matter of the ſaid appeal, to the juſtices at ſuch ſeſſions. And the ſaid juſtices upon proof of the notice given, and of the entering into ſuch recognizance, ſhall determine the appeal in a ſummary way, and award coſts to either party. And none of the proceedings ſhall be quaſhed for want of form, nor removed by *certiorari* or other proceſs into any of the courts at Weſtminſter.

By the 9 Anne, c. 25.—If any perſon whatſoever ſhall take or kill, any moor, heath-game, or grouſe, *in the night-time*; he ſhall, on conviction before one juſtice, on the oath of one witneſs, forfeit 5l. half to the informer, and half to the poor, by diſtreſs; for want of diſtreſs, to be ſent to the houſe of correction for three months for the firſt offence, and for every other offence four months.

And by the 13 Geo. III. c. 80.—If any perſon ſhall knowingly and wilfully kill, take, or deſtroy, or uſe any gun, dog, ſnare, net, or other engine, with intent to kill, take, or deſtroy, any moor-game or heath-game, *in the night*, viz. between the hours of ſeven at night and ſix in the morning, from the 12th day of October to the 12th day of February; and between the hours of nine at night and four in the morning, from the 12th day of February to the 12th day of October, or, in the day time, on a Sunday or Chriſtmas-day: he ſhall forfeit for the firſt offence not exceeding 20l. nor leſs than 10l. for the ſecond offence not exceeding 30l. nor leſs than 20l. for the third and every other ſubſequent offence, 50l. To be levied and recovered as the like penalties for killing any hare in the night, or on a Sunday or Chriſtmas-day, as is above ſet forth. And by 39 & 40 Geo. III. *c.* 50. idle and diſorderly perſons amounting to two or more, who ſhall deſtroy or attempt to deſtroy any *black game*, or *red game*, (grouſe,) or any other game, in the night, ſhall be deemed rogues and vagabonds.

For the better preſerving the red and black game of grouſe commonly called heath-cocks, or heath-polts, no perſon whatſoever on any mountains, hills, heaths, moors, foreſts, chaſes, or other waſtes, ſhall preſume to burn, between February 2 and June 24, any grig, ling, heath, furze, goſs, or fern; on pain of being committed to the houſe of correction, for any time not exceeding one month, nor leſs than ten days, there to be whipt and kept to hard labour. 4 & 5 *W.* *c.* 23.—However, as there is no method of conviction directed for this offence, the juſtices of the peace ſeem to have no cognizance of it; but the trial and conviction muſt be at the aſſizes, or in the courts at Weſtminſter.—See the article TETRAO.

OF HERONS.

Every perſon who ſhall ſhoot at, kill, or deſtroy, any heron, with gun or bow, ſhall, on conviction before two juſtices, by confeſſion or oath of two witneſſes, be committed to gaol for three months, unleſs on conviction he pay to the churchwardens for the uſe of the poor, 20s. for each heron, or after one month from his commitment, become bound by recognizance with two ſureties in 20l. each, before two juſtices, not to offend again in like manner: the recognizance to be returned to the next ſeſſions. 1 *J.* *c.* 27.

No perſon, without his own ground, ſhall flea, take, or cauſe to be taken, by means of craft or engine, any herons, unleſs it be with hawking, or with long bows; on pain of ſix ſhillings and eight-pence to him who ſhall ſue by action of debt: or the ſeſſions may call before them perſons ſuſpected, and examine them; and if found in default, may commit them till they have found ſurety for payment of the forfeiture to the king; and the juſtices ſhall have the tenth part of the forfeiture for their labour. 19 *H.* VII. *c.* 11.—And no perſon, without his own ground, ſhall take any young herons out of the neſt; on pain of 10s. in like manner, for every young heron. 19 *H.* VII. *c.* 11.

And if any perſon, from March 31 to June 30, ſhall take or deſtroy the eggs of any heron; he ſhall be impriſoned for a year, and forfeit for every egg eight-pence, half to the king, and half to him that will ſue by action of debt, or before the juſtices of the peace. 25 *H.* VIII. *c.* 11.

OF HAWKS.

No man ſhall bear any hawk of the breed of England, called a nyeſſe, goſhawk, taſſel, laner, laneret, or faulcon, on pain of forfeiting his hawk to the king. And if he bring any of them over ſea, he ſhall bring a certificate thereof from the officer of the port: on the like pain of forfeiting the ſame to the king. And the perſon that bringeth any ſuch hawk to the king, ſhall have a reaſonable reward of the king, or elſe the hawk for his labour. 11 *H.* VII. *c.* 17.

Every perſon who findeth a faulcon, tercelet, laner or laneret, or other hawk that is loſt, ſhall preſently bring the ſame to the ſheriff; and the ſheriff ſhall make proclamation in all the good towns in the county that he hath ſuch an hawk in his cuſtody; and if he is challenged in four months, the owner ſhall have him again, paying the coſts; if he is not challenged in four months, the ſheriff ſhall have him, making gree to him that took him, if he be a ſimple man; but if he be a gentleman, and of eſtate to have the hawk, then the ſheriff ſhall re-deliver to him the hawk, taking of him reaſonable coſts for the time that he had him in his cuſtody. 34 *Ed.* III. *c.* 22.

And if any man ſteal any hawk, and the ſame carry away, not doing the ordinance aforeſaid, it ſhall be done of him as of a thief that ſtealeth a horſe or other thing, 37 *Ed.* III. *c.* 19. that is, he ſhall be guilty of felony, but ſhall have his clergy. 3 *Inſt.* 98.—Or if any perſon ſhall take away any hawks or their eggs, by any means unlawfully out of the woods or ground of any perſon, and be thereof convicted at the aſſizes or ſeſſions, on indict-

ment, bill, or information, at the ſuit of the king, or of the party; he ſhall be impriſoned three months, and ſhall pay treble damages; and after the three months expired, ſhall find ſureties for his good abearing for ſeven years, or remain in priſon till he doth. 5 *El. c.* 21.

But by a more ancient ſtatute, no man ſhall take any ayre, faulcon, goſhawk, taſſel, laner, or laneret, in their warren, wood, or other place; nor purpoſely drive them out of their coverts accuſtomed to breed in, to cauſe them to go to other coverts to breed; nor ſlay them for any hurt done by them: on pain of 10l. half to him that will ſue before the juſtices of the peace, and half to the king. And no manner of perſon of what condition or degree he be, ſhall take or cauſe to be taken, on his own ground or any other man's, the eggs of any faulcon, goſhawk or laner, out of the neſt; on pain (being convicted thereof before the juſtices of the peace) of impriſonment for a year and a day, and fine at the king's will; half to the king, and half to the owner of the ground where the eggs were taken. 11 *H.* VII. *c.* 17.

If any manner of perſon ſhall hawk in another man's corn, after it is eared, and before it is ſhocked; and be convicted at the aſſizes, ſeſſions, or leet; he ſhall forfeit 40s. to the owner: and if not paid in ten days, he ſhall be impriſoned for a month. 23 *El. c.* 10.

In general; no manner of perſon, from the laſt day of March to the laſt day of June yearly, ſhall by day or night, take or deſtroy any eggs of any kind of wild fowl, from or in any neſt or place, where they ſhall chance to be laid by any kind of the ſame wild fowl; on pain of impriſonment for a year, and to forfeit for every egg of a buſtard 20d. of a bittour or ſhovelard 8d. and of other wild fowl (except crows, ravens, boſcards, and other fowl not uſed to be eaten) 1d. half to the king, and half to him that will ſue by action of debt. Alſo the juſtices of the peace may determine the ſame, as in caſes of treſpaſs. 25 *Hen.* VIII. *c.* 11.

With regard to fowl not uſed to be eaten, together with certain other noxious animals, there were proviſions made by an ancient ſtatute, viz. 8 Eliz. c. 15. intitled, *an Act for the preſervation of graine*, which it were to be wiſhed might be revived with a proper conſideration of the difference of the value of money betwixt that time and the preſent; by which it was required, that the churchwardens ſhould levy by an aſſeſſment, and pay for the heads of every three old crowes, choughes, or rookes, 1d. of ſixe young crowes, choughes, or rookes, 1d. and for every ſixe egges of any of them, 1d. for every twelve ſtares heads, 1d. for every heade of merten, hawks, fureſekytte, moldkytte, buſarde, chagge, carmeraunt, or ryngtayle, 2d. and for two egges of them 1d. for every iron or oſpray's heade, 4d. for the heade of every wood wall, pye, jay, raven, kyte, or king's fiſher, 1d. bulfynce, or other bird that devoureth the blowth of fruit, 1d. for the heade of every foxe or graye 12d. and for the heade of every fytchewe, polcate, weſel, ſtote, fayre, bade, or wylde cat, 1d. for the head of every otter or hedgehogge, 2d. for the heades of three rattes or twelve miſe, 1d. for the heade of every want or moldwarp, one halfpenny.—And by another ancient ſtatute 24 H. VIII. c. 10. Every townſhip was required to keep a crow net, to deſtroy crows, rooks, and choughs.

There is a faint ſhadow of theſe regulations ſtill remaining in ſome pariſhes, where they give a reward for deſtroying ſeveral of the abovementioned noxious fowl and vermin. Theſe ſtatutes were ſuffered to grow into diſuſe, probably becauſe in a ſhort time there would be no need of their continuance; but it might be convenient nevertheleſs, to revive the like proviſions from time to time; and among the reſt of the ravenous tribe, to ſet a price upon the head of the FALCON, that diſtinguiſhed fowl, for the ſake of which moſt of the ancient laws concerning the winged game were enacted, and which it was felony to deſtroy. The current having received a contrary direction, the hawk himſelf now perhaps deſtroys more game than gunpowder and hailſhot which have uſurped his empire.—See the article FALCONRY, vol. vii. p. 197—199.

Of the QUALIFICATION for killing GAME.

On this much-conteſted ſubject ſir William Blackſtone writes as follows: "The offence of deſtroying ſuch beaſts and fowls, as are ranked under the denomination of *game*, we may remember, upon the old principles of the foreſt law, is a treſpaſs and offence in all perſons alike, who have not authority from the crown to kill game, (which is royal property,) by the grant of either a free warren, *or at leaſt a manor of their own.* But the laws, called the *Game Laws*, have inflicted additional puniſhments on perſons guilty of this general offence, unleſs they be people of ſuch rank or fortune as is therein particularly ſpecified. All perſons therefore, of what property or diſtinction ſoever, that kill game out of their own territories, or even upon their own eſtates, *without the king's licence*, expreſſed by the grant of a franchiſe, are guilty of the firſt original offence, of encroaching on the royal prerogative. And thoſe indigent perſons who do ſo, without having ſuch rank or fortune as by the game laws is called a *qualification*, are guilty not only of the *original* offence, but of the aggravations alſo, created by the ſtatutes for preſerving the game: which aggravations are ſo ſeverely puniſhed, and thoſe puniſhments ſo implacably inflicted, that the offence againſt the king is ſeldom thought of, provided the delinquent can make his peace with the lord of the manor. But the only rational footing upon which we can conſider it as a crime, is, that in low and indigent perſons it promotes idleneſs, and takes them away from their proper employments and callings: which is an offence againſt the public police and economy of the commonwealth.

"The ſtatutes for preſerving the game are many and various, and not a little obſcure and intricate; it being remarked, that in one ſtatute only, 5 Ann. c. 14. there is falſe grammar in no fewer than ſix places, beſides other miſtakes: the occaſion of which, or what denomination of perſons were probably the penners of theſe ſtatutes, I ſhall not at preſent inquire. It is in general ſufficient to obſerve, that the *qualifications* for killing game, as they are uſually called, or more properly the *exemptions* from the penalties inflicted by the ſtatute law, are, 1. The having a freehold eſtate of 100l. per annum; there being fifty times the property required to enable a man to kill a partridge, as to vote for a knight of the ſhire: 2. A leaſehold for ninety years of 150l. per annum: 3. Being the ſon and heir apparent of an eſquire, (a very looſe and vague deſcription,) or perſon of ſuperior degree: 4. Being the owner, or keeper, of a foreſt, park, chaſe, or warren. For unqualified perſons tranſgreſſing theſe laws, by killing game, keeping engines for that purpoſe, or even having game in their cuſtody, or for perſons (however qualified) that kill game, or have it in poſſeſſion, at unſeaſonable times of the year, or unſeaſonable hours of the day or night, as killing it on Sundays, or on Chriſtmas-day, there are various penalties aſſigned, corporal and pecuniary, by different ſtatutes; on any of which, but only on one at a time, the juſtices may convict in a ſummary way, or proſecutions may be carried on at the aſſiſes. And, laſtly, by ſtatute 28 Geo. III. c. 12. no perſon, however qualified to *kill*, may make merchandize of this valuable privilege, by *ſelling* or expoſing to ſale any game, on pain of like forfeiture as if he had no qualification; but a perſon qualified to kill, is not ſubject to any penalty for *buying* game."

It is not neceſſary that the eſtate ſhould be a freehold, for copyhold, or an equitable eſtate of *inheritance* of the clear value of 100l. per annum, is a qualification. But it is not ſufficient, if the value of the eſtate is reduced

below that ſum by the intereſt of a mortgage. A *life*-eſtate, as a church benefice, muſt be of the clear annual value of 150l. The eldeſt ſon of an eſquire, or of any perſon of higher degree, is qualified without any eſtate, whilſt his father is living; but the father himſelf, though an eſquire, doctor, knight, or perſon of ſtill higher rank, is not qualified without having the eſtate required by the ſtatute.

But ſince many ancient laws relating to the game are ſtill in force, and are generally enacted ſo to be by the ſubſequent ſtatutes, it will be neceſſary, in order to have a thorough knowledge of the ſubject, to infert them in their order, becauſe the penalties on each being different, the proſecutor, or the magiſtrate, may chuſe which of them they will convict an offender upon. Thus by the ſtatute of the 5 Anne, if a perſon not having 100l. a-year ſhall keep dogs or engines to deſtroy the game, he ſhall forfeit 5l. but if ſuch perſon have not 40s. a-year he may upon the ſtatute of Rd. II. be puniſhed by a year's impriſonment; and ſo of the reſt: provided, as obſerved above, that no perſon be proſecuted upon more than one act for one offence.

The firſt qualification relating to the game was in the 13th year of the reign of Richard II. by which it is enacted, that no layman which hath not lands or tenements of 40s. a-year, nor clergyman if he be not advanced to 10l. a-year, ſhall have or keep any grey-hound, hound, nor other dog to hunt; nor ſhall uſe ferrets, hays, nets, hare-pipes, nor cords, nor other engines, for to take or deſtroy hares nor conies, nor other gentlemen's game: on pain of a year's impriſonment. And the juſtices of the peace (that is, in their ſeſſions) ſhall inquire of the offenders in this behalf, and puniſh them by the pain aforeſaid. 13 *Rd.* II. *ſt.* 1. *c.* 13. 16 *Geo.* III. *c.* 30.

The next qualification by eſtate or degree to kill game, was by a ſtatute in the 1 James, whereby it is enacted that every perſon who ſhall keep any greyhound for courſing of deer or hare, or ſetting-dog or net to take pheaſants or partridges, (except he be ſeiſed, in his own right or the right of his wife, of 10l. a-year eſtate of inheritance, or 30l. a-year of a lives eſtate, or goods to the value of 200l. or be the ſon of a knight or lord, or the ſon and heir apparent of an eſquire,) and be thereof convicted by confeſſion, or oath of two witneſſes, before two juſtices, he ſhall be committed to gaol three months, unleſs upon conviction he pay 20s. to the churchwardens for the uſe of the poor, or after one month after his commitment he become bound by recognizance with two ſureties before two juſtices, in 20l. a-piece, not to offend again in like manner. 1 *J.* *c.* 27.

The next qualification relates to deer and conies only, in ſtat. 3 James, by which it is enacted, that if any perſon not having hereditaments of 40l. a-year, or not worth in goods 200l. ſhall uſe any gun or bow to kill any deer or conies; or ſhall keep any buckſtall, nets, or coney dogs, (except he have grounds incloſed, and uſed for the keeping of deer or conies, the increaſing of which ſaid conies ſhall amount to the value of 40s. a-year; or keepers or warreners in their parks, warrens, or grounds;) in ſuch caſe any perſon having lands or hereditaments of 100l. a year in fee, or for life, in his own right or the right of his wife, may take from ſuch perſon to his own uſe for ever ſuch guns, bows, buckſtalls, nets, and coney dogs. 3 *J.* *c.* 13.

The next qualification relates to pheaſants and partridges only, and is as follows: every free warrener, lord of a manor, or freeholder ſeiſed in his own or his wife's right of 40l. a-year of inheritance, or lives eſtate of 80l. or worth in goods 400l. may take pheaſants and partridges (in the day time only) in his own free warren, manor, or freehold, betwixt Michaelmas and Chriſtmas yearly. 7 *J.* *c.* 11.—Theſe, ſir William Blackſtone aſſerts, are the only *two* inſtances wherein an expreſs *permiſſion* to kill game, was ever given by ſtatute law. But Mr. Chriſtian remarks, that "what the learned judge has here ſtated reſpecting the *firſt* permiſſion, has ariſen from a miſconception of the ſubject. The firſt qualification act is the 13 Richard II. c. 13, the title of which is "None ſhall hunt but they who have a ſufficient living." The preamble ſtates, that divers artificers, labourers, ſervants, and grooms, keep grey-hounds and dogs, and on the holydays, when good chriſtian people be at church hearing divine ſervice, they go a hunting in parks, and warrens, and connigrees of lords and others, to the very great deſtruction of the ſame, and ſometime under ſuch colour they make their aſſemblies, conferences, and conſpiracies for to riſe and diſobey their allegiance; it is therefore ordained, that no artificer, labourer, or other layman, which hath not lands or tenements to the value of 40s. by the year, nor any prieſt to the value of 10l. ſhall keep any dogs, nets, nor engines, to deſtroy deer, hares, nor conies, nor other gentlemen's game, upon pain of one year's impriſonment.—This ſtatute clearly admits and reſtrains their *former* right: the 1 Jac. I. c. 27, which ſeems intended for the encouragement of hawking, the moſt honourable mode of killing game at that time, begins with a general prohibition to all perſons whatever to kill game with guns, bows, ſetting dogs, and nets; but there is afterwards a proviſo in the act, that it ſhall and may be lawful for perſons of a certain deſcription and eſtate to take pheaſants and partridges, upon their own lands, in the day-time, with nets. This proviſo and permiſſion clearly refers to the preceding prohibition introduced by the ſtatute, and by no means gives a *new* permiſſion to the perſons thus qualified, which they did not poſſeſs antecedently to that ſtatute. Thoſe, therefore, who will take the trouble to examine the ſtatute, will be convinced of the truth of this remark; and that the correction of this error alone will contribute in ſome degree to the refutation of the doctrine which the learned judge has advanced in this and other parts of the commentaries, viz. that all the game in the kingdom is the property of the king or his grantees, being uſually the lords of manors."

The laſt general qualification by eſtate or degree to kill game, and which is now moſt to be regarded, is in 22 & 23 Charles II. c. 25. by which it is enacted, that every perſon, not having lands and tenements or ſome other eſtate of inheritance, in his own or his wife's right, of the clear yearly value of 100l. or for term of life, or having leaſe or leaſes of ninety-nine years, or for any longer term, of the clear yearly value of 150l. (other than the ſon and heir apparent of an eſquire, or other perſon of higher degree, and the owners and keepers of foreſts, parks, chaſes, or warrens, being ſtocked with deer or conies for their neceſſary uſe, in reſpect of the ſaid foreſts, parks, chaſes, or warrens,) is hereby declared to be a perſon, by the laws of this realm, not allowed to have or keep for himſelf or any other perſon, any guns, bows, greyhounds, ſetting dogs, ferrets, coney dogs, lurchers, hays, nets, lowbels, harepipes, gins, ſnares, or other engines aforeſaid, but ſhall be and are hereby prohibited to have, keep, or uſe, the ſame.

QUALIFICATION BY ESTATE OF 100l. BUT MORTGAGED.—CASE of Wethrell and Hall, *Mich. Term*, 23 Geo. III. On an action againſt the defendant, for the penalty of 5l. for uſing a gun to kill and deſtroy the game, not being a perſon qualified ſo to do, the cauſe was tried at Durham aſſizes in 1782, when the jury found a verdict for the plaintiff, ſubject to the opinion of the court of king's bench, on the following caſe:—The defendant Hall, having an eſtate of 103l. a-year, mortgaged a part of it, of the value of 14l. a-year, to Robert Kelſey, for 400l. which part being copyhold, he ſurrendered the ſame, according to the cuſtom of the manor, to the ſaid Robert Kelſey, who thereupon was admitted tenant. But Kelſey never entered upon the premiſes; Hall continuing in poſſeſſion, and paying intereſt of the mortgage regularly. The queſtion for the opinion of the court was, whether the defendant was duly qualified to uſe

engines

engines to kill and deſtroy game?—Lambe for the plaintiff contended, firſt, that a *legal* eſtate of 100l. a-year, was neceſſary to conſtitute a qualification: that here the defendant had no more than an *equitable* eſtate in the part mortgaged; and that ſuch eſtate cannot be taken notice of by a court of law in the conſtruction of an act of parliament. Lord Mansfield intimating that it would be difficult to ſupport this ground of argument, Mr. Lambe inſiſted, ſecondly, that if an *equitable* eſtate were conſidered as giving a qualification, ſtill in point of annual value the defendant had not, upon the true conſtruction of the act, an eſtate ſufficient to qualify him: that the words of the act were, the clear yearly value of 100l. that this could not mean the groſs value of the eſtate, but muſt mean the net income; that ſuch it could not be, if, by incumbrances of any ſort, the iſſues and profits were brought within that ſum; that the object of the legiſlature was, to entitle thoſe only, whoſe independence, ariſing from the produce of their lands, would enable them to uſe theſe rights for the purpoſe of amuſement; that upon comparing the value of land at the time this law paſſed with its preſent value, it would be found that the meaſure of this independence had already been reduced much below the intention of the legiſlature; that if the conſtruction contended for were admitted, no degree of intereſt whatſoever in the produce of lands would be neceſſary, and the intention of the legiſlature muſt be totally fruſtrated, inaſmuch as the holder of an eſtate, whether he charged it himſelf to its utmoſt value, or had it transferred to him under ſuch charge, without having, or without ever having had, an income ariſing out of land to the amount of one farthing, muſt in ſuch caſe be entitled.—Lord Mansfield calling on the other ſide, Chambre for the defendant, ſtated the only queſtion to be, whether the intereſt of the mortgage was to be conſidered as ſuch a reduction of the annual value of the eſtate as would deſtroy the defendant's qualification? and contended, that this being a penal law, could not be extended by conſtruction; that it was beſides a general law, and in its terms does not require the party to have a *legal* eſtate. That the mortgage is in ſubſtance a ſpecialty debt, the equity of redemption is conſidered as a real eſtate, and deſcends to the heir of the mortgagor; who is conſidered as a debtor, and his perſonal aſſets liable in the firſt inſtance to diſcharge the mortgage; and though at law the heir of the mortgagee takes a legal eſtate, yet the perſonal repreſentatives are conſidered as entitled to receive the mortgage debt. And further inſiſted, that a mortgagee can never get poſſeſſion, if the mortgagor is ready to pay the money: and that by 7 Geo. II. c. 20. it may be paid *impendente lite*: and that if the legal eſtate only were to be regarded, an eſtate of 1000l. a-year, mortgaged in fee for 100l. would not furniſh a qualification. That the only remaining queſtion was, whether the intereſt of the mortgage money was to be conſidered as an outgoing that would reduce the value of the eſtate below 100l. and he contended, that the intereſt was not a thing iſſuing out of any part of the eſtate in the nature of a rent or ſervice; that both principal and intereſt were a debt; that the intereſt muſt be conſidered as a debt on the perſonalty, juſt as the principal is conſidered as a debt; and that the eſtate was neither made of greater or leſs value by the mortgage, but was merely a pledge for the payment of the debt; that the legiſlature, therefore, when they uſed the words *clear yearly value*, meant to advert only to the value of the eſtate itſelf, and not to the quantity of intereſt that any perſon might have in it, the thing itſelf, without any regard to the charge upon it, provided only that the party was in poſſeſſion. That in the ſame manner, in the caſe of a mortgagee in poſſeſſion, there can be no doubt but that he is entitled to kill game; and the court in ſuch caſe will not enquire into the amount of the intereſt money of the ſum advanced to the mortgagor upon his land, provided the ſecurity, the land itſelf, be of the annual value the law requires; that the court would well weigh the conſequences of ſuch a doctrine as is contended for; that the juſtices, who muſt enquire into this in a ſummary way, muſt make all perſons, of whatever oſtenſible eſtate, diſcloſe their private circumſtances; which would be too great an extenſion of a law already conſidered in many inſtances as tyrannical; that a rent charge indeed, or ſervices iſſuing out of an eſtate, as matters of notoriety, might perhaps be conſidered by the juſtices; but of ſuch things only as were oſtenſible could they take cognizance; that if every private tranſaction in money concerns were to be laid open, if it could be ſeriouſly argued that ſuch diſcuſſions were proper ſubjects for a ſummary juriſdiction, it would be inveſting juſtices and informers with powers of haraſſing the country as far beyond any known precedent, as it was beyond the intention of the legiſlature; that their object had not been at any time an enquiry into debts, but the actual poſſeſſion of, and intereſt in, landed property, and the viſible amount of that property; that with reſpect to chooſing knights of the ſhire, the legiſlature have declared by ſeveral ſtatutes, that the mortgagor or *ceſtuy que truſt* in poſſeſſion may vote for ſuch eſtates, notwithſtanding ſuch mortgage or truſt.—Buller J. But he muſt ſwear that he has 40s. a-year above every charge payable in reſpect of them.—Chambre. But this is by the expreſs proviſion of ſubſequent ſtatutes. 13 Geo. II. c. 8. and 19 Geo. II. c. 28.—Lord Mansfield. The privilege here is given to property, and the *ceſtuy que truſt*, the mortgagor, is really the owner; the truſtee, the mortgagee, is merely nominal. We conſider the defendant's intereſt in this court juſt as it would be conſidered in a court of equity: it is an intereſt ſubject to the payment of the mortgage; it is a qualification of property; and though it is not neceſſary that he ſhould have a legal eſtate, he muſt have ſuch property in the land as ſhall produce a clear income of 100l. per annum; or it might be carried ſo far, as that he might have nothing and yet enjoy the privilege. What then are a mortgagor and mortgagee in chancery? one the owner, and the other as having a charge upon the land; and the charge goes along with it.—Buller J. In the caſe of rent-charges the cognizance of the juſtice is admitted; and in many others they muſt interfere, as in contracts between landlord and tenant. Neither is there any pretence on the part of the defendant to complain of hardſhip. Poſſeſſion is *prima facie* evidence of property: the defendant, therefore muſt be preſumed to be the entire owner: the hard taſk lies upon the other party; who muſt make proof of the contrary. If the juſtice may receive proof of rent-charges and ſervices, what ſhould prevent his doing the like as to mortgages? The only point then is, whether the words *clear yearly value*, mean, *clear yearly value to the perſon in poſſeſſion?* The words of this act would of themſelves leave little room for doubt; but when explained and ſupported by the ſtatutes of James in *pari materia*, the words of which are, *over and above all charges and reprifes*, it can no longer admit of a queſtion, but that it muſt mean *clear value* to the perſon in poſſeſſion; for by the common rule of conſtruction, all ſtatutes upon the ſame ſubject are conſidered as making one ſyſtem of law, and conſequently the words in the two laſt ſtatutes muſt be referred to the ſtatute in queſtion. Willes and Aſhhurſt Js. concurred. Judgment for the plaintiff. *Cald. Caſ.* 230.

QUALIFICATION DISPROVED BY A RETURN ON THE PROPERTY TAX.—Caſe of the K. *v.* Clarke, *Eaſter Term*, 39 Geo. III.—This was a conviction on 5 Anne, for keeping and uſing a greyhound for the deſtruction of game without being duly qualified. The conviction was in the uſual form, negativing ſpecifically each of the qualifications enumerated in 22 & 23 Car. II. The conviction then proceeded as follows: "And it duly appears to us the ſaid juſtices in the preſence of the ſaid defendant, that on the 22d of March, 1798, at, &c. before

fore A. B. and C. D. commiſſioners appointed by an act for granting to his majeſty an aid and contribution for the proſecution of the war, then and there acting as ſuch commiſſioners, did make a declaration in writing, ſigned by him, that his *annual income* did not exceed 50l. and being examined upon oath, depoſed that the value of the whole lands, tenements, and eſtate of the ſaid defendant was then 70l. a-year and no more; and that 17l. a-year intereſt money was then payable out of the ſaid lands; and claimed to be allowed the ſame as intereſt paid for money charged upon the ſaid lands; and the ſame was allowed. And the defendant admits that he made the ſaid declaration and claim of allowance; and that the value of his ſaid lands, &c. has not increaſed ſince the time of making ſuch declaration, and that he has not ſince the ſaid 22d of March acquired other lands, and that the 17l. a-year intereſt money is ſtill payable out of the ſaid lands, &c." The conviction next proceeded to ſtate, that the defendant, being called upon to make his defence, ſaid that he was poſſeſſed of an eſtate in the pariſh of Whitgift of the yearly value of 100l. and upwards, and produced a witneſs, who ſaid that he knew the defendant's ſaid eſtate, and he thought it worth 100l. a-year, and that he would give 100l. a-year and upwards for it, but admitted that he would not ſwear that the defendant's ſaid eſtate was worth 100l. a-year *clear of repriſes*.—*Per curiam*. It muſt be taken *pro confeſſio* that the defendant at the time mentioned in the conviction, when he was before the commiſſioners on the amount of his income, had not then an eſtate of 100l. a year in value; it is evidence out of his own mouth; and the witneſs adduced by him did not contradict this, even if he were credited to the full extent of what he depoſed; for he would not undertake to ſay that the eſtate was of that value *clear of repriſes*; and as to the deductions being on account of ſimple contract debts, the contrary appears by the defendant's own ſhewing; for he claimed the allowance before the commiſſioners for the intereſt of money *charged upon his eſtate*. Conviction affirmed. *D. & E.* 8 V. 220.

By Estate for term of life.—It hath been doubted upon theſe words, in what order of qualification an eccleſiaſtical living ſhall be ranked, which a man holds not in his own or his wife's right, but in the right of his church. It is allowed to be a life eſtate, although it may happen to be determined ſooner, as by reſignation, deprivation, or accepting another living incompatible. But the queſtion is, whether theſe words ſhall belong to the former or the latter part of the ſentence? The difficulty ſeems to be partly occaſioned by the diſjointed manner of punctuation. But the points are no part of the ſtatute; the ſtatutes themſelves are without points; the punctuation is only made by the printer. Abſtracted from the punctuation, it ſhould ſeem that the former part of the ſentence, reſpecting the qualification of 100l. a-year by an eſtate of inheritance, ought to terminate with the words per annum. And that a life eſtate, being of inferior quality, ought to be coupled with leaſehold, whereof 150l. a-year is neceſſary to conſtitute a qualification. And ſo it was determined in the caſe of Lowndes, eſq. *v.* Lewis, clerk, that a life eſtate of leſs than 150l. per annum is not a qualification to kill game. *Cald. Caſ.* 183.

By Lease of ninety-nine years of 150l. yearly value.—An eſtate of the value of 150l. per annum, holden by the party in his own right, under a leaſe for ninety-nine years to truſtees, if he and others ſhould ſo long live, is a ſufficient qualification; and leaſes of this kind have always been ſo deemed. Earl Ferrers *v.* Henton. *D. & E.* 8 V. 506.

By being the son and heir apparent of an esquire.—Eſquire is a name of dignity next above the common title of gentleman, and below a knight. Heretofore he was attendant, and had employment as a ſervant, waiting on ſuch as had the order of knighthood, bearing their *ſhields*, and helping them to horſe, or ſuch like. See the article Esquire, vol. vii. p. 20. And this title is of that nature with us now, that to whomſoever either by blood, or place in the ſtate, or other eminency, we conceive ſome higher attribute ſhould be given than that ſole title of gentleman, knowing yet that he hath no other honorary title legally fixed on him, we uſually ſtile him *an eſquire*, in ſuch paſſages as require legally that his degree or ſtate be mentioned. *Seld. Tit. of Hon.* 374, &c.

Or Person of higher degree.—In the order of precedence, the heralds, next below knights and their ſons, and above eſquires, rank colonels, ſerjeants at law, and doctors in the three learned profeſſions. 1 *Blackſt. Comm.* 405.—In the caſe of K. *v.* Utley, upon an information on the game laws, and a conviction of the defendant on the ſtat. of Car. II. as "not being the eldeſt ſon of an eſquire, or *of* other perſon of higher degree," Chambre moved to quaſh this information on the inſertion of the word *of*; and contended, that though this was copied from precedent, yet it was not warranted in law, for that by this conſtruction, neither an eſquire or a knight would be qualified as ſuch.—Buller J. ſaid, that the legiſlature ſeemed to him to have taken it for granted, that an eſquire or other perſon of higher degree would have a ſufficient eſtate to qualify him, and therefore they had neglected to do it expreſsly; though there was a caſe in Lord Hardwicke's time, where the word *of* was rejected, and no notice taken. However he was of opinion that the conviction ſhould be affirmed: and it was ſo. *D. & E.* 1 V. 413.

Case of Jones *v.* Smart, *Mich. T.* 26 Geo. III.—This was an action to recover a penalty for killing game, by 5 & 9 An. *not being duly qualified*. The queſtion was, whether a diploma from St. Andrew's in Scotland appointing the defendant *doctor of phyſic*, gave him a qualification under 22 & 23 Car. 2. c. 25. to kill game? Conſte for the plaintiff argued, that ſuppoſing him to have the ſame rank as a doctor of the Engliſh univerſities, yet he is not ſuch a character as was meant to be qualified by the ſtatute of Car. II. The qualification claimed muſt be derived from conſtruing the words *or other perſon of higher degree* in the nominative caſe, and ſuppoſing that every perſon of higher degree than an eſquire is thereby qualified. That this is not a true conſtruction of the ſtatute is clear by the caſe of K. *v.* Utley, 24 Geo. III. And ſuppoſing the doctors of the two Engliſh univerſities have the right contended for by the preſent defendant, which is a very doubtful matter, yet this diploma does not confer ſuch a right. There is no inſtance in which foreign diplomas and degrees have been acknowledged here, and there is a great difference between degrees acquired by long labour and reſidence, and one beſtowed in a ſummary manner. 8 *Rep.* 114. Dr. Bonham's caſe. And by the union, it does not follow that perſons having taken Scotch degrees are to be endowed with all the privileges of Engliſh degrees. Dr. Gilbert, having taken his degree of D. D. in Scotland, wiſhed to preach at Oxford in his proper habit as doctor, but was not allowed: and Dr. Pitcairn accepted a degree at our univerſities, although he had before taken the ſame degree in Scotland.—Erſkine in reply made three queſtions; 1ſt. Whether on the conſtruction of 22 & 23 Car. II. every perſon as a member of the civil ſtate, who is an eſquire or ſuperior in rank, may not kill game? 2dly. Whether a doctor of phyſic who has taken his degree in England be not ſuch perſon? 3dly. Whether a Scotch diploma does not confer the ſame privileges? As to the firſt, the language of the ſtatute is very ſtrong; the word *other* muſt be conſidered as the *nominative* and not as the *genitive* caſe, both in reaſon and grammatical conſtruction. It is clear the ſtatute did not mean to confine the qualification altogether to *landed* property, by extending it to the ſon and heir apparent of an eſquire, who is ſuppoſed to have no landed property of his own.

The

The eſquires alſo who are enumerated by Camden are perſons who have no land: from 8 Rep. 118. we may collect, that where a ſtatute will bear two interpretations, one contrary to ſenſe, the other agreeable to it, the latter ſhall prevail: here it was evidently the intention of the legiſlature, that perſons of higher degree than an eſquire ſhould be qualified, for if the oppoſite conſtruction was to prevail, a perſon would have a derivative title, when the perſon from whom ſuch title derived would have none, and this very defendant's ſon will derive a right from his father's diploma, which it is contended the father himſelf has not. 2dly. As to the queſtion, whether an Engliſh doctor be of ſuperior degree to an eſquire? Blackſtone ranks doctors above eſquires, and ſo do the heralds, but this relates only to Engliſh degrees: then 3dly. Does a Scotch diploma confer the ſame right? A Scotch doctor is of equal rank as an Engliſh one as a member of the civil ſtate: and the 4th article of the act of union ſays *there ſhall be a communication of all rights, &c.* except where expreſsly agreed to the contrary: as to the college of phyſicians and the univerſities refuſing to allow Scotch doctors their own privileges within their own juriſdictions, they, as private corporations, may make what regulations they pleaſe concerning their own bodies; but as to all general immunities derived from the common law, or under the act of union, they cannot deprive any body of theſe. —The court took time to conſider: but Lord Mansfield then ſaid, that as to the latter ground he had no doubt, that all privileges granted by the ſtatutes to the univerſities, were confined to our own, and did not extend to Scotland or other foreign univerſities, which were governed by their own particular laws and cuſtoms. But that the general queſtion upon the conſtruction of the ſtatute of Car. II. ſhould not paſs undecided.—Afterwards the court delivered their opinions *ſeriatim*.—Lord Mansfield. This is an action brought by the plaintiff againſt the defendant for uſing a gun for the purpoſe of killing game, not being duly qualified. The caſe ſtates that the defendant reſted his juſtification upon a diploma from St. Andrew's in Scotland, conferring on him the degree of doctor of phyſic. Two objections have been raiſed: firſt, That under this diploma, the defendant had the ſame rights and privileges conferred upon him as are acquired by a degree beſtowed by the Engliſh univerſities. 2dly. That doctors in the learned profeſſions are of higher degree than an eſquire, and therefore by 22 and 23 Car. II. are exempted from the penalties of the game laws. The ſtatute of 22 & 23 Car. II. has theſe words, *other than the ſon and heir apparent of an eſquire, or other perſon of higher degree.* For the defendant it has been contended, that *other perſon of higher degree* relates to the eſquire himſelf, and means that a perſon of higher degree than an eſquire is qualified; whereas on the other ſide it is contended, that it means *other than the ſon and heir apparent of an eſquire, or the ſon of any other perſon of higher degree.* To be ſure, abſurd conſequences may ſeem to follow from giving a privilege to the ſon which the father has not; but the queſtion is, has the ſtatute done it or not? I wiſh to have the general point determined becauſe of the conſequences: this court conſidered the point before in K. *v.* Utley, and there they held that the ſtatute meant *the ſons of other perſons of higher degree:* on full conſideration I am not ripe to vary from the opinion given in that judgment, all the precedents are ſo; but what ſtruck me moſt was this, the drawer of the ſtatute of Car. II. certainly had the former ſtatute of Jac. I. in his view; for though it does not follow the other ſtatute throughout, yet it does in that clauſe, and that does not admit of a doubt, for there the word *of* is expreſsly inſerted: I cannot therefore unneceſſarily vary from the deciſion that has been given; I ſay *unneceſſarily*, becauſe I am ſatisfied on the other ground of the opinion I delivered the other day; on that ground there is not a colour for ſaying that the defendant is qualified by the act of union; it is true, that by the 4th article of that act, the Scotch have the ſame general privileges as the Engliſh, but then they muſt have the ſame qualifications otherwiſe they come not within the ſame deſcription, for the general article which declares, there ſhall be a communication of all privileges, can only mean ſuch as are of a general nature: a burgeſs of London is endued with certain privileges, to which a burgeſs of Edinburgh has no claim; ſo in every caſe where a privilege is of a qualified nature, it muſt be underſtood with that qualification; a doctor of the Engliſh univerſities may become a member of the college of phyſicians, may plead in doctors commons, and has various other privileges from which a Scotch doctor, as ſuch, is excluded; the qualification therefore, muſt be from Oxford or Cambridge. In like manner, the ſtatute allowing men of certain degrees to have certain diſpenſations for holding two livings, neceſſarily refers to ſuch degrees only as are obtained in an Engliſh univerſity, for the church of Scotland is diſtinct from ours, and admits not of the ſame rules; therefore whatever rank the defendant may hold by courteſy; he is not in point of law to be conſidered as a doctor to this purpoſe.—Willes J. It is my misfortune to differ from the reſt of the court on the conſtruction of the ſtatute of Car. II. The caſe of K. and Utley came before us on a motion to quaſh a conviction on account of the word *of* being inſerted before the words, *other perſons of higher degree.* I find by looking at my own paper book that the caſe was but ſlightly argued, and the court principally relied upon the ground of all the precedents having been in that form; I adopted that opinion at that time, but I now retract my aſſent to that determination for three reaſons: 1ſt. the game laws are already ſufficiently oppreſſive, and therefore ought not to be extended by implication; 2dly. becauſe I think that in grammatical conſtruction and propriety the words *other perſons* muſt be taken to be in the *nominative* and not in the *genitive* caſe; 3dly. becauſe a different conſtruction is unnatural and unreaſonable, and muſt be productive of endleſs inconvenience and abſurdity. Firſt, nothing can be more oppreſſive than the preſent ſyſtem of the game laws; we are told they aroſe from the old foreſt laws, which reſtrained the right of killing game to much narrower limits; and hence that theſe new regulations encroach on no privileges to which we were before entitled; but on the contrary are mild when compared with the ſources from whence they flow. Blackſtone however, in 2d book of his Commentaries, c. 27. holds a different language: and wherever a law is productive of tyranny, I ſhall ever give my conſent to narrow the conſtruction. 2dly. According to grammatical conſtruction, I think the words *other perſons of higher degree* muſt be taken in the *nominative* caſe, for want of the word *of*, and I am the more confirmed in that opinion, for where the legiſlature meant the *genitive* caſe they have expreſsly inſerted the word *of*, as in 1 Jac. I. c. 27. and 9 An. c. 5. which relates to qualifications to ſit in parliament. But 3dly, what I moſt rely on, are the many abſurdities which muſt flow from a different interpretation; the eldeſt ſon of a barriſter at law or of a captain in the army or navy will be qualified as ſuch, and yet the father himſelf will not; even a peer who is not qualified by property, will not be privileged to kill game, though his ſon who claims through him will: the act could never mean to annex the qualification to *land* only, for no landed eſtate however large will confer the title, but it muſt be acquired either by office, the king's patent, or ſome of the means laid down by Selden and Camden. A lord of the manor is certainly not an eſquire by virtue of his manor, or royalty, though in common acceptation he is conſidered as ſuch; this is evident from the 2d ſec. of 22 & 23 Car. II. c. 25. which empowers lords of manors or other royalties, *not under the degree of an eſquire*, to appoint game-keepers; but no lord of a manor under that rank can make ſuch an appointment, whatever

whatever his eſtate may be. On the other hand, was ever an eſquire, ſince the paſſing of this act, convicted on it? If no ſuch inſtance can be produced, that ſhows the general ſenſe of the nation as to this act, and is a much more powerful argument, and has greater weight with me, than any faulty precedent. From the preambles of the ſtatutes on this ſubject, it is plain they are chiefly pointed againſt perſons of low degree, to prevent mechanics from leaving their employments to deſtroy the game, to the prejudice of noblemen, gentlemen, lords of manors, and others: for thoſe reaſons I think gentlemen of this deſcription ought not to be deprived of their amuſements, and this is my opinion on the general import of the act; how far it may affect the preſent queſtion is another matter. As to the 2d point, if an *eſquire as ſuch* is qualified, I am likewiſe of opinion that *doctors* are ſo; to this it is objected, that at all events, a perſon who has not taken his degree in England, is not to be conſidered in the light of a perſon qualified by the ſame means as thoſe are; but this objection is in my mind done away by the 4th article of the union, which enacts, that there ſhall be a communication of all privileges, except where it is expreſsly provided to the contrary: as to their being excluded by the college of phyſicians, that is merely the reſult of a local inſtitution; however, as the reſt of the court are againſt me on the firſt point, I ſhall give no further opinion upon this.—Aſhhurſt J. I ſee no reaſon to depart from the conſtruction which has been put upon the ſtatute 22 & 23 Car. II. by this court in the caſe of K. & Utley. The game laws are to be conſidered as poſitive rules, rather than as founded on reaſon; therefore it is ſafer to adopt what they have actually ſaid, than to ſuppoſe what they meant to ſay: though by the ſtatute of Jac. I. rank as well as property gave a qualification: yet under this ſtatute of Car. II. a man can only be qualified by means of property; but ſaid the legiſlature, the heir apparent, who is in the line of ſucceſſion, ſhall likewiſe be qualified, from a ſuppoſition that the eſquire was ſo already; according to which conſtruction I cannot think that it was in their intention purpoſely to exclude the father, but in fact they have done it; and the matter is put out of all doubt by the ſtatute of James which expreſsly excludes them, and ſo does the ſtatute of Car. II. as effectually in my opinion; the blunder has been adopted perhaps without meaning it; this appears to me from the wording of the clauſe, for it ſhould ſeem ſtrange that in fixing the qualifications, they ſhould begin with property, then go to a derivative qualification, and then return to a very large deſcription of original ones, namely, quality and degree. In a grammatical ſenſe alſo, it muſt be taken to be in the *genitive* caſe in the ſame manner as if the word *of* had been actually inſerted. I ſee no reaſon to depart from the conſtruction put upon the ſtatute Car. II. in K. and Utley; nor can any inconvenience reſult from it, for the legiſlature may hereafter extend the qualification if they think proper. It is not neceſſary to ſay any thing upon the other head, if it were, I ſhould agree with my lord. —Buller J. The caſe of the K. & Utley did not paſs with ſo little argument as my brother Willes ſuppoſes, for I remember it was argued very fully, and the grounds of our deciſion were, 1ſt, the conſtant form of convictions on the game laws, which ought to have great weight with the court: 2dly, from a compariſon of the ſeveral acts relating to game. But notwithſtanding that deciſion, if I ſaw any reaſon to alter the opinion which I then gave, I would be ready to do it and correct my miſtake; but upon full conſideration, in my opinion that judgment was right: 1ſt, taking this clauſe of Car. II. in a grammatical ſenſe, had the exception extended no farther than to *other perſons of higher degree*, ſtill I ſhould have thought that the word *of* was intended, and that the word *other* was to be underſtood in the *genitive* caſe; but I am confirmed in my opinion by the manner in which the clauſe proceeds, for the words immediately following are, *and the owners and keepers of foreſts, parks, chaſes, and warrens*; now had the preceding part of the ſentence, *or other perſons of higher degree*, been intended to have been taken in the *nominative* caſe, why did the legiſlature alter the mode of expreſſion? for when they ſpeak of other perſons to be exempted in their own right, they change the words. Again it is aſked, what reaſon is there for excepting the eldeſt ſon alone, and not the younger? The only reaſon that can be given is, becauſe he is the preſumptive heir to the real eſtate, which is a further argument for ſuppoſing that landed qualification was the immediate object of the ſtatute, and in fact this act of Car. II. had that principally in view, for it repeals the perſonal qualification of the ſtatute of James, and leaves no other but that of land, with the exception in favour of the heir apparent, on account of his right of ſucceſſion. And we may obſerve, that there is the ſame exception introduced into the act of qualifications of members of parliament. I have no doubt that the legiſlature took it for granted that eſquires themſelves would be qualified in reſpect of their land, and for the reaſons aſſigned, extended the qualification to their eldeſt ſons. So that had the legiſlature been aſked at the time of making this act, whether they intended to exclude the younger ſons of *dukes?* they would have anſwered *no*; but I am as firmly perſuaded, that had the ſame queſtion been put to them reſpecting *doctors*, they would have anſwered in the *affirmative*: be this as it may, we are bound to take the act as they have made it; a *caſus omiſſus* can in no caſe be ſupplied by a court of law, for that would be to make laws; nor can I conceive that it is our province to conſider, whether ſuch a law that has been paſſed is tyrannical or not: it has been ſaid that this act is only pointed againſt perſons of low degree, as appears from the preamble; to conſider the preamble of an act is to be ſure in general a good mode to come at the meaning of the legiſlature, but it does not aſſiſt us in this caſe, for we gather from the enacting part of the ſtatute, that a perſon who has a freehold of 99l. per annum, or a leaſehold for ninety-nine years of 149l. per annum, is not qualified, but can it be ſaid that either of theſe is a mean or vulgar perſon? Thus far we have been conſidering the ſtatute of Cha. II. alone, but now conſider it as coupled with the former ſtatutes which are *in pari materia*. In the ſtatute of James, the ſame words *other perſons of higher degree* are uſed, and there it is clear they are uſed as part of the deſcription of the ſons, for the particle *of* is expreſsly prefixed; now if the ſtatute of Car. II. is any ways doubtful we muſt expound it by the ſtatute of James, and that is confined to ſons alone. But the ſtrong ground of all is, that all the acts relative to game have been from time to time reſtrictive of the right to kill game: they aboliſh ſome qualifications and raiſe others, and conſequently leſſen the number of qualified perſons, and no one ſtatute can be conſtrued into an enabling one; this is deciſive. There is not a pretence to ſay that a doctor of phyſic is within the exception of the ſtatute of James; then if he is not within that ſtatute, how can he be ſaid to be qualified under the ſtatute of Car. II. which is a reſtraining one, and gives no new qualification whatever? As to the other queſtion, whether a doctor of phyſic of the defendant's deſcription is qualified? I think he is not on another ground, but on this head I refer generally to what my lord has ſaid.—Judgment for the plaintiff. *D. & E.* 1 V. 44.

And all lords of manors or other royalties may authorize their gamekeepers WITHIN THEIR RESPECTIVE MANORS OR ROYALTIES, to take and ſeize all ſuch guns, bows, greyhounds, fetting-dogs, lurchers, or other dogs to kill hares or conies; ferrets, tramels, lowbels, hays, or other nets, hare-pipes, ſnares, or other engines for the taking and killing of conies, hares, pheaſants, partridges, or other game, as within the precincts of ſuch reſpective manors ſhall be uſed by any perſon who by this act is prohibited to keep or uſe the ſame: and moreover,

moreover, any ſuch gamekeeper (or other perſon being thereunto authoriſed by warrant of one juſtice) may in the day time ſearch the houſes, out-houſes, or other places, of any ſuch perſon by this act prohibited to keep or uſe the ſame, as upon good ground ſhall be ſuſpected to have or keep in his cuſtody any guns, bows, greyhounds, ſetting-dogs, ferrets, coney-dogs, or other dogs to deſtroy hares or conies, hays, tramels, or other nets, lowbels, hare-pipes, ſnares, or other engines aforeſaid, and the ſame may ſeize, detain, and keep, for the uſe of the lord of the manor or royalty where found or taken, or otherwiſe to cut in pieces or deſtroy, as things by this act prohibited to be kept by perſons of their degree. 22 & 23 *Car.* II. c. 25.

And if any unqualified perſon ſhall have, keep, or uſe, any bows, greyhounds, ſetting dogs, ferrets, coney-dogs, hays, lurchers, nets, tunnels, lowbels, hare-pipes, ſnares, or any other inſtruments, for the deſtruction of fiſh, fowl, or other game, and ſhall not give a good account before a juſtice, to the ſatisfaction of ſuch juſtice, how he came by the ſame, or elſe ſhall not in ſome convenient time (to be ſet by ſuch juſtice) produce the party of whom he bought the ſame, or ſome other credible perſon, to depoſe upon oath ſuch ſale thereof; he ſhall forfeit for every offence not under 5s. nor above 20s. half to the informer, and half to the poor, by diſtreſs; for want of diſtreſs, to be committed to the houſe of correction, not more than one month, nor leſs than ten days, there to be whipped and kept to hard labour. And if any perſon ſo produced or charged with the ſaid offence, ſhall not before the juſtice give ſuch evidence of his innocence as aforeſaid, he ſhall be convicted thereof in the ſame manner as the perſon firſt charged therewith, and ſo from perſon to perſon till the firſt offender be diſcovered. 4 & 5 *Will.* c. 23. And all lords of manors or their game-keepers may within their manors oppoſe and reſiſt ſuch offender, in the night time, in the ſame manner as if the fact had been committed in any ancient chaſe, park, or warren, incloſed. And no certiorari ſhall be allowed to remove any conviction, unleſs the party firſt become bound to the proſecutor in 50l. with ſuch ſufficient ſureties as the juſtice ſhall think fit, to pay within a month after the conviction confirmed, or procedendo granted, full coſts and charges; and in default thereof, the juſtice ſhall proceed to the execution of the conviction.

But by a ſubſequent ſtatute, 5 Anne, c. 14, if any perſon, not qualified by the laws of this realm ſo to do, ſhall keep or uſe any greyhounds, ſetting-dogs, hays, lurchers, tunnels, or any other engine to kill and deſtroy the game, and ſhall be thereof convicted on the oath of one credible witneſs, before one juſtice, he ſhall forfeit 5l. half to the informer, and half to the poor of the pariſh where the offence was committed, to be levied by diſtreſs and ſale of the offender's goods; for want of diſtreſs, to be ſent to the houſe of correction for three months for the firſt offence, for every other offence four months.—And any juſtice, or lord *within his manor*, may take away ſuch dogs, nets, or other engines, which ſhall be in the power or cuſtody of any perſon not qualified, and may keep the ſame to his own uſe without being accountable to any perſon for the ſame.

Case of K. *v.* Newman. *Hilary Term*, 13 Geo. III.—An information was moved for againſt a juſtice, for convicting two perſons for uſing greyhounds to deſtroy game; which perſons were themſelves unqualified, but were out with a qualified perſon; which they pleaded in their defence, and that the dogs were not their own. The juſtice ſaid he knew it, and thereupon convicted them. —On behalf of the juſtice, Mr. ſerjeant Burland ſaid, that the convicted perſons being by their own evidence not qualified, and it not appearing by any evidence expreſsly that the perſon they were with was a qualified perſon, or that the dogs were (as they aſſerted) not theirs, but his, he hoped the information would not be granted. It was further ſaid, that it hath never been adjudged, that unqualified perſons, out with qualified, were free from the penalty; nor that it ſignified, whether the dogs belonged to the qualified man, or to the others: for the being out to *uſe* them, was ſufficient within the ſtatute; or at leaſt it had been much doubted. ——L. Mansfield: Let the juſtice pay the whole coſts, and go before the maſter.——Upon which, the ſerjeant ſaid, Does your lordſhip then think them ſufficiently qualified?——L. Mansfield: Yes; and it is matter of tenderneſs to take it this way. I know you to be very judicious, and thought you led to it. The defence you ſet up for the juſtice was none; if it had ever been thought of by him. Shall not a gentleman take any body out with him, to beat the buſhes and ſee a hare killed? It appeared alſo on the evidence, that the ſummons was taken out on the Sunday, and that the parties aſked an hour's time to go for Mr. Linch, the gentleman they went out with, who, they ſay, is worth ſeveral hundreds a-year. It is not pretended on the other ſide, but they might have brought this witneſs in three or four hours at longeſt. This (as his lordſhip added) with ſome of the above-mentioned, were very aggravating circumſtances: however, you know the ſtrength of your own caſe: Take it by way of information.—The ſerjeant, however, thought it adviſeable to deſire leave to refer it to the maſter. Which was granted accordingly. *Lofft.* 178.

In the caſe of Peſhall *v.* Layton. *Mich. T.* 29 Geo. III. *L. Kenyon*, Ch. J. ſaid, that where ſeveral unqualified perſons offended by going out together and killing a hare, that only one penalty can be recovered, though the proſecutor has his election which he will ſue. *D. & E.* 2 *V.* 712.

Alſo in the caſe of K. *v.* Bleaſdale and another, *Trinity Term*, 32 Geo. III. which was a conviction on 5 Anne, c. 14. for uſing a greyhound to deſtroy game without being qualified; for which the defendants were convicted in 5l. *each*; which the *court*, without hearing any argument, ſaid, could not be ſupported, for that it was only one offence, and that the magiſtrate ſhould only have convicted them in *one* penalty. And they ſaid that this point had been ſeveral times decided; in Hardman *v.* Whitacre, *Bull. N. P.* 189, and in others.—Conviction quaſhed. *D. & E.* 4 *V.* 809.

Case of K. *v.* Marriot, *Mich. T.* 4 Geo. This was a conviction for keeping a greyhound; reciting that one William Toune came and informed, that the defendant being a perſon not qualified to keep a greyhound, did nevertheleſs keep one, and therewith killed ſeveral hares; and that he being ſummoned did appear, and being aſked what he had to ſay, offered nothing in excuſe, and therefore the juſtice convicted him. It was objected, that the juſtice ſhould ſet out, why the defendant is not a qualified perſon, as that he is not the ſon of an eſquire, nor has 100l. a-year in his own or his wife's right: for he ought not to make himſelf the ſole judge, but give the reaſons at large. Parker Ch. J. ſeemed to think the conviction would be good, having followed the words of the ſtatute, and that if the defendant was qualified, he ought to have ſhewn it before the juſtice, being ſummoned for that purpoſe. Eyre J. ſtarted an objection, that it was not the juſtice that had taken upon him to ſay the defendant was not qualified; but only the witneſs; for the conviction runs, that the witneſs being ſworn ſaith, that the defendant, *being a perſon no way qualified*, did ſuch a day keep a greyhound; ſo that it appears, the witneſs has given the law to the juſtice, and takes upon himſelf to judge of the defendant's qualification, and the juſtice is only made uſe of as an inſtrument, to reduce the opinion of the witneſs into a conviction. By Parker Ch. J. The *being not qualified* ſhould be the concluſion of the juſtice, and not the words of the witneſs; for he ought not to ſwear generally a man is not qualified, and ſuch a general proof will not be good: this

this is only an invention to ſupport a conviction in general terms, which would be bad if the particular facts were alleged. Pratt J. Where the juſtices have a ſummary juriſdiction, and no appeal lies, as in this caſe, we muſt keep them up ſtrictly to the law: and I ſhould be glad if we could make them ſet out the whole particularly. The caſe was adjourned. And afterwards Pengelly ſerjeant mentioned two caſes, Q. and Hayward, E. 12 An. There it was, *not being qualified, licenſed, or authoriſed to keep any engine*, and it was quaſhed. The other was in the ſame term, and quaſhed, becauſe no qualifications were mentioned. And towards the end of the term this conviction was quaſhed; and the principal reaſon declared to be, becauſe the witneſſes had taken upon themſelves to judge of the qualifications. 1 *Str.* 66.

Case of K. and Hill, *Hilary T.* 12 Geo.—Defendant was convicted, for unlawfully keeping a lurcher and a gun to kill and deſtroy the game, *not being qualified by the laws of this realm ſo to do.* And the conviction, being removed into the king's-bench by *certiorari*, was quaſhed; becauſe it was only averred generally, that he was not qualified, and did not aver that the defendant had not the particular qualifications mentioned in the ſtatute, as to degree, eſtate, and the reſt. 2 *Ld. Raym.* 1415.

A perſon was likewiſe convicted before a juſtice upon the ſtatute, for keeping a gun, not having 100l. per annum; and the conviction, being removed into the court of king's-bench, was quaſhed, for not ſaying *when* the defendant had not 100l. a-year; for it might be he had ſuch qualification at the time when he kept the gun, though not at the conviction; and the offence and time ought to be certainly alleged. 3 *Mod.* 280.

Case of K. *v.* Jarvis, *Hil. T.* 30 Geo. II.—This conviction ſet forth, that defendant did unlawfully keep and uſe, and had in his cuſtody and poſſeſſion, one ſetting dog and ſetting net, for the deſtruction of the game; and that he the ſaid Jarvis was not then anywiſe qualified, impowered, licenſed, or authoriſed, by or according to the laws of this realm, to kill game. It was moved to quaſh this conviction. And by L. Mansfield, Ch. J. It is now ſettled by the uniform courſe of authorities, that the qualifications muſt be all negatively ſet out: otherwiſe the juſtices have no juriſdiction over the perſons killing game, or keeping dogs or engines for the deſtruction of it. The *obiter* ſaying in 10 *Mod.* (if it was a book of better authority than it is) would ſignify nothing, when the determinations are the other way. There is a great difference between the purview of an act of parliament and a proviſo in an act of parliament. In the caſe of K. *v.* Marriot, where the witneſs ſwears only generally, it was holden inſufficient: and the juſtices who convict upon the evidence of the witneſs can have no other or further ground to go upon, than what the witneſs ſwears. In the caſe of K. *v.* Hill, it is the very point eſtabliſhed and ſettled, that the general averment is not ſufficient, and that it muſt be averred that the defendant had not the particular qualifications mentioned in the ſtatute. In the caſe of Bluet, *qui tam*, and Needs; (*Com. R.* 522.) the general averment of the defendant's not being qualified, was holden to be ſufficient upon an action, though inſufficient upon a conviction; for in the examination of the queſtion at the trial of an action, the qualification may be gone into: the diſtinction is obvious between an action and a conviction. In the preſent caſe, the witneſs ſwears generally, that the defendant was not qualified. The juſtices adjudge it generally, only. The ſtream can go no higher than the ſpring head. So the concluſion, which the juſtices draw from the teſtimony of the witneſs, muſt be as general as that teſtimony. In the caſe of K. *v.* Pickels, *M.* 19 Geo. II. it was laid down as a rule, that the want of the particular qualifications required by the 22 and 23 Car. II. c. 25, ought to be negatively ſet out in convictions. And the only queſtion there was, Whether it was neceſſary to add the inferred or argumentative qualification, collected from the 5 An. c. 14, but not mentioned in the 22 and 23 Car. II. c. 25, of his not being lord of a manor? *Exceptio probat regulam:* Nor was the general rule at all doubted or diſputed in that caſe. In indictments upon the 8 and 9 Will. c. 26, for having a coining preſs, every thing which ſhews that the defendant had no authority, muſt be negatively ſet out: and ſo it was done in the indictment of Bell, which was lately argued before all the judges. I take the point to be ſettled, by the conſtant tenor of all the authorities: and I think upon very good reaſon, if there was need to enter into the reaſon at large, after it has been fully ſettled already.—Mr. J. Deniſon concurred, and ſaid, it was a clear caſe, and that it was fully ſettled and eſtabliſhed, that in theſe convictions, the want of the particular qualifications mentioned in the 22 and 23 Car. II. ought to be negatively ſet out. If not, the juſtices have no juriſdiction to convict the defendant as an offender. And the evidence and adjudication ought both of them to be, that he had not the qualifications which are ſpecified in that act, *nor any of them.* Indeed you are not obliged to go further than the words of this act of parliament of the 22 and 23 Car. II. and that was the caſe of K. *v.* Pickels. But however in that caſe, the preſent point was eſtabliſhed, and taken to be indiſputable. There is a known diſtinction between exceptions in a ſtatute by way of proviſo (which need not be ſet forth) and thoſe in the purview of the act: and to this point there is a very ſtrong caſe (K. *v.* Bell, *Foſt.* 430.) upon an indictment for having coining inſtruments in his cuſtody. It was ſaid that in a conviction it is ſufficient to purſue the words of the act of parliament; but I think that is not ſo, and there are many caſes where that has been ruled otherwiſe. Among other inſtances, it was determined in K. *v.* Chapman, *E. T.* 28 Geo. II. upon a conviction of a perſon for robbing an orchard; which the court held not ſufficient; but it ought to have appeared of what and how the orchard was robbed, that they might judge whether it were a robbery within the meaning of the 43 Eliz. c. 7.—Mr. J. Foſter alſo concurred, and ſaid, that on negative acts of parliament, the point is fully ſettled and eſtabliſhed, that the particular qualifications mentioned in the purview of them, muſt be negatively ſpecified in convictions made upon them.—And by the court unanimouſly, the conviction was quaſhed. 1 *Burr.* 148.

Case of K. *v.* Filer, *Hil. T.* 8 Geo.—Conviction for *keeping* a lurcher to deſtroy game, not being qualified. Exception was taken, that it was not ſhewn he *uſed* the dog to deſtroy game; and it may be he only kept it for a gentleman who was qualified, it being common to put out dogs in that manner. But by the court, the ſtatute is in the diſjunctive, *keep* or *uſe*; ſo that the bare *keeping* a lurcher is an offence; and ſo it was determined in the caſe of K. *v.* King, *E.* 3 Geo. which was a conviction for keeping a gun; and it was not doubted by the court, whether the *keeping* was not enough to be ſhewn, but the only queſtion they made was, Whether a gun was ſuch an engine as is within that ſtatute? and in that caſe a difference was taken, as to the keeping a *dog*, which could only be to deſtroy the game; and the keeping a *gun*, which a man might do for the defence of his houſe. And the conviction was confirmed. 1 *Str.* 426.

Case of K. *v.* Hartley, *Eaſter Term*, 22 Geo. III.—This was a conviction on 5 Anne, for *keeping* and *uſing* a *greyhound* to kill and deſtroy the game.—On a rule to ſhew cauſe why this conviction ſhould not be quaſhed, Chambre took two objections: That it was not fully and ſufficiently ſtated, that there had been an *uſing* of the greyhound (that is) how, and in what manner, and for what purpoſe. 2d, That it was not expreſsly and poſitively averred, that he had kept and uſed a *greyhound* at all; being only ſet forth, that he kept and uſed a dog *called* a greyhound, but that it might be called ſo, and yet be another

ther kind of dog; that it might be an *Italian* greyhound, or might be kept for the protection of a houſe, or other purpoſes than to kill or deſtroy the game.—By L. Mansfield. Convictions muſt certainly be preciſe, that the court may ſee whether the offence committed falls within the juriſdiction of the magiſtrate; and muſt be quaſhed if not ſo. In this act there are two offences deſcribed, a *keeping* and *uſing*; and the legiſlature mean, that there may be a keeping to deſtroy, &c. which is not of neceſſity to be proved by an uſing to that purpoſe; if it were ſo it would be tautologous, for ſuch evidence would be a proving of the other offence: the *keeping* therefore of a thing prohibited being an offence under the act, it is neceſſary *prima facie* evidence of a keeping for the purpoſe prohibited, and it is incumbent upon the defendant to ſhew that it is kept for another purpoſe, as that in the preſent caſe it is a houſe dog, a favourite dog, or a particular ſpecies of greyhound: the deſcription cannot be more preciſe, unleſs ſome particular inſtance of uſing is ſhewn, which, if *keeping* of itſelf conſtitutes an offence, cannot be neceſſary. As to the other objection, that the averment is defective in ſtating only that this was a dog *called* a greyhound, I think it poſitive enough: it muſt mean the dog of that ſpecies generally known in this country.—The other judges concurred.—Rule diſcharged and conviction affirmed. *Cal. Caſ.* 175.

In the caſe of K. *v.* King aforeſaid, Parker Ch. J. ſaid, that walking about with *intent* to kill game, is evidence of *uſing* the inſtrument for that purpoſe. 1 *Seſſ. C.* 88.

And in the caſe of K. *v.* T. Davis, *Hilary T.* 35 G. 33. which was a conviction on the above ſtatute 5 Anne, c. 14, ſ. 4, for keeping and uſing a gun for the deſtruction of game. It appeared on the conviction, that on, &c. "one credible witneſs, (viz.) R. Pyndar of Hadſon, (where the offence was committed,) upon his oath, in the preſence of the defendant, depoſed, that the aforeſaid T. Davis, not having the qualifications, &c. (repeating them,) did keep and uſe a certain engine called a *gun*, with intent to kill and deſtroy the game; and that he (the witneſs) was ſatisfied that the ſaid T. Davis did keep and uſe the ſaid gun for the purpoſe aforeſaid, from the circumſtance of his hearing a gun go off, and obſerving that it was fired by the ſaid T. Davis, who was then walking about a piece of ground in the pariſh of Hadſon aforeſaid, with that apparent intent," &c.—Erſkine and Lane took two objections to this conviction; 1ſt, That the witneſs was incompetent, becauſe he was an inhabitant of the pariſh where the offence was committed; 2dly, If competent, that his evidence was not ſufficient to ſupport the conviction. The evidence is, that the defendant "did keep and uſe a certain engine called *a gun*, with intent to kill and deſtroy the game." If this had been a dog or a ſnare, this evidence perhaps would have been ſufficient, but the defendant may have kept and uſed a gun for a variety of purpoſes beſides that of killing game. Keeping or uſing a gun is not of itſelf an offence within the act, K. *v.* Gardiner; it muſt be kept or uſed with an intent to kill game; and though the witneſs has undertaken to ſwear to the defendant's *intention*, that is not ſufficient, if the reaſon on which his oath is founded do not warrant ſuch a concluſion: now the only reaſon aſſigned by the witneſs is, that the defendant fired a gun, and "walked about a piece of ground with that apparent intent;" to kill game cannot be collected from the mere circumſtance of a perſon carrying a gun.—L. Kenyon Ch. J. (ſtopping Bower, contra.) The firſt objection is anſwered by the ſtatute 27 Geo. III. c. 29, which was paſſed to prevent difficulties of this kind, and to enable inhabitants and pariſhioners to give evidence in proſecutions where the penalty is given to the pariſh, provided it do not exceed 20l. With regard to the other objection, here was evidence tending to prove the offence. That being the caſe, we have no authority to examine further, and ſee whether the concluſion drawn by the magiſtrate, be or be not the inevitable concluſion from the evidence: It is ſufficient in convictions, if there were ſuch evidence before the magiſtrate as in an action would be ſufficient to be left to a jury: here we cannot ſay that there was no evidence of the fact for the conſideration of the magiſtrate. In K. *v.* Gardiner, the defendant was only charged "with having and keeping a gun, being an engine for deſtroying game."—Groſe J. was of the ſame opinion. Conviction affirmed. *D.* and *E.* 6 *V.* 177.

Case of Hooker *v.* Wills, *Hil. T.* 13 Geo. II.—An action was brought on the 8 Geo. c. 19, for uſing a *hound* to deſtroy game. And after a verdict for the plaintiff, the judgment was arreſted; for the ſtatute of the 5 Anne, c. 14, has not the word *hound*, and the words *other engines* come after *nets*, and are applicable only to inanimate things. And this being a penal law, cannot be extended. The ſtatute of the 22 and 23 Car. II. c. 25, has indeed general words *or any other dogs to deſtroy game*; but this is not a conviction on that ſtatute. 2 *Str.* 1126.

Nor indeed could it have been a conviction *on that ſtatute* for any penalty *in certain* for killing and deſtroying the game; for the ſtatute of the 22 and 23 Car. II. doth not inflict a general penalty upon perſons unqualified who ſhall kill and deſtroy the game; but only declares who ſhall or ſhall not be deemed *unqualified*; and gives power to lords of manors and their gamekeepers to ſeize the dogs, nets, and other engines, of ſuch unqualified perſons. But if the defendant did kill the game, and had the ſame in his cuſtody, he might have been proſecuted for the penalty of 20s. for ſuch offence, by the ſtatute of the 4 and 5 Will. hereafter following. But then the conſequence of all this will be, that it is not penal barely to keep a *hound* on this ſtatute of the 5 Anne, but if any unqualified perſon ſhall do ſo, the gamekeepers or others, authoriſed by a juſtice's warrant, may ſeize and keep or deſtroy the ſame, by the aforeſaid ſtatute of the 22 and 23 Car. II.

So in the caſe of Raſon and Liſle, *Trin. T.* 11 Geo. II.—In an action upon the ſtatute, the plantiff declared, that the defendant did keep and uſe a *dog* to deſtroy the game. It was objected, that he ought to have expreſſed what ſort of dog; for it might be a maſtiff or a lap-dog, which might chance to kill game; and the ſtatute only mentions greyhounds, ſetting dogs, and lurchers; and this being a penal law, ſhall not be extended by equity. And of this opinion was the court. And judgment was arreſted. *Com. R.* 576.

Case of K. *v.* Gardiner, *Trin. T.* 11 Geo. II.—It was moved to quaſh a conviction, for unlawfully having and keeping a *gun*, being an engine or inſtrument for deſtroying the game. And it was urged, that this is no ſufficient charge within this act, or any other of the laws relating to the game: for it is not ſaid that the defendant *uſed* the gun for the deſtruction of game; and a gun is not an inſtrument ſo far appropriated to killing game, as that it is criminal for a perſon to have one in his cuſtody only: and it would have been altogether as well, if it had been ſaid that the defendant had in his cuſtody a *cane* for the deſtruction of the game, which may poſſibly be uſed for that purpoſe. The only offences intended to be prevented by the act are, the keeping of engines appropriated to, and which can only be uſed in, the deſtroying of game. A gun is an engine, not for killing the game, but for the defence of a man's houſe. And the whole court were clearly of opinion, that this conviction was not good. For (as they argued) if the ſtatute is to be conſtrued ſo largely, as to extend to the bare having of any inſtrument that *may* poſſibly be uſed in deſtroying game, it will be attended with very great inconvenience; there being ſcarce any, though ever ſo uſeful, but what may be applied to that purpoſe. And though a gun may be uſed in deſtroy-

ing game, and when it is ſo, doth then fall within the words of the act; yet as it is an inſtrument proper, and frequently neceſſary to be kept and uſed for other purpoſes, as the killing of noxious vermin, and the like, it is not the having a gun, without applying it in the deſtruction of game, that is prohibited by the act: but it is otherwiſe of lurchers, harepipes, and ſuch like, which are *peculiarly* fitted or diſpoſed for killing game. The bare *keeping* of theſe for the purpoſe of killing game, is ſufficient to convict an offender, and it will be incumbent upon the defendant himſelf to prove, that he kept them for other purpoſes. And the conviction was therefore quaſhed. After which, Strange ſolicitor-general ſaid, that in the caſe of K. *v.* King, *E.* 3 Geo.—Lord Macclesfield ſaid, that he was in the houſe of commons when this act was made, and he himſelf objected to the inſerting of the word *gun* therein, becauſe it might be attended with great inconvenience. *And.* 255. 2 *Seſſ. C.* 204. 2 *Str.* 1098.

Case of K. *v.* Johnſon, *Hil. T.* 6 Geo.—Conviction for keeping a gun, not being qualified. Exception was taken, that there was not a reaſonable *ſummons*; it was anſwered, that the defendant appeared at the time and made defence, ſo that cures all defects in the ſummons. And by the court, The anſwer is right. 1 *Str.* 261.

Case of K. *v.* Heber, *Hil. T.* 5 Geo. II.—On a rule to ſhew cauſe, why an information ſhould not be granted againſt the defendant, Mr. Heber, a juſtice of the peace, for convicting two perſons, Hargrave and Lancaſter, for killing game, not being qualified; the complaint in relation to Hargrave was, that the defendant ſent his warrant for him, by which he was arreſted, without any previous information upon oath; in relation to Lancaſter, the complaint was, that he happening to be preſent at the time Hargrave was convicted, the defendant took that opportunity of convicting him alſo, without giving him any previous ſummons, by which he might prepare himſelf for his defence. The court (the chief juſtice being abſent) were very clear, that an information ought to go againſt the juſtice for his behaviour in relation to Lancaſter; for they ſaid, it was a moſt known rule of common law, that no man ought to be convicted of an offence, till he has previous notice given him of the charge, that he may be prepared to put in his anſwer to it. Accordingly the rule, as to him, was made abſolute. As to Hargrave, judge Probyn thought, that the rule with reſpect to him alſo ought to be made abſolute. He ſaid, a warrant deprives a man of his liberty; and therefore a ſummons ought only to iſſue, and not a warrant, without an information upon oath. The other two judges did not think this a ſufficient cauſe for granting an information. And therefore the rule, with reſpect to Hargrave, was diſcharged.—In this caſe, the court would not proceed to make a rule to ſhew cauſe, until the convictions were removed thither by *certiorari*: for, they ſaid, if there was no conviction, there ought to be no information; and if there was a conviction, this ought to appear by the record. 2 *Barnardiſt.* 34, 101.

If, however, a conviction before a juſtice on the game laws ſtate that the defendant was *preſent* at the time when the information was read and the witneſſes examined; and that when called on for his defence, he produced no evidence, and did not require any further time; that is ſufficient, without ſtating, that he was previouſly ſummoned to anſwer, &c. K. *v.* Stone, 1 *Eaſt's R.* 639.

Case of K. *v.* Thomas Spencer Crowther, *Hil. T.* 26 Geo. III.—This was a conviction before a juſtice on 5 Anne, c. 14, for uſing a gun. After ſtating the information, which negatived ſpecifically every one of the qualifications in 22 and 23 Car. II. c. 25, it proceeded to ſtate, that, "On the ſame 14th day of the ſame month of September 1785, at the pariſh of Sevenoak, in the county of Kent, one credible witneſs, to wit, Edward Tye, came before me the ſaid juſtice, and by his depoſition taken in writing before me the ſame juſtice, upon his oath, &c. ſwore, affirmed, and ſaid, that the aforeſaid T. S. Crowther, on the 8th day of September aforeſaid, in the year aforeſaid, at the pariſh, &c. did keep and uſe a gun, and certain dogs called ſetting dogs or pointers, to kill and deſtroy the game; and hunted them over certain grounds, part of Black Hall farm, in the pariſh, &c. and did then and there ſhoot at and kill one partridge with his ſaid gun, againſt the form of the ſtatute in ſuch caſe made and provided. And afterwards, that is to ſay, on the 15th day of September in the year aforeſaid, he the ſaid T. S. Crowther, having been duly ſummoned in this behalf, appeareth before me the juſtice aforeſaid, and is preſent to make his defence againſt the ſaid charge; and having heard the ſame, and the aforeſaid depoſition of the ſaid Edward Tye having been read over again to the ſaid E. Tye in the preſence and hearing of the ſaid T. S. Crowther, and the ſaid *E. Tye having again affirmed his ſaid depoſition to be true, in the preſence and hearing of the ſaid T. S. Crowther*, he the ſaid T. S. Crowther, is aſked by me, the ſaid juſtice, If he can ſay any thing for himſelf, why he, the ſaid T. S. Crowther, ſhould not be convicted of the premiſes above charged upon him in the form aforeſaid: whereupon the ſaid T. S. Crowther ſaith, that he is not guilty of the ſaid offence, but he doth not produce to me any evidence whatſoever, that he is in any manner qualified, allowed, or authorized, by the laws of this realm, to have, uſe, or keep, for himſelf or any other perſon, any gun, ſetting dog, pointer, or any other engine, to kill and deſtroy the game of this kingdom. And thereupon it manifeſtly appearing to me, that the aforeſaid T. S. Crowther is guilty of the ſaid offence charged upon him in the ſaid information, I do therefore hereby convict him of the offence aforeſaid, and do declare and adjudge that he the ſaid T. S. Crowther hath forfeited the ſum of 5l. for the offence aforeſaid, &c."—It was moved to quaſh this conviction on the two following grounds: 1ſt, That the evidence on which it was founded was not given in the *preſence* of the defendant, for on his appearing before the juſtice, the witneſs only *affirmed* his former depoſition to be true, and K. *v.* Vipont was cited. 2dly, The qualifications required by 22 and 23 Car. II. c. 25, were not negatived by the evidence. The evidence was only general, that what he did was *againſt the form of the ſtatute*, &c. and K. *v.* Jarvis, and K. *v.* Wheatman, were cited.—In anſwer thereto it was ſaid, That the depoſition of the witneſs having been read over in the defendant's preſence, and affirmed by him to be true, was the ſame as if he had been re-ſworn.—That as to the other objection, the information had negatived every ſeparate qualification, and was ſo ſtated in the conviction, and there was no occaſion to prove it by evidence. It was impoſſible to bring evidence to prove the want of each qualification negatively. If the information is ſpecific, a general depoſition that he is not qualified, is ſufficient to put the defendant upon proving that he was.—By the court. The firſt objection is good: the witneſs ought to have been re-ſworn in the defendant's preſence. As to the other point, there is no caſe in which it has been directly decided, that the evidence ſhould negative every particular qualification. It cannot be ſo from the nature of the caſe.—Conviction quaſhed. *D.* and *E.* 1 *V.* 125.

Case of K. *v.* Thomſon, *Trin. T.* 27 Geo. III.—This was a conviction on 5 Anne, c. 14, ſtating an information on 8th December 1786; the appearance of the defendant on the 9th, after being ſummoned, and the plea of *not guilty*, and then proceeding as follows: "nevertheleſs, on the ſaid 9th day of December in the year aforeſaid, at, &c. one credible witneſs, to wit, Richard Taylor, of, &c. cometh before me the ſaid juſtice, and before me the ſame juſtice upon his oath, ſaith, that the defendant,

ſendant, on the 7th day of December aforeſaid, in the year aforeſaid, at, &c. (negativing the qualifications of 22 and 23 Car. II. c. 25.) *did keep and uſe a gun to kill and deſtroy the game*; and thereupon the ſaid defendant, before me the ſame juſtice, by the oath of one credible witneſs aforeſaid, according to the form of the ſtatute aforeſaid, is convicted, and for his offence aforeſaid, hath forfeited 5l. to be diſtributed, &c."—Cockell objected, that it did not appear upon the conviction of what the defendant had been convicted: it only ſaid, "thereupon the defendant on, &c. before me the ſame juſtice, by the oath of one credible witneſs, according to the form of the ſtatute, is convicted, and for his offence hath forfeited, &c." This is only a concluſion of law, and not an adjudication of the juſtice. There is nothing to connect it with that which precedes it; ſuch as that "he is convicted of the premiſes," or "in manner and form aforeſaid."—But the *court* were clearly of opinion that there was no ground for that objection; but deſired it might be argued again on another objection, which they ſuggeſted to the counſel; whether the evidence was ſufficiently ſet forth, ſo that the court could ſee by what act the defendant had incurred the penalty; for they obſerved, that the act of *keeping a gun* was in itſelf ambiguous, and it muſt be ſhewn to be *kept for the purpoſe of killing game*, in order to bring the party keeping it within the act; it was not like keeping a greyhound or a ſnare; which could not be kept for any other purpoſe, and which was expreſsly prohibited by the act.—Wood, in conſequence, argued againſt the conviction. It is a fatal objection that the evidence on which the conviction is grounded, is not particularly ſet forth; the evidence which is ſtated is merely a repetition of the information. Only the reſult ariſing from the facts ſet forth; but every part of the evidence ought to have been ſpecially ſhewn, that the court might have had an opportunity of judging whether the juſtice drew a legal and proper inference from the facts ſworn to, ſo as to bring the defendant within the penalty of the act. The evidence which was given before the juſtice, could not be given in the manner in which it is ſtated in the conviction, for this evidence is the language of the act of parliament, and even if it was given in this general way, the juſtice ought to have refuſed it.—Chambre *contrà* did not diſpute the general rule that it was neceſſary to ſtate the evidence particularly in a conviction, but inſiſted that in the preſent caſe, the evidence was ſufficiently ſtated, being expreſsly ſtated that the defendant *kept and uſed the gun to kill and deſtroy the game*; that this form of conviction has been almoſt univerſally uſed on ſimilar occaſions.—Aſhhurſt J. If this were a new caſe, I ſhould moſt undoubtedly be of opinion that this conviction could not be ſupported, becauſe I think the evidence ſhould be ſet forth particularly, that we may judge whether the juſtice has convicted upon proper evidence. The fact of keeping or uſing the gun for the purpoſe of deſtroying game ſhould appear; but it is only ſtated here that the defendant kept and uſed, &c. which is the reſult of his evidence. Then whether he kept it for the purpoſe of killing *game* is likewiſe a queſtion of law; for an ignorant witneſs in the country might fancy that a woodcock was game. So that it ſeems to me that permitting this general evidence to be ſtated, is allowing the witneſs to give his ſentiments on the law as well as on the facts. But as the precedents are uſually in this form, and as the conviction in K. *v.* Hartley was ſimilar to the preſent, it is better to ſupport this conviction, than by quaſhing it to overturn all former precedents.—Buller J. If this precedent had never been adopted, I ſhould have been of opinion that the evidence ſhould have been fully ſet forth; but after ſo many convictions have been made in the ſame form, it would be dangerous to quaſh the preſent. The diſtinction taken in K. *v.* Filer is good law; it is not an offence to *keep* or *uſe* a gun, unleſs it be *kept* or *uſed for the purpoſe of killing game*. But it is here ſtated by the evidence, that the defendant did keep and uſe a gun to kill and deſtroy the game." As to the other queſtion reſpecting *game*, I cannot agree that the witneſs in ſwearing that the defendant uſed a gun to deſtroy game, would be ſwearing to a queſtion of law, becauſe it is ſettled by act of parliament, and *every man is bound to know what is game:* if he ſwears that to be game which is not ſo in law, he would be guilty of perjury. Game muſt be underſtood in its legal ſenſe. —Groſe J. I cannot give my conſent to ſupport this conviction. The juſtice ſhould return particularly all the facts and the concluſion in the conviction; firſt the information, the ſummons, the appearance, or the defendant's default in not appearing, that the information was read to the defendant, that he was aſked what he had to plead, the whole of the evidence particularly, and the adjudication. The witneſs ſhould ſwear to the *facts*, and not to the *law:* and in this caſe it is almoſt incredible that the witneſs ſhould have ſworn in the manner in which this evidence is ſet out: the juſtice ſhould not have received it, if it were offered in this general way, but ſhould have queſtioned the witneſs as to the manner in which this gun was kept, for what purpoſe it was uſed, and what particular kind of game he killed or attempted to kill. All theſe particulars ſhould have been ſpecially ſet forth, in order that we might judge whether they conſtituted an offence within the act. Here the witneſs ſwore to the law, namely, that the defendant *kept and uſed a gun to kill and deſtroy the game*. I had rather chooſe to decide this caſe according to the K. *v.* Baker and K. *v.* Hartley. And although this conviction cannot be quaſhed, becauſe my brothers have given their opinions in ſupport of it, yet I did not chooſe that this queſtion ſhould paſs *ſub ſilentio*, eſpecially as this declaration of my opinion may have the effect of inducing juſtices in future to ſtate the whole matter upon the record.

There was another doubt entertained by the court, namely, whether it ſufficiently appeared that the evidence was given in the defendant's preſence? but it was over-ruled. Conviction affirmed. *D.* and *E.* 2 *V.* 18.

Case of K. *v.* Swallow, *Trin. T.* 39 Geo. III.—This was conviction in the ſum of 15l. for three penalties under the game laws. Lord Kenyon C. J. ſaid, There is no objection to the conviction on the ground that the defendant has been convicted of ſeveral penalties. It is the conſtant practice in actions on the game laws, and not unfrequent in convictions. Even in indictments for capital offences, ſeveral offences are ſometimes charged, as burglary, and ſtealing in the dwelling houſe to the value of 40s. I by no means wiſh that magiſtrates in drawing up convictions ſhould ſet all forms at nought; but they ought not to be entangled in greater forms and ceremonies than the ſuperior courts. The word "convicted" in this caſe applies to the ſeveral offences with which the defendant was charged, and to the evidence given in ſupport of them; and the following words are, "and for his ſeveral offences *aforeſaid*, &c." Taking the whole of the adjudication together, it is evident that the magiſtrate convicted the defendant in the three ſeveral offences charged. Conviction affirmed. *D.* and *E.* 8 *V.* 284.

Case of K. *v.* Gage, *Hil. T.* 9 Geo.—The defendant was convicted for uſing a greyhound in killing hares. Exception was taken to the conviction that the ſtatute had only given the juſtices juriſdiction to convict upon the oath of one or more credible witneſſes, whereas this was upon his own confeſſion, which it was inſiſted the juſtices had no power to take. But by the court: The conviction muſt be confirmed. The intent of mentioning the oath of one witneſs, was only to direct the juſtices, that they ſhould not convict on leſs evidence; ſuppoſe the confeſſion had not been before the juſtices, but before two witneſſes who had ſworn it; that would be convicting him on the oaths of witneſſes; and yet the evidence

evidence would not be ſo ſtrong as this. Here the juſtices had a better evidence than the oath of any ſingle witneſs; and it is a monſtrous thing to ſay, that a better ſort of evidence ſhall not do. 1 *Str.* 546.

Case of K. *v.* Stone, *M.* 2 Geo. II.—A conviction was quaſhed, becauſe the informer was the witneſs, divers convictions having been quaſhed for the ſame reaſon before. 2 *Ld. Raym.* 1545. The ſame adjudged in the caſe of K. *v.* Blaney, *Trin. T.* 11 Geo. II. *Andr.* 240. And in the ſtatute of the 2 Geo. III. c. 19, it is recited, that in proſecutions on the act of 8 Geo. c. 19, in the courts at Weſtminſter, where a part of the penalty is given to the poor of the pariſh, the inhabitants of ſuch pariſh had been diſallowed to give evidence; and therefore in that caſe, to remedy the ſame, the act gives the whole penalty to the proſecutor, in order to enable the inhabitants to give evidence.

Case of Indictment. K. *v.* Buck, *Hil. T.* 12 Geo.—It was moved to quaſh the *indictment* for killing a hare, this not being a matter indictable, the ſtatute appointing a ſummary proceeding before juſtices of the peace; and a caſe was cited, K. *v.* James, *T.* 1 Geo. where an indictment for keeping an alehouſe was quaſhed, becauſe the ſtatute of the 3 Car. c. 3, had directed a particular remedy. And by the court: The indictment muſt be quaſhed. 2 *Str.* 679.

Case of Q. *v.* Matthews, *Tri. T.* 10 Anne.—On a conviction exception was taken, that the perſon was charged with ſo many five pounds as he had killed hares in the ſame day. And the court was of opinion that the offence for which the ſtatute gave the forfeiture, was the keeping dogs and engines, and not killing the hares. If a man not qualified goes a hunting, and kills never ſo many hares on the ſame day, he would forfeit but one 5l. for it is but one offence; but if a man keeps dogs, and goes a hunting ſeveral days and kills hares, if it was thus laid, that he ſuch a day kept dogs, and killed, and then again ſuch a day, by laying it thus ſeverally, the offence is ſevered, and he ſhall forfeit 5l. for each offence. 10 *Mod.* 26.

So in the caſe of Marriot *v.* Shaw, *Eaſter T.* 4 Geo. where the defendant was convicted, that upon ſuch a day he kept and uſed a greyhound to kill and deſtroy the game at ſuch a place, that on the ſame day he kept and uſed a greyhound to kill and deſtroy the game at another place, and ſo at a third place, and killed ſeveral hares at the ſaid ſeveral places; it was adjudged by the court, that this being all done on the ſame day, was only one offence; for this ſtatute does not give 5l. for every hare; but only ſays, if any unqualified perſon ſhall keep or uſe any greyhound, or the like, to kill and deſtroy the game, he ſhall forfeit 5l. *Com. R.* 274.

Where the offence was committed.—In ſome ſituations a man may ſtand in one pariſh (or county), and ſhoot into two or three: in ſuch caſe the place where the offence was committed is, where the party *ſtood* when he ſhot, and not where the object was which he ſhot at. *Show.* 339. K. *v.* Alſop, *Mich. T.* 3 Will.

Case of K. *v.* Burchet, *Trin. T.* 9 Geo.—The court ordered an attachment (unleſs cauſe ſhewn) againſt the town-clerk of Guildford, and a defendant convicted on the game act, for granting and ſuing out a replevin of goods diſtrained for the penalty. But on ſhewing cauſe the next term, when Eyre J. only was preſent, he diſcharged the rule, becauſe it was only a contempt to the inferior juriſdiction of the juſtices, and in that caſe the king's-bench never interpoſes. 1 *Str.* 567.

But in the caſe of the king againſt the ſheriff of Leiceſterſhire and others, *Mich. T.* 2 Geo. II. an attachment was moved for againſt the defendants, for replevying three horſes, which were ſeized as forfeited upon a juſtice's warrant, they being driven in a waggon contrary to act of parliament. The court, though they would not grant an attachment, yet made a rule to ſhew cauſe why an information ſhould not go. And on ſhewing cauſe, the court thought there was enough to excuſe the ſheriff; but granted it againſt Parſons, whoſe horſes were ſeized, becauſe he knew that the juſtices had granted this warrant; but it did not appear that the ſheriff did. 1 *Barnardiſt.* 110.

And in the caſe of K. *v.* Monkhouſe, *Eaſt. T.* 16 Geo. II. The court granted an attachment againſt the under ſheriff of Cumberland, for granting a replevin of goods diſtrained on a conviction for deer ſtealing. 2 *Str.* 1184.

Case of Feltham *v.* Tarry, *Eaſt. T.* 13 Geo. III.—The defendant levied money by ſeizing and ſelling the plaintiff's goods, on a juſtice's warrant founded on a conviction. Which conviction was afterwards quaſhed. And it was holden, that an action for money had and received then lay for the clear money produced by the ſale of the goods. *Bull. Ni. Pri.* 131.

Case of Hill *v.* Bateman, *Trin. T.* 12 Geo. Before Raymond Ch. J. at Weſtminſter.—The defendant Bateman, being a juſtice of the peace, had convicted the plaintiff for deſtroying game, and though (as it was proved) the plaintiff had effects of his own which might have been diſtrained, which were ſufficient to anſwer the penalty he had incurred, yet the defendant ſent him immediately to Bridewell, without endeavouring to levy the penalty upon his goods: and an action of treſpaſs and falſe impriſonment being brought againſt Bateman for this commitment, the chief juſtice was of opinion that the action well lay. 2 *Str.* 710.

A conviction on the 4th ſect. of the ſtat. 5 Anne, c. 14, for keeping a dog and gun to kill game, without being duly qualified, muſt be made within *three months* after the offence committed; and if the hearing of the matter be adjourned over that time, though with the conſent of the defendant, a conviction afterwards is bad. K. *v.* Tolley, 3 *Eaſt's R.* 467.

And [no] *certiorari* ſhall be allowed to remove the conviction or other proceedings on this act, unleſs the party convicted ſhall before the allowance thereof become bound to the proſecutor in 50l. with ſuch ſureties as the juſtice ſhall think fit, to pay full coſts and charges in fourteen days after the conviction [confirmed], or *procedendo* granted. And in default thereof, the juſtice ſhall proceed in execution of the conviction in ſuch manner as if no *certiorari* had been awarded. 5 *Anne*, c. 14.

The word [*no*] is inſerted inſtead of the words [*if any*] which are in the act, ſince that word ſeemeth neceſſary to make up the ſenſe; and the word [*confirmed*] is added for the like reaſon. And indeed there have been too many inadvertencies in the drawing up of this act; for there is falſe grammar in no fewer than ſix places, beſides other miſtakes.

By the yearly mutiny act, if any officer or ſoldier ſhall, without leave of the lord of the manor under his hand and ſeal, deſtroy any hare, coney, pheaſant, partridge, pigeon, or other fowl, poultry, or fiſh, or his majeſty's game, and be convicted thereof, on oath of one witneſs, before one juſtice; every officer ſo offending ſhall forfeit 5l. to the poor; and the commanding officer upon the place, for every offence committed by any ſoldier under his command, ſhall forfeit 20s. in like manner. And if, upon conviction by the juſtices, and demand thereof made by the conſtable or overſeers of the poor, he ſhall not in *two days* pay the ſaid penalties, *he ſhall forfeit his commiſſion.*

This clauſe, though enacted by the legiſlature for the beſt of purpoſes, that of preventing officers in the army from being eſtranged from their duty by the ſports of the field; yet, in its operation, it is liable to bear extremely hard upon a moſt meritorious claſs of men, embarked under every peril of their lives for the defence and glory of their country. Had this prohibition been tempered with ſome ſuch words as *while on duty*, or, *on a march*, or, *under orders for embarkation*, or, *during the alarm*

alarm of invaſion, &c. no hardſhip or particular ſeverity could be complained of. But as the law now ſtands, officers in the army, while in cantonments, in barracks, in winter quarters, or even on leave of abſence at their own homes, and on their own eſtates, be their qualifications in rank or fortune whatever they may, appear, by the mutiny act, to be reſtrained from ſhooting, hunting, courſing, or killing game, in any kind of way whatſoever, without being amenable to informers and forfeitures.—This will alſo appear the more unreaſonable, when it is recollected that officers in the navy are not reſtricted from theſe recreations, either by the Articles of War, or any other code by which the nautical diſcipline is regulated.

Of GAME found on CARRIERS, HIGLERS, and unqualified PERSONS.

By ſtat. 4 and 5 Will. c. 23, the conſtable, authoriſed by a juſtice's warrant, ſhall enter into and ſearch (in ſuch manner and with ſuch power as in caſes where goods are ſtolen, or ſuſpected to be ſtolen) the houſes, out-houſes, or other places belonging to ſuch houſes, of ſuſpected perſons not qualified; and if any hare, partridge, pheaſant, pigeon, fiſh, fowl, or other game, ſhall (upon ſuch ſearch or otherwiſe) be found, the offender ſhall be carried before a juſtice; and if ſuch perſon do not give a good account how he came by the ſame, ſuch as ſhall ſatisfy the ſaid juſtice, or elſe ſhall not, in ſome convenient time to be ſet by the juſtice, produce the party of whom he bought the ſame, or ſome other credible perſon to depoſe upon oath ſuch ſale thereof, he ſhall be convicted by the ſaid juſtice of ſuch offence, and upon ſuch conviction ſhall forfeit for every hare, partridge, pheaſant, fiſh, fowl, or other game, any ſum not under 5s. and not exceeding 20s. half to the informer, and half to the poor by diſtreſs; for want of diſtreſs, to be committed to the houſe of correction not more than one month, nor leſs than ten days, there to be whipt and kept to hard labour.

And if any perſon ſo produced, or charged with the ſaid offence, ſhall not before the juſtice give ſuch evidence of his innocence as aforeſaid, he ſhall be convicted thereof in the ſame manner as the perſon firſt charged therewith, and ſo from perſon to perſon till the firſt offender is diſcovered. And no *certiorari* ſhall be allowed to remove any conviction, unleſs the party firſt become bound to the proſecutor in 50l. with ſuch ſufficient ſureties as the juſtice ſhall think fit, to pay within a month after the conviction confirmed, or *procedendo* granted, full coſts and charges; and in default thereof, the juſtice to proceed to the execution of the conviction.

If any higler, chapman, carrier, innkeeper, victualler, or alehouſekeeper, ſhall have in his cuſtody or poſſeſſion, or ſhall buy, ſell, or offer to ſell, any hare, pheaſant, partridge, moor, heath-game, or grouſe, unleſs ſuch game in the hands of ſuch carrier be ſent up by ſome perſon qualified; (or, if any perſon whatſoever, WHETHER QUALIFIED OR NOT, ſhall ſell, expoſe, or offer to ſale any hare, pheaſant, partridge, moor, heath-game, or grouſe, 28 Geo. II. c. 12,) he ſhall be carried before a juſtice where the offence is committed; and being convicted thereof (in three months after the offence) on view, or oath of one witneſs, he ſhall forfeit for every hare, pheaſant, partridge, moor, heath-game, or grouſe, the ſum of 5l. half to the informer, and half to the poor, by diſtreſs; for want of diſtreſs, to be committed to the houſe of correction for the firſt offence three months, and for every other offence four months.

And no *certiorari* ſhall be allowed to remove the conviction or other proceedings, unleſs the party convicted ſhall, before the allowance thereof, become bound to the proſecutor in 50l. with ſuch ſureties as the juſtice ſhall think fit, to pay full coſts in fourteen days after the conviction confirmed, or *procedendo* granted. And in default thereof the juſtice ſhall proceed in execution of the conviction, in ſuch manner as if no *certiorari* had been awarded. 5 *Anne*, c. 14.

And if any hare, pheaſant, partridge, moor, heath-game, or grouſe, ſhall be found in the ſhop, houſe, or poſſeſſion of any poulterer, ſaleſman, fiſhmonger, cook, or paſtry-cook, or of any perſon not qualified in his own right to kill game, or entitled thereunto under ſome perſon ſo qualified, it ſhall be deemed an expoſing thereof to ſale. 9 *Anne*, c. 25. 28 *Geo.* II. c. 12.

And any juſtice of the peace, and lord *within his manor*, may take away any ſuch hare, pheaſant, partridge, moor, heath-game, or grouſe, or any other game, from any ſuch higler, chapman, innkeeper, victualler, or carrier, or any other perſon not qualified, which ſhall be found in his cuſtody or poſſeſſion. 5 *Anne*, c. 14.

And any perſon that ſhall deſtroy, ſell, or buy, any hare, pheaſant, moor, heath-game, or grouſe, and ſhall in three months make diſcovery of any higler, chapman, carrier, innkeeper, alehouſekeeper, or victualler, that hath bought or ſold, or offered to buy or ſell, or had in their poſſeſſion, any hare, pheaſant, partridge, moor, heath-game, or grouſe, ſo as any one ſhall be convicted; ſuch diſcoverer ſhall be diſcharged of the pains and penalties hereby enacted for killing and ſelling ſuch game, and ſhall receive the ſame benefit as any other informer.

And whereas great miſchiefs do enſue by inferior tradeſmen, apprentices, and other diſſolute perſons, neglecting their trades and employments, who follow hunting, fiſhing, and other game, to the ruin of themſelves and damage of their neighbours; therefore if any ſuch perſon ſhall preſume to hunt, hawk, fiſh, or fowl, (unleſs in company with the maſter of ſuch apprentice duly qualified,) he ſhall not only be ſubject to the other penalties, but if he be proſecuted for treſpaſs, in coming on any perſon's land, and be found guilty, the plaintiff ſhall not only recover damages againſt him, but full coſts. 4 and 5 *Will.* c. 23, ſ. 10.

The words "inferior tradeſmen," ſeem to extend to every tradeſman not qualified to kill game. 2 *Tidd's Pract.* 887. But in Buxton *v.* Mingay, *Trin. T.* 30 and 31 Geo. II. In the common pleas. The plaintiff declared, that the defendant being an inferior tradeſman, viz. an apothecary, ſuch a day committed a treſpaſs in hunting in the plaintiff's cloſe. On a trial at the aſſizes, a verdict was found for the plaintiff, with 1s. damages, and 40s. coſts; ſubject to the opinion of the court, upon a caſe made, which ſtates, that it was proved at the trial, that the defendant at the time of the treſpaſs was a ſurgeon and an apothecary, and not qualified to kill game; that on ſuch a day he was hunting with divers others not qualified, in company with a perſon who was properly qualified to kill game, and committed a treſpaſs in the plaintiff's cloſe. The queſtion for the conſideration of the court was, Whether upon the facts above ſtated the defendant ſhall be deemed an *inferior* tradeſman within the meaning of the ſtatute? This caſe was argued ſeveral times at the bar; and the judges were equally divided. For the plaintiff it was argued, that among tradeſmen no line can be drawn with reſpect to who are ſuperior and who are inferior, but they are all upon an equal footing as tradeſmen; but that the line which the legiſlature intended to draw was between thoſe that were qualified, and thoſe that were not: ſo that in this reſpect every tradeſman is *inferior* who is not qualified. For the defendant it was urged, that every caſe of this kind ought to be determined on its own particular circumſtances, and left to the jury, whether the defendant is an inferior tradeſman or diſſolute perſon within the ſtatute. The court being equally divided, no rule in this caſe was made, nor has ſince been made. 2 *Wilſon*, 70. [Indeed the word *inferior* ſeems to be applicable rather to the *man* than to the *trade*; ſo as that two perſons of the ſame trade may be one a *ſuperior* and the other an *inferior* tradeſman.]

Of the SHOOTING CERTIFICATE.

By 25 Geo. III. c. 50, every perſon who ſhall uſe any dog, gun, net, or other engine for the taking or deſtruction of game, *(not acting as a gamekeeper,)* ſhall previouſly deliver in a paper or account in writing, containing his name and place of abode, to the clerk of the peace of the county where he ſhall reſide, and annually take out a certificate thereof, upon which he ſhall be charged a ſtamp duty of 2l. 2s. And by 31 Geo. III. c. 21, 1l. 1s. more. Total 3l. 3s.

And every ſuch clerk of the peace, on the delivery of ſuch paper or account as aforeſaid, ſhall thereupon iſſue ſuch certificate, ſtamped as before directed, with a *two* guinea and a *one* guinea ſtamp; and the ſame ſhall bear date on the day on which it is iſſued, and ſhall continue in force until the 1ſt day of July next following the date thereof, *and no longer*; for which ſuch clerk of the peace, previous to the delivery thereof, ſhall be entitled to one ſhilling for his trouble. And if he ſhall iſſue any certificate otherwiſe than as above ſet forth, or ſhall neglect or refuſe to deliver a certificate properly ſtamped in manner as aforeſaid, he ſhall forfeit 20l. and moreover ſhall be liable to pay the duty on ſuch certificate.

And if any perſon ſhall uſe any greyhound, hound, pointer, ſetting dog, ſpaniel, or other dog, or any gun, net, or other engine, for the taking or deſtruction of any hare, pheaſant, partridge, heath-fowl, commonly called *black game*, or grouſe, commonly called *red game*, or any other game whatſoever, without having obtained ſuch certificate, he ſhall forfeit 20l.

And to prevent the evading the payment of the ſaid duties, and to facilitate the detection of offenders, it is enacted, that if any perſon ſhall be found uſing any dog, gun, net, or other engine, for the taking or deſtruction of game, by any other perſon, who hath obtained ſuch certificate as aforeſaid, it ſhall be lawful for ſuch perſon, *producing ſuch certificate*, to demand and require from the perſon ſo uſing ſuch dog, gun, net, or other engine, to produce and ſhew a certificate iſſued to him for that purpoſe; and every ſuch perſon ſhall, upon ſuch demand, produce his certificate to the perſon ſo demanding the ſame, and permit the ſame to be inſpected accordingly: and if any ſuch perſon ſhall wilfully refuſe to produce and ſhew a certificate iſſued to him for that purpoſe, or not having produced and ſhewn ſuch certificate, ſhall refuſe on demand thereof, to give in his chriſtian and ſurname, and the place of his reſidence, or ſhall give in a falſe or fictitious name or place of reſidence, he ſhall forfeit 5ol.

Provided nevertheleſs, that ſuch certificate *ſhall not authorize any perſon* to uſe any greyhound, hound, pointer, ſetting dog, ſpaniel, or other dog, nor any gun, net, or other engine, for the taking or deſtruction of game, at any time, or in any manner, prohibited by law, nor ſhall give to any perſon any *right* to uſe any greyhound, hound, pointer, ſetting dog, ſpaniel, or other dog, nor any gun, net, or other engine for the taking or deſtruction of game, *unleſs ſuch perſon ſhall be duly qualified*, under and by virtue of the laws now in being, made for the preſervation of the game; but he ſhall remain liable to the penalties in all or any of the ſaid laws contained, in the ſame manner as if this act had not been made.

And the clerks of the peace ſhall on or before the firſt day of Auguſt in each year, whenever they ſhall be thereunto required by the commiſſioners of the ſtamp-duties, make out and tranſmit to the head office of ſtamps, correct liſts in alphabetical order, of the certificates ſo iſſued by them, diſtinguiſhing the duties paid on each reſpective certificate; for which they ſhall have one halfpenny for each name; and in caſe any clerk of the peace ſhall neglect or refuſe to make out ſuch liſt, or ſhall not inſert therein, a full, true, and perfect account, of all the perſons the ſame ought to contain, then and in every ſuch caſe he ſhall forfeit 20l.

And the ſaid liſts ſhall be kept at the ſaid office, and may within the office hours be inſpected by any perſon on payment of one ſhilling. And the ſaid commiſſioners ſhall once or oftener in every year, as ſoon as conveniently may be after ſuch liſts have been ſo tranſmitted, cauſe the ſame to be inſerted in the newſpapers circulating in each reſpective county, or in ſuch public newſpapers as to them ſhall ſeem moſt proper.

All penalties and forfeitures by this act impoſed, may be ſued for and recovered in the courts at Weſtminſter, to the uſe of the plaintiff, if he ſhall recover the ſame, with coſts of ſuit. But where the penalty doth not exceed 20l. the ſame may be recovered before one juſtice, who is required upon complaint to ſummon the party accuſed, and alſo the witneſſes on either ſide; and upon appearance of the party accuſed, or in default thereof, (ſuch ſummons being duly proved,) to proceed to hear and determine the matter in a ſummary way; and upon due proof made thereof, either by the voluntary confeſſion of the party, or by the oath of one witneſs, to give judgment therein, and to iſſue his warrant for levying the penalty by diſtreſs, one moiety thereof to go to the perſon who ſhall inform and proſecute for the ſame *within ſix* calendar months after the offence is committed, and the other moiety to go to the king, after firſt deducting the neceſſary charges of recovering the ſame; but if not ſued for *within* ſix calendar months, the whole ſhall go to the king. And where ſufficient diſtreſs cannot be found, to commit ſuch offender to the common goal, or houſe of correction, (for three calendar months,) unleſs ſuch penalty ſhall be ſooner paid.

And any perſon who ſhall find himſelf aggrieved, may upon giving ſecurity to the amount of ſuch penalty, together with ſuch coſts as ſhall be awarded, in caſe ſuch judgment ſhall be affirmed, appeal to the next ſeſſions, who are to hear and finally determine the ſame; and in caſe the judgment of ſuch juſtice ſhall be affirmed, they may award ſuch coſts as to them ſhall ſeem meet.

FORM OF THE CERTIFICATE

I, WILLIAM BALCOMBE LANGRIDGE, Clerk of the Peace for the County of Suſſex, do hereby declare, that John Wilkes, Eſquire, of Milland Houſe in the ſaid County, hath delivered into my Office a Paper Writing or Account containing his Name and Place of Abode, bearing Date July 5th, 1806, which I do hereby certify, in purſuance of an Act of Parliament paſſed in the Twenty fifth Year of King George the Third, intituled, "An Act for repealing an Act made in the Twenty-fourth Year of the Reign of his preſent Majeſty, intituled 'An Act for granting to his Majeſty certain Duties on Certificates iſſued with reſpect to the killing of Game,' and for granting other Duties in lieu thereof."—As witneſs my Hand this Twenty-third Day of Auguſt, 1806. W. BALCOMBE LANGRIDGE.

Of the APPOINTMENT and POWER of a GAMEKEEPER.

All lords of manors, or other royalties, not under the degree of an eſquire, may by writing under their hands and ſeals authorize one or more gamekeeper or gamekeepers, within their reſpective manors or royalties. 22 and 23 *Car.* II. c. 25. In the caſe of Jones *v.* Smart, as ſtated above, p. 220, Willes J. ſaid, That the lord of a manor is certainly not an eſquire by virtue of his manor or royalty, though in common acceptation he is conſidered as ſuch; and that no lord of a manor under that rank, can appoint a gamekeeper, whatever his eſtate may be. *D.* and *E.* 1 *V.* 44. And in Calcroft *v.* Gibbs, *M.* 33 Geo. III. L. Kenyon Ch. J. ſaid, That the lord of a manor cannot convey to another the power of appointing a gamekeeper, without a deed of conveyance of the manor itſelf. Such a power is a mere emanation of the manor, and it is inſeparable from it. It is a mere ſhadow, accompanying the ſubſtance. *D.* and *E.* 5 *V.* 19.

And the lords of manors may impower him thereby, upon their own manors, to kill hare, pheaſant, partridge, or any other game: but if the gamekeeper ſhall, under colour thereof, kill or take the ſame for the uſe of the lord,

lord, and afterwards ſell and diſpoſe thereof without the lord's conſent; and be convicted, on complaint of ſuch lord, and on oath of one witneſs, before one juſtice; he ſhall be committed to the houſe of correction for three months, to be kept to hard labour. 5 *Anne*, c. 14. But no lord of the manor ſhall make above *one* perſon to be gamekeeper within *any one manor*, with power to kill game. And the name of ſuch perſon ſhall be entered with the clerk of the peace where the manor lies; the entry to be made and viewed without fee; and a certificate thereof ſhall be granted by the clerk of the peace, on payment of one ſhilling.

And if any other gamekeeper, whoſe name is not ſo entered, *who ſhall not be otherwiſe qualified* by the laws of this kingdom to kill game, ſhall kill, ſell, or expoſe to ſale, any hare, pheaſant, partridge, moor, heath-game, or grouſe; he ſhall on conviction before one juſtice, on oath of one witneſs, forfeit for every offence 5l. half to the informer, and half to the poor, by diſtreſs: for want of diſtreſs, to be ſent to the houſe of correction for three months for the firſt offence, and for every other offence four months. 9 *Anne*, c. 25.

WHO SHALL NOT BE OTHERWISE QUALIFIED.—From theſe words it ſeemeth clear, that a gamekeeper who is qualified in his own right to kill game, need not be entered with the clerk of the peace. But by 25 Geo. III. c. 50,—Every deputation of a gamekeeper ſhall be regiſtered with the clerk of the peace of the county where the manor ſhall lie, and ſuch gamekeeper ſhall take out a certificate thereof *annually*, upon which there ſhall be charged a ſtamp duty of 10s. 6d. and by 31 Geo. III. c. 21, 10s. 6d. more. Total 1l. 1s. And if any gamekeeper, to whom ſuch deputation ſhall be granted, ſhall for *twenty days* next after the granting thereof, neglect or refuſe to regiſter the ſame, and take out a certificate thereof as aforeſaid, he ſhall forfeit 20l.

And in caſe of a new deputation of a gamekeeper, the ſame ſhall be regiſtered with the clerk of the peace, and a certificate thereof taken out in manner as aforeſaid; whereupon the former certificate ſhall be void, and the perſon acting under the ſame after notice to him given of ſuch new certificate, ſhall be liable to the penalties preſcribed by this act, in the ſame manner as if no certificate had been granted to him. And no ſuch deputation and certificate ſhall authorize any ſuch gamekeeper to take or deſtroy game out of the limits of the manor for which ſuch deputation was given.

And moreover, by 3 Geo. c. 11, it is further enacted, that no lord of a manor ſhall make any perſon to be a gamekeeper with power to kill game, unleſs ſuch perſon be qualified by the laws of this realm ſo to do; or unleſs ſuch perſon be truly and properly a *ſervant* to the ſaid lord; or be immediately employed and appointed to take and kill the game for the *ſole uſe* of the ſaid lord, and not otherwiſe.

And if any perſon, not being qualified by the laws ſo to do, or not being truly and properly a ſervant of any lord of a manor, or not immediately employed and appointed to take and kill the game for the ſole uſe or immediate benefit of the ſaid lord, ſhall under colour or pretence of any power or authority, deputation or qualification to him granted by any lord of a manor, take and kill any hare, pheaſant, partridge, or other game whatſoever; or ſhall keep or uſe any greyhounds, ſetting dogs, hays, lurchers, guns, tunnels, or any other engine to kill and deſtroy the game; he ſhall forfeit 5l. in like manner.

The gamekeeper (ſo authorized) may ſearch for dogs and engines, and ſeize the ſame for the uſe of the lord, or deſtroy them. 22 and 23 *Car.* II. c. 25. But it hath been adjudged, that an authority from the lord of the manor is not ſufficient of itſelf for this purpoſe, but that he ought to have a warrant from a juſtice of the peace. *Comb.* 183. Carpenter *v.* Adams. At leaſt it may be ſafe to have ſuch warrant, eſpecially if any houſes are to be entered and ſearched. For it would give too great a power to the gamekeepers, to leave it in their own diſcretion to ſearch what places they ſhall think proper, as alſo to conſtitute them the judges whether ſuch or ſuch a perſon is or is not qualified to kill game. Therefore it is beſt to have a warrant from a juſtice of the peace, after information and oath of the offence firſt made.

On a conviction, *Trin. T.* 10 Anne, Q. *v.* Matthews, exception was taken, that the conviction reciting the defendant not to be a perſon ſo and ſo qualified, and enumerating diſtinctly the ſeveral qualifications in 22 and 23 Car. II. omitted the qualification of *gamekeeper*, namely, that he was not a perſon authoriſed by a lord (or lady) of a manor to kill game for his uſe. And by the court: Had it been generally laid thus, that he not being a *perſon qualified according to law*, and ſo on, it had been enough; and ſo it would have been in an action *qui tam*, but not in a conviction, *Com. R.* 522, and *K.* v. *Jarvis*, as ſtated above, p. 224; but the qualifications being diſtinctly and ſeverally mentioned, the omiſſion of one is fatal. [But where the informer need not negative any of the exceptions, if he negative, it will be ſurpluſage. *D.* and *E.* 1 *V.* 320.] 10 *Mod.* 26.

CASE of Rogers *v.* Carter, *Mich. T.* 9 Geo. III.—The plaintiff Rogers brought an action againſt the defendant, being a juſtice of the peace, for taking and carrying away the plaintiff's gun. On a verdict for the plaintiff, a new trial was moved for. The caſe was, the plaintiff, being gamekeeper within the manor of Ringwood, in beating for game within the ſaid manor, ſprung a covey of partridges, which he ſhot at *within* the ſaid manor. They took a ſecond flight, and he purſued them *out of* the manor, but could not find them. As he was returning to the manor of Ringwood, he was met by the defendant about three quarters of a mile diſtant from that manor, who aſked him if he had a qualification. The plaintiff anſwered, I have a deputation from the lord of the manor of Ringwood. The defendant replied, You are now out of that manor; and demanded his gun, and took it from him. The defendant did not ſhoot out of the manor, but was three quarters of a mile out of the manor, with his gun and dog, with an *intention* to ſhoot at game. By the court: The queſtion is, Whether the juſtice had a right to take the plaintiff's gun from him, whilſt he was ſporting for the purpoſe of killing game in another manor, out of the manor of Ringwood? And we are all of opinion, *he had not ſuch right.* If he had killed game where he was not a gamekeeper, he might have been convicted in the penalty of 5l. but he was entitled to keep and have dogs, guns, and nets, any where; and a gamekeeper's gun cannot be ſeized either in going to or returning from the manor, or in any other place; and if gamekeepers were permitted to ſeize one another's guns, it would create a kind of border war amongſt them. And the rule to ſhew cauſe why there ſhould not be a new trial was diſcharged. 2 *Wilſon*, 387.

FORM OF THE DEPUTATION.

To all to whom theſe preſents ſhall come, John Wilkes of Milland Houſe in the county of Suſſex, Eſquire, ſendeth greeting. Know ye that I the ſaid John Wilkes have appointed, authorized, and empowered, and by theſe preſents do appoint, authorize, and empower, George Goldring, of Rake, in the pariſh of Rogate and county of Suſſex, to be my Gamekeeper of and within the ſeveral manors of Rogate Bohunt, Rogate College, Clarke's Dean, and Milland, and the royalties, rights, members, and appurtenances thereto belonging, in the ſaid county of Suſſex, during my pleaſure. And I do hereby give and grant unto him the ſaid George Goldring, during ſuch my will and pleaſure as aforeſaid, full power and authority to ſeize and take all and all manner of guns, bows, greyhounds, ſetters, ferrets, tramels, lowbels, kayes,

or other nets, harepipes, ſnares, or other engines for taking or deſtroying conies, hares, pheaſants, partridges, or other game. And alſo all manner of fiſhing-nets, leaſhes, angles, pitchers, and other inſtruments or engines for the taking of fiſh, uſed and employed within the ſaid manors of Rogate Bohunt, Rogate College, Clarke's Dean, and Milland, and the royalties, members, and precincts thereof, by any perſon or perſons whomſoever prohibited by the laws of this realm in any wiſe to uſe, employ, or keep, the ſame, as any other gamekeeper may lawfully do. And further I do hereby give and grant unto him the ſaid George Goldring, during my pleaſure, full power and authority to do all and every act or acts, thing or things, which by the laws of this realm are requiſite and neceſſary for the preſervation of the ſaid game within the ſaid manors; and the rights, members, and appurtenances thereof, and for the diſcovery of offenders therein, againſt the laws and ſtatutes in that caſe made and provided. In witneſs whereof I have hereunto ſubſcribed and ſet my hand and ſeal this 5th day of July, in the year of our Lord 1806.
Sealed and delivered in the preſence of } *JOHN WILKES.*
WILLOUGHBY RHOADES. }

Lewes, 23d of Auguſt, 1806.—*I do hereby certify that the above Deputation was this day regiſtered in my office, purſuant to the ſtatute in that caſe made.*

W. BALCOMBE LANGRIDGE,
Clerk of the Peace for the County of Suſſex.

FORM OF THE CERTIFICATE UPON IT.

I, WILLIAM BALCOMBE LANGRIDGE, Clerk of the Peace for the county of Suſſex, do hereby declare, that George Goldring, of Rake in the pariſh of Rogate in the ſaid county, hath regiſtered a Deputation bearing date the 5th day of July 1806, *whereby he is appointed a Gamekeeper by John Wilkes, Eſquire, of Milland Houſe, for the manors and lands of Rogate Bohunt, Rogate College, Clarke's Dean, and Milland, in the county aforeſaid, which I do hereby certify, in purſuance of an Act of Parliament paſſed in the twenty-fifth year of King George the Third, intituled, "An Act for repealing an Act made in the twenty-fourth year of the reign of his preſent Majeſty, intituled, 'An Act for granting to his Majeſty certain duties on certificates iſſued with reſpect to the killing of game,' and for granting other duties in lieu thereof." As witneſs my hand this 23d day of Auguſt,* 1806. *WILLIAM BALCOMBE LANGRIDGE.*

The Deputation thus given to a Gamekeeper on a thirty-ſhilling ſtamp, does not require to be renewed, until a different perſon is appointed; and then it muſt be done on a freſh ſtamp; but the Deputation requires to be regiſtered *annually* with the clerk of the peace, on the 5th day of July, and a new Certificate for the current year taken out, otherwiſe the Gamekeeper is liable to the penalty.

ANOTHER FORM OF THE DEPUTATION.

I, JOHN WILKES, of Milland Houſe in the county of Suſſex, Eſquire, Lord of the Manor of Upper and Lower Kingſham and Trippets, in the ſeveral pariſhes of Iping, Chithurſt, and Trotton, in the ſaid county, do hereby nominate, authorize, and appoint Richard Budd, of Milland aforeſaid, to be my Gamekeeper of and within my manor of Upper and Lower Kingſham and Trippets, with full power, licence, and authority, to kill any hare, pheaſant, partridge, or other game whatſoever, in and upon my ſaid manor, for my ſole uſe and benefit. And alſo to take and ſeize all ſuch guns, bows, greyhounds, ſetting-dogs, lurchers, or other dogs to kill hares or conies, ferrets, tramels, lowbels, hayes, or other nets, harepipes, ſnares, or other engines, for the taking and killing of conies, hares, pheaſants, partridges, or other game. And alſo all manner of fiſhing-nets, leaſhes, angles, pitchers, and other inſtruments or engines for the taking of fiſh, uſed and employed within the ſaid manor of Upper and Lower Kingſham and Trippets, by any perſon or perſons who by law are prohibited to keep or uſe the ſame. Given under my hand and ſeal this 5th day of July, in the year of our Lord 1804.
Witneſs, THOMAS ELMES. *JOHN WILKES.*

Horſham, 30th of Auguſt, 1804. *I hereby certify that the above Deputation was this day regiſtered in my office, purſuant to the ſtatute in that caſe made.* *WILLIAM ELLIS,*
Clerk of the Peace for the County of Suſſex.

CERTIFICATE UPON IT FOR THE CURRENT YEAR.

I, WILLIAM BALCOMBE LANGRIDGE, Clerk of the Peace for the county of Suſſex, do hereby declare, that Richard Budd, of Milland in the pariſh of Trotton in the ſaid county, hath regiſtered a Deputation bearing date the 5th day of July, 1804, *whereby he is appointed a Gamekeeper by John Wilkes, Eſquire, of Milland Houſe, for the manor and lands of Upper and Lower Kingſham and Trippets, in the ſeveral pariſhes of Iping, Chithurſt, and Trotton, in the county aforeſaid, which I do hereby certify, in purſuance of an Act of Parliament, &c. &c.* (*as recited above.*) *Signed, W. BALCOMBE LANGRIDGE.*
Lewes, 23d Auguſt, 1806.

It may here be proper to notice, that as by act of parliament every ſhooting certificate expires annually on the fifth of July, the freſh one ought to be taken out on that or the day following, otherwiſe gentlemen, and their gamekeepers, who are in the habit of hunting, courſing, or killing hare, which is almoſt every where renewed in July and Auguſt, are liable to the penalties of the act, until ſuch freſh certificate is actually obtained.

OF TRESPASS IN PURSUING GAME.

In order to obtain a ſatisfactory idea of the nature and extent of that ſpecies of treſpaſs which a man is liable to commit in the purſuit of game, it may be proper to inveſtigate the rights and privileges of thoſe ancient demeſnes or royalties, which were time out of mind appropriated for the preſervation and breed of game; ſuch as foreſts, purlieus, chaſes, parks, warrens, honours, and manors.

A FOREST is a "royal demeſne, or territory, compriſing woody grounds and fruitful paſtures, privileged for wild deer and fowls of foreſt, chaſe, and warren, to reſt and abide there under the ſafe protection of the king; which territory of ground ſo privileged is meered and bounded with unremoveable marks, meers, and boundaries, either known by matter of record, or by preſcription; and alſo repleniſhed with beaſts of venary or chaſe, and with great coverts of vert for the ſuccour of the deer there to abide: for the preſervation and continuance of which, there are particular officers, laws, and privileges, belonging to the ſame, anciently inſtituted for that purpoſe, and proper only to a foreſt, and to no other place." *Manw.* 40. The *vert* comprehends every thing which bears green leaves in the foreſt. *Manw.* 51. And the lord having the wood in the tenant's land, *which is ſtill cuſtomary in many manors,* was originally for preſervation of the vert, for the ſuſtentation of the lord's game there. Beaſts of foreſt are properly hart, hind, buck, hare, and boar; but legally all wild beaſts of venary. 1 *Inſt.* 233.—They are called *beaſts of venary*, becauſe they are gotten by the chaſe; and *venatio*, or veniſon, becauſe being *hunted*, are reckoned moſt wholeſome. They are appurtenant to a foreſt, as the peculiar privilege of crowned heads; whence aroſe the foreſt laws, the courts of eyre, ſwainmote, &c. and the chief juſtice in eyre, warden, ranger, regarder, verderor, and other officers, whoſe buſineſs it is to protect the vert and veniſon, and puniſh thoſe who preſume to treſpaſs within the foreſt liberty, in purſuit of his majeſty's game.—See the article FOREST, vol. vii. p. 565—568, where this ſubject is amply diſcuſſed.

PURLIEU, comes from the French *pur*, clear, entire, and exempt; and *lieu*, a place: that is, a place, entire, clear, or exempt, from the foreſt, and ſignifies thoſe grounds which Henry the Second, Richard the Firſt, or king John, added to their ancient foreſts, over other men's grounds, and were diſafforeſted by the ſtatute of *charta de foreſta*. 4 *Inſt.* 303. *Manw.* 318. But nevertheleſs the *purlieu* as to ſome purpoſes is foreſt ſtill, and is diſaf-

diſafforeſted as to the particular owners of the land and for their benefit, and not generally to give liberty to any man to hunt the deer and ſpoil the vert. And if thoſe beaſts do eſcape out of the foreſt into the *purlieu*, the king hath a property in them ſtill againſt any man but againſt the owners of the woods and lands in which they are; and ſuch owners have a ſpecial property in them *ratione loci*, but yet ſo that they hunt them fairly and not foreſtall them in their return towards the foreſt. *Manw.* 366. But if the purlieu-man find the beaſts of the foreſt in his woods or lands *in the purlieu*, in ſuch caſe he hath a property in them againſt any other man *ratione ſoli*. And if he begins the hunting in his own lands, then by reaſon of that property he may purſue his hunting through any man's woods or lands, ſo as he doth not enter into any foreſt, chaſe, park, or warren. And if he kill the deer in another man's land, and out of ſuch privileged place, he may take and carry away the ſame by reaſon of the firſt property. But if the deer recover the foreſt, he muſt call back his dogs, for they are then the king's wild beaſts again. And if he do not call back and rebuke his dogs, and they kill the deer in the foreſt, he is a *treſpaſſer*, though himſelf never came within the bounds thereof. *Manw.* 373.—See the article PURLIEU.

A CHASE, (from *chaſſer*, to chaſe,) is a privileged place for the receipt of deer, very ſimilar to a purlieu; and is of a middle nature betwixt a foreſt and park. It is leſs than a foreſt, and not endowed with ſo many liberties; as officers, laws, courts, &c. and yet is of a larger compaſs than a park, but differeth in that it is not incloſed; though it muſt have certain metes and bounds, and may be in other men's grounds as well as in one's own: being indeed the liberty of keeping beaſts of chaſe or royal game therein, protected even from the owner of the land, *with a power of hunting them thereon without treſpaſs*. 2 *Comm.* 38.—See the article CHASE, vol. iv. p. 120, 121.

A PARK is an encloſed chaſe, extending only over a man's own grounds. The word park indeed properly ſignifies an encloſure; but yet it is not every field or common, which a gentleman pleaſes to ſurround with a wall or paling, and to ſtock with a herd of deer, that is thereby conſtituted a *legal* park: for the king's grant, or at leaſt *immemorial preſcription*, is neceſſary to make it ſo. 2 *Inſt.* 220. Though *now* the difference between a real park, and ſuch encloſed grounds, is in many reſpects not very material: only that it was anciently ſtated to be unlawful for any perſon to kill any beaſts of park or chaſe, viz. any hart, hind, hare, boar, or other beaſts of venary or hunting, except ſuch as poſſeſſed theſe franchiſes of foreſt, chaſe, or park. *Co. Litt.* 233.—A park muſt be incloſed, otherwiſe the owner cannot maintain an action of treſpaſs againſt ſuch as hunt in his park. *Manw. Cromp. Juriſd.* 148. —See the article PARK.

FREE-WARREN is a franchiſe erected for preſervation or cuſtody of beaſts and fowls of warren; which are hares, conies, and roes: the fowls are either *campeſtres*, as partridges, rails, and quails; or *ſylveſtres*, as woodcocks and pheaſants, or *aquatiles*, as mallards and herons. *Co. Litt.* 233. —Upon the introduction of the foreſt laws, ſoon after the Norman conqueſt, theſe animals being looked upon as royal game, this franchiſe of free-warren was invented to protect them; by giving the grantee a ſole and excluſive power of killing ſuch game ſo far as his warren extended, on condition of his preventing other perſons. This royal franchiſe is almoſt fallen into diſregard, ſince the new ſtatutes for preſerving the game; the name being now chiefly preſerved in grounds that are ſet apart for breeding hares and rabbits. There are many inſtances of keen ſportſmen in ancient times, who have ſold their eſtates, and reſerved the free-warren, or right of killing game, to themſelves; by which means it comes to paſs that a man and his heirs have ſometimes free-warren over another's ground. *Bro. Abr. tit. Warren.* 3.—2 *Comm.* 39. A free warren may lie open, there being no neceſſity of incloſing it. It is not lawful, however, for any perſon to make any chaſe, park, or warren, in his own freehold, or elſewhere, to keep in it any wild beaſts or birds of foreſt, chaſe, park, or warren, without the king's grant or warrant ſo to do; and if any man do, he is to be puniſhed in a *quo warranto*, and the franchiſe to be ſeized into the king's hands. *Manw.* 56.

CASE of K. *v.* ſir William Lowther, *Mich. T.* 12 *G.*—It was moved for leave to file an information in nature of a *quo warranto* againſt ſir William Lowther, to ſhew by what authority he had made and ſet up a warren. But it was denied by the court: becauſe it was of a private nature, and therefore proper to be proſecuted only in the name of the attorney general by information, if his majeſty thought fit. And the like motion had been denied before in the caſe of the lord Liſburne. 2 *L. Raym.* 1409. 1 *Stra.* 637.

CASE of lord Dacre *v.* Tebb, *Eaſter T.* 17 *Geo.* III.—This was a declaration in treſpaſs, for breaking and entering his free warren in Aveley in the county of Eſſex, and chaſing, hunting, and killing, divers foxes, hares, conies, partridges, and pheaſants of the plaintiff, and taking away other his goods and chattels. On not guilty pleaded, and tried by a ſpecial jury, the defendant was found guilty of breaking and entering the free warren of the plaintiff, and chaſing and hunting one hare, damages ſixpence, and not guilty as to the reſidue. It was moved for the plaintiff that he ſhould have full coſts; alleging that the ſtat. 22 & 23 Car. II. (which reſtricts coſts in treſpaſs, where the damages are under forty ſhillings, unleſs the freehold or title to the land came in queſtion) did not extend to this action, in which there could not poſſibly be any queſtion relating to the land, but merely to the franchiſe of free warren: for that act related only to ſuch action of treſpaſs, where ſome injury was done to the land. For the defendant it was anſwered, that it was poſſible the freehold or title to the land might be ſo interwoven with the title to the free warren, that both might come in queſtion. And where the title of the land may come in queſtion, but did not, and the damages are under forty ſhillings, there ſhall be no more coſts than damages.—By the court: The act is confined to ſuch actions of treſpaſs where the ſoil or land is mentioned in the declaration as the ſubject of the treſpaſs complained of. The right of free warren was not in the contemplation of the legiſlature. In an action merely for breaking free warren, it is impoſſible the title of the ſoil can ever come in queſtion. For though both may concur in one perſon, yet the title to the free warren is always collateral to that of the land, for a man may have free warren in another man's land. Beſides, the hare ſo hunted was the perſonal property of the owner of the free warren; and if any injury be done to perſonal property, that will take it out of the ſtatute, and intitle the plaintiff to full coſts. And the rule was made abſolute for taxing full coſts. 2 *Black. Rep.* 1151.

The next franchiſe which confers a right of killing game, is termed an HONOUR; and conſiſts of lands, liberties, and royalties. 1 *Bulſt.* 197. 2 *Rol.* 72. *l.* 48. And it is the moſt noble ſeigniority. *Co. Lit.* 108 *a.* One or more manors may be parcel of an honour. 2 *Rol.* 72. *l.* 45. So a foreſt may be appendant to it. 2 *Rol.* 73. *l.* 3. —An honour originally ſhall be created by the king. *Co. Lit.* 108 *a.* Every honour muſt be holden of the king. *R.* 1 *Bul.* 195. And if it be aſſigned, or granted over to another, it ſhall not be holden of a ſubject For it may be granted by the king alone to a ſubject. A man may claim and hold an honour by grant, or by preſcription: but the king at this day cannot make an honour by grant, without an act of parliament. *R.* 1 *Bul.* 195, 196. *Co. Lit.* 108 *a.*

The following is a liſt of *honours* within the realm, viz. Ampthill (by ſtat. 33 Hen. VIII. c. 37). Aquilay

(formerly Pevenſey), Arundel, Abergavenny, Boloine, Berkhamſtead, Beaulieu, Barnard's Caſtle, Bullingbroke, Barnſtable, Bononia, Brecknock, Bramber, Bedford, Clare, Crevecure, Clun, Chriſtchurch, Cockermouth, Cormayls, Candicut, Cariſbrook, Clifford caſtle, Cheſter, Carmarthen, and Cardigan, Donnington caſtle, (by ſtat. 37 Hen. VIII. c. 18.)—Dudley, and Dover caſtle, Eye, and Egremond.—The honour of Eaſt and Weſt Greenwich, Glamorgan, Gloceſter, Grentmeſnil, Gower, Grafton, (by ſtat. 33 Hen. VIII. c. 38.)—Haganet, Hampton court, (by ſtat. 31 Hen. VIII. c. 5,) —Huntingdon in Herefordſhire, Heveningham, Hawenden-caſtle, Hertford, and Halton, Lancaſter, Lincoln, Leiceſter, Lovetot, Hinckley, Kingſton upon Hull, (by ſtat. 37 Hen. VIII. c. 18.)—Kington, and Folkingham. —The honour of Montgomery, Mowbray, Middleham, and Maidſtone, Nottingham, Newelhn or Newelme, Oakhampton, St. Oſith, (by ſtat. 37 Hen. VIII. c. 18.)—Oxford.—The honour of Plimpton, Peverel; Pickering, Raleigh, Richard's caſtle, Skipton, Stafford, Strigul, Tickhil, Tremanton, Totneſs, Theony, Tamworth.—The honour of Wigmore, Wallingford, Weſtminſter, (by ſtat. 37 Hen. VIII. c. 18.)—Windſor, Wormgay, Whirwelton in Yorkſhire, Werk, Whitchurch, and Warwick, Webley, and Tutbury.—At this day the earl of Arundel only hath his honour and earldom by preſcription, the beginning of which is not within the memory of any one, ſo that his earldom is the moſt ancient in the realm. 1 *Bulſt.* 196.—Each of theſe honours are maintained and kept up by a court, ſimilar to thoſe of a manor, over many of which however they claim ſeigniority.—See *Spelman* in v. *Honor*.

The next and laſt franchiſe by which a right of killing game is inſiſted upon, is called a MANOR, or LORDSHIP. Theſe, ſays Blackſtone, are as ancient as the Saxon conſtitution, though perhaps differing in ſome immaterial circumſtances from thoſe that exiſt at this day. *Co. Cop.* 2. 10. It is ſaid to have been named *manor*, from the French *manoir*, *habitatio*; or rather *manendo*, an abiding place; it being a noble ſort of fee granted for the reſidence or domain of a lord, *with juriſdiction over his tenants for their farms*. This fee was of old termed a *barony*; from whence the court, which is appendant to the manor, is called the *Court-baron*.—See *Skeene de verb Signif.* —and the article COURT BARON, vol. v. p. 298. Concerning the original ſetting out of manors, it ſeems to be generally admitted that in the beginning, there was a circuit of ground, granted by the king to ſome baron or man of worth, for him and his heirs to dwell upon, and to exerciſe juriſdiction more or leſs within that compaſs, as he thought good to grant; performing ſuch ſervices, and paying ſuch yearly rent for the ſame, as the king by his grant required; and that afterwards this great man parcelled his land to other meaner men, enjoining them ſuch ſervices and rents as he thought good, and ſo, as he became tenant to the king, the inferiors became tenants to him. *Perkin's Reſervations*, 670: *Horne's Mirror of Juſtices*, *lib.* 1. *cap. de Roy Alfred*; *Fulbeck*, 18. But in theſe days, a manor as often ſignifies the juriſdiction and royalty incorporeal, as the land or ſite. For a man may have a manor in groſs, that is, the right and intereſt of a court-baron, with the perquiſites thereunto belonging, and another, or others, have every foot of the land. *Kitchen*, *fol.* 4. At this day a manor cannot be made, becauſe a court-baron cannot now be made, and a manor cannot be without a court-baron, and ſuitors or freeholders, two at the leaſt; for if all the freeholds except one eſcheat to the lord, his manor is gone *cauſâ quâ ſupra*, although in common ſpeech it may be ſo called. *Cowell. Co. Lit.* 58, 108; *Lit.* 73: 2 *Rol. Abr.* 121.

A manor may contain one or more villages or hamlets; or only great part of a village, &c. And there are capital manors which have other manors under them, the lords whereof perform cuſtoms and ſervices to the ſuperior lords. 2 *Inſt.* 67: 2 *Rol. Abr.* 72. There may be alſo cuſtomary manors, granted by copy of court-roll, and held of other manors. 4 *Rep.* 26: 11 *Rep.* 17. But ſtill it cannot be a manor in law, if it wanteth freehold tenants; nor be a cuſtomary manor, without copyhold tenants. 1 *Inſt.* 58: *Lit.* 73: 2 *Rol. Abr.* 121. The tenemental lands of ancient manors were, from the different modes of tenure, diſtinguiſhed by two different names. Firſt, *book-land*, or charter-land, which was held by deed under certain rents and free-ſervices, and in effect differed nothing from free ſocage lands. *Co. Cop.* 3. And from hence have ariſen moſt of the freehold tenants who hold of particular manors, and owe ſuit and ſervice to the lord. The other ſpecies was called *folk-land*, which was held at firſt by no aſſurance in writing, but diſtributed among the common folk, or people, at the pleaſure of the lord, and reſumed at his diſcretion: hence came the copyholders. The reſidue of the manor being uncultivated, was termed the *lord's waſte*. And it is curious to obſerve, that the ancient nobility, from pride, or the affectation of diſplaying a princely domain, were every where fond of having around them a vaſt extent of ſuch *waſte* territory. "Una ex parte a Suevis circiter millia paſſuum DC agri *vacare* dicuntur." *Cæſar, de Bell. Gall. lib.* 4. c. 2. "Civitatibus maxima laus eſt quam latiſſimas circum ſe vaſtatis finibus *ſolitudines* habere." *Id. lib.* 6. c. 22. "Bella cum finitimis gerunt, ut quæ circa ipſos jacent *vaſta* ſint." *Mela*, *lib.* 3. It is remarkable alſo, that after land came to be connected with individuals, every great baron and chief lord diſtributed portions of their poſſeſſions to their followers; and they again even affected *waſtes* of this kind, which often created a manor *within* a manor; over which the original poſſeſſor ſtill claimed his authority as *lord paramount*, which was ſecured to him by the cuſtomary homage at his court, and by fine or fee. Beſides this mode of parcelling out a domain, the lord of a manor, after having aſſigned a tract of ground for the maintenance of his houſe and hoſpitality, gave other diviſions to his vaſſals and tenants, for the ſupport of his political greatneſs; and theſe purpoſes being anſwered, a large proportion of territory often remained wholly unemployed by him. This *waſte* domain gave an idea of the extent of his power, and ſerved to excite, in ſtrangers, a ſentiment of admiration of his extenſive riches and princely authority. On this tract of land, the inhabitants of the diſtrict, connected with his caſtle, were indulged in feeding their cattle, till, in the courſe of time, he almoſt loſt all connection with it himſelf, while his tenants and vaſſals, from the conſtant and undiſturbed uſe of it, at length aſſerted a preſcriptive right over it. Hence aroſe *common* of *paſture*, and *commons* in general. On theſe *waſtes*, therefore, *qualified perſons* are apt to imagine they have an authority to ſhoot and hunt; but it is not ſo: they are equally as liable to actions of *treſpaſs* for ſporting on waſte lands and commons, after forbiddance by notice in writing, as upon incloſed lands, or in private grounds.

In imitation of the grants above-mentioned, the inferior lords began to carve out and grant to others ſtill more minute eſtates, to be holden of themſelves; whence came *manor farms*: and they were ſo proceeding downwards *in infinitum*, till the ſuperior lords obſerved, that by this method of ſubinfeudation they loſt all their feudal profits of wardſhips and eſcheats, which fell into the hands of theſe meſne or middle lords, who were the immediate ſuperiors of the *terre-tenant*, or him who occupied the land; and alſo that the meſne lords themſelves were ſo impoveriſhed thereby, that they were diſabled from performing their ſervices to their own ſuperiors. This occaſioned, firſt, that proviſion in the 32d cap. of Magna Charta, 9 Hen. III. (which is not to be found in the firſt charter granted by that prince, nor in the great charter of king John;) that no man ſhould either give or ſell his land, without reſerving ſufficient to anſwer the demands of his lord; and afterwards the ſtat. of

Weſtm.

Weſtm. 3, or *quia emptores*, 18 Edw. I. c. 1. which directs that upon all ſales or feoffments of lands, the feoffee ſhall hold the ſame, not of his immediate feoffor, but of the chief lord of the fee of whom ſuch feoffor himſelf held it. But theſe proviſions not extending to the king's own tenants *in capite*, the like law concerning them is declared by the ſtatute of *prerogativa regis*, 17 Edward II. c. 6. 34 Edw. III. c. 15. by which all ſubinfeudations, previous to the reign of Edw. I. were confirmed: but all ſubſequent to that period were left open to the king's prerogative. From hence it is clear, that all manors exiſting at this day, muſt have exiſted as early as king Edward I. for it is eſſential to a manor, that there be tenants who hold of the lord; and by the operation of theſe ſtatutes no tenant *in capite* ſince the acceſſion of that prince, and no tenant of a common lord ſince the ſtatute of *quia emptores*, could create any new tenants to hold of himſelf. 2 *Comm. c. 6. p.* 90–92. Hence it is material to notice, that as there can be no manor *in law*, without two copyhold or two freehold tenants *at the leaſt*, who are to form the jury and court by which alone the rights of a manor can be maintained; ſo, where no ſuch court is or can be holden, the franchiſe is loſt, and the lordſhip is termed a *manor extinct*, or only a *reputed manor*.

From the laws or claims founded on the franchiſes above deſcribed, but particularly from the foreſt laws, (ſays ſir William Blackſtone, 4 *Comm.* p. 415,) "has ſprung a baſtard ſlip, known by the name of the *Game-law*, now arrived to and wantoning in its higheſt vigour: both founded upon the ſame unreaſonable notions of permanent property in wild creatures; and both productive of the ſame tyranny to the commons: but with this difference; that the foreſt laws eſtabliſhed only *one* mighty hunter throughout the land, and the game laws have raiſed a little Nimrod in every manor. And in one reſpect the ancient law was much leſs unreaſonable than the modern: for the king's grantee of a chaſe or freewarren might kill game in every part of his franchiſe; but now, though a freeholder of leſs than 100l. a year is forbidden to kill a partridge upon his own eſtate, yet nobody elſe can do it, without committing a treſpaſs, and ſubjecting himſelf to an action at law."

The learned Commentator alſo remarks, that if a man ſtarts any game within his own grounds, and follows it into another's, and kills it there, the property remains in himſelf. 11 *Mod.* 75. And this is grounded on reaſon and natural juſtice: for the property conſiſts in the poſſeſſion; which poſſeſſion commences by the finding it in his own liberty, and is continued by the immediate purſuit. And ſo if a ſtranger ſtarts game in one man's *chaſe, or free warren*, and hunts it into another liberty, the property continues in the owner of the chaſe or warren, this property ariſing from privilege, and not being changed by the act of a mere ſtranger. Or if a man ſtarts game on another's private grounds and kills it there, the property belongs to him in whoſe ground it was killed, becauſe it was alſo ſtarted there, the property ariſing *ratione ſoli*. *Lord Raym.* 251. Whereas if, after being ſtarted there, it is killed in the *grounds* of a third perſon, the property belongs not to the owner of the firſt ground, becauſe the property is local; nor yet to the owner of the ſecond, becauſe it was not ſtarted in his ſoil; but it veſts in the perſon who ſtarted and killed it; *though guilty of a treſpaſs againſt both the owners*. *Ld. Raym. ib.* 7 *Mod.* 18. 2 *Comm.* 419. On a reference to this law, as laid down by ſir William Blackſtone, Mr. Chriſtian very acutely obſerves, that theſe diſtinctions never could have exiſted, if the doctrine were true, "that all the game was the property of the king,"—for in that caſe the maxim *in æquali jure potior eſt conditio poſſidentis*, muſt have prevailed. 2 *Comm.* c. 27.

On the principle of the common law above laid down, Dr. Burn has ſtated the following general maxim from *Manwood*:—"If I find a pheaſant in my lands, and I let my hawk fly, I may follow the flight into another man's land by reaſon of the firſt property which I had in the pheaſant *ratione ſoli*; and if my hawk kill the pheaſant in another man's land, I may enter and take it, by reaſon of that property and purſuit; and in that caſe, I ſhall not be puniſhed as a treſpaſſer for taking and carrying away the *pheaſant*, but only for *entering the ground*. But if the pheaſant fly into a warren (which is a privileged place for birds of warren) and the hawk kill it there, the falconer ſhall not have the pheaſant, but the owner of the warren. And the law is the ſame in the caſes of all wild beaſts of the foreſt and chaſe. *Manw.* 389.—But if he be qualified to kill game, and the damage found ſhall be under 40s. he ſhall in ſuch caſe pay no more coſts than damages.

But in the caſe of Reynold *v.* Edwards, *M. T.* 35 Geo. III. which was upon an action of *treſpaſs* tried before Buller, J. at Staffordſhire aſſizes, where it appeared in evidence, that a treſpaſs was committed by the defendant in courſing over a cloſe belonging to the plaintiff, who four years before had given a general notice to all perſons not to treſpaſs on his lands. It appeared alſo, that the defendant was anxious to avoid treſpaſſing on the plaintiff's grounds, and had made enquiries reſpecting his boundaries. The plaintiff's counſel preſſed the judge to certify that the treſpaſs was wilful and malicious, in order to entitle the plaintiff to full coſts under 8 & 9 Will. c. 11, which ſets forth, that in all actions of treſpaſs, where at the trial it ſhall appear and be certified by the judge under his hand, upon the back of the record, that the treſpaſs was *wilful* and *malicious*, the plaintiff ſhall recover not only his damages, but his full coſts of ſuit. And the judge, conceiving that he had no diſcretion on the ſubject, accordingly certified, reſerving liberty to the defendant to move to ſet aſide that certificate, if this court ſhould be of opinion that the ſtatute was not compulſory on the judge.—Afterwards a motion was made to that effect. But the court refuſed to grant the rule, ſaying, that in the caſe of Swinnerton *v.* Jarvis, *E. T.* 22 Geo. III. in the common pleas, it was determined that if it appeared that the treſpaſs, however trifling, was committed *after notice*, the judge was bound to certify under the ſtatute; and that it was proper to adhere to that as an univerſal rule. *D. & E.* 6 *V.* 11.

It was otherwiſe in the caſe of Pallant *v.* Roll, *E. T.* 13 Geo. III.—This was an action of *treſpaſs*; for that the defendant, being a diſſolute perſon, neglecting his employment, and following hunting and other game, and by no means qualified by law ſo to do, broke and entered the plaintiff's cloſes, and with dogs, guns, and other engines for deſtruction of the game, hunted upon the ſaid cloſes, trod down the graſs and corn, and broke the fences, againſt the form of the ſtatute. On Not Guilty pleaded, and iſſue thereon, a verdict was found for the plaintiff, at Bury aſſizes, for *one ſhilling* damages, ſubject to the opinion of the court upon the following caſe: The defendant was not qualified in his own right to kill game, but was, and for three years had been, a menial ſervant, and by certificate a huntſman, to Robert Leman, eſquire, a gentleman of 1500l. a-year eſtate, who had kept hounds for twenty years; and the defendant went out by his maſter's order with the hounds, his maſter not being preſent, and was beating over the plaintiff's grounds. The plaintiff deſired the defendant to go off his land, which he refuſed, and at length found a hare, and hunted it over ſeveral pieces of land mentioned in the declaration, two of which were ſown with wheat. The queſtion was, Whether, if the court ſhould be of opinion that the defendant is not a diſſolute perſon, or the like, under the ſtatute of the 4 & 5 Will. the plaintiff can recover againſt him in this action upon the ſtatute? or whether he ought to have brought a common action of treſpaſs for breaking his cloſe? By the court: We have no doubt, but that the defendant is not a diſſolute perſon within the meaning of the act. The only real queſtion is, Whether, as this action is framed, the

the plaintiff can recover any thing? He certainly cannot have his full coſts. If he cannot recover any thing, but is nonſuit, he muſt pay coſts. If he can recover, as upon a common action of *treſpaſs*, he ſaves his coſts. Now certainly any man might have always brought an action of treſpaſs for hunting upon his ground. For this injury, among others, the ſtatute of Glouceſter gave coſts as well as damages. The 22 & 23 Car. II. c. 9, to prevent vexation, lowered the coſts, and if leſs than 40s. recovered, gave no more coſts than damages. This ſtatute of 4 & 5 Will. reſtored full coſts again, even in caſe of ſmall damages recovered againſt diſſolute and other perſons deſcribed in the ſaid ſtatute. But as we are of opinion, that the defendant is not within theſe deſcriptions, the offence falls back upon the ſtatute of Car. II. whereby the plaintiff ſhall recover no more coſts than damages. And the verdict was entered by conſent, that the jury find the defendant not a diſſolute perſon, but guilty of the treſpaſs; damages 1s. coſts 1s. 2 *Black. Rep.* 900.

A treſpaſs is conſidered as *wilful*, where the perſon has been forewarned not to come upon the land; and *malicious*, where the treſpaſs is committed plainly with intent to vex and diſtreſs the plaintiff. 3 *Blac. Com.* 214. And where this appears to have been the caſe, it ſeems that the judge is bound to certify, provided that he be required ſo to do *in court* immediately upon the trial. *Eſp. Ni. Pri.* 424. 5 *Wms. Juſt.* 80.

FORM OF THE NOTICE.

MR. JOHN DILLAWAY.—*Take notice, that if you hunt, ſhoot, fowl, courſe, or fiſh, in or upon any of the manors, lands, fields, woods, or premiſes, ponds, rivers, or waters, belonging to John Wilkes, Eſq. lying and being within the ſeveral pariſhes of Trotton, Iping, and Chithurſt, in the county of Suſſex, you will be conſidered as a wilful treſpaſſer, and be dealt with according to law. Dated this 20th day of Auguſt*, 1806.

T. RHOADES, *Steward of the ſaid Manors.*

The common law allows of the hunting of foxes and badgers, being beaſts of prey, *in another man's ground*, becauſe the deſtroying of them is looked upon as a public benefit; yet the digging and breaking of ground to unearth them is held to be unlawful, and the owner of the ground may maintain an action of treſpaſs. *Cro. Jac.* 321.

CASE of Gundry *v.* Feltham, *Trin. T.* 26 Geo. III.—This was an action of treſpaſs for breaking the hedges and trampling the graſs of the plaintiff, with horſes, dogs, &c. belonging to Humphrey Sturt, eſquire, a qualified perſon, and to whom the defendant was huntſman, in purſuing a fox.——Lawrence for the plaintiff obſerved the queſtion was, whether a perſon hunting has a right to follow foxes upon the ground of another? The qualification of the perſon is entirely out of the queſtion. By the general law, no perſon can go over the ground of another without his permiſſion; and in Sutton *v.* Moody, 1 *Ld. Raym.* 250, Holt ſaid, "If A. ſtarts a hare in the ground of B. and hunts it into the ground of C. and kills it there, the property is in A. the hunter; but A. is liable to an action of treſpaſs for hunting in the grounds as well of B. as of C." In Gedge *v.* Minne, 2 *Bulſt.* 60, it was determined that the defendant could not juſtify digging for a *badger*.——Gibbs for the defendant was ſtopped by the court. Lord Mansfield ſaid, that, by all the caſes as far back as Hen. VIII. it is ſettled that a man *may follow a fox into the grounds of another*.—— Willes, J. ſaid, that the caſe in Popham, 162, was much ſtronger than the preſent.——Buller, J. ſaid, the queſtion in this caſe was, whether the defendant is juſtified in following the fox over another man's ground? it is averred in the plea, that this was the only means of killing the fox. This caſe does not determine that a perſon may *unneceſſarily* trample down another man's hedges, or *maliciouſly* ride over his grounds; if he does more than is abſolutely neceſſary, he cannot juſtify it.—Judgment for the defendant. *D. & E.* 1 *V.* 334.

But as there is a modern faſhion among foxhunters, which ſeems to call loudly for reſtraint, namely, that of importing foxes from the continent on purpoſe to *turn out*, for the multiplication of the ſpecies as well as of the ſport, but to the great injury and annoyance of their neighbours: it ſhould be remembered, that this practice cannot be juſtified on any ground; and in an action of treſpaſs for foxhunting, if it can be ſhewn that the defendant was in the habit of procuring foxes or young cubs on purpoſe to turn out for his diverſion, *and did actually turn them out*, it is more than probable that the verdict would go againſt him; beſides that he might be proſecuted for a public nuiſance.—It is a caſe which appears never to have been tried, or even noticed in the books, though in common and conſtant practice.

It is a fundamental principle of the common law, laid down by all the great authorities, that no perſon can break cloſe, or enter upon another man's land in purſuit of game, without being liable to an action of treſpaſs. 2 *Bac. Abr.* 613. 2 *Comm.* 417. 2 *Blac. Rep.* 900. And to this ſir William Blackſtone has added, in very ſtrong language, "that not even the lord of a manor can by common law juſtify ſporting even *on his own ſoil*, unleſs he hath a grant of *free-warren*; nor can he come upon another man's ground to hunt or ſhoot, *though it be in his own manor*, without committing treſpaſs, and ſubjecting himſelf to an action for the ſame." 2 *Comm.* 39. and 4 *Comm.* 415.

In this opinion all the modern writers on the game laws ſeem to have unanimouſly concurred; though we might obſerve that the ſentiments of all theſe writers appear to have been derived from one and the ſame ſource, namely, the Commentaries of Sir William Blackſtone. And yet that learned commentator, in his fourth volume, p. 174, ſays expreſsly, "that thoſe who have a grant of *free-warren*, or a *manor of their own*, ARE EXEMPT FROM THIS SPECIES OF TRESPASS." And with reſpect to the poſition "that the lord of a manor cannot juſtify ſporting even on his own ſoil, by reaſon that the property of the game is *excluſively* veſted in the king,"—this is pretty evidently refuted by the facts ſtated from Mr. Chriſtian's notes, recited above. It would ſeem therefore that the general doctrine of treſpaſs with reſpect to the owners of manerial property, (if it holds good at all,) muſt apply to the lords of *reputed* manors, and not to thoſe who poſſeſs a *legal* manor, over which the lord exerciſes a complete ſupremacy by his baronial court, compels ſuit and ſervice from all his tenants, receives the fines and quit-rents and homage due for the *farms and lands held of him*, and records the preſentments of his jury which are to puniſh all innovations, encroachments, and injuries, which might appear ſubverſive of the privileges and franchiſes of his manor, or of the rights of the tenants *who hold under him*.

It would ſeem indeed highly incompatible with the well-known principle of an original grant of *manor* and *royalty*, though the lord might have leaſed or granted off to tenants under him the principal part of it in farms and incloſed grounds, and for which theſe tenants are obliged to render him ſuit and ſervice, that this very lord ſhould not poſſeſs the right of purſuing his game over ſuch ſoil, (although the franchiſe itſelf was originally granted by the king,) without being liable to an action of treſpaſs *from his own tenants*—the very men who acknowledge to hold theſe lands of him by their fealty at his court, and who pay him fines, and quit-rents, and ſervices, as a token of their ſubmiſſion to his ſupremacy over the ſoil. Nor is it reaſonable to imagine that thoſe great and arbitrary barons, who were ſo jealous and ſcrupulous of the game, would ever have granted the uſe of the ſoil in any ſhape to their vaſſals, if by ſuch grant they were to be afterwards excluded from purſuing the game on thoſe particular parts of the royalty or manor ſo granted off.

There is a further glaring abſurdity in the contrary pro-

propoſition, which has been remarked by ſeveral diſtinguiſhed writers, namely, that if the lord of a manor cannot juſtify killing the game on the farms of a tenant *within his royalty*, and the tenant not being qualified by law to kill it himſelf, that then the game on all thoſe numerous farms muſt remain wholly untouched, and be continually propagated in vain, as being for no man's uſe, nor for the benefit of ſociety. This the legiſlature could never intend; nor is it any where ſet forth when, or how, the ancient lords of *legal* manors forfeited or loſt this franchiſe, which muſt have been granted originally with the manor. For if the right of purſuing the game over all men's property, by the feodal ſyſtem, or ſyſtem of tenures, was univerſally admitted to reſide excluſively in the king, then of courſe it follows, that when the king granted theſe immunities to a ſubject, that ſubject muſt have poſſeſſed in full right every ſuch privilege as was inherent in the king himſelf.

That the legiſlature, in framing the modern game laws, conceived the right of purſuing the game over every part of the manor, as well the *incloſed part* as the waſte, to veſt in the lord of ſuch manor, appears extremely evident from the words of the ſtatute in the powers delegated to a gamekeeper, viz. "that all lords of manors may authorize their gamekeepers WITHIN THEIR RESPECTIVE MANORS OR ROYALTIES,—(not exempting the incloſed parts or farms, but in ALL parts WITHIN the manerial liberty,)—to take and ſeize all ſetting-dogs, tunnels, tramels, hays, or other nets, lowbels, hare-pipes, ſnares, or other engines, for the taking and killing of hares, pheaſants, partridges, or other game, as WITHIN the PRECINCTS of ſuch reſpective manors ſhall be uſed, by any perſon who by this act is prohibited to keep or uſe the ſame." 22 & 23 *Car.* II. c. 25.

Now, if it be held, as ſir William Blackſtone has affirmed, "that neither the lord of a manor, nor his gamekeeper, can enter upon his tenant's land without being liable to an action of treſpaſs,"—how can he poſſibly "take and ſeize ſetting-dogs, nets, hays, tunnels, tramels, lowbels, harepipes, ſnares, or other engines,"—ſet or placed for the deſtruction of game?

Theſe engines are almoſt always made uſe of in the *incloſed grounds*, particularly for partridge and pheaſant; and for hare likewiſe, the ſnares are much oftener placed in coppices, on the ſides of rows and hedges, on the borders of corn-fields and turnips, of clover and ſaintfoin, than upon waſtes and commons, where the chance of ſucceſs in poaching is much leſs, and the danger of detection much greater, than in woods and incloſed grounds, where the game is ſure to be moving at its accuſtomed hours of feeding; and which hours and places are therefore always choſen for its deſtruction. This fact is incontrovertible: and therefore if a gamekeeper is not warranted to enter an incloſure for the ſeizure of theſe implements of poaching, and for the detection of the perſons employed in ſetting them, then ſuch an appointment becomes of no avail, and the act of parliament itſelf is a perfect nullity. On the contrary, if it be granted that the gamekeeper has a right to enter the incloſed grounds and farms *within the manor* for theſe purpoſes, then the lord of the manor who appointed him muſt inherently poſſeſs the ſame right, otherwiſe he could not delegate it to his ſervant. And, from a parity of reaſoning, if he poſſeſſes the right of entering his tenant's farm and grounds in ſearch of nets, dogs, ſnares, &c. it cannot be pretended that he poſſeſſes not the right of purſuing and killing the game in and upon all ſuch grounds and incloſures, *without being liable to an action of treſpaſs from any of his manerial tenants.*

How far this right can be maintained on a *reputed* manor, or manor *extinct*, is another queſtion; but as all the other manerial rights and privileges are loſt and gone by the extinction of the court-baron, ſo it is reaſonable to conclude that this right, (if it be one,) is loſt likewiſe; and the more ſo, as there are no tenants who hold *of* or *under* ſuch a manor; and it is not pretended that the lord of a *legal* manor can juſtify entering, either of himſelf or by his gamekeeper, into any man's land ſituated *out of his manor*, or even *within* his manor, if ſuch occupant does not perform ſuit and ſervice at his court for the land he occupies: which is ſometimes the caſe with allodial and other freehold farms, ſituated *within* the boundary of a legal manor. In all caſes, however, where the baronial courts are maintained, and at which the tenants perform their ſuit and ſervice, it is conceived that the lord can claim, without treſpaſs, the *right* of ſporting over the incloſed ground; and the opinion of many men, of diſtinguiſhed abilities in the Engliſh juriſprudence, is in favour of this manerial franchiſe; ſomewhat arbitrary, indeed, and perhaps the only exiſting fragment of the ancient feodal authority. In all the precedents we have ſtated, or have heard of, the actions for treſpaſs have been brought againſt *unqualified* perſons, or the lord of a manor *extinct*, or for treſpaſs of a *legal* lord *out of his manor*. But the queſtion, in the ſhape we have propoſed it, with the many and nice diſtinctions which emanate from it, has never been before the court; though it would be extremely deſirable, for the information of the owners of ſuch franchiſes, as well as of the public at large, that the matter ſhould be coolly and ſeriouſly argued, and decided upon with that candour and deliberate juſtice, for which the Engliſh courts of law are ſo eminently diſtinguiſhed.

That the game-laws, in their preſent confuſed form, are in many reſpects contradictory and vexatious, appears to be univerſally admitted. The juſtices Aſhhurſt and Willes (*D. & E.* 1. v. 44.) openly declared in court, that "nothing could be more oppreſſive than the preſent ſyſtem of the game-laws; and that in expounding them, they ought to be conſidered only as poſitive rules, rather than as laws founded on reaſon."—Perhaps it might hereafter be found expedient to repeal the ſtatutes now in force relating to this ſubject, in order to form a new ſyſtem under one act of parliament, that ſhall appear more conſonant to human reaſon, and explain more obviouſly and ſatisfactorily the rights of individuals, and the pains and penalties to be incurred by thoſe who offend. Of what utility can the clauſe be now, in the *ſtat.* 33 *Hen.* VIII. *c.* 6. which ſets forth, that ſhooting with a croſs-bow, hand-gun, or demihake, by any perſon not poſſeſſing 100l. a year, incurs a penalty of 10l. Or that hand-guns are to be of a yard length in the ſtock and gun, otherwiſe qualified perſons are to take, ſeize, and deſtroy them? Many other of our preſent exiſting laws, enacted for the preſervation of the game, ſtand in a ſimilar predicament; and previous to any ſubſtantial reformation to be made in the code, it might perhaps be worth while *well* to conſider, whether it would not prove more beneficial to the community at large, and much more advantageous to the ſportſman, to make the game *private property*. This would effectually ſtrike at the root of poaching; game would abound in every part of the kingdom; our markets would be ſupplied with it throughout the ſeaſon at a reaſonable price; and every man poſſeſſed of landed property would enjoy the right he ought to inherit from nature, that of ſporting on his own ſoil, and of poſſeſſing in full right the game it nurtures up, and which he feeds, and propagates, and protects. Selfiſh minds alone will revolt at ſo juſt and equitable an arrangement of the game-laws. The circumſtance of the game being *ferœ naturæ*, is not a ſufficient ground whereon to found an objection, provided every perſon is confined within the boundaries of his own land; and as to its paſſing occaſionally from one man's ſoil to that of another, the chance being equal, will ſtill afford the ſame participation of equal advantage and of equal right. The royalty of all river fiſheries in England is maintained upon this principle; and ſo might that of the game, with the ſame juſtice and facility.

GA'MECOCK, *ſ.* Cocks bred to fight.—They manage the diſpute as fiercely as two *game-cocks* in the pit. *Locke.*

GA'ME-EGG, *ſ.* Eggs from which fighting cocks are bred:

Thus boys hatch *game-eggs* under birds of prey,
To make the fowl more furious for the fray. *Garth.*

GA'MEHEN, *ſ.* A hen of the game kind.

GA'MEKEEPER, *ſ.* A perſon who looks after game and ſees it is not deſtroyed. See the article GAME, p. 231.

GAME'LIA, a ſirname of Juno, as Gamelius was of Jupiter, on account of their preſiding over marriages. Alſo a feſtival privately obſerved among the Greeks at three different times. The firſt was the celebration of a marriage, the ſecond was in commemoration of a birthday, and the third was an anniverſary of the death of a perſon.

GAME'LION, in the ancient chronology, was the eighth month of the Athenian year, containing twenty-nine days, and anſwering to the latter part of our January and beginning of February. It was ſo called, as being, by the laws of the Athenians, the moſt proper ſeaſon for marriage.

GAMELO'RA, a ſmall iſland in the Mediterranean, near the north-eaſt coaſt of Tunis: three miles eaſt of Cape Zibeeb.

GA'MESOME, *adj.* Frolicſome; gay; ſportive; playful; ſportful.—This *gameſome* humour of children ſhould rather be encouraged, to keep up their ſpirits and improve their ſtrength and health, than curbed or reſtrained. *Locke.*

The *gameſome* wind among her treſſes play,
And curleth up thoſe growing riches ſhort. *Fairfax.*

GA'MESOMENESS, *ſ.* Sportiveneſs; merriment.

GA'MESOMELY, *adv.* Merrily.

GA'MESTER, *ſ.* One who is viciouſly addicted to play.—Could we look into the mind of a common *gameſter*, we ſhould ſee it full of nothing but trumps and mattadores: her ſlumbers are haunted with kings, queens, and knaves. *Addiſon.*

All the ſuperfluous whims relate,
That fill a female *gameſter's* pate;
What agony of ſoul ſhe feels
To ſee a knave's inverted heels. *Swift.*

One who is engaged at play;

When lenity and cruelty play for kingdoms,
The gentler *gameſter* is the ſooneſt winner. *Shakeſpeare.*

A merry frolicſome perſon.—You're a merry *gameſter*, my lord Sands. *Shakeſpeare.*—A proſtitute; *not in uſe:*

She's impudent, my lord,
And was a common *gameſter* to the camp. *Shakeſpeare.*

GAM'ET, or OLD MANDOE, a ſmall iſland in the north ſea, belonging to Denmark: three miles from the continent, and eight weſt-ſouth-weſt of Ripen.

GA'MING, *ſ.* The art or practice of playing and following up any game, particularly thoſe of hazard; as cards, dice, eo-tables, &c. This practice has at all times been conſidered as a thing of pernicious conſequence to the commonwealth, and is therefore ſeverely prohibited by law; the ſtatutes enacted for which, and the caſes wherein they are applied, have been already ſtated under the preceding article GAME, p. 204. It is lamentable to obſerve, however, that not even the force of laws has been able to reſtrain or prevent that ſort of diſſipation, which indeed ought to be avoided as the deſtroyer of every good principle, that which leads a man to venture his fortune upon the deciſion of a game of chance. This is the worſt ſort of *thoughtleſſneſs*, if that be not too ſoft a name for a vice which lays aſleep every tender, every benevolent, ſentiment. Covetouſneſs, in the extreme, is the ruling paſſion of theſe ſharping gameſters, who call themſelves *men of the world.* They lie in wait for the young, the weak in judgment, and for him whoſe head is diſordered with wine. They make plunder of the confidence of a relation, a friend, or a guardian. The hoſpitality of your houſe is made an excuſe for robbing your children. Can this be ſupported on any principle of religion or morals? Covetouſneſs ſtifles every affection, and deſtroys every tie of blood, or obligation of gratitude. It is a maxim that allows of few exceptions, That a fortune which is made ſuddenly, is not made fairly: That honeſt gain is only to be acquired by laudable induſtry and perſeverance.

Is there the perſon living who will venture to maintain a contrary doctrine, or become an advocate for the baneful deluſions of a gaming table? If there be, let him contemplate the following extract from Dr. Biſſet's Diſcourſes: "Though you ſhould be the ſucceſsful adventurer, you muſt have been much hardened, if you feel no ſtings of conſcience for the diſtreſs you have brought upon innocent families. Children are turned out of their father's houſe, becauſe they had the misfortune to encounter with you. He who lived in plenty has no bread: Poverty has come from your hand: Your breath brings miſery, as the mildew of the clouds bring famine into a fruitful land. If we ſuppoſe, on the other hand, that a man is the loſer, how can he behold the face of the relations he has ruined? It had been happy for his children that they had been fatherleſs; for his wife that ſhe had been a widow. He who ought to have ſaved them, has deſtroyed them. Hold thy hand, barbarous man. An amiable wife, and engaging children, do warmly beſeech thee not to throw away their inheritance, and to leave them for a patrimony, cold, and hunger, and nakedneſs. Thy ſon, or thy daughter, may, without friends or comforters, be expoſed to a thouſand misfortunes, by this folly of their father. Thy adverſary, who, at this time, may appear with ſoftened brow, will be the firſt to execute this ſentence: He is a hardened creature. How could he be otherwiſe, when he flouriſhes by the misfortunes of men? Hold thy hands, barbarous man, that thou mayeſt not force thy children upon the paw of the bear, or the tooth of the lion, who thirſts for their blood.

"Some vices portend great evil to the country where they are practiſed: This vice in particular. The hazard is, That he who lays a ſnare for his friend, will not be ſcrupulous about the intereſt of his country. Though the number, the rank, or ſhining parts, of thoſe who take this road, may give a currency to the moſt ſelfiſh of vices, yet no rank or ability can authoriſe any man to be the plunderer of his friends, to make prey of the harmleſs, the unſuſpicious, the ignorant, and the uninformed."

The *chance* or *hazard* in gaming, is a matter of mathematical inveſtigation, becauſe it admits of more and leſs. Gameſters either ſet out upon an equality of chance, or are ſuppoſed to do ſo. This equality may be altered in the courſe of the game, by the greater good-fortune or addreſs of one of the gameſters, whereby he comes to have a better chance, ſo that his ſhare in the ſtakes is proportionably better than at firſt. This more and leſs runs through all the ratios between equality and infinite difference, or from an infinitely little difference till it come to an infinitely great one, whereby the game is determined. The whole game, therefore, with regard to the iſſue of it, is a chance of the proportion the two ſhares bear to each other.

The probability of an event is greater or leſs, according to the number of chances by which it may happen, compared with the number of all the chances by which it may either happen or fail. On this principle M. de Moivre, in a treatiſe *de Menſura Sortis*, has computed the variety of chances in ſeveral caſes that occur in gaming, the laws of which may be underſtood by what follows:

If A and B play with a ſingle die, on this condition, that, if

if A throw two or more aces at eight throws, he ſhall win; otherwiſe B ſhall win; What is the ratio of their chances? Since there is but one caſe wherein an ace may turn up, and five wherein it may not, let $a=1$, and $b=5$. And again, ſince there are eight throws of the die, let $n=8$; and you will have $\overline{a+b}|^n - b^n - nab^n - 1$, to $b^n + nab^n - 1$: that is, the chance of A will be to that of B as 663991 to 10156525, or nearly 2 to 3.

A and B are engaged at ſingle quoits; and, after playing ſome time, A wants 4 of being up, and B 6; but B is ſo much the better gameſter, that his chance againſt A upon a ſingle throw would be as 3 to 2; What is the ratio of their chances? Since A wants 4, and B 6, the game will be ended at nine throws; therefore, raiſe $a+b$ to the ninth power, and it will be $a^9+9\,a^8b+36\,a^7bb+84\,a^6b^3\times 126\,a^5b^4+126\,a^4b^5$, to $84a^3b^6+36\,aab^7+6ab^8+b^9$; call a 3, and b 2, and you will have the ratio of chances in numbers, viz. 1759077 to 194048.

A and B play at ſingle quoits, and A is the beſt gameſter, ſo that he can give B 2 in 3: What is the ratio of their chances at a ſingle throw? Suppoſe the chances as z to 1, and raiſe $z+1$ to its cube, which will be z^3+3z^2+3z+1. Now ſince A could give B 2 out of 3, A might undertake to win three throws running; and conſequently the chances in this caſe will be as z^3 to $3z^3+3z+1$. Hence $z^3=3z^2+3z+1$; or $2z^3=z^3+3z^2-3z+1$. And therefore $z^3\sqrt{2}=z+1$; and, conſequently, $z=\frac{1}{\sqrt[3]{2}-1}$. The chances, therefore, are $\sqrt[3]{2}-1$, and 1 reſpectively.

Again, ſuppoſe I have two wagers depending, in the firſt of which I have 3 to 2 the beſt of the lay, and in the ſecond 7 to 4; What is the probability I win both wagers? 1. The probability of winning the firſt is $\frac{3}{5}$, that is the number of chances I have to win, divided by the number of all the chances: the probability of winning the ſecond is $\frac{7}{11}$: therefore, multiplying theſe two fractions together, the product will be $\frac{21}{55}$, which is the probability of winning both wagers. Now, this fraction being ſubtracted from 1, the remainder is $\frac{34}{55}$, which is the probability I do not win both wagers: therefore the odds againſt me are 34 to 21. 2. If I would know what the probability is of winning the firſt, and loſing the ſecond, I argue thus: the probability of winning the firſt is $\frac{3}{5}$, the probability of loſing the ſecond is $\frac{4}{11}$: therefore multiplying $\frac{3}{5}$ by $\frac{4}{11}$, the product $\frac{12}{55}$ will be the probability of my winning the firſt, and loſing the ſecond; which being ſubtracted from 1, there will remain $\frac{43}{55}$, which is the probability I do not win the firſt, and at the ſame time loſe the ſecond. 3. If I would know what the probability is of winning the ſecond, and at the ſame time loſing the firſt, I ſay thus: The probability of winning the ſecond is $\frac{7}{11}$; the probability of loſing the firſt is $\frac{2}{5}$: therefore, multiplying theſe two fractions together, the product $\frac{14}{55}$ is the probability I win the ſecond, and alſo loſe the firſt. 4. If I would know what the probability is of loſing both wagers, I ſay, the probability of loſing the firſt is $\frac{2}{5}$, and the probability of loſing the ſecond $\frac{4}{11}$: therefore the probability of loſing them both is $\frac{8}{55}$: which, being ſubtracted from 1, there remains $\frac{47}{55}$: therefore, the odds of loſing both wagers is 47 to 8.

This way of reaſoning is applicable to the happening or failing of any events that may fall under conſideration. Thus if I would know what the probability is of miſſing an ace four times together with a die, this I conſider as the failing of four different events. Now the probability of miſſing the firſt is $\frac{5}{6}$, the ſecond is alſo $\frac{5}{6}$, the third $\frac{5}{6}$, and the fourth $\frac{5}{6}$; therefore the probability of miſſing it four times together is $\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}=\frac{625}{1296}$; which being ſubtracted from 1, there will remain $\frac{671}{1296}$ for the probability of throwing it once or oftener in four times: therefore the odds of throwing an ace in four times, is 671 to 625.

But if the flinging of an ace were undertaken in three times, the probability of miſſing it three times would be $\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}=\frac{125}{216}$; which being ſubtracted from 1, there will remain $\frac{91}{216}$ for the probability of throwing it once or oftener in three times: therefore the odds againſt throwing it in three times are 125 to 91. Again, ſuppoſe we would know the probability of throwing an ace once in four times, and no more: ſince the probability of throwing it the firſt time is $\frac{1}{6}$, and of miſſing it the other three times, is $\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}$, it follows, that the probability of throwing it the firſt time, and miſſing it the other three ſucceſſive times, is $\frac{1}{6}\times\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}=\frac{125}{1296}$; but becauſe it is poſſible to hit every throw as well as the firſt, it follows, that the probability of throwing it once in four throws, and miſſing it the other three, is $\frac{4\times 125}{1296}=\frac{500}{1296}$; which being ſubtracted from 1, there will remain $\frac{796}{1296}$ for the probability of throwing it once, and no more, in four times. Therefore, if one undertake to throw an ace once, and no more, in four times, he has 500 to 796 the worſt of the lay, or 5 to 8 very nearly.

Suppoſe two events are ſuch, that one of them has twice as many chances to come up as the other; what is the probability, that the event, which has the greater number of chances to come up, does not happen twice before the other happens once, which is the caſe of flinging 7 with two dice before 4 once? Since the number of chances is as 2 to 1, the probability of the firſt happening before the ſecond is $\frac{2}{3}$, but the probability of its happening twice before it is but $\frac{2}{3}\times\frac{2}{3}$ or $\frac{4}{9}$: therefore it is 5 to 4 ſeven does not come up twice before four once. But, if it were demanded, what muſt be the proportion of the facilities of the coming up of two events, to make that which has the moſt chances come up twice, before the other comes up once? The anſwer is, 12 to 5 very nearly: whence it follows, that the probability of throwing the firſt before the ſecond is $\frac{12}{17}$, and the probability of throwing it twice is $\frac{12}{17}\times\frac{12}{17}$, or $\frac{144}{289}$; therefore the probability of not doing it is $\frac{145}{289}$: therefore the odds againſt it are as 145 to 144, which comes very near an equality.

Suppoſe there is a heap of thirteen cards of one colour, and another heap of thirteen cards of another colour; What is the probability, that, taking one card at a venture out of each heap, I ſhall take out the two aces? The probability of taking rhe ace out of the firſt heap is $\frac{1}{13}$, the probability of taking the ace out of the ſecond heap is $\frac{1}{13}$; therefore the probability of taking out both aces is $\frac{1}{13}\times\frac{1}{13}=\frac{1}{169}$, which being ſubtracted from 1, there will remain $\frac{168}{169}$: therefore the odds againſt me are 168 to 1.

In caſes where the events depend on one another, the manner of arguing is ſomewhat varied. Thus, ſuppoſe that out of one ſingle heap of thirteen cards of one colour, I ſhould engage to take out firſt the ace; and, ſecondly, the two: though the probability of taking out the two be likewiſe $\frac{1}{13}$: yet, the ace being ſuppoſed as taken out already, there will remain only twelve cards in the heap, which will make the probability of taking out the two to be $\frac{1}{12}$; therefore the probability of taking out the ace, and then the two, will be $\frac{1}{13}\times\frac{1}{12}$. In this laſt queſtion the two events have a dependence on each other; which conſiſts in this, that one of the events being ſuppoſed as having happened, the probability of the other's happening is thereby altered. But the caſe is not ſo in the two heaps of cards.

If the events in queſtion be n in number, and be ſuch as have the ſame number a of chances by which they may happen, and likewiſe the ſame number b of chances by which they may fail, raiſe $a+b$ to the power n. And if A and B play together, on condition that if either one or more of the events in queſtion happen, A ſhall win, and B loſe, the probability of A's winning will be $\frac{\overline{a+b}|^n - b^n}{\overline{a+b}|^n}$; and that of B's winning will be $\frac{b^n}{\overline{a+b}|^n}$; for when $a+b$ is

actually raised to the power n, the only term in which a does not occur is the last b^n: therefore all the terms but the last are favourable to A.

Thus if $n=3$, raising $a+b$ to the cube $a^3+3a^2b+3ab^2+b^3$, all the terms but b^3 will be favourable to A; and therefore the probability of A's winning will be $\frac{a^3+3a^2b+3ab^2}{\overline{a+b}^3}$, or $\frac{\overline{a+b}^3-b^3}{\overline{a+b}^3}$; and the probability of B's winning will be $\frac{b^3}{\overline{a+b}^3}$. But if A and B play on condition, that if either two or more of the events in question happen, A shall win; but in case one only happen, or none, B shall win; the probability of A's winning will be $\frac{\overline{+b}^n-nab^{n-1}-b^n}{\overline{n+b}^n}$; for the only two terms in which aa does not occur, are the two last, viz. nab^{n-1} and b^n. See the article ALGEBRA, vol. i. p. 315; and the game of FARO, vol. vii. p. 221.

GA'MING, in sculpture and painting, is represented by a woman sitting at a gaming table, and sweeping money into a bag full of holes, through which it immediately falls out again. By her side an anchor, and with her right foot endeavouring to stop the wheel of fortune.

GA'MING-HOUSE, *s.* A house where gaming is carried on.—All disorderly inns or alehouses, bawdy-houses, *gaming-houses*, stage-plays unlicensed, booths and stages for ropedancers, and the like, are public nuisances. *Blackstone.*

GA'MING-TABLE, *s.* A table appropriated to gaming.—They frequent plays, operas, and taverns; and at home have their routs and their *gaming-tables. World.*

GAM'LITZ, a town of Germany, in the duchy of Stiria: eleven miles north-north-west of Marburg.

GAM'MA, *s.* [from the Greek letter Γ, which it is like.] A surgical instrument for cauterising a hernia.

GAMMACA'NOR, or GAMMADOUR, a town of the island of Bachian, one of the Moluccas.

GAM'MADIM, GAM'MADIMS, *s. plu.* [etymology doubtful.] The garrison placed in the towers of Tyrus. *Ezek.*

GAMMALAM'MA, a town of the island of Ternate, where the king usually resides.

GAM'MER, *s.* [Of uncertain etymology; perhaps from *grand mere*, and therefore used commonly to old women.] The compellation of a woman corresponding to gaffer; as, *Gammer* Gurton's Needle; an old play.

GAM'MING, a town of Germany, in the archduchy of Austria: ten miles east-south-east of Bavarian Waidhofen.

GAM'MING (Markt), a town of Germany, in the archduchy of Austria: ten miles east of Bavarian Waidhofen.

GAM'MO, a town of Africa, on the Ivory Coast.

GAM'MON, *s.* [*gambone*, Ital.] The buttock of an hog salted and dried; the lower end of the flitch:

Ask for what price thy venal tongue was sold;
A rusty *gammon* of some sev'n years old. *Dryden.*

A kind of play with dice; the back-gammon-board:

The quick dice,
In thunder leaping from the box, awake
The sounding *gammon.* *Thomson.*

GAM'MON POINT, anciently called *Point Gilbert*, in North America, forms the eastern side of the harbour of Hyennes, in Barnstable county, and in the state of Massachusetts.

GA'MUT, *s.* [*gama*, Ital.] The scale of musical notes. See MUSIC.

When by the *gamut* some musicians make
A perfect song, others will undertake,
By the same *gamut* chang'd, to equal it:
Things simply good can never be unfit. *Donne.*

GAMPS, a town of Switzerland, which belongs partly to the canton of Schweitz, and partly to Glaris, with a bailiwick, in which is a sulphurous medicinal spring: five miles south of Appenzel.

GAM'RY-HEAD, a cape of Scotland, on the north coast of Bamffshire: six miles east of Bamff.

GAN, for *began*, from *'gin* for *begin*:

The noble knight *'gan* to feel
His vital force to faint. *Spenser.*

GAN, a city of China, of the first rank, and metropolis of the province of Se-tchuen. Lat. 31. 16. N. lon. 13. S. W. Pekin.

GAN, a town of China, of the second rank, in the province of Pe-tcheli: fifteen miles east of Paoting, and seventy south-south-west of Peking. Lat. 38. 54 N. lon. 133. 15. E. Ferro.

GAN, a town of France, in the department of the Lower Pyrenées: one league and a half south of Pau, and three and a half east of Oleron.

GAN-GIN', a town of China, of the third rank, in the province of Hou-quang: thirty-six miles east-south-east of Heng-tche.

GAN-NAN', a town of China, of the third rank, in the province of Koei-tcheou: thirty-five miles east of Poungan.

GAN-PIN', a town of China, of the third rank, in the province of Koei-tcheou: twenty miles north-east of Ngan-chun.

GAN-PING', a town of China, of the third rank, in the province of Pe-tcheli: twelves miles north of Ching.

GAN-YE', a town of China, of the third rank, in the province of Se-tchuen: fifty-two miles west of Ho.

GA'NA, a town of Arabia Felix: 150 miles north of Mocha.

GANA'NO-COU'I, a river of Upper Canada, which runs into the river St. Lawrence: four leagues below Kingston.

GANA'RA, a country of Africa, with a town of the same name, situated on the banks of the Niger. The country is populous and fertile: the articles of commerce are gold, sena, and slaves. Lat. 12. 20. N. lon. 16. E. Greenwich.

GAN'AT-SUR-LOIRE, a town of France, in the department of the Allier, and chief place of a canton, in the district of Moulins, situated on the Loire: five leagues north-east of Moulins.

To GANCH, *v. a.* [*ganciare*, from *gancio*, a hook, Ital. *ganche*, Fr.] To drop from a high place upon hooks by way of punishment: a practice in Turkey, to which Smith alludes in his *Pocockius*:

Cohors catenis qua pia stridulis
Gemunt onesti, vel sude trans sinum
Luctantur actâ, pendulive
Sanguineis trepidant in uncis. *Musæ Ang.*

GAN'DE, a river of Germany, which runs into the Leine: four miles west-south-west of Gandersheim.

GANDELU', a town of France in the department of the Aisne, and chief place of a canton, in the district of Chateau Thierry: two leagues and three quarters west-north-west of Chateau Thierry, and three north of la Ferté-sous-Jouarre.

GAN'DER, *s.* [ȝandꝑa, Sax.] The male of the goose. See ANAS, vol. i. p. 516.—As deep drinketh the goose as the *gander*. *Camden.*—One *gander* will serve five geese. *Mortimer.*

GAN'DERSHEIM, a town of Germany, in the circle of Lower Saxony, and principality of Wolfenbuttel, situated on the river Gande, with a celebrated abbey of Protestants, composed of an abbess, who is a princess, and four ladies of noble families: twenty miles west of Goslar.

GAND'JA,

GAND'JA, or GANGEA, a town of Aſia, in the country of Georgia: 100 miles ſouth-eaſt of Teflis. Lat. 41. 32. N. lon. 65. 10. E. Ferro.

GAN'DIA, a ſeaport town of Spain, in the kingdom of Valencia, with a ſmall univerſity. The town declared for the archduke in 1706, but was taken by the French, after the battle of Almanza: twenty-eight miles ſouth of Valencia, and forty north-north-eaſt of Alicant. Lat. 38. 58. N. lon. 16. 29. E. Peak of Teneriffe.

GANDICOT'TA, a celebrated hill fortreſs of Hindooſtan, ſituated on the ſouth ſide of the Pennar, on the ſummit of a lofty mountain, with a ſteep precipice on one ſide, and acceſſible on the other only by an aſcent of from ſeven to eight feet wide, with the river Pennar at the bottom. It was for ages thought to be impregnable, and its garriſon ſet at defiance every attempt to reduce it. Yet in 1652 it was taken by the famous Emir Jumla, a general in the ſervice of the king of Golconda; but Thevenot informs us that it was effected by corrupting the governor. Eighty-ſeven miles weſt-north-weſt of Nellore, and thirty-three north-weſt of Cuddapa. Lat. 14. 45. N. lon. 78. 29. E. Greenwich.

GAN'DINA, a town of Italy, in the Bergamaſco, belonging to the ſtate of Venice: ten miles north-eaſt of Bergamo.

GANDO'LA, *ſ.* in botany. See BASELLA.

GANEGAM', a town of the iſland of Ceylon: ſixty miles ſouth-ſouth-eaſt of Columbo.

GA'NET, or SOLAND GOOSE, in ornithology. See PELICANUS.

GA'NET ISLANDS, a cluſter of ſmall iſlands, near the eaſt coaſt of Labrador. Lat. 54. N. lon. 56. 10. W. Greenwich.

To GANG, *v. n.* [*gangen*, Dut. ȝanȝan, Sax. *gang*, Scot.] To go; to walk; an old word not now uſed, except ludicrouſly.—Your flaunting beaus *gang* with their breaſts open. *Arbuthnot.*

But let them *gang* alone,
As they have brew'd, ſo let them bear blame. *Spenſer.*

GANG, *ſ.* A number herding together; a troop; a company; a tribe; a herd. It is ſeldom uſed but in contempt or abhorrence.—As a *gang* of thieves were robbing a houſe, a maſtiff fell a barking. *L'Eſtrange.*

Admitted in among the *gang*,
He acts and talks as they befriend him. *Prior.*

GA'NG-BOARD, *ſ.* a ſea term; a plank with ſeveral cleats nailed to it for the convenience of going into or out of a boat where the water is not deep enough to float the boat cloſe to the landing place.

GA'NG-WEEK, *ſ.* [*q. d.* going or walking week.] The time when the bounds of the pariſhes are luſtrated, or gone over by the pariſh-officers; *rogation-week.*

GANGANEL'LI. See CLEMENT XIV. vol. iv. p. 654.

GANGA'RIDÆ, in ancient hiſtory, a people near the mouths of the Ganges. They were ſo powerful that Alexander did not dare to attack them. Some attributed this to the wearineſs and indolence of his troops. They are placed by Valerius Flaccus among the deſerts of Scythia. *Juſtin.*

GAN'GELT, a town of Germany, in the circle of Weſtphalia, and duchy of Juliers: twelve miles ſouth-ſouth-eaſt of Ruremond. Lat. 51. 8. N. lon. 23. 34. E. Ferro.

GAN'GES, a town of France, in the department of the Herault, and chief place of a canton, in the diſtrict of Montpellier: ſeven leagues north of Montpellier, and ſix and a half north-eaſt of Ledeve.

GAN'GES, a noble river of Aſia, the Nile of Hindooſtan, which riſes by two branches from the mountains of Kentaiſſe, in the country of Thibet; theſe two branches take a weſterly direction, inclining to the north, for a courſe of about 300 miles in direct diſtance, when meeting the great chain or ridge of mount Himmaleh, which extends from Cabul along the north of Hindooſtan, and through Thibet, the rivers are compelled to turn to the ſouth, in which courſe they unite their waters, and then form what is properly termed the river Ganges. This body of water now forces a paſſage through the ridge of mount Himmaleh, at the diſtance, poſſibly, of one hundred miles below the place of its firſt approach to it, and ſapping its foundation, ruſhes through a cavernous aperture, and precipitates itſelf into a vaſt baſon, which it has worn in the rock, at the hither foot of the mountains. From this ſecond ſource (as it may be termed) of the Ganges, its courſe becomes more eaſtwardly than before, through the rugged country of Sirinagur, until, at Hurdwar, it finally eſcapes from the mountainous tract, in which it has wandered for about eight hundred Britiſh miles. At Hurdwar it opens itſelf a paſſage through mount Sewallick; which is the chain of mountains that borders on the level country, on the north of the province of Delhi. After entering Hindooſtan, it paſſes by Anopſheer, Furruckabad, Canoga, Cawnpour, Allahabad, where it is joined by the Jumna, Merzapour, Chunar, Benares, Patna, thirty-ſix miles above which it is joined by the Dewah, and ſixteen miles above the ſame town by the Soane, and oppoſite to it by the Gunduck. After leaving Patna, it paſſes by Bar, Monghir, forty miles eaſt of which it is joined by the Coſa, it then paſſes by Rajemal, forty miles below which it is joined by a branch of the Sanpoo, or Teeſta, and eighty miles below that by another branch of the ſame river. Soon after which it divides into various branches, called *the Mouths of the Ganges*, which empty themſelves into the Bay of Bengal, in lat. 21. 40. to 22. N. A circumſtance attending the courſe of the Ganges and the Burrampooter rivers in reſpect to each other is remarkably ſingular. Iſſuing from oppoſite ſides of the ſame ridge of mountains, they direct their courſe towards oppoſite quarters, till they are more than 1200 miles aſunder, and afterwards meet in one point near the ſea, after each has performed a winding courſe of more than 2000 miles.

The multitude of rivers which fall into the Ganges from each ſide of its banks, give it a matchleſs inland navigation. Some of theſe rivers are equal in ſize to the Rhine, and none leſs than the Thames: it maintains, in the parts already known, thirty thouſand boatmen, by their carriage of ſalt and food for ten millions of people in Bengal and its dependencies, which occaſions a vaſt expenditure; beſides the exports and imports, the common interchange of divers articles within its limits, its fiſheries, and its travellers; which, all together, occaſion annually a further circulation of at leaſt two millions of money.

Juſt before the periodical rains ſet in, which is about the middle of July, the waters of the Ganges begin to increaſe, ſimilar to thoſe of the Nile, occaſioned by the ſnow on the tops of the hills from whence the river iſſues (above thirteen hundred miles from the ſea) being melted by the vertical ſun; as ſoon as the rains commence it hourly ſwells, pouring with the moſt impetuous velocity, and the river has the appearance of a ſea, and in ſome parts, where there happen to be rocks or very high hills on each ſide pretty near the river, the water being there pent up, it riſes to a prodigious height, and the current is ſo ſtrong and rapid, that it is hardly poſſible for any boat to ſtem it. After about two months, when the violence of the rain begins to ſubſide, the water decreaſes almoſt as ſuddenly as it aroſe, and that which was of late one entire ſheet of water, except perhaps ſome tops of trees, now appears a moſt fertile country, covered with woods, corn-fields, and other plantations, and the different arms which the river branches into, preſent many little iſlands, which in the rainy ſeaſon appeared to have no exiſtence. Some of theſe iſlands produce three and four crops yearly; rice, which grows only when it is co-

vered with water; after that corn; then water-melons, &c. In the dry ſeaſon the current runs very ſlow, not above three miles an hour; in the wet ſeaſon from five to eight; the deſcent is only four inches in a mile. In the time of the inundations, the veſſels ſail in all directions as over a vaſt inland ſea: the dangers in navigating it are very great, either from the fierce eddies occaſioned by other rivers diſcharging themſelves into the Ganges, or, in the dry ſeaſon, by the falling in of great fragments of the banks, or by the ſtriking on trees ſunk beneath the ſurface of the water, which often occaſion very fatal accidents.

Of the mutability of the courſe and bed of this pre-eminent river, in its paſſage through the extenſive regions of Bengal, major Colebrooke, in the Aſiatic Tranſactions, vol. vi. and vii. has given a very intereſting account. "By rapidly impelling its vaſt body of waters through a plain compoſed of a light ſandy ſoil to a conſiderable depth, it is there continually changing its bed, and producing alterations which excite the aſtoniſhment of all men. Iſlands and ſand-banks are in a ſhort time formed in places which were once the deepeſt parts of the river, ſome towns and villages which were once near its banks are deſerted by it, others are undermined, and the vaſt body of earth on which they ſtood is entirely ſwept away. In thoſe parts where the velocity of the ſtream is greateſt, and the ſoil extremely looſe, the banks of them become as perpendicular as a wall, and crumble in ſo frequently and ſuddenly, that it is dangerous to approach them. The ſhifting of the current, and the effects of inundations, produce alluvions, and iſlands of an unuſual extent. The reader may form ſome idea of theſe operations from the following inſtance: The alteration of the river at Colgong, may be reckoned among the moſt extraordinary which have ever been obſerved in modern times, and of this I can ſpeak with great confidence, having been an eye witneſs of the ſtate of the river at this place at four ſeveral periods, in three of which I obſerved a conſiderable difference, viz. in the dry ſeaſons of 1779, 1788, and 1796-7. At the former of theſe periods, the river was a broad open ſtream, and free from ſhallows; at the ſame time, the three rocks near Colgong were ſurrounded by dry land, and appeared to be at ſome little diſtance from the ſhore. But in January 1788, I found theſe three rocks completely inſulated, and the current ruſhing between them with great rapidity; the river having undermined and borne away the whole of the ſoil which had for many years adhered to them, and having formed a bed for itſelf, with a conſiderable depth of water, which continued for ſeveral years to be the principal, and indeed the only navigable channel of the river in the dry ſeaſon. Here boats are frequently in imminent danger of ſtriking againſt the rocks, as during the period of the river's encroachment, and particularly in the rains, it was difficult to avoid them when coming down with the ſtream. While the river continued thus to expand itſelf, an iſland was growing up in the middle of its bed, which, when I laſt ſaw it in January 1797, extended from near Pattergotta, five miles below Colgong, to a conſiderable diſtance above the latter place, being altogether eight miles in length, and two in breadth; and filling nearly the whole ſpace which had been occupied by the principal ſtream in the year 1779. The quantity of ſand, and ſoil, which the river muſt have depoſited to effect this, will appear prodigious, if it be conſidered, that the depth of water in the navigable part of the Ganges is frequently upwards of ſeventy feet; and the new iſlands had riſen to more than twenty feet above the level of the ſtream. Again, the quantity of earth which it had excavated in forming a new channel for itſelf, will appear no leſs aſtoniſhing: ſome idea of this may, however, be conceived, from the ſoundings which I cauſed to be taken near the rocks, which varied from ſeventy to ninety feet. If we add twenty-four feet for the height of the ſoil that had formerly adhered to theſe rocks, as indicated by the marks it had left, it will appear that a column of one hundred and fourteen feet of earth had here been removed by the ſtream."

From the ſurvey here taken, the author conſiders the Ganges as having under its dominion a conſiderable portion of the flat country, and thinks that its bed cannot be ſtated as permanent in any part of its courſe through Bengal. Of the nature and extent of the iſlands thus thrown up, the reader may judge from the following delineation: "The appearance of ſome of theſe iſlands is ſingularly rural and pleaſing, if not altogether romantic; for, although an extenſive flat can hardly come under the latter denomination, yet it may partake of a degree of wildneſs, that will pleaſe the lovers of nature; at the ſame time, that the peaceful appearance of the flocks, fields, and habitations, will give delight to the philanthropiſt. If we preſent to our imaginations a wide extended plain, with pens for cattle, and a few humble huts, whoſe tops are crowned with gourds, and the intervening ſpace highly cultivated; with wheat, barley, and pulſe of all ſorts, growing in abundance, the flowers of the latter preſenting to the eye a variety of rich tints; numerous herds of cattle grazing, and a few ſcattered villages at a diſtance; the horizon bounding the view, with no other remote objects than a long line of graſs jungle, and a few trees, which, from their great diſtance on the main land, are barely diſcernible; we ſhall have a tolerable picture of theſe iſlands in the Ganges. If we fancy, at the ſame time, that the lark is ſoaring, the air cool, and the ſky perfectly unclouded, we ſhall have a ſtill more lively idea of the ſtate of theſe iſlands during at leaſt ſix months of the year."

GAN'GES ISLANDS, or NORTH NATUNAS, two ſmall iſlands between the iſland of Borneo and the Gulf of Siam. Lat. 4. 55. N. lon. 106. 45. E. Greenwich.

GAN'GIATORS, *ſ.* in the Scots law; officers, whoſe buſineſs it is to examine meaſures and weights.

GAN'GITIS, *ſ.* in botany. See NARDUS.

GAN'GLION, *ſ.* [γαγγλιον, Gr.] In anatomy, it imports a knot frequently found in the courſe of the nervous ſyſtem, and which is not morbid; from wherever any nerve ſends out a branch, or receives one from another, or where two nerves join together, there is generally a *ganglion* or *plexus*, as may be ſeen at the beginning of all the nerves of the medulla ſpinalis, and in many other places of the body. See PLEXUS.

In ſurgery, it denotes a moveable tumor formed any where about the tendons of muſcles, and the ligaments; the moſt frequent ſituation is about the carpus; but in whatever part of the body it happens, it is near the ſkin, and is not attended with any conſiderable uneaſineſs to the patient. *Ganglions* are formed of lymph, which is ſecreted within the vaginæ of tendons; they are different in their form, conſiſtence, and other appearances, but they never ſuppurate. See the article ANATOMY, vol. i. p. 633–636.

GANGO'TRI, a town of Aſia, in the country of Thibet, on the Ganges: 138 miles north of Delhi. Lat. 33. 8. N. lon. 76. 35. E. Greenwich.

GANGOU'TRA, a ſtupendous rock of mount Himmaleh, in Hindooſtan, through which the Ganges precipitates its waters with awful impetuoſity, into a vaſt and deep chaſm below. The word imports a caſcade of the *Ganga*, or Ganges.

GANGPOU'R, a town of Hindooſtan, in the country of Oriſſa: 244 miles weſt of Calcutta, and 226 ſouth of Patna.

To GAN'GRENATE, *v. a.* To produce a gangrene; to mortify.—Parts cauterized, *gangrenated*, ſiderated, and mortified, become black, the radical moiſture or vital ſulphur ſuffering an extinction. *Brown.*

GAN'GRENE, *ſ.* [*gangrene*, Fr. *gangræna*, Lat.]

A mortification; a ſtoppage of circulation followed by putrefaction.—If the ſubſtance of the ſoul is feſtered with theſe paſſions, the *gangrene* is gone too far to be ever cured; theſe inflammations will rage to all eternity. *Addiſon.*—See the article SURGERY.

She ſaves the lover, as we *gangrenes* ſtay,
By cutting hope, like a lopt limb, away. *Waller.*

To GAN'GRENE, *v. a.* [*gangrener*, Fr.] To corrupt to mortification.—In cold countries, when men's noſes and ears are mortified, and, as it were, *gangrene* with cold, if they come to a fire they rot off preſently; for that the few ſpirits that remain in thoſe parts, are ſuddenly drawn forth, and ſo putrefaction is made complete. *Bacon.*

Gangren'd members muſt be lop'd away,
Before the nobler parts are tainted to decay. *Dryden.*

To GAN'GRENE, *v. n.* To become mortified.—As phlegmons are ſubject to mortification, ſo alſo in fat bodies they are apt to *gangrene* after opening, if that fat be not ſpeedily digeſted out. *Wiſeman.*

Wounds immedicable
Rankle and feſter, and *gangrene*
To black mortification. *Milton.*

GAN'GRENOUS, *adj.* Mortified; produced or betokening mortification.—The blood, turning acrimonious, corrodes the veſſels, producing hæmorrhages, puſtules red, lead-colour, black and *gangrenous*. *Arbuthnot.*

GANGUE, *ſ.* In mineralogy, the ſtones which fill the cavities that form the veins of metals are called the *gangue*, or matrix of the ore; the rocks that lie over the veins are called the roof; thoſe that lie under them the floor, and by ſome the hading: the matrix is almoſt always a finer ſpecies of ſtone than the ſurrounding rocks, though of the ſame genus; even the rocks themſelves are finer grained as they approach the vein. There is no matrix peculiarly appropriated to any metal; it has only been remarked, that tin is generally found among ſtones of the ſiliceous genus, and lead very frequently among thoſe of the calcareous.

GANG'WAY, *ſ.* In a ſhip, the ſeveral ways or paſſages from one part of it to the other.

GA'NIA, *ſ.* in botany. See CORCHORUS.

GAN'JAM, a town of Hindooſtan, in the circle of Cicacole, on the ſea coaſt of the bay of Bengal: eight miles ſouth-ſouth-weſt of Cattack, and ninety-five north-eaſt of Cicacole. Lat. 19. 23. N. lon. 85. 20. E. Greenwich.

GANI'TRUS, *ſ.* in botany. See ELÆOCARPUS.

GAN'KA, a town of Arabia, in the province of Oman: 124 miles ſouth of Maſcate.

GAN'KU, a town of China, of the third rank, in the province of Se-tchuen: twelve miles weſt of Ho.

GAN'NAT, a town of France, and principal place of a diſtrict, in the department of the Allier, containing about 3000 inhabitants: nine leagues ſouth of Moulins. Lat. 46. 5. N. lon. 20. 52. E. Ferro.

GAN'NELOR, a ſmall iſland of North America, in the gulph of St. Lawrence, in north lat. 48, near Bird Iſland.

GAN'NEMIE, a town of Arabia: twenty-eight miles north-weſt of Dsjebi.

GAN'NET ISLAND, a ſmall iſland near the north coaſt of New Zealand, in the South Pacific Ocean.

GAN'NING, a town of China, of the ſecond rank, in the province of Yun-nan: 1162 miles ſouth-ſouth-weſt of Pekin. Lat. 25. N. lon. 120. 2. E. Ferro.

GA'NOS, a town of European Turkey, in the province of Romania: thirty-two miles north-eaſt of Gallipoli.

GA'NOWIZ, a town of Germany, in the duchy of Stiria: ſix miles ſouth-weſt of Windiſch-Weiſtritz.

GANS'BACH, a town of Germany, in the archduchy of Auſtria: ſix miles ſouth-ſouth-weſt of Maultern.

GANT, a town of France, in the department of the Lower Pyrenées: four miles ſouth of Pau.

GANT, a town of Germany, in the Tyroleſe: ſeven miles weſt-north-weſt of Landeck.

GAN'TELOPE, or GANT'LET, *ſ.* [*gantlet* is only corrupted from *gantelope*; *gant*, all, and *loopen*, to run, Dut.] A military puniſhment, in which the criminal running between the ranks receives a laſh from each man.—Young gentlemen are driven with a whip, to run the *gantlet* through the ſeveral claſſes. *Locke.*

But would'ſt thou, friend, who haſt two legs alone,
Would'ſt thou to run the *gantlet* theſe expoſe,
To a whole company of hob-nail'd ſhoes? *Dryden.*

GAN'YMEDE, a goddeſs, better known by the name of HEBE, which ſee.

GANYME'DES, in mythology, a beautiful youth of Phrygia, ſon of Tros, and brother to Ilus and Aſſaracus. According to Lucian, he was ſon of Dardanus. He was taken up to heaven by Jupiter as he was hunting, or rather tending his father's flocks on mount Ida, and he became the cup-bearer of the gods in the place of Hebe. Some ſay that he was carried away by an eagle, to ſatisfy the unnatural deſires of Jupiter. He is generally repreſented ſitting on the back of a flying eagle in the air.

GAN'ZA, *ſ.* [*ganſa*, Span. a gooſe.] A kind of wild gooſe, by a flock of which a virtuoſo was fabled to be carried to the lunar world:

They are but idle dreams and fancies,
And favour ſtrongly of the *ganza's*. *Hudibras.*

GAO'GA, a country of Africa, to the weſt of Nubia, with a town of the ſame name, ſituated on a large lake. The inhabitants are ſaid to be barbarous and uncivilized. Lat. 16. N. lon. 26. E. Greenwich.

GAOL, *ſ.* [*gaola*, Lat. *geole*, Fr. i. e. *caveola*, a cage for birds; uſed metaphorically for a priſon.] A ſtrong place or houſe for keeping of debtors, &c. and wherein a man is reſtrained of his liberty to anſwer an offence done againſt the laws. Every county hath two gaols, one for debtors, which may be any houſe where the ſheriff pleaſes; the other for the peace and matters of the crown, which is the *county gaol*. There are alſo others of an inferior kind, called the *county bridewell*.

Gaols are of ſuch univerſal concern to the public, that none can be erected by any leſs authority than an act of parliament. 2 *Inſt.* 705. All priſons and gaols belong to the king, although the ſubject may have the cuſtody or keeping of them. 2 *Inſt.* 589. It is ſaid, that none can claim a priſon as franchiſe, unleſs they have alſo a gaol-delivery; and that therefore the dean and chapter of Weſtminſter, though they have the cuſtody of the Gate-houſe priſon, yet as they have no gaol-delivery, they muſt ſend a kalendar of the priſoners to Newgate. 1 *Salk.* 343. 7 *Mod.* 31. By ſtat. 14 Edw. III. c. 10, it is enacted, that the ſheriffs ſhall have the cuſtody of the gaols as before, and ſhall put in under-keepers for whom they will anſwer. This ſtatute is confirmed by ſtat. 19 Hen. VII. c. 10. And although divers lords of liberties have the cuſtody of priſons, and ſome in fee, yet the priſon itſelf is the king's, *pro bono publico*; and therefore it is to be repaired at the common charge. 2 *Inſt.* 589.

The juſtices, or the greater number of them within the limits of their commiſſion, upon preſentment of the grand jury at the aſſizes (or ſeſſions; ſtat. 12 Geo. II. c. 29,) of the inſufficiency or inconveniency of the county-gaol, may contract with any perſon for the building, finiſhing, or repairing, the ſame. *Stats.* 11 & 12 *Will.* III. c. 19. The expence thereof to be paid by the treaſurer out of the general county rates. *Stat.* 12 *Geo.* II. But this (by ſaid ſtat. 11 & 12 Will. III.) not to extend to gaols held by inheritance, nor to charge any perſons in any town or liberty, which have common gaols for felons, and commiſſioners of aſſiſe or gaol-delivery, with any

any aſſeſſment to the making the common gaol of the ſhire.

By ſtat. 24 Geo. III. ſt. 2. c. 54, the juſtices, at their general quarter ſeſſions, or the major part of them, not being leſs than ſeven, on preſentment made by the grand jury, of the inſufficiency, inconveniency, or want of repair, of the gaol, may contract for the building, repairing, or enlarging, the ſame; or for erecting any new gaol upon any ſcite within two miles from that of the old gaol; and in that caſe for the ſelling the old goal, and the ſcite thereof, and the materials and land belonging thereto. In certain caſes alſo juſtices may build a new gaol in any part of the county; which is always to be divided into ſeparate apartments, with divers conveniences, for the benefit of the health and morals of the priſoners, which are enforced by ſtat. 31 Geo. III. c. 46.

Juſtices of peace may not commit felons, and other criminals, to the counters in London, or other priſons, but the common gaols, for legally they cannot impriſon any where but in the common gaol. *Co. Lit.* 9, 119. But the houſe of correction, and the counters of the ſheriffs of London, are the common priſons for offenders for the breach of the peace, &c. And by ſtat. 5 Hen. IV. c. 10, it is enacted, "That none ſhall be impriſoned by any juſtice of the peace, but only in the common gaol, ſaving to lords and others, who have gaols, their franchiſe in this caſe." This ſtatute is only declaratory of the common law. 2 *Inſt.* 43. But the court of king's bench may commit to any priſon in the kingdom which they ſhall think moſt proper, and the offender ſo committed or condemned to impriſonment cannot be removed or bailed by any other court. *Moor* 666. *pl.* 919. 1 *Sid.* 145. 31 *C.* II. *c.* 2.

And as priſoners ought to be committed at firſt to the proper priſon, ſo ought they not to be removed from thence, except in ſome ſpecial caſes. To which purpoſe, by the ſaid ſtat. 31 Car. II. c. 2, it is enacted, "That if any ſubject of this realm ſhall be committed to any priſon, or in cuſtody of any officer, for any criminal or ſuppoſed criminal matter, he ſhall not be removed into the cuſtody of any other; unleſs it be by a *habeas corpus*, or other legal writ; or where the priſoner is delivered to the conſtable, &c. to be carried to ſome common gaol; or where any perſon is ſent by order of any judge of aſſiſe, or juſtice of the peace, to any common work-houſe, or houſe of correction; or where the priſoner is removed from one priſon to another within the ſame county, in order to a trial or diſcharge by due courſe of law; or in caſe of ſudden fire or infection, or other neceſſity; upon pain that he who makes out, ſigns, or counterſigns, or obeys, or executes, ſuch warrant, ſhall forfeit to the party grieved 100l. for the firſt offence, 200l. for the ſecond, &c." See ſtat. 19 Car. II. c. 4, for impowering juſtices of the peace to remove priſoners in caſe of infection.

By ſtat. 11 & 12 Will. III. c. 10, all murderers and felons ſhall be impriſoned in the common gaol, and the ſheriffs ſhall have the keeping of the gaol. And offenders committed to priſon, are to bear the charges of their conveying to gaol; or, on refuſal, their goods ſhall be ſold for that purpoſe, by virtue of a juſtice of peace's warrant; and if they have no goods, a tax is to be made by conſtables, &c. on the inhabitants of the pariſh where the offenders were apprehended. 3 *Jac.* I. *c.* 10. And by ſtat. 27 Geo. II. c. 3. the expence of conveying poor offenders to gaol, or the houſe of correction, ſhall be paid by the treaſurer of the county, except in Middleſex.

For the relief of priſoners in gaols, juſtices of peace in ſeſſions have power to tax every pariſh in the county, not exceeding 6s. 8d. per week, leviable by conſtables, and diſtributed by collectors, &c. 14 *Eliz. c.* 5. 12 *C.* II. *c.* 29. And by ſtat. 31 Geo. III. c. 46, the juſtices in ſeſſions may order ſuch ſums as they ſhall think neceſſary to be paid out of the county-rate towards aſſiſting ſuch priſoners as are not able to work, or being able, cannot procure employment ſufficient to maintain themſelves in food and raiment, and not otherwiſe provided for by law.

Various proviſions have been, from time to time, made for the relief of poor priſoners, and ſetting them to work. By ſtat. 22 & 23 Car. II. c. 20, it is enacted, "That all ſheriffs, gaolers, &c. ſhall permit their priſoners to ſend for neceſſary food where they pleaſe; nor demand any greater fee for their commitment or diſcharge, than what is allowable." Alſo it is thereby directed, that an inquiry be made into all charities given for the benefit of poor priſoners. And by ſtat. 29 Geo. III. c. 67, every gaoler is, on forfeiture (of 50l. if a county gaoler, and 20l. if a bridewell keeper), to deliver in at the Michaelmas ſeſſions yearly, a certificate ſtating how far the proviſions made by various ſtatutes for the benefit of priſoners, are obſerved in his gaol. The following are the ſtatutes to be particularized in ſuch certificate.

"The ſtat 22 & 23 Car. II. c. 20, enacts, that felons and debtors ſhall be kept ſeparate. Stat. 24 Geo. II. c. 40, enacts, that no gaoler ſhall ſell, lend, uſe, give away, or ſuffer, any ſpirituous liquors within any gaol: and that a copy of the clauſes prohibiting thereof ſhall be hung up in the gaol. Stat. 32 Geo. II. c. 28, enacts, The clerk of the peace ſhall cauſe a liſt of the fees payable by debtors, and the rules and orders for the government of gaols and priſons, to be hung up in the court where the aſſiſes or ſeſſions are held, and ſend another copy to the gaoler, who ſhall cauſe the ſame to be hung up in a conſpicuous part of the gaol. Stat. 13 Geo. III. c. 58, enacts, That clergymen may be provided to officiate in gaols. Stat. 14 Geo. III. c. 20, enacts, That perſons acquitted, or diſcharged on proclamation for want of proſecution, ſhall be diſcharged immediately in open court and without fee. Stat. 14 Geo. III. c. 59, enacts, That the walls and ceilings of cells in gaols ſhall be ſcraped and white-waſhed, *at leaſt once a year*; that the cells ſhall be kept clean, and ſupplied with freſh air by ventilators, &c. that there ſhall be two rooms ſet apart for the ſick; that a warm and cold bath or bathing tubs ſhall be provided; that a ſurgeon or apothecary ſhall be appointed with a ſalary; that this act ſhall be hung up in the gaol." And by ſtat. 32 Geo. III. c. 45, Priſoners diſcharged may, on application, be conveyed to their ſettlement by a vagrant paſs. See the article VAGRANT. Thus humane have the legiſlature continually ſhewn themſelves, in repeatedly interfering for the health and comfort of thoſe who are conſidered generally as the mere out-caſts of ſociety. To employ them alſo in uſeful induſtry, and thus turn their minds to good from evil, has been another attempt no leſs praiſe-worthy than the former.

The juſtices in general ſeſſions may provide a convenient ſtock of materials for ſetting poor priſoners to work, to be paid for by the treaſurer out of the general county-rate: and may pay and provide fit perſons to overſee and ſet ſuch priſoners on work; and make the orders needful as to regulating the accounts, for puniſhing neglects and abuſes, and for beſtowing the profits of their labour for the relief of the priſoners. *Stats.* 19 *C.* II. *c.* 4. 12 *Geo.* II. *c.* 29. 31 *Geo.* III. *c.* 46.

The offence of breaking gaol, by the common law, was no leſs than felony; and this whether the party were committed in a criminal or civil caſe, or whether he were actually within the walls of the priſon, or only in the ſtocks, or in the cuſtody of any perſon who had lawfully arreſted him, or whether he were in the king's priſon, or one belonging to a lord, or franchiſe. 2 *Inſt.* 589. But now, by the ſtatute 1 Edw. II. ſtat. 2. *de frangentibus priſonam*, "None from henceforth that breaketh priſon ſhall have judgment of life, or member, for breaking

ing of priſon only, except the cauſe for which he was taken and impriſoned did require ſuch judgment, if he had been convicted thereupon according to the law and cuſtom of the realm; albeit in times paſt it hath been uſed otherwiſe." So that to break priſon and eſcape, when one is lawfully committed for any treaſon or felony, remains ſtill felony, as at the common law: and to break priſon, (whether it be the county gaol, the ſtocks, or other uſual place of ſecurity,) when lawfully confined upon any other inferior charge, is ſtill puniſhable as a high miſdemeanor by fine and impriſonment. 4 *Comm. c.* 10. 2 *Hawk. P. C. c.* 18. The offence of breaking priſon is but felony, whatſoever the crime were for which the party was committed, unleſs his intent were to favour the eſcape of others who were committed for treaſon, for that will make him a principal in the treaſon. 2 *Hawk. P. C. c.* 18. The felony of breach of priſon is within clergy, though the offence for which the party was committed be excluded clergy. 1 *Hal. H. P. C.* 612.

To GAOL, *v. n.* To impriſon; to commit to gaol.—*Gaoling* vagabonds was chargeable, peſterous, and of no open example. *Bacon.*

GAOL-DELIV'ERY, the judicial proceſs by which the juſtices of aſſiſe diſpoſe of the priſoners in a gaol. The adminiſtration of juſtice being originally in the crown, in former times our kings in perſon rode through the realm once in ſeven years, to judge of and determine crimes and offences; afterwards juſtices in eyre were appointed; and ſince juſtices of aſſiſe and gaol-delivery, &c. A commiſſion of gaol-delivery is a patent in nature of a letter from the king to certain perſons, appointing them his juſtices, or two, or three, of them, and authoriſing them to deliver his gaol, at ſuch a place, of the priſoners in it; for which purpoſe, it commands them to meet at ſuch a place, at the time they themſelves ſhall appoint; and informs them that for the ſame purpoſe the king hath commanded his ſheriff of the ſame county to bring all the priſoners of the gaol, and their attachments, before them, at the day appointed. *Cromp. Juriſd.* 125. And by ſtat. 3 Hen. VII. c. 3, Thoſe that have the cuſtody of gaols muſt certify the names or calendar of all the priſoners to the juſtices of gaol-delivery in order to their trial or diſcharge, on pain of 5l.

Juſtices of gaol-delivery are impowered by the common law to proceed upon indictments of felony, treſpaſs, &c. and to order execution or reprieve: And they have power to diſcharge ſuch priſoners, as upon their trials ſhall be acquitted; alſo all ſuch againſt whom, upon proclamation made, no evidence appears to indict them; which juſtices of oyer and terminer, &c. may not do. 2 *Hawk. P. C.* But theſe juſtices have nothing to do with any perſon not in cuſtody of the priſon, except in ſome ſpecial caſes; as if ſome of the accomplices to a felony be in ſuch priſon, and ſome of them out of it, the juſtices may receive an appeal againſt thoſe who are out of the priſon, as well as thoſe who are in it; which appeal, after the trial of ſuch priſoners, ſhall be removed into the king's-bench, and proceſs iſſue from thence againſt the reſt. *Fitz. Coron.* 77. Such juſtices have no more to do with one let to mainpriſe, than if he were at large; for ſuch perſon cannot be ſaid to be a priſoner, ſince it is not in the power of his ſureties to detain him in their cuſtody. And where any perſon is bailed, there he is in the cuſtody of his ſureties, and they may detain him where they pleaſe. 2 *H. P. C.* 25. Though per Holt, Ch. J. If a perſon be let to bail, yet he is in law in priſon, and his bail are his keepers; and therefore the juſtices of gaol-delivery may take an indictment againſt him, as well as if he was actually in gaol. And they may take indictments not only of felony, but alſo of high treaſon, if the offenders are in priſon, and try and give judgment upon them, like unto commiſſioners of oyer and terminer; though it has been formerly held otherwiſe. 2 *Hale's Hiſt. P. C.* 35. Juſtices of gaol-delivery may puniſh thoſe who unduly bail priſoners; as being guilty of a negligent eſcape. 25 *Edw.* III. *c.* 39. They are alſo to puniſh ſheriffs and gaolers, refuſing to take felons into their cuſtody from conſtables, &c. *ſtat.* 4 *Edw.* III. *c.* 10; and have authority to puniſh many particular offences by ſtatute.

GAOL'ER, *ſ.* The maſter or keeper of a priſon; one that hath the cuſtody of the place where priſoners are kept. Sheriffs muſt make ſuch gaolers for which they will anſwer. But if there is a default in the gaoler, action lies againſt him for an eſcape, &c. 2 *Inſt.* 592. In common caſes, the ſheriff, or gaoler, is chargeable at the diſcretion of the party; though the ſheriff is moſt uſually charged. He who hath the cuſtody of the gaol wrongfully, or of right, ſhall be charged with the eſcape of priſoners; and if he that hath the actual poſſeſſion be not ſufficient, his ſuperior ſhall anſwer. 2 *Hawk. P. C.*

It is ſaid that for his own ſecurity a gaoler may hamper a felon with irons to prevent his eſcape; 1 *Hal. H. P. C.* 601. *Dalt. c.* 170; and that a gaoler is no way puniſhable for keeping even a debtor in irons; 2 *Hawk. P. C.* But it has been obſerved that this proceeding, even in the caſe of a felon, (much more in that of a debtor,) can only be intended where the officer has juſt reaſon to ſuſpect an eſcape: as where the priſoner is unruly, or makes any attempt to that purpoſe; but otherwiſe, notwithſtanding the too common practice of gaolers, it ſeems altogether unwarrantable, and contrary to the mildneſs and humanity of the laws of England, by which gaolers are forbidden to put their priſoners to any pain or torment: and lord Coke, 2 Inſt. 381, is expreſs, that by the common law it might not be done. And if the gaoler keep the priſoner more ſtrictly than he ought of right, whereof the priſoner dieth, this is felony in the gaoler by the common law. And this is the cauſe that if a priſoner die in gaol the coroner ought to ſit upon him: and if the death was owing to cruel and oppreſſive uſage on the part of the gaoler, or any officer of his, it will be deemed wilful murder in the perſon guilty of ſuch dureſs. 3 *Inſt.* 91. *Foſt.* 321, 2. But if a criminal endeavouring to break the gaol, aſſault his gaoler, he may be lawfully killed by him in the affray. 1 *Hawk. P. C.* 1 *H. H.* 496.

A perſon in execution in the king's bench priſon was put in irons by the marſhal: and the court ordered the marſhal to keep his priſoner according to law: and in this caſe they ſaid the gaoler might juſtify putting him in irons if he feared an eſcape; or if the priſoner was unruly. 7 *Mod.* 52. In the ſecond year of Geo. II. ſir William Rich, being laid in irons in the fleet priſon, had his irons taken off by order of the houſe of commons; who thereupon began an inquiry into the conduct of gaolers, which produced ſome of the wholeſome laws for the regulation of gaols.

By ſtat. 14 Edw. III. c. 10. "If any keeper of a priſon, or under-keeper, by too great dureſs of impriſonment, and by pain, make any priſoner that he hath in his ward to become an appellor againſt his will, he is guilty of felony." By ſtat. 4 Edw. III. c. 10, It is enacted, that the ſheriffs and gaolers ſhall receive, and ſafely keep in priſon from henceforth, ſuch thieves and felons, by the delivery of the conſtables and townſhips, without taking any thing for the receipt; and the juſtices to deliver the gaol, ſhall have power to hear their complaints, that will complain againſt the ſheriffs and gaolers in ſuch caſe, and moreover to puniſh the ſheriffs and gaolers, if they be found guilty. By ſtat. 3 Hen. VII. c. 3, The ſheriff and every other perſon, having authority or power of keeping of gaol, or of priſoners for felony, ſhall certify the names of all priſoners in his cuſtody to the juſtices of gaol-delivery. And if any perſon aſſault a gaoler, for keeping a priſoner in ſafe cuſtody, he may be fined and impriſoned. 1 *Hawk. P. C.* Where a gaol is broken by thieves, the gaoler is anſwerable; not if it be broken by enemies. 3 *Inſt.* 52.

It ſeems clearly agreed, that a gaoler, by ſuffering vo-

luntary eſcapes, by abuſing his priſoners, by extorting unreaſonable fees from them, or by detaining them in gaol, after they have been legally diſcharged, and paid their juſt fees, forfeits his office; for that in the grant of every office it is implied, that the grantee execute it faithfully and diligently. *Co. Lit.* 233. *Mod.* 143.

By ſtat. 8 & 9 Will. III. c. 27, The marſhal of the king's bench and warden of the fleet taking any reward to connive at priſoner's eſcape, ſhall forfeit 500l. and their office, and be rendered for ever after incapable of executing any ſuch office. It hath been reſolved, that a forfeiture by a gaoler who hath but a particular intereſt, as of him who hath cuſtody of a gaol for life, or years, does not affect him in remainder, or reverſion, who hath the inheritance, but that upon ſuch forfeiture his title ſhall acrue, and not go to the king. *Poph.* 119. 2 *Lev.* 71. *Raym.* 216. 3 *Lev.* 288.

By ſtat. 8 & 9 Will. III. c. 27, it is enacted, That the office of marſhal of the king's bench, and warden of the fleet, ſhall be executed by thoſe who have the inheritance of the ſaid priſons, or their deputies, &c. and the profits of their office may be ſequeſtered on motion to the court of king's-bench, to ſatisfy a judgment had againſt them for eſcape. By ſtat. 3 Geo. I. c. 15, None ſhall purchaſe the office of gaoler, or any other office pertaining to the high ſheriff, under pain of 500l.

By ſtat. 24 Geo. III. ſt. 2. c. 54, a gaoler ſhall not directly or indirectly ſell liquors to the priſoners, or keep, or be concerned in, or benefited by, any tap-houſe, tap-room, tap, or licence for that purpoſe, on pain of 10l. for each offence. The juſtices in ſeſſions may make allowance to gaolers in lieu of profits formerly derived to them from the ſale of liquors. By ſtat. 31 Geo. III. c. 46, gaolers are, on the firſt day of every aſſiſe to make a return of the ſize and condition of gaols, the number of priſoners, &c. therein.

GA'ONS, an order of Jewiſh doctors, who appeared in the eaſt, after the cloſing of the Talmud. The word *gaons* ſignifies "excellent." The Gaons ſucceeded the Seburæans or Opiners, about the beginning of the ſixth century. Chanan Meiſchtia was the head, and firſt of the excellents. He reſtored the academy of Pandebita, which had been ſhut up for thirty years

GAP, *ſ.* [from *gape*.] An opening in a broken fence.—Buſhes are moſt laſting of any for dead hedges, or to mend *gaps*. *Mortimer*.

With terrors and with furies to the bounds
And cryſtal wall of heav'n; which, opening wide,
Roll'd inward, and a ſpacious *gap* diſclos'd
Into the waſteful deep. *Milton*.

A breach.—The loſs of that city concerned the chriſtian commonweal; manifold miſeries afterwards enſued by the opening of that *gap* to all that ſide of chriſtendom. *Knolles*.—Any paſſage:

So ſtands the Thracian herdſman with his ſpear
Full in the *gap*, and hopes the hunted bear,
And hears him ruſtling in the wood. *Dryden*.

An avenue; an open way.—The former kings of England paſſed into them a great part of their prerogatives; which though then it was well intended, and perhaps well deſerved, yet now ſuch a *gap* of miſchief lies open thereby, that I could wiſh it were well ſtopt. *Spenſer*.—A hole; a deficiency.—If you violently proceed againſt him, miſtaking his purpoſe, it would make a great *gap* in your honour. *Shakeſpeare*.—Any interſtice; a vacuity.—One can revive a languiſhing converſation by a ſudden ſurpriſing ſentence; another is more dexterous in ſeconding; a third can fill the *gap* with laughing. *Swift*.

To make 'twixt words and lines huge *gaps*,
Wide as meridians in maps. *Hudibras*.

An opening of the mouth in ſpeech during the pronunciation of two ſucceſſive vowels.—The hiatus, or *gap* between two words, is cauſed by two vowels opening on each other. *Pope*.

To ſtop a GAP, is to eſcape by ſome mean ſhift; alluding to hedges mended with dead buſhes, till the quick-ſets will grow:

His policy conſiſts in ſetting traps,
In finding ways and means, and *ſtopping gaps*. *Swift*.

To ſtand in the GAP. To make defence; to expoſe himſelf for the protection of ſomething in danger.—What would become of the church, if there were none more concerned for her rights than this? Who would *ſtand in the gap? Leſley*.

GAP, a town of France, and capital of the department of the Higher Alps. Before the revolution, the ſee of a biſhop, ſuffragan of Aix, and capital of a county called *Gapençois*, about nine leagues long and ſix wide. In 1602, the town was taken and burned by the duke of Savoy; near it is a mineral ſpring: eight leagues north of Siſteron, and fifteen ſouth of Grenoble. Lat. 44. 34. N. lon. 23. 45. E. Ferro.

To GAPE, *v. n.* [ȝeapan, Sax.] To open the mouth wide; to yawn.—*Gaping* or yawning, and ſtretching, do paſs from man to man; for that that cauſeth *gaping* and ſtretching is when the ſpirits are a little heavy by any vapour. *Arbuthnot*.

She ſtretches, *gapes*, unglues her eyes,
And aſks if it be time to riſe. *Swift*.

To open the mouth for food, as a young bird:

As callow birds,
Whoſe mother's kill'd in ſeeking of the prey,
Cry in their neſt, and think her long away;
And at each leaf that ſtirs, each blaſt of wind,
Gape for the food which they muſt never find. *Dryden*.

To deſire earneſtly; to crave; with *for*:

To thy fortune be not thou a ſlave;
For what haſt thou to fear beyond the grave?
And thou, who *gap'ſt for* my eſtate; draw near;
For I would whiſper ſomewhat in thy ear. *Dryden*.

With *after*.—What ſhall we ſay of thoſe who ſpend their days in *gaping after* court-favour and preferments. *L'Eſtrange*.—With *at*.—Many have *gaped at* the church revenues; but, before they could ſwallow them, have had their mouths ſtopped in the church-yard. *South*.—To open in fiſſures or holes.—The earth *gapes* and greedily opens itſelf to drink in the dew of heaven, or the refreſhments of a ſhower. *South*.

If it aſſume my noble father's perſon,
I'll ſpeak to it, though hell itſelf ſhould *gape*
And bid me hold my peace. *Shakeſpeare*.

To open with a breach:

The planks, their pitchy coverings waſh'd away,
Now yield, and now a yawning breach diſplay:
The roaring waters, with a hoſtile tide,
Ruſh through the ruins of her *gaping* ſide. *Dryden*.

To open; to have an hiatus.—There is not to the beſt of my remembrance, one vowel *gaping* on another for want of cæſura in this poem. *Dryden*.—To make a noiſe with open throat:

And, if my muſe can through paſt ages ſee,
That noiſy, nauſeous, *gaping*, fool is he. *Roſcommon*.

To ſtare with hope or expectation:

Others will *gape* t' anticipate
The cabinet deſigns of fate;
Apply to wizards, to foreſee
What ſhall, and what ſhall never, be. *Hudibras*.

To ſtare with wonder.—Parts of different ſpecies jumbled together, according to the mad imagination of the dawber; and the end of all this to cauſe laughter; a very

ry monſter in a Bartholomew fair, for the mob to *gape at*. *Dryden*.

Where elevated o'er the *gaping* crowd,
Claſp'd in the board the perjur'd head is bow'd. *Gay*.

To ſtare irreverently.—They have *gaped* upon me with their mouth. *Job*. xvi. 10.

"He that GAPETH until he be fed,
"Well may he GAPE until he is dead."

This proverb teacheth that we are not ſo entirely to depend upon the gifts of Providence, as not to uſe the ordinary means, and our utmoſt endeavours, to gain a livelihood, and obtain the comforts of human life in lawful and commendable manner.

"GAPING is catching."—The French ſay, *Un bon bailleur en fait bailler deux*; One good gaper will make two follow him. It might indeed as well have been ſaid *twenty*, for it is generally obſerved to affect the whole company

GAPEN'NES, a town of France, in the department of the Somme: ſeven miles north-eaſt of Abbeville.

GA'PER, *ſ.* One who opens his mouth. One who ſtares fooliſhly. One who longs or craves.—The golden ſhower of the diſſolved abbey-lands rained well near into every *gaper's* mouth. *Carew*.

GAP'SAL, a town of Ruſſia, in the government of Revel: thirty-ſix miles weſt-ſouth-weſt of Revel. Lat. 59. 5. N. lon. 60. 10. E. Greenwich.

GAR, in Saxon, ſignifies a weapon. So *Eadgar* is a happy weapon; *Ethelgar*, a noble weapon. *Gibſon*.

To GAR, *v. a.* [*giera*, Iſlandic.] To cauſe; to make. *Obſolete*. But it is ſtill uſed in Scotland:

Tell me, good Hobbinol, what *gars* thee greet?
What! hath ſome wolf thy tender lambs ytorn?
Or is thy bagpipe broke, that ſounds ſo ſweet?
Or art thou of thy loved laſs forlorne? *Spenſer*.

GAR-EL-MAI'LAH, a ſeaport of Africa, on the eaſt coaſt of Tunis: four miles weſt of Cape Zibeeb.

GAR'-FISH, HORN-FISH, or SEA-NEEDLE, *ſ.* See ESOX.

GA'RA LOUGH, a lake of Ireland, in the county of Sligo: twenty miles ſouth of Sligo.

GARABU'SA, a ſmall iſland in the Mediterranean, near the weſt coaſt of the iſland of Candi, taken by the Turks in 1692, and confirmed to them by the peace of Carlowitz. Lat. 35. 39. N. lon. 41. 8. E. Ferro.

GA'RAC, a town of France, in the department of the Charente, and chief place of a canton, in the diſtrict of Angoulême: four miles eaſt-ſouth-eaſt of Angoulême.

GARA'CHIO, or GARACHICO, a town on the weſt coaſt of the iſland of Teneriffe.

GA'RACK, an iſland in the Gulf of Perſia, near the mouth of the Euphrates, otherwiſe called *Bahhrein*. See BAHHREIN.

GAR'AMA, in ancient geography, the capital of the Garamantes in Libya Interior; near the ſprings of the Cinyphus, now in ruins. Garamantes the people. It lay to the ſouth of the Gætulia, extending from the ſprings of the Cinyphus, and the adjacency of the river Gir, to the mountains which form at the *Vallis Garamantica* (Pliny); or from the ſprings of the Bagrades to the lake Nuba (Ptolemy).

GARAMAN'TES (ſing. *Garamas*), a people in the interior parts of Africa, now called the *Deſerts of Sahara*. They lived in common, and ſcarce clothed themſelves, on account of the warmth of their climate. *Virgil*.

GARAMAN'TIS, in mythology, a nymph who became mother of Iarbas, Phileus, and Pilumpus, by Jupiter. *Virgil*.

GAR'AMAS, a king of Libya, whoſe daughter was mother of Ammon by Jupiter.

GAR'AMOND (Claude), an ingenious letter-founder at Paris, who began, in 1510, to found printing types free from all the remains of the gothic or black-letter ſtyle; and brought them to ſuch perfection, that he had the honour of ſurpaſſing all who went before him in that valuable profeſſion. His types were preferred in all parts of Europe; inſomuch that in Italy, Germany, England, and Holland, authors, by way of recommending their books, diſtinguiſhed the type by his name; inſomuch that even the printers boaſted of having the type called *Garamond's Long Primer*. By command of Francis I. king of France, he founded three ſizes of Greek types for the uſe of Robert Stephens, who with them printed all his beautiful editions of the New Teſtament, and other Greek authors. He died at Paris in 1561.

GA'RAN, a ſmall iſland in the North Sea, near the north coaſt of Scotland: three miles eaſt-ſouth-eaſt of Cape Wrath.

GARAS'SE (Francis), a French Jeſuit, noted for his controverſial writings, born at Angoulême, in 1585. While he was in his noviciate, he publiſhed a defence of the Jeſuits againſt three different attacks upon the order, in a piece entitled *Andreæ Schioppii Caſparis Fratris Horoſcopus, &c.* 1614, 4to. which is drawn up in an ironical ſtrain, and not deſtitute of wit. Of the ſame caſt is his *Andreæ Schioppii Caſparis Fratris Elixir Calviniſticum, &c.* 8vo. publiſhed in the following year, againſt ſome ſtrictures on his order by miniſters of the proteſtant communion. When he had completed his noviciate, he became a very popular preacher, and maintained that character for many years in the principal cities of France and Lorrain. In 1623 he ventured on the production of a large work, intended to controvert the principles of atheiſts and libertines, entitled The curious Doctrine of the Wits, or Pretenders to Wit, of this Age, containing ſeveral Maxims pernicious to the State, Religion, and good Manners, refuted and overthrown by Father Garaſſe, of the Society of Jeſus, 4to. In 1625 he publiſhed The Theological Summary of the capital Truths of the Chriſtian Religion, folio. The moſt able criticiſm on this performance was publiſhed in 1626, by the abbot of St. Cyran, entitled The Summary of the capital Faults and Falſhoods contained in the Theological Summary of Father F. Garaſſe, 4to. This work brought a conſiderable imputation on the religious character of Garaſſe, and he was baniſhed from Paris to a houſe belonging to the Jeſuits at Poitiers. But they entertained an invincible hatred to the abbot of St. Cyran, who was a Janſeniſt; and by ſome writers this is ſaid to have been the cauſe of the war which afterwards raged ſo furiouſly between the Jeſuits and the Janſeniſts. While father Garaſſe was at Poitiers, the plague having ſpread its ravages into that part of the kingdom in 1631, he begged leave of his ſuperiors to attend thoſe who were infected with it; and, having obtained their permiſſion, he caught the contagion, while charitably adminiſtering relief and conſolation to the afflicted ſufferers, and died in the hoſpital, at the age of forty-ſix. Beſides his profeſs works, he was the author of ſome Latin verſes, conſiſting of elegies on the death of Henry IV. a poem in heroic verſe, addreſſed to Louis XIII. upon his inauguration.

GARAZU', a town in Brazil, and province of Pernambuco: twenty-five miles north from Olinda.

GARB, *ſ.* [*garbe*, Fr.] Dreſs; clothes; habit.—He puts himſelf into the *garb* and habit of a profeſſor of phyſic, and ſets up. *L'Eſtrange*.

Thus Belial, with words cloth'd in reaſon's *garb*,
Counſel'd ignoble eaſe and peaceful ſloth. *Milton*.

Faſhion of dreſs:

Horace's wit, and Virgil's ſtate,
He did not ſteal, but emulate;
And when he would like them appear,
Their *garb*, but not their clothes, did wear. *Denham*.

Exterior appearance:

This is ſome fellow,
Who having been prais'd for bluntneſs, doth affect
A ſaucy roughneſs, and conſtrains the *garb*
Quite from his nature. *Shakeſpeare*.

GARB, *ſ.* in botany. See SALIX BABYLONICA.

GAR'BAGE,

GAR'BAGE, *ſ* [*garbear*, Span.] The bowels: the offal; that part of the inwards which is ſeparated and thrown away.—When you receive condign puniſhment, you run to your confeſſor, that parcel of guts and *garbage*. *Dryden.*

The cloyed will,
That ſatiate yet unſatisfy'd deſire, that tub
Both fill'd and running, ravening firſt the lamb,
Longs after for the *garbage*. *Shakeſpeare.*

Luſt, though to a radiant angel link'd,
Will ſate itſelf in a celeſtial bed,
And prey on *garbage*. *Shakeſpeare.*

GARBAN'ZO, *ſ.* in botany. See CICER ARIETINUM, vol. iv. p. 589. To that article we may add, that this pulſe is highly eſteemed in Spain as fodder for cattle, and at the table in ſoups and other diſhes, but principally with that ſtandard diſh in all families, the *olio*. The garbanzo plant has a very inconſiderable root, not penetrating far into the ground, and therefore not impoveriſhing the ſoil; its branches are numerous, and the large ſort throws out ſhoots three feet long; it varies in colour, white, reddiſh, or rather grey; and the ſeed of each is of the ſame colour reſpectively. Each pod contains but one ſeed, or at moſt two; not round, but rather pointed; whence it is compared to a ſheep's head, and has the trivial name *arietinum*. In Caſtile they ſay that the beſt ſort has the ſurface wrinkled like the face of an old woman, the broad back of a porter, and the bill of a parrot; the colour alſo ſhould be not white, but of a pale hue; and it ſhould be light, ſoft, and fat. This pulſe does not ſucceed ſo well in the hotter parts of Spain as in the cold northern diſtricts of Fuente Sauco, Mentrida, and others. It is ſowed in the ſame manner as other pulſe, and generally in open fields. A ſoft rich ſoil is beſt for the garbanzo, but a ſtiff clay is not unſuitable to it. The Spaniards have a proverb, that rain never hurts garbanzos. There are two principal ſorts, or rather varieties, the large or winter, and the ſmall or ſummer garbanzo. The former ſhould be ſown the firſt week in October, that it may acquire a good root, and ſpread out luxuriantly for fodder. The latter muſt be ſown about the end of February. The conſumption of the garbanzo is great in Spain to fodder cattle, and it is reckoned tolerably nutritive. It is uſed either by feeding it on the ground, by cutting it green and giving it to them in the ſtall or ſtable, which is the beſt, or dried after the manner of hay. The large ſort furniſhes an early fodder for cattle, ſheep and lambs, at a time when no other is to be had. It is a good preparation for other crops, becauſe it is deſtructive of weeds, and ſhades the ſurface of the ground.

GAR'BEL, *ſ.* A plank next the keel of a ſhip.

GAR'BIDGE, *ſ.* Corrupted from *garbage*.—All ſhavings of horns, hoofs of cattle, blood, and *garbidge*, is good manure for land. *Mortimer.*

GAR'BISH, *ſ.* Corrupted from *garbage*.—In Newfoundland they improve their ground with the *garbiſh* of fiſh. *Mortimer.*

To GAR'BLE, *v. a.* [*garbellare*, Ital.] To ſift; to part; to ſeparate the good from the bad:—The underſtanding works to collate, combine, and *garble*, the images and ideas, the imagination and memory preſent to it. *Cheyne.*

But you who fathers and traditions take,
And *garble* ſome, and ſome you quite forſake. *Dryden.*

GAR'BLER, *ſ.* He who ſeparates one part from another.—A farther ſecret in this clauſe may beſt be diſcovered by the projectors, or at leaſt the *garblers* of it. *Swift.*

GAR'BLER OF SPICES, an officer of antiquity in the city of London, who may enter into any ſhop, warehouſe, &c. to view and ſearch drugs and ſpices, and *garble* and make clean the ſame, or ſee that it be done. And anciently all drugs, &c. were to be cleanſed and garbled before ſold, on pain of forfeiture, or the value. By 6 Ann. c. 16, this officer is to be appointed by the court of lord mayor, aldermen, and common council, to garble ſpices at the requeſt of the owner, but not otherwiſe.

GAR'BLES, *ſ.* The duſt, ſoil, or filth, ſeparated by garbling.

GAR'BO (Il), a town of Italy, in the duchy of Tuſcany: ſix miles eaſt-ſouth-eaſt of Leghorn.

GAR'BOIL, *ſ.* [*garbouille*, Fr. *garbuglio*, Ital.] Diſorder; tumult; uproar. *Hanmer.*

Look here, and at thy ſovereign leiſure read
What *garboils* ſhe awak'd. *Shakeſpeare.*

GAR'CES or GRACES (Henry), a native of Porto, in the kingdom of Portugal; who went to Peru in the Spaniſh ſervice, and after the death of his wife became canon of the cathedral of Mexico. He tranſlated the Luſiad of Camoens from the Portugueſe into Spaniſh, and this has procured him a place in profeſſor Dieze's tranſlation of Velaſquez's Hiſtory of Spaniſh poetry. He cauſed a law to be enacted that no ſilver bullion ſhould be ſuffered to circulate in Peru; but his greateſt ſervice was the diſcovery of the quickſilver mines. As he was one day examining the red earth, which the Indians uſe for paint, and call *limpi*, he obſerved that it was native cinnabar; and as he knew that quickſilver was extracted from it in Europe, he went to the place where it was dug up, made ſome experiments, and thus, in 1566, laid a foundation for the moſt important works. No one, however, thought of employing it, in the ſilver mines, till the year 1571, when, Francis de Toledo being viceroy, Pero Fernandes de Velaſco came to Peru, and offered to refine the ſilver by mercury, as he had learned at the ſmelting-houſes in Mexico. His propoſal being accepted, and his attempts proving ſucceſsful, the old methods were abandoned, and that of amalgamating purſued as it is practiced at preſent. From this account it appears that Garces was not the inventor of amalgamation; but that it was introduced firſt into Peru in 1571, and that it had been long before practiced there: but at what period is uncertain. It was, however, ſubſequent to the death of Garces, which took place in Mexico.

GARCHAN'SKOI, a town of Ruſſian Siberia: in the government of Tobolſk, on the river Tobol: eighty miles ſouth of Tobolſk.

GAR'CIA, a town of Spain, the province of Catalonia: eighteen miles north of Tortoſa.

GAR'CIAS-LAS'SO or GARCILASSO (de la Vega), one of the moſt eminent of the Spaniſh poets, born at Toledo, in 1503. His works are contained in a ſmall volume, and conſiſt in a great meaſure of paſtorals. His principal excellence is tenderneſs, which he beautifully diſplays in ſome of his ſonnets, the moſt intereſting of his compoſitions. He was indebted to a familiarity with the ancients for a greater freedom from bombaſt than his countrymen in general; but he does not riſe to the ſublime, and his learning and taſte were ſuperior to his genius. Many editions of his poems have been given, and they have been commented upon by Sanchez de Las Brozas, the moſt learned of the Spaniſh grammarians. Garcilaſſo followed the profeſſion of arms, and attended Charles V. in many of his expeditions. He loſt his life at an early age in 1536, at the attack of a fortreſs in Provence, while ſignaliſing his courage in the preſence of his ſovereign.

Another GARCILASSO DE LA VEGA, a native of Cuſco in Peru, compoſed in Spaniſh a Hiſtory of Florida, and another of Peru, and its Incas.

GARCIN'IA, *ſ.* [named in honour of Laurent Garcin, M. D. F. R. S. who travelled into the Eaſt-Indies.] In botany, the MANGOSTAN; a genus of the claſs dodecandria, order monogynia, natural order bicornes, *Linn.* (guttiferæ, *Juſſ.*) The generic characters are—Calyx: perianth four-leaved; leaflets roundiſh, concave, obtuſe, ſpreading, permanent. Corolla: petals four, roundiſh, concave, ſpreading; a little larger than the

the calyx. Stamina: filaments ſixteen, (twelve or more, *G.*) upright, placed in a cylinder, ſimple, ſhorter than the calyx; antheræ roundiſh. Piſtillum: germ ſuperior, ſuboval; ſtyle ſcarcely any; ſtigma flat, ſpreading, peltate, eight-cleft, obtuſe, permanent. Pericarpium: berry coriaceous, globular, large, one-celled, crowned with the ſtigma: ſeeds eight, convex on one ſide, angular on the other, villoſe, fleſhy.—*Eſſential Character.* Calyx four-leaved, inferior; petals four; berry eight-ſeeded, (or five, ſix, to eight;) crowned with the peltate ſtigma.

Species. 1. Garcinia mangoſtana, mangoſtan, or mangoſteen: leaves ovate; peduncles one-flowered. The common mangoſtan riſes with an upright ſtem near twenty feet high, ſending out many branches on every ſide, which are placed oppoſite, and ſtand oblique to each other, and not at right angles; the bark of the branches is ſmooth, of a grey colour, but on the tender ſhoots it is green, and that of the trunk is of a darker colour, and full of cracks; the leaves are entire; they are ſeven or eight inches long, and about half as much in breadth in the middle, gradually diminiſhing to both ends, of a lucid green on their upper ſide, and of an olive colour on their under, having a prominent midrib through the middle, with ſeveral ſmall veins running from that to both ſides of the leaf. The flower is like that of a ſingle roſe, compoſed of four roundiſh petals, which are thick at their baſe, but are thinner toward their ends; they are of a dark red colour; the fruit is round, the ſize of a middling orange; the top is covered by a cap, which was the ſtigma on the top of the ſtyle, and is indented in rays to the number of ſix or ſeven, which are obtuſe; the ſhell of the fruit is like that of the pomegranate, but ſofter, thicker, and fuller of juice; it is green at firſt, but changes to a dark brown, with ſome yellowiſh ſpots; the inſide of the fruit is of a roſe-colour, and divided into ſeveral parts by thin partitions, as in oranges, in which the ſeeds are lodged, ſurrounded by a ſoft juicy pulp of a delicious flavour, partaking of the ſtrawberry and the grape, and is eſteemed one of the richeſt fruits in the world; the trees naturally growing in the form of parabolas, and the branches being well garniſhed with large ſhining green leaves, they have an elegant appearance, and afford a kindly ſhade in hot countries, therefore are worthy of cultivation in all thoſe countries where there is warmth enough to ripen the fruit. It is eſteemed the moſt delicious of the Eaſt-Indian fruits, and a great deal of it may be eaten without any inconvenience; it is the only fruit which ſick people are allowed to eat without ſcruple. It is given with ſafety in almoſt every diſorder; and we are told that Dr. Solander, in the laſt ſtage of a putrid fever at Batavia, found himſelf inſenſibly recovering, by ſucking this delicious and refreſhing fruit; the pulp has a moſt happy mixture of the tart and ſweet, and is no leſs ſalutary than pleaſant, for which reaſon, in hot climates, it is allowed, with the ſweet orange, in any quantity, to thoſe who are afflicted with fevers, either of the putrid or inflammatory kind. The dried bark is uſed with ſucceſs in the dyſentery and teneſmus; and an infuſion of it is eſteemed a good gargle for a ſore mouth or ulcers in the throat. The Chineſe dyers uſe this bark for the ground or baſis of a black colour, in order to fix it the firmer. Native of the Moluccа iſlands, whence it has been tranſplanted to Java and Malacca. The head is ſo fine and regular, and the leaves ſo beautiful, that it is looked upon at Batavia as the tree moſt proper for adorning a garden, and affording an agreeable ſhade. Mangoſtan is the Malayan name.

2. Garcinia Celebica, or Celebes mangoſtan: leaves lanceolate; peduncles three-flowered. This is not a lofty tree, but it has an elegant ſpreading head; leaves oppoſite, on ſhort ſtrong petioles, five or ſix pairs, narrower and ſharper than thoſe of the common mangoſtan; in a young tree they are nine inches and a half long, and three and a half or four inches broad, entirely ſmooth and even; the fruit reſembles that of the common mangoſtan, but ſometimes grows to a larger ſize; it is of a yellowiſh red or ſaffron colour, like the pomegranate, and is not crowned with a ſtar, but with a little crown, which is hollowed above, and broader there than at its origin. Native of the iſland of Celebes about Macaſſar, whence it has been tranſplanted into Amboyna and Java, where however it ſeldom bears ripe fruit.

3. Garcinia cornea, or horny mangoſtan: leaves lanceolate, veinleſs; peduncles one-flowered, drooping. The trunk of this tree is lofty, but not very thick; it is covered with a black bark, adhering firmly to the wood; the branches extend wide, and divide into many ſhort branchlets, which have a pair of leaves at each joint; theſe are large; from eleven to fifteen inches long, and four broad, but on old trees ſhorter, ſmooth, firm and ſhining, having a thick midrib beneath, but above ſmooth and grooved; petioles thick and ſhort, frequently ſo curved in, that the lower ſide of the leaf becomes the upper one; the flower comes out from the branch between the upper leaves, hanging on an incurved peduncle, having the form of a ſmall roſe, but of a yellow colour. Fruit ſolitary, growing cloſe to the branch, the ſize of a plum, crowned by a ſort of a wart like the head of a nail; it is of a duſky brown or ſmoaky colour on the outſide, and within it has a mucous pulp, in which lie a few ſeeds in ſhape of a half moon; it has a reſinous ſmell when freſh; the wood is heavy and very hard like horn, whence Rumphius names it *lignum corneum*; it is uſed for the handles of tools, and the young trees in building, the older ones being too hard to work. Native of Amboyna, in high remote mountains.

Propagation and Culture. As there are but few of the ſeeds which come to perfection (for the greateſt part of them are abortive), ſo moſt of thoſe which have been brought to Europe have failed; therefore the ſureſt way to obtain the plants, is to ſow the ſeeds in tubs of earth in the country, and when the plants have obtained ſtrength, they may be brought to Europe; but there ſhould be great care taken in their paſſage, to ſcreen them from ſalt water and the ſpray of the ſea, as alſo not to give them much water, eſpecially when they are in a cool or temperate climate, for theſe plants are very impatient of wet. When the plants arrive in Europe, they ſhould be carefully tranſplanted, each into a ſeparate pot, filled with light kitchen-garden earth, and plunged into the tan-bed, obſerving to ſhade them from the ſun till they have taken new root; then they muſt be treated in the ſame manner as other tender plants from hot countries. It may be increaſed here by cuttings in the ſame manner as is directed for Gardenia.

GAR'ÇON, *ſ.* a French term for a boy or male child any time before his marriage. It is alſo applied to divers inferior ſervants, among us called *grooms*, *garçiones*, &c.

GARD, *ſ.* [*garde*, Fr.] Wardſhip; care; cuſtody.

GARD, a department of France, bounded on the north by the departments of the Lozere, and Ardeche, on the eaſt by the Rhône, on the ſouth by the Mediterranean and the department of the Herault, and on the weſt by the departments of the Herault and the Aveiron. Nimes is the capital.

GAR'DA, a town of Italy, in the Veroneſe, on a lake of the ſame name: twelve miles north-weſt of Verona. It comprehends eight pariſhes. The town of Garda, in the time of the Guelphs and Gibelines, was a celebrated fortreſs with a citadel, where Adelheit, the widow of the emperor of Lotharius, afterwards the conſort of the emperor Otto I. was detained in priſon by Berenger II. At preſent Garda is but an open place; and on the ruins of its citadel has been built an hermitage or convent of the Camalduan monks.

GAR'DA, a celebrated lake of Italy, between the Veroneſe and the Breſſan. It is about fifteen leagues long,

and its mean breadth about three leagues. The head of the lake is ſhut in between Monte Baldo and the mountains of Breſſan, which are cut perpendicularly from Gargano to Riva. The lower part is included between hills, to which learned Italians give the name of *Colli-Benacenſi*. It receives the Sarca on the north; towards the weſt, the torrents of Ponal, Braſa, Lampion, and Toſcolano; and on the eaſt, the waters which run from Monte Baldo. The ſurface of the lake is broken by three iſlands, the Trimelone, Olivi, and Frati, and by the peninſula of Sermione, which projects from the middle of the lower ſide of the baſin. Its waters being extremely limpid, we can perceive at a great depth the ſtones at the bottom, and the plants which cover them; but its depth is ſo very unequal that its mean cannot be eaſily aſſigned. The water is very light, but it has a fiſhy taſte. M. Zeviani ſays that it does not curdle ſoap, and boils vegetables perfectly well. At the commencement of the ſummer, the water riſes, which the fiſhermen attribute to the plants that ſpring up from the bottom of the lake; but which it is more natural to aſſign to the melting of the ſnows, and the heavy rains which fall at that ſeaſon. The navigation is then often dangerous. When the water ſinks, marſhes appear in certain places; the exhalations from which, by the action of the ſun, render the air unhealthy.

South and north winds prevail in the morning and in the evening, but the various directions of the vallies, which border on the lake, occaſion currents of air, to which the inhabitants give names referring either to their effects, or to the part of the ſhore from which they proceed. The Vexentina blows after changes of the weather, or when it becomes ſettled. The Toſcano blows when the weather is about to change, and is often followed by a high wind. The names of theſe two refer to their direction; they are ſtormy, as is alſo that which blows from Garda, and is called *Spizzocher*, being often as tremendous as that from the north, but it is of ſhort duration. The *Andro*, which blows from the ſide of Lonato, is little dangerous. Thoſe of Ponal and Navenne, named from the places whence they proceed, are much to be feared in the ſummer ſeaſon, taking the barks by ſurpriſe which fail in theſe directions: but theſe winds are not of long continuance. The Ora blows all the year, eſpecially in April; but it never diſturbs the lake. The Sovero is the moſt furious, often violently agitating the whole maſs of water; at which time the lake preſents the terrific appearance of a ſtormy ſea. The veſſels, which are overtaken by it, do not endeavour to reſiſt it, and only think of ſhelter. Theſe tempeſts commonly happen either in winter, when the ſnow is on the mountains; or in ſummer, when they become tremendous ſtorms, which continue for two or three days. The appearance of the atmoſphere indicates their approach.

The commerce of the lake is conſiderable, and it would become more ſo if the Mincio were rendered navigable. At Torri, Garda, Limon, Torbole, Peſchiera, and Riva, the fiſhery is a very important object. The principal market is at Dezenzano: but there is another alſo at Torri. The people carry their fiſh to Venice, Milan, and even to Genoa; and every where it is much in requeſt. On the eaſtern bank, the ports moſt frequented are thoſe of Laſiſe, San Virgilio, and Malſonina; they are moreover the largeſt and moſt commodious. That of Torri is choaked up with ſand, or at leaſt ſubject to that inconvenience. Thoſe of Bardolino and Brenzone are uſed only as ferries. That of Riva is the largeſt and the ſafeſt, and it is the *entrepôt* of the commerce of the Tyrol.

GARDAN'NE, a town of France, in the department of the Mouths of the Rhône, and chief place of a canton, in the diſtrict of Aix: three leagues north-north-eaſt of Marſeilles, and one and a half ſouth-ſouth-eaſt of Aix.

GAR'DANT, *adj.* Keeping guard. In heraldry a creature full-faced, and looking right forward.

GAR'DE (La), a town of France, in the department of the Var, and chief place of a canton, in the diſtrict of Toulon: two leagues weſt of Hieres, and one and a half eaſt of Toulon.

GAR'DECAUT, or GUARD DU CORD, *ſ.* in a watch, is that which ſtops the fuſee, when wound up, and for that end is driven up by the ſpring. Some call it guard-cock; others guard du gut.

GARDEI'AH, a town of Africa, the capital of Beni Mezzab: 180 miles eaſt of Fighig. Lat. 32. 15. N. lon. 2. 30. E. Greenwich.

GARDELE'GEN, or GARDELEBEN, a town of Germany, in the circle of Upper Saxony, and Old Mark of Brandenburg, containing four churches, four hoſpitals, and a manufacture of cloth; celebrated for its beer: forty-four miles weſt-north-weſt of Brandenburg, and ſeventy-two weſt of Berlin. Lat. 53. 7. N. lon. 29. 9. E. Ferro.

GAR'DEN, *ſ.* [*gardd*, Welſh; *jardin*, Fr. *giardino*, Ital.] A piece of ground incloſed, and cultivated with extraordinary care, planted with herbs or fruits for food, or laid out for pleaſure.—In the royal ordering of *gardens*, there ought to be *gardens* for all the months in the year. *Bacon.*—In every *garden* ſhould be provided flowers, fruit, ſhade, and water. *Temple.*

My *garden* takes up half my daily care,
And my field aſks the minutes I can ſpare. *Harte.*

A place particularly fruitful or delightful:

I am arrived from fruitful Lombardy,
The pleaſant *garden* of great Italy. *Shakeſpeare.*

GARDEN is often uſed in compoſition for *hortenſis*, or belonging to a garden. *Garden-mould*, is mould fit for a garden.—They delight moſt in rich black *garden mould*, that is deep and light, and mixed rather with ſand than clay. *Mortimer.*—*Garden-tillage*, is tillage uſed in cultivating gardens.—Peas and beans are what belong to *garden-tillage* as well as that of the field. *Mortimer.*—*Garden-ware*, is the produce of gardens.—A clay bottom is a much more pernicious ſoil for tree and *garden-ware* than gravel. *Mortimer.*

To GAR'DEN, *v. n.* To cultivate a garden; to lay out gardens.—When ages grow to civility and elegancy, men come to build ſtately, ſooner than to *garden* finely; as if *gardening* were the greater perfection. *Bacon.*

At firſt, in Rome's poor age,
When both her kings and conſuls held the plough,
Or *garden'd* well. *Ben Jonſon.*

Robbing gardens of fruit growing therein, is puniſhable criminally by whipping, ſmall fines, impriſonment, and ſatisfaction to the party wronged, according to the nature of the offence. 43 *Eliz. c.* 7.

GAR'DEN (Francis), known by the title of *lord Gardenſtone*, born at Edinburgh, in 1721. His father was an opulent landholder in Aberdeenſhire; his mother was Jane, daughter of ſir Francis Grant of Cullen. After paſſing through the uſual courſe of liberal education at the univerſity, he betook himſelf to the ſtudy of law for his profeſſion; and in 1744 he was admitted a member of the faculty of advocates, and called to the Scottiſh bar. In his practice as an advocate, he ſoon began to be diſtinguiſhed by a ſtrong rectitude of underſtanding, and by great vivacity of genius; though his taſte was averſe from auſtere and plodding ſtudy, while it was captivated by the faſcinations of polite learning, and the fine arts. He became his majeſty's ſolicitor, July 3, 1764; and at length the worth of his character, and his abilities as a lawyer, recommended him to the office of a judge in the courts of ſeſſion and juſticiary, the ſupreme judicatures, civil and criminal, for Scotland. His place in the court of ſeſſion he continued to occupy till his death; but had, ſome years before, reſigned the office of

of a commiſſioner of juſticiary, and in recompence got a penſion of 200l. per annum. Clear diſcernment, ſtrong good ſenſe, conſcientious integrity, and amiable benevolence, remarkably diſtinguiſhed his conduct as a judge.

In 1762 he purchaſed the eſtate of Johnſton, in the county of Kincardine. Within a few years after he began a plan of the moſt liberal improvement of the value of this eſtate, by an extenſion of the village of Laurencekirk, adjoining. He offered leaſes of ſmall farms, and of ground for building upon, which were to laſt for the term of one hundred years; and of which the conditions were extremely inviting to the ſurrounding country. Theſe offers were eagerly embraced. More deſirous to make the attempt beneficial to the country, than to derive profit from it to himſelf, he was induced, within a few years, to reduce his ground-rents to one half of the original rate. Numerous artiſans reſorted to ſettle in the riſing village. His lordſhip's earneſtneſs for the ſucceſs of his project, and to promote the proſperity of the people whom he had received under his protection, led him to engage in ſeveral undertakings; by the failure of which he incurred conſiderable loſſes. Projects of a print-field, and of manufactures of linen and of ſtockings, attempted with ſanguine hopes in the new village, and chiefly at his lordſhip's riſk and expence, miſgave in ſuch a manner as might well have finally diſguſted a man of leſs ſteady and ardent philanthropy, with every ſuch engagement. But the village ſtill continued to advance. It grew up under his lordſhip's eye; and in 1779, he procured it to be erected into a burgh or barony; having a magiſtracy, an annual fair, and a weekly market. He provided in it a good inn for the reception of travellers; and with an unconmon attention to the entertainment of the gueſts who might reſort to it, furniſhed this inn with a library of books for their amuſement. Before his lordſhip's death, he ſaw his plan of improving the condition of the labourers, by the formation of a new village at Laurencekirk, crowned with ſucceſs beyond his moſt ſanguine hopes. He has acknowledged, with an amiable frankneſs, in a memoir concerning this village, "That he had tried, in ſome meaſure, a variety of the pleaſures which mankind purſue; but never reliſhed any ſo much as the pleaſure ariſing from the progreſs of his v llage."

In 1785, upon the death of his elder brother, Alexander Garden of Troup, M. P. for Aberdeenſhire, lord Gardenſtone ſucceeded to the poſſeſſion of the family eſtates, which were very conſiderable, and afforded him an opportunity of viſiting the continent. In the month of September 1786, his lordſhip ſet out from London for Dover, and paſſed over into France. After viſiting Paris, he proceeded to Provence, and ſpent the winter months in the genial climate of Hieres. In the ſpring of 1787 he returned northwards, viſiting Geneva, Swiſſerland, the Netherlands, and the Dutch provinces, and paſſing through Germany into Italy. With a fond curioſity, attentive alike to the wonders of nature, to the noble monuments of the arts, and to the awful remains of ancient grandeur, with which Italy abounds, he viſited all its great cities, and ſurveyed almoſt every remarkable and famous ſcene that it exhibits. He eagerly collected ſpecimens of the ſpars, the ſhells, the ſtrata of rocks, and the veins of metals, in the ſeveral countries through which he paſſed. He amaſſed alſo cameos, medals, and paintings. He enquired into ſcience, literature, and local inſtitutions. He wrote down his obſervations, from time to time; not indeed with the minute care of a pedant, or the oſtentatious labour of a man travelling with a deſign to publiſh an account of his travels; but ſimply to aid memory and imagination in the future remembrance of objects uſeful or agreeable. After an abſence of about three years, he returned to his native country. The laſt years were ſpent in the diſcharge of the duties of his office as a judge; in ſocial intercourſe with his friends, and in the performance of a thouſand generous offices of benevolence and humanity. As an amuſement for the laſt two or three years of his life, when his increaſing infirmities precluded him from active exerciſe, he bethought himſelf of reviſing ſome of the light fugitive pieces, in which he had indulged the gaiety of his fancy in his earlier days; and a ſmall volume of poems was publiſhed, in which the beſt pieces are, upon good authority, aſcribed to lord Gardenſtone. He reviſed alſo the memorandums which he had made upon his travels, and permitted them to be ſent to the preſs. The two former volumes were publiſhed while his lordſhip was alive; the third after his death. They convey much agreeable information, and beſpeak an elegant, enlightened, and amiable, mind. The laſt volume is filled chiefly with memorandums of his lordſhip's travels in Italy; and contains many intereſting criticiſms upon ſome of the nobleſt productions of the fine arts of painting and ſculpture. His lordſhip's health had long been declining; and he died a bachelor on the 22d of July 1793.

GARDEN BAY', a bay on the eaſt coaſt of Newfoundland. Lat. 49. 42. N. lon. 54. 50. W. Greenwich.

GAR'DEN-PLOT, *ſ.* Plot in a garden:

In bower and field he ſought, where any tuft
Of grove, or *garden-plot*, more pleaſant lay. *Milton.*

GAR'DEN-STUFF, *ſ.* The produce of the garden, eſpecially that which is dreſſed and eaten with meat.

GAR'DENER, *ſ.* He that attends or cultivates gardens.—Our bodies are our gardens, to the which our wills are *gardeners*; ſo that if we plant nettles, or ſow lettuce, the power lies in our will. *Shakeſpeare.*—The life and felicity of an excellent *gardener* is preferable to all other diverſions. *Evelyn.*

Then let the learned *gard'ner* mark with care
The kinds of ſtocks, and what thoſe kinds will bear.
Dryden.

GARDE'NIA, *ſ.* [So named by Ellis, in honour of Alexander Garden, M. D. of Charleſtown in Carolina.] In botany, a genus of the claſs pentandria, order monogynia, natural order contortæ, (rubiaceæ, *Juſſ.*) The generic characters are—Calyx: perianthium one-leafed, five-cleft, ſuperior; diviſions upright, permanent. Corolla: one-petalled, funnel-form or ſalver-form; tube cylindric, longer than the calyx; border flat, five-parted. Stamina: filaments none; antheræ five, inſerted into the mouth of the tube, linear, ſtreaked, half the length of the border. Piſtillum: germ inferior; ſtyle filiform or club-ſhaped; ſtigma ſtanding out, ovate, obtuſe, two-lobed, often furrowed. Pericarpium: berry (berried drupe, *Gærtner,*) dry, one, two, or four, celled. Seeds: very many, flatted, imbricate in two rows, (two rows in each cell. *Juſſ.*)—*Eſſential Character.* Corolla one-petalled, contorted or twiſted; ſtigma lobed; berry inferior, two or four-celled, many-ſeeded.

Species. 1. Without thorns. 1. Gardenia radicans, or rooting gardenia: corollas obtuſe; calyx angular; leaves elliptic; ſtem rooting. Stem decumbent, ſmooth, thickneſs of a reed, about a foot high, putting out roots at the bottom; branches oppoſite, tubercled with rudiments of leaves, flexuoſe, upright; leaves aſſembled at the ends of the branches, oppoſite, ſubſeſſile, entire, marked with parallel nerves, ſmooth, upright, from an inch to two inches in length. It is commonly cultivated in Japan, where it flowers in June and July.

2. Gardenia florida, or fragrant gardenia, or Cape jaſmine: corollas ſalver-ſhaped; calycine ſegments vertical, lanceolate-ſubulate; leaves elliptic. Stem large and woody, ſending out many branches, which are firſt green, but afterwards the bark becomes grey and ſmooth, the branches come out by pairs oppoſite, and have ſhort joints; the leaves alſo are oppoſite, cloſe to the branches; they are five inches long, and two and a half broad in the middle, leſſening to both ends, terminating in a point; they are of a lucid green, having ſeveral tranſverſe

verſe veins from the midrib to the borders; they are entire, and of a thick conſiſtence; the flowers are produced at the ends of the branches, ſitting cloſe to the leaves; when fully blown, the double flower is as large as a middling roſe. It has a very agreeable odour, on the firſt approach ſomething like that of the orange-flower, but on being more cloſely ſmelt to, like the common double white narciſſus. There are hedges of it in Japan, and the Japaneſe are very fond of it near their houſes, and in the walks of their gardens. Both in Japan and China the fruit is uſed for dying yellow. The mucilage preſſed out with the ſeeds produces a fine yellow; that from the ſeeds only is lighter, but tinges water of a lively yellow, and is ſaid to dye ſilk of a deep orange, or even ſcarlet, but not the deep China ſcarlet. Native of the Cape of Good Hope, Cochinchina, China, Japan, Surat, Amboyna, and the South-Sea iſlands. Introduced about 1754, by captain Hutchinſon, of the Godolphin Indiaman, who found it near the Cape of Good Hope, being attracted by the great fragrancy of the flowers. He preſented it to Richard Warren, Eſq. of Woodford in Eſſex, in whoſe curious garden it continued flowering. Mr. James Gordon, of Mile-end, propagated it from cuttings in 1757. It flowers in July and Auguſt. It varies with ſingle and double flowers: the former has from five to nine diviſions of the corolla, and ſtamens.

3. Gardenia Thunbergia, or ſtarry gardenia: corollas ſalver-ſhaped; calyxes burſting laterally, with the ſegments dilated at the tip; leaves elliptic. This is a tree, about two fathoms in height, ſmooth, and branching very much; branches alternate, round, having rings on them from the rudiments of leaves, aſh-coloured, ſmooth, erect, branchletted; leaves in whorls of three or four, acuminate to both ends, entire, concave, ſomewhat waved, marked with parallel nerves, ſmooth, having hairy glands in the axils of the nerves on the lower ſurface, ſpreading, unequal, longer than the internodes, two inches long and more; berry ovate, ſomewhat wrinkled, ſmooth, greeniſh, turning white, one-celled, five-valved, the ſize of a hen's egg, continuing ſeveral years without opening or falling; having a woody hard bark, and ſcarcely any pulp. Native of the Cape of Good Hope, and introduced in 1773, by ſir James Cockburn, Bart.

4. Gardenia latifolia, or broad-leaved gardenia: corollas ſalver-ſhaped; calycine ſegments ſubulate, obtuſely keeled; leaves obovate-roundiſh. Native of the barren rocky hills both in the Circars and Carnatic. Its large gloſſy green leaves, and the ſize and fragrance of the flowers, render it both ornamental and deſirable. *Roxb.* 134.

5. Gardenia gummifera, or gummy gardenia: corollas obtuſe; calyx rough with hairs; leaves oblong, obtuſe. This reſembles G. florida in the ſize and form of the border of the corolla; the tube of the calyx is longer, more filiform, and covered with more ſlender hairs. A gum-reſin, very much like gum elemi, exudes from the clefts of the bark, and from the leaves. Native of Ceylon; found there by Koenig.

6. Gardenia Muſſænda, or Muſſænda gardenia: corollas acute; calyx rough with hairs; leaves ovate, acute. Native of South America.

7. Gardenia Genipa, or Genipa gardenia: leaves oblong-lanceolate; peduncles axillary, many-flowered, corollas ſalver-ſhaped, with an abbreviated tube. This is a thornleſs ſhrub, according to Swartz, with oblong-lanceolate leaves; axillary many-flowered; peduncles and ſalver-ſhaped corollas with a ſhort tube. It differs from the other gardenias principally in the form of the corolla, which varies much in this genus. Native of South America.

8. Gardenia rothmannia, or ſpotted-flowered gardenia: corollas funnel-ſhaped; calycine ſegments ſubulate; leaves oblong; (corollas acute, ſubcampanulate; calyx ſmooth; leaves oblong, acute. *Thunb. cap.*) Stem arboreous, erect, branching very much, a fathom and half in height; leaves oppoſite, on very ſhort petioles, acute, entire, nerved, ſmooth, bright green above, paler beneath, evergreen, having hairy glands in the axils of the nerves on the lower ſurface; berry ovate, fleſhy, angular, with about twelve obſcure lines, ſmooth, two-valved, one-celled, pulpy, the ſize of a ſmall pear, black when ripe, opening on one ſide, and falling from the tree when dry; pulp ſoft, like that of the tamarind; the wood of this is very hard; flowers white, ſmelling very ſweet, eſpecially during the night; native of the Cape of Good Hope.

II. Thorny. 9. Gardenia ſpinoſa, or thorny gardenia: flowers ſeſſile, hirſute. Native of China near Macao.

10. Gardenia dumetorum, or buſhy gardenia: thorns oppoſite, longer than the leaves; germs ſmooth. This is one of the moſt common thorny ramous ſhrubs on the coaſt of Coromandel; flowering in the beginning of the wet ſeaſon. Uſed for fences and fire-wood; flowers few, but highly fragrant. The fruit, when ripe, reſembles a ſmall yellow apple; when bruiſed, and thrown into fiſh-tanks, the fiſh are ſoon intoxicated, and ſeen floating on the ſurface. If practiſed in the hot ſeaſon, it is ſaid the fiſh generally die, but if in the cold ſeaſon they recover. Fiſhermen ſometimes follow this mode of catching fiſh; and they are not on that account deemed leſs wholeſome. *Roxb.* 136. It is the G. ſpinoſa of Linnæus, but a different plant from the G. ſpinoſa of Thunberg, which is a native of China, and has the calyx externally, with the corolla very hairy; whereas in this they are ſmooth.

11. Gardenia micranthus, or ſmall flowered gardenia: flowers ſeſſile, ſmooth. Native of China and the iſland of Ceylon.

12. Gardenia ſcandens, or climbing gardenia: climbing; flowers peduncled. Native of China, near Macao: according to Retzius, it is a ſhrub very much branched both oppoſitely and alternately; ſpines ſhort; leaves oppoſite and ſcattered, ovate, quite entire, the ſame ſize as in G. dumetorum; flowers at the ends of the twigs, uſually ſolitary, peduncled, altogether like thoſe of jaſminum odoratum; but the ſtamens and piſtil as in gardenia; it has the calyx of jaſmin, but more leathery, as is alſo the corolla.

13. Gardenia uliginoſa, or boggy gardenia: branches thorny at the end; tube of the corolla hirſute within. A ſhrub with brown ſquariſh branches, the twigs ſhort and growing by pairs, having leaves and two thorns at the end. Native of the Eaſt-Indies in marſhes: found there by Koenig. Roxburgh deſcribes it thus: A rigid ramous ſmall tree, armed with numerous ſtrong thorns, delights in moiſt places; flowers at the beginning of the hot ſeaſon, or in ſome meaſure all the year. *Roxb.* 135.

14. Gardenia armata, or armed gardenia: ſpines of the branchlets terminating in fours; calycine ſegments linear wedgeform; flowers crowded. This is a ſmall tree, about ten feet high, and very ſeldom more than three inches in diameter, frequently branching very near the ground; flowers ſeſſile, commonly four together from the end of each twig; extremely odorous. Native of South America and the Weſt-India iſlands.

15. Gardenia aculeata, or round leaved gardenia: thorns oppoſite, both they and the flowers ſhorter than the leaves; branches ſmooth. Browne calls it the indigo-berry, and ſays that it is a ſmall ſhrub riſing by a branched ſtalk, and ſhooting commonly to the height of ſeven or eight feet; the main ſtem tough and hard; the branches ſomewhat prickly at the ends; the leaves of an oval form, and growing in tufts; the pulp of the berries, which are generally numerous on the ſmaller branches, is very thick, and ſtains paper or linen of a fine fixed blue colour. Native of the Weſt-Indies. Introduced before 1733 by William Houſtoun, M.D. who found it near Vera Cruz, and gave it the name of Randia, in honour

GARDENIA.

Gardenia Latifolia.

London, Published as the Act directs August 2nd 1806 by J. Wilkes.

nour of Mr. Iſaac Rand, who was a curious botaniſt; it had alſo been diſcovered by ſir Hans Sloane in the iſland of Barbadoes.

16. Gardenia fragrans, or fragrant gardenia. Like G. dumetorum, delights in a poor ſoil; for, when brought into a good ſoil, the thorns almoſt totally diſappear; flowers in June and July, about the beginning of the rains. *Roxb.* 137.

Propagation and Culture. The common gardenia or cape jaſmin is eaſily propagated by cuttings during the ſummer ſeaſon, planted in pots, plunged into a moderate hot-bed, covered cloſe with bell or hand-glaſſes, and ſcreened from the ſun; when they have taken root, they ſhould be carefully parted, and put each into a ſeparate ſmall pot, plunging them again into the hot-bed, and ſhading them until they have taken new root, after which they ſhould be gradually inured to the open air; though the cuttings ſtrike freely, and make ſtrong ſhoots a year or two after, yet in three or four years they are apt to be ſtinted in their growth, the leaves turn pale and ſickly, and the plants frequently die ſoon after. The other gardenias, ſo far as we are yet acquainted with them, may be increaſed and treated in the ſame manner; allowance being made for ſome, which are natives of hotter climates.

15. The randia is propagated by ſeeds, ſown early in ſpring, in pots filled with light freſh earth, and plunged into a hot-bed of tanner's bark, obſerving to water the earth frequently but gently; when the plants come up, admit freſh air to them every day when the weather is warm, and refreſh them often with water; in a month's time they will be fit to tranſplant; ſhake them carefully out of the pots, plant each in a ſmall pot filled with light freſh earth, and plunge them into the hot-bed again, ſcreening them from the ſun until they have taken new root; after which they muſt have air and moiſture according to the warmth of the ſeaſon. The plants may remain in the hot-bed till towards Michaelmas, when the nights begin to be cold; then they ſhould be removed into the ſtove, and if they are plunged into the bark-bed, it will greatly forward their growth; though they will live in the dry ſtove, in a moderate temperature. During the two firſt ſeaſons, whilſt the plants are young, keep them conſtantly in the ſtove, waſhing their leaves whenever they contract filth; after they have obtained ſtrength, expoſe them in ſummer to the open air for two or three months, in a warm ſituation; but in winter place them in the ſtove, in a moderate warmth. The leaves continuing green throughout the year, this is a valuable plant for the ſtove.

GAR'DENING, *ſ.* The act of cultivating or planning gardens.—My compoſitions in *gardening* are after the Pindaric manner, and run in the beautiful wilderneſs of nature, without affecting the nicer elegancies of art. *Addiſon.*—For the art of planning, cultivating, and improving, GARDENS, with the lateſt and beſt methods of grafting, pruning, framing, forcing, and conſtructing hot-beds, pinaries, hot-houſes, lawns, pleaſure-grounds, and flower-gardens, ſee the article HORTICULTURE.

GAR'DENSTOWN HARBOUR, a bay of Scotland, on the north coaſt of Bamfſhire: ſix miles eaſt of Bamff.

GARDEOL'LE (La), a town of France, in the department of the Tarn: eighteen miles ſouth-eaſt of Lavaur.

GAR'DINER (Stephen), an eminent Engliſh prelate and ſtateſman, born at Bury St. Edmunds, in 1483. According to the moſt probable accounts he was the natural ſon of Dr. Lionel Woodvill, or Widvill, biſhop of Saliſbury, and brother to Elizabeth, queen conſort to Edward IV. He took his ſurname from his reputed father, a menial ſervant of the biſhop, whom his mother married to prevent the prelate's reputation from being injured. He was ſent to Trinity hall, in the univerſity of Cambridge, where he purſued his ſtudies with great diligence and ſucceſs, and obtained reputation for correctneſs and elegance in writing and ſpeaking Latin, and extraordinary ſkill in the Greek language. His writings afford ample proof how much he ſtudied the works of Cicero; and the critics of his time reproached him with affectation, for the cloſeneſs with which he imitated his ſtyle. Afterwards he applied himſelf to the ſtudy of the civil and canon law, and was created doctor of the former in 1520, and of the latter in the following year. The reputation which he acquired in the univerſity ſoon proved the means of his introduction to the favour and confidence of ſome of the greateſt men of that age. Some accounts ſtate that he was at firſt patroniſed by Thomas Howard, duke of Norfolk, and it is certain that he was taken into the family of cardinal Wolſey, who made him his ſecretary. While he filled this poſt an incident happened which introduced him to the knowledge of the king, and thus gave riſe to his farther advancement. Cardinal Wolſey having projected an alliance with the French king, Francis I. in 1525, he employed Gardiner to draw up the plan of it. During the time that he was engaged on this work at the cardinal's houſe at More-Park, in Hertfordſhire, king Henry accidentally went thither, and was highly pleaſed with the progreſs which the ſecretary had made. In 1527-8 Gardiner was appointed, jointly with Edward Fox, to proceed on an embaſſy to Rome, for the purpoſe of negociating the buſineſs of the king's divorce from queen Catharine. Gardiner was appointed chief of the embaſſy; and his addreſs and management ſucceeded ſo well, that he obtained a commiſſion from the pope, addreſſed to the cardinals Wolſey and Campeggi, empowering them to determine the buſineſs. Having ſent Fox home with an account of their negociations, Gardiner continued ſome time longer at Rome, where the dangerous illneſs of pope Clement VII. gave riſe to various intrigues for ſecuring a majority of votes in the ſacred college, in caſe of his demiſe. After Gardiner's return to England, the archdeaconry of Norfolk was beſtowed upon him, in return for his ſervices at Rome. This appears to have been his firſt preferment in the church; but in the ſtate he made a more rapid progreſs. By his capacity for buſineſs, and activity in conducting it, he had ſo far recommended himſelf to the king, that he reſorted to him in all matters of moment; and as the libidinous Henry was deſirous of having him entirely in his ſervice, he took him from his ſituation of ſecretary to Wolſey, and appointed him to the office of ſecretary of ſtate; in which capacity he could be more cloſely conſulted on the ſubject of the divorce, which lay neareſt his majeſty's heart. The readineſs and diligence which Gardiner manifeſted in carrying the king's wiſhes into execution, were ſoon rewarded by valuable eccleſiaſtical promotions. In the ſpring of 1531 he was inſtalled archdeacon of Leiceſter, when he reſigned the archdeaconry of Norfolk; and in the September following he reſigned his new preferment in favour of Dr. Fox. In the ſame year he was incorporated doctor of laws in the univerſity of Oxford, and in the month of November conſecrated biſhop of the rich ſee of Wincheſter. Dr. Gardiner was not appriſed, at the time, of the king's deſign of conferring this biſhopric upon him, for Henry would frequently abuſe him as though he had been unworthy of any favour; and at the inſtant when he granted him this preferment, he put him in mind of it. "I have," ſaid the king, "often *ſquared* with you, Gardiner," (a word which he uſed for that ſpecies of rebuke,) "but I love you never the worſe, as the biſhopric which I give you will ſufficiently evince." After this preferment, Gardiner could ſtand a royal battling without much anxiety; or, to uſe his own words to the duke of Somerſet, "he folded it up in the matter, and bore it patiently." In 1533, biſhop Gardiner ſat in the court with archbiſhop Cranmer, when the latter prelate pronounced the ſentence by which queen Catharine's

marriage was declared null and void. In the ſame year he was ſent ambaſſador to France, whither he was ſoon followed by Dr. Bonner. Their inſtructions were to attend an interview between the pope and the French king at Marſeilles, and to diſcover the deſigns of the holy father and the French monarch, which Henry and his council ſuſpected to be of a hoſtile nature againſt England. They there intimated the appeal of Henry VIII. to a general council, if the pope ſhould pretend to proceed to judgment in his cauſe; and alſo the appeal of the archbiſhop of Canterbury to the ſame tribunal, if any deſign ſhould be avowed of excommunicating him, and interdicting his church. Upon Gardiner's return from his French embaſſy, he was called upon, together with the other biſhops, to acknowledge the king as ſupreme head of the church, and to take the oath appointed for that purpoſe. With this ſummons he not only readily complied, but alſo publiſhed a defence of the king's ſupremacy, entitled "*De Vera Obedientia.*" His pen was alſo made uſe of in vindicating the king's divorce, and his emancipation of the kingdom from the tyranny of the papal ſee; upon which ſubject his writings, at the time, acquired him very high reputation. In 1538, he was ſent ambaſſador, with ſir Henry Knevit, to the German diet at Ratiſbon, where he is ſaid to have acquitted himſelf well with reſpect to the objects of his commiſſion; but he there fell under a ſuſpicion of holding a ſecret correſpondence with the pope, on the ſubject of rendering popery again triumphant in England. This ſuſpicion occaſioned a miſunderſtanding between him and his colleague, who tranſmitted to the king the particulars on which it was founded. Whether the king was ſatisfied that theſe particulars were fabricated by the enemies of Gardiner, as the latter maintained, or to whatever cauſe it might be owing, the biſhop was not brought into any trouble on this account during the reign of Henry.

Upon the fall of lord Cromwell, in 1540, Gardiner was elected chancellor of the univerſity of Cambridge, and, for a man of learning, as he unqueſtionably was, gave an extraordinary inſtance of his attachment to old cuſtoms and practices, however abſurd: for when ſir John Cheke, who was diſtinguiſhed for his knowledge of the Greek language, attempted to introduce into the univerſity a reform of the vicious and barbarous pronunciation which then obtained in England, Gardiner, as chancellor of the univerſity, interpoſed his authority, and by a dictatorial edict prohibited the improvement, to which he gave the name of novelty and innovation, under very ſevere penalties. When Cheke, in defence of himſelf, alleged the authority of Eraſmus and other learned foreigners, and obſerved that what he had done was in vindication of truth; Gardiner exclaimed, "*Quid non mortalia pectora cogit veri quærendi fames!*" What does not the itch of ſeeking out truth compel men to do! And he bade Cheke not to be the author of removing "an evil well placed." During the year 1543, Gardiner was one of the commiſſioners appointed to conclude a treaty of peace with Scotland, and to negociate a marriage between the prince of Wales and the young queen of Scotland. But whatever public employments he was engaged in, he never loſt ſight of a favourable opportunity of impeding the progreſs of the reformation; and he was, conjointly with others, very active in bringing to the ſtake ſeveral proteſtants of diſtinguiſhed zeal and character; among whom was Mrs. Anne Aſcough, a lady of unblemiſhed manners; and, by making her the object of their perſecution, they hoped to extort confeſſions from her which would furniſh matter of accuſation againſt the ducheſs of Suffolk, the counteſs of Suſſex, the counteſs of Hertford, and other high characters, among whom were ſome of the king's council. Sir George Blage, one of the king's privy-chamber, was alſo committed to Newgate, and by a ſummary proceſs condemned to be burnt. But the king, hearing of it, was greatly offended with Gardiner, and commanded him immediately to iſſue his pardon. As ſoon as ſir George was releaſed, and come into the royal preſence, the king cried out, as he was accuſtomed to call him, "Ah! my pig." "Yes," ſaid ſir George; "if your majeſty had not been better to me than your biſhops, your pig had been roaſted ere this time."

After the death of Henry VIII. in 1547, biſhop Gardiner, refuſing to conform to certain homilies, was committed a cloſe priſoner to the Fleet, where he continued till the end of the ſeſſion of parliament, when he was releaſed by the general pardon of Edward VI. though he was not charged judicially with any offence. Gardiner, being now at liberty, repaired to his diocefe, where, in general, he ſo conformed himſelf outwardly to the orders of the council, that it was not eaſy to find any advantage againſt him. But ſtill he did what lay in his power to oppoſe the principles of the reformation. Of this conduct complaint was made againſt him in the council, before which he was ſummoned in 1548, and was committed to the Tower, where he was kept ſo cloſe a priſoner for about two years, that his chaplain was only allowed admittance to him once, when he was ill, and afterwards refuſed, becauſe his life was not thought to be in danger. In 1551, he was deprived of his biſhopric, for diſobedience and contempt of the king's authority. Gardiner continued in the Tower during the remainder of king Edward's reign; but the rigor of the order of council concerning him appears to have been abated, ſince in that interval he compoſed a variety of Latin poems, tranſlated into Engliſh verſe ſeveral of the poetical parts of the Old Teſtament, and wrote ſome controverſial tracts. In 1553, king Edward having died in the beginning of July, queen Mary made her ſolemn entry into the Tower; when Gardiner preſented a congratulatory ſpeech to her majeſty, and being immediately ſet at liberty, was received into the higheſt favour. On the 8th day of that month he performed, in the queen's preſence, the Romiſh obſequies for the late king Edward, who was buried at Weſtminſter with the Engliſh ſervice by archbiſhop Cranmer; on the 9th he reſumed poſſeſſion of Winchester-houſe, in Southwark, after a confinement of ſomewhat more than five years; and on the 23d he was declared chancellor of England, when he became the queen's prime-miniſter, and was entruſted with the chief management of public affairs.

Being thus raiſed to the height of power, he determined, in conformity with the queen's zealous wiſhes, and his own inclination, as ſpeedily as poſſible to reeſtabliſh the popiſh religion, and to reconcile the kingdom to the ſee of Rome. The firſt ſtep to this end was the iſſuing of a proclamation, by which all preaching throughout the kingdom was prohibited, excepting by the queen's ſpecial licence under the great ſeal. On the 1ſt of October the biſhop of Winchester crowned queen Mary, when a pardon was proclaimed, from the benefit of which all the priſoners in the Tower and the Fleet, and many others, were excepted, who were chiefly proteſtants. On the 10th of the ſame month Gardiner opened the firſt parliament in Mary's reign. In this parliament an act was paſſed for confirming the marriage of Catharine of Arragon, the queen's mother, with Henry VIII. in the preamble of which the divorce was pronounced impious and illegal, and the whole blame of it, againſt all truth and juſtice, attributed to archbiſhop Cranmer. Biſhop Burnet very truly obſerves, that Gardiner, "in the drawing of it, ſhewed that he was paſt all ſhame: when he could frame ſuch an act, of a buſineſs which he himſelf had ſo ſervilely promoted." Before the end of the year he cauſed a bill to be brought into the houſe of lords, which, after a debate of ſix days in the houſe of commons, was at length carried, by which all the laws made in king Edward's time, relating to religion, were repealed; and it was alſo enacted, that there ſhould be no other form of divine ſervice but what had been uſed

in

in the laſt year of king Henry VIII. While the parliament was ſitting the convocation likewiſe met, where by artful management there were but ſix clergymen in the proteſtant intereſt, who were threatened, and interrupted in their arguments. When in the debate, Weſton, the prolocutor, was hard preſſed by their reaſoning, he inſultingly ſaid to them, "You have the word, but we have the ſword;" truly pointing out, ſays Burnet, wherein the ſtrength of their reſpective cauſes lay. Soon after this, ſeveral proteſtant prelates were deprived of their ſees, on different pretences, and their places were filled by thoſe who had been deprived in the reign of Edward VI. By theſe proceedings the proteſtants were with good reaſon convinced, that a ſevere perſecution was determined againſt them; and more than eight hundred of them thought it prudent to conſult their ſafety, by withdrawing into foreign parts. David Lloyd writes, that Gardiner threatened concerning theſe exiles, that "he would watch their ſupplies, ſo that they ſhould eat their nails, and then feed on their fingers' ends." Events ſoon ſhewed how well founded were their apprehenſions, for in the beginning of 1554, the marſhalſea in London, and the priſons in other parts of the kingdom, were filled with proteſtants.
